#### Harry Harrison comments

I have always believed in readability. The easier the flow of the prose, the more basic the vocabulary, the more readers there will be who can follow and enjoy a book. But complex technical terms can be used where there is no alternative. I have found that an action story with two or three levels of intellectual content below the surface enables me to say just what I wish to say. I have also found that humor—and black humor—can carry ideas that can be expressed in no other way. The fact that my books have been translated into 21 languages must indicate that I am communicating with my audience.

\* \* \*

Harry Harrison is the principal pen-name of Hank Dempsey. From the start of his writing career, he made SF his calling in every devotional sense of the word. Determined at the outset to make his living by it, at the same time he took it up as a craft to serve and improve upon. Academic critics of the genre often fail to detect the artistic passion that drives a man like Harry Harrison to cultivate it as a genuine art form, scornful as they are of its original newstand outlets, as if this thing we call SF were impossible to achieve beauty and craft because of its commercial motives. We are thus led to believe that creative values can arise only from the most rarified of aesthetic motives, never out of meeting publisher's deadlines.

The vitality and astonishing vigor of Harrison's prose, animated by the highest ideals of craftsmanship, show even in the least of his hurried efforts. Adapted to the demands of the market, his habitual practice at times reaches that elegance of statement he strives for always. A classic example is "Rescue

Operation," a short story that deserves recognition as one of the finest in the history of American letters. It is a perfect literary jewel. One need not agree with the case it argues—for it is an argument as well as a moving story—to appreciate the skillful rhetoric of its composition. It is truly a work of art, as its author hoped works of SF could be, even while it states his rationalist faith in the saving grace of science to rescue mankind from its pre-modern follies. This one story might well stand as a summary of the Enlightenment idea, to which magazine SF was dedicated at its inception, but which now embraces the counter-argument.

Harrison's first novel, *Deathworld*, was turned into a series by that name. Derived from the adventure-story format of the early SF magazines, it offered something more, informed by ecological science. At this point he made himself master of the intelligent adventure story, perfected in his most recent and very popular *Homeworld* series. The wit and nervous vitality contained in all these have their corollary in his comic adventure stories. Comedy in SF is almost impossible to carry off, yet Harrison does it with the ease and éclat that seem to be the natural expression of his vigorous personality and contagious sense of humor. *Bill, The Galactic Hero*, written as a satire on Heinlein's *Starship Troopers*, is a comic masterpiece worthy of Mark Twain, unfair as it is. Just as wildly funny is *The Technicolor Time Machine*. A story about on-location movie making in the Viking Age, it contains a wealth of realistic insights into those times, of the sort treated more seriously in *Stonehenge* (with Leon Stover), which evokes the authentic Bronze-Age culture of that monument's builders. But his comic genius keeps bursting forth in ever new sequels to *The Stainless Steel Rat*, although he claims that public demand for more and more of it (and this is very real) keep him from his growing philosophical concerns.

These also are very real. In his maturity, Harrison has come to embark upon a most remarkable series that returns SF to the philosophical values of its classical origins in the scientific romances of H. G. Wells. Wells is much honored as the father of modern SF by today's writers in this genre; but they usually so much betray him that it takes Harrison's burgeoning new line of work to remind them of their literary beginnings. As this essay goes to press, Harrison has released the first volume of his *West of Eden* series.

In *West of Eden* Harrison ponders on the curious question, why is it that everybody loves to associate dinosaurs and cavemen, even though the two are separated by some 200 million years? Conan Doyle first brought them together in his *Lost World* fantasy, and Edgar Rice Burroughs kept it up until the image was indelible. No amount of paleontological fact has ever been able to shake this picture of Alley Opp living with the dinotherium.

All right, says Harry. If that's what you want, that's what you'll get—only this time with a convincing explanation. In *West of Eden* he offers us an alternative prehistory. Early man and the ancient reptiles are given a plausible occasion for coexisting, with this difference—time has allowed for the saurians to evolve a culture-bearing species of humanoid on their own. And the two meet at that level.

The one difficulty in carrying this off lies in finding a parallel in human evolution among the mammals for the reptiles. The open and shut case for demarcation between animal and man in human origins is the mastery of fire—the first step to all modern technology, in controlling a source of energy external to mammalian body heat. But the reptiles are cold-blooded, and such a step is not possible to imagine for the take-off point in a technological species of reptile. But Harrison worked out the functional equivalent of this, in keeping with reptilian

biology, and that is fundamental to the scientific idea behind *West of Eden*, in this the most extraordinary story of intelligent adventure that he has written to date.

—Leon Stover

##### M. John Harrison comments:

I am often thought of as a pessimistic writer. I believe this is an over-simplification and prefer to think of myself as a compassionate but realistic one. There is a difference between compassion and that facile, sentimental—and political—optimism found at the crux of most sf, a genre the poverty of whose subject matter is legendary.

My fiction is concerned with the inability of people to feel ordinary emotions, or to communicate them successfully to one another; their efforts to maintain identity in the face of abstract systems and idealistic social structures; and their perception of themselves as live individuals in a meaningless, contingent universe.

The most radical expression of this existential standpoint is found in the collection *Viriconium Nights*, but it is clearly present in stories such as "The Machine in Shaft Ten" and "Settling the World" and in *The Committed Men*.

In fact, my fiction is not easily described as sf. Though in-genre critics have described it as an "illustration of entropy," this is to put the cart before the horse. In work like "Running Down" and *In Viriconium* I have consistently used entropy as a metaphor, an illustration, of the human condition: I have no

interest in it as a scientific concept. I have used the psychology of sensory deprivation and the ethological notion of "Umwelt" in a similarly metaphorical way. Fiction and science get into bed together at the risk of popularisation, which despite George Steiner's elegant efforts is still only popularisation, or (increasingly) bad faith. I would prefer to avoid that.

My interest in the fantastic allegory or parable, bread and butter of contemporary sf, has declined.

Since 1980 I have turned away from the extreme absurdism of *The Pastel City* and *A Storm of Wings*—with their stress on the failure of, and the fear of, action—and in "The Quarry" or "Old Women" can be seen an increasingly direct and sensual engagement with those areas where ethology, early-modernist fiction and a moderate existentialism seem to share ground in the concept of the "accented moment sign" or moment-of-being. I am interested in the lives of individuals; compassion is not a function of the grand or political scale. For the same reason I am drawn to the short novel rather than the heavily researched three-decker with its blundering Victorian moralism.

My writing is oblique, compressed, and allusive, with a carefully textured surface. Despite this I am much less a stylist, and very much less a "writer-for-writing's-sake," than is generally supposed in the theoretical regions of sf, which are as poverty-stricken as its human ones.

For the more recent short stories—"The Ice Monkey," "Egnaro," "The New Rays," and "A Young Man's Journey to Viriconium"—and for *Climbers*, my novel-in-progress, my notebooks have provided material observed from life. This is ordered at the outset according to its own internal demands. Thereafter setting and event amplify the theme; character and meaning are less stated than allowed to emerge. What appears to be atmosphere is more often than not metonymy or metaphor.

\* \* \*

M. John Harrison's most enduring work in science fiction is the Viriconium series. The first book, *The Pastel City*, presents a civilization in decline where medieval social patterns clash with the advanced technology and superscience weaponry that the citizens of the city know how to use but have forgotten how to engineer. Harrison's leading character, Cromis, fancies himself a better poet than a swordsman; yet he leads the battle to save Viriconium, the Pastel City, from the brain-stealing golems from Earth's past. The decadence Harrison describes is reminiscent of Michael Moorcock's vision of the far future in *The End of All Songs*.

The next book in the Viriconium series is *A Storm of Wings*. Fay Glass and Alstath Fulthor of the Reborn try to alert the powers of Viriconium that the northern highlands are overrun by insectile armies. A race of intelligent insects is invading Earth as human interest in survival wanes. Fay brings the severed head of an invading locust-like giant insect to show the extent of the disaster. Harrison brilliantly depicts the workings of civilization on the verge of collapse and the heroic efforts of individuals to help it sustain itself a little longer.

*The Floating Gods* is a moody portrait of Viriconium beset by a mysterious plague. As artist Audsley King slowly dies from the plague, her friend Ashlyme tries to save her. Yet his efforts are purposeless and his adventures misdirected. Where the previous books in the series held some sword and sorcery elements, *The Floating Gods* goes beyond black humor into a coma of despair.

*Viriconium Nights* is a collection of eight vignettes of the night life in the Pastel City. Many of the pieces feature some of

Harrison's best writing, but that is what most of the stories are: exercises in style. The characters remain ill-defined and the actions are directionless and at times absurd. Vivid images come to nothing as plot and characters never interact.

Of Harrison's other novels his first, *The Committed Men*, is notable for its grotesque descriptions of post-nuclear holocaust Earth. A band of unlikely characters—a dwarf, a cripple, a doctor, and a girl who has just given birth to a ugly mutant baby—travel south to save the baby they are "committed" to delivering to the new race of mutants.

Harrison's most accessible book is *The Centauri Device* where space tramp John Truck is hunted down by a cast of bizarre characters: General Alice Gaw, ruthless head of the Israeli World Government; Gadaffi ben Barka, terrorist supreme of the Union of Arab Socialist Republics; and Dr. Grishkin, leader of the weird Opener cult. Truck's mother was a Centauran, one of the last before the Centauri Genocide. Now Truck is the last Centauran and the rival groups need him to arm the most powerful weapon in the galaxy: the Centauri device which will respond only to the genetic code of a true Centauran. There's plenty of action, black humor, and political commentary in this fast-paced space opera. The ending is a bit too pat, but Harrison is in fine control of this book all the way.

*The Ice Monkey and Other Stories* shows Harrison's wide range of subject matter. In seven stories, Harrison manages to capture pathos, humor, awe, despair, and pain. The best piece is "The Incalling" where an editor is haunted by an author's attempts to cure himself of cancer by faith healing. This is an unforgettable story.

M. John Harrison is a brilliant stylist whose work captures the grotesque and the decadent in vivid, absurd images that are as fascinating as they are unique.

\*

Manuscript Collection: British Library, London.

Critical Studies: *L. P. Hartley* by Paul Bloomfield, London, Longman, 1962, revised edition, 1970; *L. P. Hartley* by Peter Bien, University Park, Pennsylvania State University Press, and London, Chatto and Windus, 1963; *Wild Thyme, Winter Lightning: The Symbolic Novels of L. P. Hartley* by Anne Mulkeen, London, Hamish Hamilton, and Detroit, Wayne State University Press, 1974.

\* \* \*

L. P. Hartley's *Facial Justice* is a dystopian novel of the future in the tradition of Zamyatin's *We*. Hartley envisages a New State founded on self-abasement and equality. All the citizens are patients and delinquents, victims of their own ego-sickness. Each citizen is named after a murderer, biblical murderers being particularly in vogue; sackcloth and ashes provide the regular costume. In this projected society, envy is seen as the single cause of personal dissatisfaction and social friction. The wants, desires, and instincts of the citizens of the

New State are suitably provided for by the Dictator. Hartley postulates that envy is stronger in women than in men, especially when it comes to the question of personal beauty. So women who are dissatisfied with their looks are encouraged to be "betafied," to have plastic surgery performed which gives them a pre-packaged beautiful face. The only difficulty is that such women have a difficult time in expressing their emotions.

Hartley's narrator and ultimately the first revolutionary in the New State is a young woman, Jael 93, who, as a result of an accident, is betafied only to resent the loss of her personality. Henceforth she attempts to discredit the Dictator and overthrow the New State. How she goes about it and the totally unexpected result of her activities provide fascinating reading. Hartley poses many of the usual dystopian concerns, freedom versus happiness, community good versus individual fulfillment, but treats them with a fresh perspective. *Facial Justice* is an intriguing venture into the dystopian tradition by a well-known mainstream author, especially in that it is written from the woman's point of view in a society which, though it professes equality, actually denigrates women.

\* \* \*

*Doppelgangers*, the novel by H. F. Heard best known to science-fiction readers, depicts a hedonistic dictatorship based on behavior control. The hero, nameless except as "the remodeled man" or Alpha II, belongs to an underground organization ruled by the Mole, who also uses behavior control to sabotage the dictatorship. In the novel, the hero is "re-modeled" physically to duplicate the dictator Alpha, who needs a double to impersonate him and absorb the psychic impact of his charismatic appearances. When Alpha commits suicide, Alpha II is left as dictator. An assassination attempt by a follower of the Mole leads to a series of discoveries about the true government of the world, which remains in the hands of spiritually evolved people called elevates.

The novel explores Heard's ideas about the human condition. The nature of Alpha's dictatorship is despotism through indulgence, suave reduction of the human soul to childishness by supplying the masses with entertainment and pleasures. "Animectomy," or cutting away of the soul, prefigures B. F. Skinner's *Walden II*. As a dystopian novel, *Doppelgangers* can also be compared to Orwell's *Nineteen Eighty-Four* or Huxley's *Brave New World*. But Heard also explores evolution, especially as a self-directed project with Hegelian overtones, since he sees human history as a continuing aspiration toward something higher, with Alpha's dictatorship only one step on the ladder. Heard is also interested in the relationship of the soul to its manifestations. Clothes reflect customs: a man's appearance determines and is determined by his ideas; etymology reveals truths of history. Indeed, one of Heard's first books was a history and philosophy of costume, *Narcissus: An Anatomy of Clothes*, and his style and ideas are influenced by the "Clothes Philosophy" of Carlyle's *Sartor Resartus*. The dictatorship in *Doppelgangers* is also based on Sheldon's somatypes which posit a relationship between body type and personality. *Doppelgangers* is a philosophical novel; though the psychological exploration of the few major characters is deep, this is not a psychological novel. The style is involuted with tricky puns and allusions.

*The Black Fox* is an occultist novel with speculative content. Throcton, a British cleric envious of advancement, uses black magic to destroy his enemy. When the magic recoils, he is saved only by the self-sacrifice of his sister. Heard bases the black magic, involving etymology of the word *alopecia* from fox mange, on Biblical, Sufist, and folklore learning, speculating on the relation of mind and body. Treatment of black magic as an explainable phenomenon prefigures the thinking of such contemporaries as Colin Wilson. Psychological analysis is strong in this novel, and the isolated, highly cerebral Throctons, brother and sister, are eccentric but complexly interesting. Except for his detective fiction, *The Black Fox* represents the best use of suspense in Heard's fiction.

*Gabriel and the Creatures* is a speculative fantasy based on the premise that a species has will to evolve in a certain direction, and that God, through the angel Gabriel, will grant each species its wish. *The Gospel According to Gamaliel* is a retelling of the New Testament by a Hebrew ecclesiast, teacher of St. Paul, speculative in its attempt to reconcile differing theological viewpoints.

Heard's short stories are mostly collected in *The Great Fog* and *The Lost Cavern*. They speculate upon some of Heard's favorite concerns: evolution in "The Thaw Plan," "The Lost Cavern," "Wingless Victory," and "The Great Fog"; medical knowledge in "The Rousing of Mr. Bradegar" and "The Crayfish"; architecture in "Dromenon"; and telephatic exchange in "The Swap." "The Cat 'I Am'" may be seen as an early study for *The Black Fox*. Heard's heroes are isolated, scholarly types.

Heard's major output is not in fiction but in religious philosophy; he has also written detective fiction and a work on flying saucers. Except for reviews and an occasional mention in critical works, Heard has received little critical attention. His strength is in speculation rather than character or plot. Nonetheless, *Doppelgangers* is a significant dystopian novel which merits a place in the science-fiction canon.

\* \* \*

Probably no one deserves to be called the Dean of Science Fiction more than Robert A. Heinlein, whose prolific output remains continuously in print, a phenomenon almost unheard of in an industry which pulps the unsold as quickly as new books can be printed. Nearly always a "good read," Heinlein's work at its best epitomizes the excitement science fiction can generate by dramatizing the possible future adventures which scientific knowledge and technology can open up for humanity, and by exploring the needs of individuals within a society to survive and find satisfaction compatible with the continuance and growth of our species; at its worst, it's still usually provocative both to SF addicts and to novices. Through his long writing career Heinlein has consistently dramatized the essential moral questions for young and old, which boil down to one: What is the ideal way to live, today—and tomorrow? Idealism dosed with pragmatism flavors the answers to this question in each of Heinlein's stories. His sympathetic characters are neither all flesh nor all spirit but a careful balance of both. The majority of his work is cautiously optimistic and celebratory of the triumph of individuals over both internal weakness and, especially, external obstacles to their physical well-being—although there are some notable exceptions, such as "All You Zombies."

Like virtually all writers of the 1940's, Heinlein began his career producing short stories, and his crisp style still inspires much emulation; "The Roads Must Roll" earned him a place in *The Science Fiction Hall of Fame*, stories selected by the Science Fiction Writers of America to honor works prior to the inception of the Nebula Awards in the mid-1960's.

After World War II he turned to the new market for science fiction novels and began writing for children. These books remain popular with the audience for which they were written, teen and pre-teen boys. *The Star Beast* is one of the best for a young reader to start with. Not only does it have both male and female central characters and a lovable alien creature full of unexpected antics (long before E. T.), the story also invents the unorthodox privilege of unhappy children to divorce unsatisfactory parents, a notion sure to delight young readers.

*Podkayne of Mars*, often regarded as an adult novel in spite of its young protagonists, has been widely denounced for using a phony female viewpoint character; the story purports to be the diary of a teenage girl, but a large portion is written by her precocious, bratty pre-teen brother, who turns out to be

smarter than she is. Heinlein has been attacked by some feminist critics for his simplistic depictions of females; others point out that in these "Golden Age" stories, Heinlein was one of the few writers who showed girls and women doing anything beyond being objects to be rescued. His recent novel *Friday*, although nominated for a Hugo, drew criticism for his depiction of a sympathetic character who not only forgives but marries her rapist. (Certainly Heinlein deserves credit for creating a more believable female narrator in *Friday* than he did in *Podkayne*, or in *I Will Fear No Evil* or even *The Number of the Beast*. *Friday* is an AP—artificial person, who by definition does not suffer the "normal" socialization of natural human females.)

Beginning in the 1960's Heinlein started producing definitely adult novels, tending toward longer and longer books with each passing decade. Heinlein's best-known novels are the four Hugo-winners, *Double Star*, *Starship Troopers*, *Stranger in a Strange Land*, and *The Moon Is a Harsh Mistress*, and they each represent much of what is characteristic of his other work. The protagonist of *Double Star*, Lorenzo Smythe, narrates his own story. Originally an unemployed actor, he is recruited (forcibly) to play the role of an incapacitated leader who must participate in delicate interplanetary diplomacy, an assignment he ultimately accepts willingly, not out of political conviction but because of the challenge to his acting ability. Heinlein's protagonists never set out to be heroes. During the course of the story, however, Lorenzo rises to the moral challenge and becomes worthy of his new power and authority. He concludes that the sacrifice of personal peace of mind is justified by "solemn satisfaction in doing the best you can for eight billion people." Noblesse oblige: the strong spirit has a duty to the weak.

In *Starship Troopers* a similar lesson is learned by Juan Rico, who also tells of his own conversion, from a mildly pacifist and apolitical youth, who volunteers almost inadvertently for Federal Service to impress a female, to a dedicated combat officer who realizes that the noblest fate he can hope for is to die defending others' lives. His Moral Instruction teacher sums it up: "The price demanded for the most precious of all things in life is life itself—ultimate cost for perfect value." Eventually Juan even helps his own father to realize and share his insight. Seasoned with rich slang that provides both verisimilitude and freshness to what could easily be a conventional situation, the novel is shaped like a sandwich. Battle action scenes open and close the book, and the moral awakening fills its center.

*Stranger in a Strange Land* is the only one of Heinlein's Hugo-winners to use a third-person narrator, and is less unified in other ways than the other three. The first two sections are largely concerned with the satiric vision of human behavior seen through the unspoiled eyes of a highly intelligent being, Valentine Michael Smith, physically human but culturally alien. Significantly, Mike regains his genetic heritage only after he learns to laugh by watching the monkeys in a zoo. The latter part of the book is devoted to myth-making of the possible limits of human interactions. Because he is culture-free, Mike is able to explore unorthodox sensuality and sexuality without the feelings of inhibition and guilt which plague the rest of us. The joy of his discoveries is powerful enough to free others from their hangups also (even his mentor Jubal Harshaw), so they create a mystical new religion. But Heinlein undermines his myth with the mocking cynicism of the blatant fraud Foster, who turns out to be Mike's boss in the hereafter (or whereafter?): "Certainly 'Thou art God'—but who isn't?" The creed of the new religion is nothing special in the cosmic scheme of things. For many critics this self-mockery comes too little and too late to counter Mike's simplistic message of free love and

the power to dispel all earthly problems simply by correct comprehension, or "grokking." But surely in reading this novel future generations will recapture the 1960's spirit of campus rebellion against hypocritical middle-class morality that it exploits.

*The Moon Is a Harsh Mistress* combines more of Heinlein's strengths and fewer of his artistic limitations than any of his other works. The length of the novel is justified by the complexity of the social and political systems depicted. The story of Luna's fight for freedom is told by Emanuel Garcia O'Kelly, a sympathetic but fallible person who might be Anyman. Mannie is not a great man, but he is the best computer technician available in the moon colony, and so becomes the first friend of Mike, the sentient computer who keeps from going insane at the interface of conflicting data by developing a sense of humor—and a protective love for those who give him a purpose in living. Since the narrator must survive to tell the tale, the interest of the reader is focused less on what will happen next than on how it happens. Of course, it is humanity, not Mannie as an individual, who created Mike; mankind has developed an intelligence beyond its own fleshly limitations, one moreover uncorrupted by petty greed and lust for power. The philosophy of TANSTAAFL—"There ain't no such thing as a free lunch"—naturally becomes the slogan of Free Luna. Their success relies on long odds and high risks, but the stakes of freedom are worth the ultimate price, paid by many of the revolutionaries including Mannie's political mentor and (apparently) Mike. Mannie is left with many doubts and unfulfilled longings at the end in a passage handled with poignancy as delicate as can be found anywhere in Heinlein's work. Ultimately he decides to go on living: "My word, I'm not even a hundred yet." The confrontation with man's own mortality pervades much of Heinlein's work.

Early in his career he conceived of a "future history," into which nearly all of his work can be placed. This means that one who has read several of his works will begin to perceive them in a different context from one who encounters a Heinlein novel for the first time. This tends to build a "cult" following, without the restrictions of a "series," allowing him to play variations on themes. This also, however, makes it difficult for a novice Heinlein reader to follow some sequences which will delight the devotee.

If Heinlein's female characters tend to be "idealized" or even sentimentalized, so do his male characters. Good people are those who keep mentally active, try avoid harming innocent others (though they have few qualms about killing enemies to survive), and, above all, wish to produce and protect babies. He has played frequently with the quantum concept of simultaneous parallel universes in novels such as *Glory Road* and in the more recent novels *The Number of the Beast* and *Job: A Comedy of Justice*. In all of his "worlds," people lacking a healthy sense of self-preservation die prematurely, for no universe is really very friendly and wise ones must adapt quickly to changing circumstances. While much of the criticism of Heinlein has centered on his repetition of formulaic plots and character relationships, he manages to freshen his materials and keep devoted fans eagerly awaiting each new book.

—Elizabeth Anne Hull

\* \* \*

As with that other great contemporary Jewish fabulist, Isaac Bashevis Singer, the range of Mark Helprin's fiction is wide enough to encompass many modes, settings, and sensibilities, although, like Singer again, his stories that border on the fantastic are some of his most memorable and accomplished. "A Jew of Persia" (*A Dove in the East*) is the deceptively simple story of an old man's obstinate belief that a youthful confrontation with the Devil on a mountain pass in Persia will lead to an inevitably deadly reunion in the streets of Tel Aviv. "Letter from the *Samantha*" (*Ellis Island*) is a Conradian (and Poesque) tale of the high seas concerning a ship-captain's obsession with a strangely human-like ape that he rescues during a typhoon. "Ellis Island," the title novella of his second collection of shorter works, chronicles the wondrously varied slapstick adventures of a turn-of-the-century Jewish immigrant as he alternately embraces and dodges the possibilities and pitfalls of this dazzling New World. Like the unnamed narrator of "Ellis Island" or the picaresque foundling-hero of *Refiner's Fire*, his first full-length work, many of Helprin's protagonists are motivated by some vague selfless ideal of redemption and love.

This sense of romantic idealism receives its fullest treatment in Helprin's second novel and best-known work, *Winter's Tale*, a full-fledged SF-fantasy saga of mammoth proportions and even larger ambitions. Virtually every major character in this century-spanning alternate-history of a once-and-future New York City is in pursuit of some ineffable vision of wealth, power, beauty, or moral potential. Peter Lake, another one of Helprin's orphans of the picaresque storm, is cast adrift as an infant on a model boat by his desperate immigrant parents and rescued and adopted by the Baymen, a primitive tribe inhabiting the late 19th-century Jersey marshes. As an adolescent apprentice thief, Peter earns the undying ire of the Short Tails, a grotesquely ugly gang of petty criminals led by the gnomelike Pearly Soames, whose fanatical dream is to build a huge room made up entirely of gold. Peter also falls deeply in love with and is married briefly to the dying consumptive heiress Beverly Penn, whose intense aestheticism allows her to hear the (literal) music of the spheres and whose ethereal beauty haunts Peter in purest Dantesque fashion over the next hundred years. Again pursued by the Short Tails, Peter leaps on the escaped milkhorse Athansor, who becomes transformed into an urban

Pegasus and catapults its rider into a mysterious white cloud that places Peter in suspended animation until the late 1990's, when the sleeper wakes, an amnesiac, but still pursued by Pearly and the memory of his doomed Beatrice/Beverly. As New York approaches an apocalyptic millenium, Peter, on his own predestined road to transcendence, runs into more romantic idealists, including a newspaperman who is searching for "a perfectly just city rejoicing in justice alone" and a Luciferian architect contemplating the erection of a bridge of light to attract the attention of an apathetic Deity.

Through all this, Helprin never allows his readers to forget that his true protagonist is America itself, with New York, in all its complexity, dismal poverty, and potential glory, as its emblem and central metaphor. As he has one of his characters ruminate, "the city was so full of combinations, permutations, and possibilities that it permitted not only any desire to be fulfilled, but any course to be taken, any reward to be sought, any life to be lived, and any race to be run." While Helprin's millenial optimism is couched in an often florid style, his richly allusive and wildly inventive *Winter's Tale* of personal and collective sacrifice and transfiguration may virtually demand such rhetorical excesses, since it is clear that, for Helprin, the writer's duty is somehow to articulate what the dreaming mountainclimber of "The Schreuderspitze" (*Ellis Island*) can only glimpse in his mind's eye: "In certain states of light he could see, he could begin to sense, things most miraculous indeed."

Zenna Henderson commented:

(1981) When I was about 12 I began reading science fiction—Jules Verne, Haggard, and Edgar Rice Burroughs, and all the current magazines I could get hold of, but it wasn't until I had graduated from college that I began writing fantasy and science fiction. I have only a sketchy scientific background, so of necessity I write from a non-technical viewpoint. My favorite science-fiction authors, when I was still reading it, were Heinlein, Bradbury, Clement, and Asimov. Mottos I try to observe when I write: stories consist of unusual people in ordinary circumstances or ordinary people in unusual circumstances; write about what you know; don't let your subtleties become obscurities.

\* \* \*

"Write what you know" is the cornerstone of Zenna Henderson's science-fiction career. She constructed story after story out of experiences accumulated during her many years in the elementary classroom. She found teachers useful viewpoint characters because their vision is multiplied through their students' eyes. Her children have the appealing naturalness that comes of being modeled directly from life.

Henderson made more and better use of adult-child interactions than adult-adult ones but she always kept human relationships paramount. She ignored man's struggles against the universe because she did not perceive the cosmos as hostile. By rejecting sex, sadism, and violence, her stories offer a gentle alternative to macho entertainments. Yet feminist critics scorn Henderson for occupational stereotyping without acknowledging that she depicts single women, older women, and female friendships positively. Wonder in familiar settings is Henderson's forte. She reveals the world a child or a saint might see—a place where time can shift and dimensions fold, where mountains walk and wishes come true. Friction between the mundane and the marvelous generates her dramas. For example, a small boy battles a demon ("Stevie and the Dark") or school routine survives the collapse of civilization ("As Simple as That").

Henderson's most popular stories are those collected in *Pilgrimage* and *The People*. Each volume's components are united by a frame-story, a device that succeeds better in *Pilgrimage* because it is a poignant tale in its own right. The frame of *The People* is simply an excuse for flashbacks to events preceding and following those in *Pilgrimage*. The People are extraterrestrial refugees with psychic gifts who have been hiding in the American southwest since the 1890's. They are gradually overcoming memories of persecution and forming partnerships with humans. Their perilous flight from their lost Home to Earth, their true Promised Land, parallels the Old Testament Exodus—a comparison underscored by Biblical names and titles. (Basic Christian values undergird all of Henderson's writing.) Although the People had a different salvation history, their beliefs are compatible with Christianity. They even use a trinitarian invocation of God as the Power, the Presence, and the Name. Their bonding through love is Henderson's answer to the conflicts between community and individuality that run through so much of her fiction.

Secret aliens among us is an old SF notion but no one has put it to happier use than Henderson. The sheer wholesomeness of her People is enough to set them apart. "They're us only more

so," says the author. Whether reading thoughts, operating spacecraft, or hemming dresses, the People wield their powers with a cheerful reverence that is refreshingly matter-of-fact. Henderson is neither anti-technological nor pro-occultist like Andre Norton. Miracles in a grittily realistic setting strike just the right note of aesthetic contrast to make the stories work.

Henderson's paradigm of sympathetic adult aiding troubled wonder-child is as distinctive as her signature. Yet it is a conscious pattern to be varied at will. "Something Bright" reverses the usual roles to disguised alien adult and helpful human child. Not all teachers are caring ("The Last Step") or effective ("You Know What, Teacher?"). Not all marvels are desirable ("The Substitute," "Turn the Page," "Sharing Time"). Children's wonderful powers can cause tragedy ("The Believing Child," "Come On, Wagon!," "Hush!"). In such works Henderson displays an excellent although curiously unappreciated touch for horror. She can handle insanity as vividly as psi ("Swept and Garnished," "One of Them").

At her worst, Henderson's sentimentality overflows. Occasionally her ideas are too weak. Her range of subject matter is admittedly small. But overall, she worked with sound, unobtrusive craftsmanship. She had the classic short story writer's talents for precise focus, good characterization, and shrewd deployment of details. A kindly, traditional sensibility animates her writing. This description of ultimate happiness from "The Anything Box" conveys her special flavor: "all the worry and waiting, the apartness and loneliness were over and forgotten, their hugeness dwindled by the comfort of a shoulder, the warmth of clasping hands—and nowhere, nowhere was the fear of parting. . . ." Henderson was SF's mistress of the happy ending.

## Joe L. Hensley comments:

I don't write very much science fiction. Suspense is a more familiar game to me. But I still admire those who do write science fiction and am happy, now and then, when I do also.

\* \* \*

Joe L. Hensley's most important stories are connected with Harlan Ellison. Hensley and Ellison are great friends, and Ellison wrote 2000 words of introduction to "Lord Randy, My Son" for *Dangerous Visions*. The story is a masterpiece of understated horror. Ellison's introduction to the story tells how Hensley—then a lawyer—saved Ellison from being court-martialed by the U. S. Army. Ellison provides another introduction to the Hensley and Ellison collaboration "Rod-

ney Parish for Hire." This chilling account of a youngster who kills other children for profit is a good example of the strengths of both writers. The story features strong characterization, fast-paced writing, and a suspenseful plot.

Hensley's only SF novel, *The Black Roads*, is a reworking of the setting and themes best developed by Mack Reynolds's *Rollertown* (1976). After a nuclear war, only American technology survives. A society based on roadways evolves as the ultimate realization of humans' love for their automobiles. Duels are fought between cars, and Red Roadmen ride the lanes in their supercharged autos keeping law and order. The mobile society is interesting, but Hensley never elevates his characters above the level of cardboard. The result is a staleness absent from his better short stories and the mystery novels for which he is better known.

The best of Hensley's short stories, both mystery and SF, are collected in *Final Doors*. Hensley's two collaborations with Harlan Ellison are included as well as his collaboration with Gene DeWeese. The most haunting story in the collection is "Killer Scent" where a sheriff secretly hunts down psychopathic killers that give off a "scent" only he can sense. The sheriff, when finally discovered, explains his hunting of the killers this way: "Sometimes I think they're mutants, the coming race for earth. . . . Maybe they came along to wipe us out, take our places, be the survivors of the cities, mercilessly preying on each other after we're gone." "Killer Scent" works equally well as a suspense story and an SF story. It is one of the seven original short stories included in this eighteen story collection.

Hensley's writing is usually crisp, his plotting is tight, and his best work has power and insight. Much of his work reflects his background in law and the criminal justice system.

\* \* \*

Frank Herbert's science fiction is humanistic in the deepest sense of the word, an amalgam of history, philosophy, psychology, and science basic to Western thought. It depicts man's diversity and his singularity—his nature, limits, potentialities, his inseparable ties to his environment and his fellow creatures, his genetic and cultural heritage that paves the way for his future, his latent mystical and psychic abilities that training and necessity might nurture. Although his characters remain familiar and psychologically true, even amid alien settings, to Herbert humanity is not fixed, but rather is continually evolving both physically and intellectually, adapting to changed or new environments, learning to survive. When he becomes fixed in rigid patterns (religious, political, genetic), he also becomes mechanical, perverted, dehumanized and doomed; but as long as there is change and evolution, even if it is violent or bizarre or seemingly incomprehensible, there is hope; adversity creates strength. His message is that man must learn from his past, avoid absolutist traps, recognize that right might be wrong in changed circumstances, explore his limits to their fullest, but never lose touch with the ecosystems on which he depends and to which he must continually adapt.

In the Dune series, *The God Makers*, *The Santaroga Barrier*, *The Heaven Makers*, *The Dosadi Experiment*, and *The Jesus Incident*, Herbert describes the trials, conflicts, and rites of passage through which man can evolve god-like powers of intellect and foresight, but further suggests the difficulties and dangers such powers necessitate. Frequently these evolutionary leaps are precipitated by contact with special organic chemicals (spice in *Dune*, Jaspers in *Santaroga*, kelp hallucinogens in *Jesus Incident*), by the genetic mix of unique strains (*God Makers*, *Dune* series, *Heaven Makers*), or by a special mind fuse (*Dosadi*, *Jesus Incident*). *Soul Catcher*, though not science fiction per se, weaves a tale of mystic Indian powers gained through birth and ritual, and ancient alien gods who heighten the perception of those seeking their frightening aid. In *The Dosadi Experiment* humans and aliens, caged together on a toxic planet, bred for vengeance and cunning, and conditioned by constant war and hunger, learn to overcome all barriers (even a tempokinetic "God Wall") and avenge themselves on their creators. An alien female with features like a praying mantis merges with a human to produce a mind switch and psi power that force the tribunal to recognize Dosadi power and potential. *The God Makers* focuses on an interplanetary troubleshooter assigned to monitor planets and to detect at early stages signs of aggressiveness that might trigger future war; in fulfilling these duties he discovers and develops extrasensory powers that lead him to rites of passage on a special planet of philosophers, rites that make clear his godhood and teach him to use his powers to do what has been his job all along—prevent war and aggression through compromise between potential enemies. But one problem with superpowers and immortality is the possibility of boredom. Paul Atreides of *Dune*, omnipotent ruler of thousands of planets, fakes his own death and retires to private interests, while his descendant, Emperor Leto II, the God Emperor of *Dune*, longs for an equal mind with whom to share the Machiavellian twists of his long-term plans for his subjects. In *Heaven Makers* an immortal alien movie producer, using Earth as a set for filming full sensory movies of wars, natural disasters, and other horrors to relieve the boredom of his jaded

race, breaks regulations and interferes with human cycles, originally to provide more entertaining disasters, but ultimately to produce a blessed loss of immortality. Each of these books examines alien intelligence in order more clearly to define the human.

The most famous of Herbert's books tracing human evolution to a higher state of being is the *Dune* quintet, a series of epic proportions and epic concerns that depicts the logical development, expansion, and diversification of religion and politics on an alien desert world, and traces the rise and fall of a great family. Its scope is incredible—an entire world thoroughly drawn in topography, ecology, history, and culture. The series beings with revolutionary powers and vast changes, and traces the political line as it sinks into stasis, becomes ingrown and perverted, until new blood and unexpected evolutions force the changes necessary for ultimate survival. The first in the series, *Dune*, concerns the growth and maturation of Paul Atreides, the product of generations of controlled breeding and Bene Gesserit training in desert discipline. Once his latent powers are enhanced by an overdose of Arrakis spice, his mind becomes permanently opened to see and shape the future; his time travel involves a succession of choices between alternative futures. Prophet to his infant brother, he leads the desert people on a *jihad* to conquer their planet and a thousand others. *Dune Messiah* traces an imperial intergalactic intrigue by the Bene Gesserit to overthrow the "god" they themselves created (a common Herbert theme), and involves a Tleilaxu face dancer and a ghola recreation of a dead hero. The focus on ecology and political intrigue continues in *Children of Dune*, wherein the House of Atreides learns to survive by appreciating traditions that will preserve the ecology, the giant worms and the melange harvest in the sands, and by learning to live by their instincts and to think and act for themselves. Religious mysticism and desert lore, Byzantine intrigue and complex intellectual discourse infuse these books with a life and interest beyond mere plot. The fourth in the series, *The God-Emperor of Dune*, is an ambitious book, more philosophy than action, an interpretation of the *Dune* past by an Atreides who has merged with the sandworms of Arrakis to become a seemingly indestructible, towering monster, but who retains all ancestral memories and thought patterns, and who reminisces, theorizes, manipulates, and teaches. Able to predict the future because of his firm sense of history and human nature, he turns tyrannical and intentionally sets in motion antagonisms that eventually erupt in violence. His goal? Growth and change instead of fixed, rigid religious and genetic patterns that would doom his subjects to weakness, degeneration, and perhaps extinction. Knowing that male armies historically turn on their own population, his is an army of women, chosen for their stability and their survival instincts. His "death" is self-chosen and self-sacrificial; at the price of his humanity, he divides into countless sandfish that will eventually become the giant worms of Arrakis. He leaves behind a fear of gods and a distrust of heroes—the ultimate lesson of the *Dune* series: man must depend on himself alone; gods and heroes foster lazy thinking, passivity, and inaction. The final book in the quintet focuses on the ultimate working out of the God Emperor's plans—Arrakis turned desert once more, its people forced to revive old skills and learn new. Therein the Bene Gesserit joins uneasy forces with Tleilaxu face dancers to fight invading forces from the distant colonies and to attempt to manipulate a desert child who rides the sandworms and the ghola, Duncan Idaho, whose quest for identity leads him to cut through the illusions that envelop him and those around him. Herein Herbert once again raises questions about genetic variability and uncertainty, hidden conditioning, hyperconsciousness, bureaucratic fail-

ings, pursuit of absolutes, and self-discovery. *Chapterhouse: Dune* continues the 50,000 year saga of the House of Atreides and their desert planet, leaping 15,000 years into the future from the time of Leto II to see his dream of rebellion fulfilled, his planet returned to desert, ghola Duncan Idaho at work again, and the Bene Gesserit battling the alien Honored Matres.

Herbert's milieu is always firmly grounded in present-day political and social realities rather than in escapist fantasy. His books are carefully researched and highly detailed. For instance, his description of a desert society whose fanatical and feudal codes of behaviour center around their desperate need for water reflects Bedouin survival in the Sahara, *The Dragon in the Sea* so concretely describes deepwater submarine controls that British Naval Intelligence followed his model, and *Destination: Void* is a comprehensive study in computer theory. In *Dragon in the Sea* a psychologist joins the four-man crew of a deepsea atomic submarine/tug to find a saboteur. The mission, to steal oil from underwater deposits in enemy territory, involves fear and tension from the natural dangers of depth and pressure, heightened by fears of a spy. The book has good suspense and superb technical detail, and defines sanity as the ability to adapt. So too does *Destination: Void*. Therein four scientists with a human cargo of thousands, all unknowingly part of a vast experiment to force invention, are supposedly travelling toward an Eden when they suffer organic computer failure and have to create a conscious mechanical brain to guide them. They react under pressure against impossible odds and succeed in producing a super cybernetic computer that acquires godlike powers of life and death, and that agrees to take them to an Eden if they will contemplate how to "worship" him.

Despite his skillful handling of technical description, Herbert, in the tradition of American romanticism, opposes the mechanistic with the natural and organic to show the superiority of the intuitive biological organism. In "Seed Stock" it is the lowly workman, not the lab dependent scientists, who instinctively adjusts to an alien planet. In *The Eyes of Heisenberg* rebels in a totally genetically engineered world oppose the immortal Optimen and their enemy Cyborgs, and deliberately interfere with gene surgery to bring about a return to mortality and to reproduce an embryo with the forbidden gene combination of intelligence and fertility. In *The Jesus Incident*, a sequel to *Destination: Void*, Herbert opposes clones and "naturals," test tube babies and true births, as he continues the story of the scientists and their crew, deposited on an alien planet (Pandora) filled with incredible horrors (nerve worms and hooded dashers and other predatory alien creatures). Instead of seeking to come to terms with the planet, they and their descendants try to wipe out its population, even the ruling sentient kelp, only to learn that the hope for Pandora rests in accepting the planet and living in harmony with its sentients, sentients that can teach them about themselves and their past, their ship and their gods. The novel exemplifies Herbert's approach: speculation about the nature of deities and of human evolution; technical wonders and genetic horrors; the concept of ancestral memory; natural enlightenment drugs; a poet who ultimately understands man's destiny, and an extraordinary child who will sweep away old orders and initiate new.

Related to Herbert's concern for the natural is an interest in ecology and a respect for rural values, a fear of man tampering with nature coupled with a realization that he must tamper with himself if he is to advance. In "Operation Syndrome" a madman's electronic device to produce mass schizophrenia forces the development of telepathic communications to save world sanity. In "The Gone Dogs" a disease wipes out the

canine population as we know it but the species is ultimately preserved in a radical new form.

The *Green Brain*, *Hellstrom's Hive*, and *The White Plague* tackle the problem of human interference in nature. Set in Oregon, *Hellstrom's Hive* focuses on a secretive zoological experiment that postulates the obsolescence of present family relations; a government agent, investigating, discovers evolution's terrifying possibilities—a utopian human hive with physical and mental specialization in order to dominate the world. *Green Brain* is another chilling tale that emphasizes man's dependence on insects and the potentiality of chemical sprays backfiring in unexpected ways. In an overpopulated world seeking lebensraum in jungles, an international organization systematically exterminates voracious insects, until they defensively mutate to incredible sizes and types; some mutations involve protective coloration—insect colonies that appear human. A ruling insect "Brain," a corporate intelligence that is the product of this mutation, plans to restore and maintain nature's balance. In *The Santaroga Barrier* Herbert deals with man coping with the imbalance within himself. In a world dominated by false, greedy, superficial advertising men, the Santaroga Valley remains isolated and impervious to modernization. An investigator engaged to a Santaroga psychiatrist seeks answers in "Jaspers," food infused with natural chemicals from Santaroga caves, chemicals that help users see through artifice and falsity to discover true values of community and integrity. But this proves a two-edged blessing, for with awareness comes the after effects of not being able to live outside the valley for very long and a subconscious reflex to destroy any stranger who does not belong. The drug produces enlightenment and well-being at the cost of freedom. *The White Plague*, his most recent and most topical projection, marks a significant change in Herbert's canon. This novel is more heavily cynical and much closer to present realities than past works. It is a double-edged attack on 1) the social and cultural attitudes that produce and encourage the mindless violence of terrorist groups, 2) the potentials unleashed by recombinant DNA research that make it possible for one man only, with the right training, to unleash at any moment a horror on the world that could not be reversed. It focuses on a molecular biologist who, unhinged by the senseless deaths of his wife and children in an IRA bombing, produces an unstoppable synthesized plague that kills only women. The result is chaos, panic, a breakdown of government and social order, and, ironically enough, a return to the self-destructive, adolescent male patterns of might makes right and survival of the most cunning and brutal that terrorism has always fostered.

In conclusion, Herbert mingles Eastern philosophies with Christian myth to produce a humanistic amalgam that recognizes man's potential for godhood as well as for self-destruction. He continually examines evolving intelligence, whether mechanical ( *Destination: Void* ), insect ( *Green Brain* ), alien ("The Tactful Saboteur," *Whipping Star*, *Dosadi Experiment* ), or humanoid ( *Dune* series, *Jesus Incident* ). He warns that man must be adaptable and must stay in tune with his environment if he is to survive. His view is relativistic, his philosophy dialectical; his historical focus cyclical; his characters are complicated, and his plots intriguing.

\* \* \*

James Herbert's novels bear only a peripheral relation to science fiction. His specialty is the contemporary horror thriller, usually set in London or its environs. Most of Herbert's novels are structured around a succession of graphic, violent set pieces which he relates in a vigorous, aggressive style laced with irony and bizarre splashes of black humor. In his best books, massive accumulations of background detail lend credibility to his fantastic plots and scenes.

Among Herbert's non-SF works are old-fashioned man-versus-monster tales ( *The Rats* and *Lair* ), and anti-fascist thriller about a neo-Nazi cult ( *The Spear* ), a police procedural tinged with the supernatural ( *The Jonah* ), an explicitly Catholic story about the aftermath of the miraculous cure of a young deaf mute ( *Shrine* ), and an atypical novel in which a man is reincarnated as a dog ( *Fluke* ). His books that contain SF motifs, all of which are disaster novels, are infused with the aesthetics of the horror writer; in them, Herbert constructs from the trappings of science fiction a framework for harrowing tales in which ordinary people confront ferociously evil forces.

The sub-texts of many of Herbert's novels are allied to the Catholic doctrine of original sin, which is explicitly invoked in *Shrine*. Universal guilt, the premise that all men are innately evil, resonates throughout Herbert's oeuvre and is at the heart of two of his best novels, *The Fog* and *The Dark*. The eponymous entity in the latter novel, an energy field of pure malevolence, is the physical incarnation of a man's potential for evil. The Dark feeds indiscriminately, releasing its victims' repressed impulses and turning them into zombie-like killing machines. In *The Dark* Herbert sets up a classic confrontation

between light (good) and darkness (evil), translating into physical images a fundamental metaphor of religious myth.

In Herbert's world, horror can erupt in the most mundane of settings, without warning, laying waste people from all walks of life. It is a world forever on the brink of chaos and catastrophe; no one is immune, no place is safe.

This painfully contemporary world view underlies *The Fog*, a gripping ecological nightmare that begins with the accidental release of a bacteriological weapon, a "mutated mycoplasma." Roaming around England embedded in a yellow-tinged fog of pollution, this creature strikes at random, engulfing whole communities and unleashing the inhabitant's destructive, often suicidal impulses. The Fog thus serves as a metaphor for the random, uncontrollable violence that currently infects the Western world.

Man's innate capacity for evil destroys civilization in the post-holocaust thriller *Domain*. Characteristically, Herbert approaches his rather conventional plot—an odyssey by a handful of survivors of a nuclear war through a wasted landscape—as a horror writer, resurrecting the giant, mutant rats of *The Rats* and *Lair*. The image of these loathsome flesh-eating vermin, the spawn of peace-time atomic tests off New Guinea, prowling through the rubble of a London ravaged by nuclear war is ironic and powerful. But *Domain* lacks the connective tissues of (non-horrific) plot and character development that knits together the set pieces in Herbert's earlier novels, and its brutality, heavy-handed irony, and omnipresent theme of universal guilt ultimately evoke numbness rather than terror.

Herbert's SF-tinged horror novels are more akin to the giant monster movies of the 1950's than to the serious science fiction of the 1980's. Nevertheless, he is one of the best practitioners of the disaster thriller, and his central image—of man's best efforts undone by evil from within the human mind—is potent and uncomfortably timely.

Critical Study: *John Hersey* by David Sanders, New York, Twayne, 1967.

\* \* \*

John Hersey is probably best known as the author of *Hiroshima* and *A Bell For Adano*. Few people think of him as a science-fiction writer even if they have read *White Lotus*, *My Petition for More Space*, or *The Child Buyer*. Hersey is seldom mentioned by science-fiction fans, or taught in science-fiction courses. It is more than likely that he does not consider himself a science-fiction writer even though some of his books use concepts generally found only in science fiction. Hersey may be one of those writers who occasionally discovers that he cannot write what he wants to write within the bounds of realistic mainstream fiction; and so he presents his ideas in a world similar to but not the same as this one—a world parallel to this one or this world in a future time. The same impulse lies behind Orwell's *Nineteen Eighty-Four* and Huxley's *Brave New World*. Such a situation seems to arise for Hersey, as it did for Orwell and Huxley, when he wishes to comment on or criticize contemporary society.

*White Lotus* is a parallel world story, one in which the author attempts to show what the world of today might be like had history taken a different turn; in a parallel world, the British defeated the American colonial rebels or lost to the Spanish Armada in 1588. In *White Lotus* the time is the present, and the Chinese are the dominant power in the world, having conquered America sometime in the first quarter of the 20th century. Except for technological developments, much of what the reader would regard as major historical events—like World War I—has not taken place. Hersey seems to have set up the parallel world of *White Lotus* for one purpose: to show white Americans what it might be like to live as an oppressed racial minority. The plot is the personal narrative of an American girl captured by slavers and sent to China. The bulk of the story is told as a flashback. Although *White Lotus* is obviously based on the whites' mistreatment of blacks in America, there are also echoes in the novel of the mistreatment of other minorities, most notably the Jews, in other countries.

*My Petition for More Space* is set in the over-populated future which has given rise to such science-fiction stories as Alice Glaser's "The Tunnel Ahead," John Brunner's *Stand On Zanzibar*, and Harry Harrison's *Make Room! Make Room!* In Hersey's book, Sam Poynter is petitioning for more living space. Sam's world is tremendously crowded: waiting in line means being crushed up against the four people around you, making love can be a semi-private act only if you hang curtains around your living space, and getting to do anything (except sit in your living space—Sam's is seven by eleven feet) means waiting in line. Simply put, *My Petition for More Space* is about the dehumanizing effects of over-population; the more people there are, the less privacy and choice there will be.

*The Child Buyer*, often compared to Orwell's *Nineteen Eighty-Four* and Huxley's *Brave New World*, is also set in the future. The plot involves a research company's attempt to buy an extremely bright child, whom they will make into a human computer; and the novel is set in the form of a transcript of a state government sub-committee hearing on the matter. *The Child Buyer* is a bitter satire on education and politics as the politicians doing the investigating and the educators doing the testifying turn out, for the most part, to be extremely shallow, prejudiced, and ignorant. Hersey's most telling point is that the needs of extremely bright children are often all but completely neglected in today's educational system.

When Hersey writes these parallel world or this-world-in-the-future stories, he is, indeed, writing science fiction; but he only does it when he requires such a background for his commentary. He does not explore the science-fiction aspect for its own sake; he uses it as a vehicle. And the rest of his fiction is solidly mainstream.

—C. W. Sullivan III

\*

Philip E. High comments:

I am a story teller. I have never claimed great literary abilities. I am not only a great believer in a happy ending, but am psychologically incapable of writing any other sort. A reader asks to be entertained and stimulated, not depressed. I have a vivid imagination and I try to put what I imagine on paper. But I am also old-fashioned: I like a story to have a beginning, a middle, an end, and, yes, a purpose with all the loose ends tied up.

\* \* \*

Philip E. High is one of a number of writers of fast-paced adventure novels who rose to prominence with the publication of several novels by Ace Books. His work is generally written with little effort at stylistic flamboyance, with simple but well-constructed plots. A definite tendency toward bizarre settings has helped to distinguish his novels from those of others working the same vein.

*Twin Planets*, for example, was set on a kind of alternate Earth, but not one of the slightly altered histories that is usual. Rather, it was a very similar world somewhat advanced in time, whose unpleasant experience with alien invaders had led its inhabitants to attempt to help our own world avoid a similar fate. Similarly, in *Invader on My Back* aliens have conquered the Earth, and divided humanity into a number of disparate types of personalities. The common failing is a mortal dread of peering upward, conditioned into them because of their subjugated status. *Reality Forbidden* is also characterized by odd settings and events, partially rationalized in this case by the existence of dream machines, inventions which lull humanity into a careless conformity. Indeed, one of the common themes in High's novels is a dread of conformity and the value of the individual, usually a super-normal human. The two protagonists of *Twin Planets* are genetic supermen, and the human sent by aliens to help "civilize" Earth in *The Prodigal Sun* is also a super-human, due to his training on that alien world. A man with an incredibly high I. Q. helps lead a revolt against an overly protective computer mind in *The Mad Metropolis*, and another with an extremely high curiosity quotient leads the revolt against the conformity of a post-collapse experimental community in *These Savage Futurians*.

In *The Time Mercenaries*, possibly High's best work, future humanity has bred itself to the ultimate degree of conformity and passivity, and cannot employ violence even in self defense. To protect themselves against alien invaders, these future beings resurrect the crew of a modern submarine, knowing that men of our times would not be constrained by their inflexible ethical code. Alien invasions are rather common in High's novel, usually with no good intentions. The exceptions to this in the early novels are *The Prodigal Sun* and *No Truce with Terra*, in both of which the author makes the point that we are too prejudiced and violent to participate in a truly civilized interstellar civilization. High does not harp on this point, however, being more concerned with his adventure story than with social commentary.

Despite the limited aspirations of his fiction, High has

produced some very durable novels, although recent work like *Speaking of Dinosaurs* and *Come Hunt an Earthman* are practically unknown. High has himself pointed out that a good story should explain itself fully to the reader and not leave him guessing. The straightforward style and relatively simple plots that he utilizes conform to this dictum.

\* \* \*

Russell Hoban is a science-fiction writer through only one novel, *Riddley Walker*; but that novel is a masterpiece. Hoban's other novels are essentially fantastic or surreal, even though several are set in contemporary London, where this American writer has lived for many years; none of his books is marketed as SF. He began as a writer of children's books, a career which culminated in the classic fantasy *The Mouse and his Child* (1967); since then he has written five adult novels, from *The Lion of Boaz-Jachin and Jachin-Boaz* (1973) through *Pilgermann* (1983). These are very personal books, and *The Lion* is almost an allegory of Hoban's life-situation. Personal elements are less obtrusive in Hoban's greatest adult novel, *Riddley Walker*.

*Riddley Walker* achieved instant recognition, and deservedly won the John W. Campbell Award in 1982. It is not remarkable for its overt plot: it is an after-the-bomb story set some 2400 years in the future in Kent, England, and covers a few weeks in which the neo-barbarians rediscover gunpowder and put it to disastrous use. The public issue is the one familiar from Walter Miller's *A Canticle for Leibowitz*: is technical progress desirable? There is another echo of Miller: the misinterpretation of a pre-bomb icon—in Miller a circuit-diagram, in Hoban a painting of the Legend of St Eustace in Canterbury Cathedral. But otherwise the books are very different. Where Miller is panoramic, Hoban concentrates on the mind of young Riddley Walker, a tribal shaman. The inner form of the book is *Bildungsroman*: it is Riddley's struggle to come to terms with the problem of Power. And that is why we get the narrative in Riddley's own voice, a very distinctive voice, which begins like this: "On my naming day when I come 12 I gone front spear and kilt a wyld boar he parbly ben the las wyld pig on the Bundel Downs any how there hadnt ben none for a long time befor him nor I aint looking to see none agen." And so it goes on. No other SF author has attempted to produce a whole novel in language so altered from present English (not even Anthony Burgess in *A Clockwork Orange*). But the language is justified by its peculiar effects. Its sheer vitality, its combination of demotic crudeness and mystical symbolism could not be achieved otherwise. Indeed, the language is symbolic in some of its minute details

(see my article "Making the Two One", *Extrapolation* 25, Summer 1984).

Above all, the altered spelling facilitates some pregnant puns, *wud* for "wood/would", *hart* for "hart/heart" and *Addom* for "Adam/atom." These appear in the "Eusa Story," the central myth-scripture of "Inland" (East Kent). In this myth, the "Littl Shynin Man the Addom" is caught by the scientist Eusa in the "Hart of the Wud" and torn apart: which signifies fission both of the atomic nucleus and of Adam, humanity. Both the atom and our selves are split in the heart of our "would," our will to creativity and power. Many characters in the novel are fissioned too, their heads blown off (by the gunpowder bomb) away from their hearts. But Riddley and his followers avoid this fate by giving up physical power in favour of "the 1st knowing" (mystical intuition): they dedicate themselves to spreading wisdom by the current literary medium, the puppet show.

The great merit of *Riddley Walker* resides not so much in its plot or theme, which are common enough, but in its sheer expressiveness. It is full of myths, legends, symbolic figures, such as Punch (violence), Greanvine (mortality), Auntie (the goddess of Death). In this it is most comparable to Vonnegut's *Cat's Cradle* (with its texts of "Bokononism") and to Le Guin's *The Left Hand of Darkness* (with its Handdara legends). It is also an instance of that fairly frequent phenomenon, the writing of a great science-fiction novel by an author on the fringe of the genre.

Bibliography: "Edward D. Hoch: A Checklist" by William J. Clark, Edward D. Hoch, and Francis M. Nevins, Jr., in *Armchair Detective* (White Bear Lake, Minnesota), February 1976; revised edition, by Nevins and Hoch, privately printed, 1979.

Edward D. Hoch comments:

I have always viewed my science fiction and fantasy as offshoots of my mystery writing, and nearly all my science fiction contains elements of mystery and detection.

\* \* \*

Edward D. Hoch is one of the few writers who have been able to blend successfully the detective story with science fiction (others include Isaac Asimov, Anthony Boucher, Fredric Brown, Randall Garrett, and Ron Goulart). Of his three novels and more than 60 short stories which qualify as science fiction

or fantasy, nearly all have criminous elements.

Each of Hoch's three SF novels is a classic mystery set in the 21st century and features the "Computer Cops," a team of government investigators led by Carl Crader and Earl Jazine. The first, *The Transvection Machine*, is perhaps the best—a strong blending of baffling mystery, inventive science fiction, and social commentary. Almost as good is *The Fellowship of the Hand* which continues Crader's and Jazine's attempts to combat an organization known as HAND (Humans Against Neuter Domination), pledged to destroy all machines capable of dominating man. *The Frankenstein Factory*, which deals with a futuristic variation on the Frankenstein theme involving cryonics, is less successful in that it seem more an attenuated novelette than a fully realized novel.

Hoch's true forte, however, is the short story. He has published more than 500 in the past quarter-century and is widely acclaimed as the premier writer of short mystery fiction. Among the more memorable of his science-fiction detective tales are "The Wolfram Hunters" and "Computer Cops"; non-criminous SF include "Zoo," "The Faceless Thing," and "The Last Paradox." But it is the 60 novelette-length adventures about Simon Ark, a man who claims to be a 2000-year-old Copt priest, which are perhaps the most well-known of all Hoch's fictional creations. These are primarily tales of detection, but each deals with such fantastic elements as werewolves, witches, religious cults, scientific experiments, and Fortean phenomena. The best of the early Simon Ark stories (from the 1950's) appear in *City of Brass* and *The Judges of Hades*. A new series of Ark stories began in *Ellery Queen's Mystery Magazine* in 1978.

The chief attribute of Hoch's work is invariably intricate and ingenious plotting; few rival him in his ability to summon a seemingly endless and wide-reaching flows of ideas. If plot receives more emphasis than character development in some of his prose (notable exceptions are "The Wolfram Hunters" and "The Faceless Thing"), this in no way diminishes its high entertainment value. The richness of idea and incident more than compensates.

—Bill Pronzini

**HODDER-WILLIAMS, (John) Christopher (Glazebrook).** Also writes as James Brogan. British. Born in London, in 1926. Educated at Eton College. Served in the Royal Signals, in the Middle East, 1944-48: Lieutenant. Worked in Africa after World War II; worked in England for film, television, and recording companies; also a composer. Address: c/o Mithras Publishing, 52 Musard Street, London W. 6, England.

\* \* \*

Christopher Hodder-Williams is not widely known in America despite his continuing popularity in Great Britain, possibly because his brand of science fiction places much more emphasis on the dangers of undisciplined research and experimentation and less on the wonders of technology. Indeed, one criticism that might be made is that he has overworked the Frankenstein theme in his novels.

His earliest work that might be called science fiction was *Chain Reaction*, a novel that dealt with the insidious threat of atomic radiation let loose upon an unsuspecting world. He moved firmly into the genre with *The Main Experiment*, which follows an unorthodox young scientist as he takes a new position with an atomic research unit. It is not long before the protagonist discovers that the project director has been taking some liberties with his progress reports and that the project itself is out of control. Even more frightening is the fact that the by-product of the research is a force which alters personalities and perceptions, strikes out beyond the boundaries of the experimental station, and might well pose a danger to the world at large.

*The Egg-Shaped Thing* repeated this theme, but with more complexity. When an entrepreneur is driven out of business, it almost costs him his sanity as well. Subsequently, he cannot be entirely certain of those things which he thinks he is experiencing. How, for example, does it happen that he can remember things which have not yet happened? Why are his rivals exacting revenge for acts which he has not yet committed? Once again the focus of our attention is a secretive research establishment experimenting with the atom, but this time the experiment itself may be conscious, and exerting itself to control the actions of others.

In *Fistful of Digits* technology is still the villain, or at least unbridled technology, but Hodder-Williams abandons the menace of atomic research for the equally promising field of computerization. A group of private businessmen have created an elaborate, extensive network of computers under the general name Servex which is secretly extending their ability to

manipulate others. Their extrapolation warns of potential problems if the protagonist continues to associate with a particular young woman involved with their project, so they take steps to abrogate the relationship. The result, naturally, is eventually to reveal to him that people are becoming peripherals to the computer banks, programmed themselves for specific functions and actions.

98.4 involves an unsuccessful security agent who is clandestinely hired to discover just what is happening within a select group of scientists at yet another research station. Computers figure prominently in the arsenal of the villains once more. A contagious, life-threatening wave of panic rocks all of Great Britain in *Panic O'Clock*. This time the central character is a young wife who flees with her child following a cryptic but frightening phone call from her husband. She must then make her way across the country to a secret rendezvous, avoiding both the authorities and the innocent victims of the induced panic.

All of Hodder-Williams's fiction is very strong in characterization, development of suspense, and logical plot construction. His anti-technological bent may well be annoying to some readers, as it is not currently fashionable to fear scientific advancement. They are, however, excellent thrillers with science-fiction content and are probably much more commercially successful as such.

—Don D'Amassa

\* \* \*

One of the most remarkable visionary fantasy authors of the first part of this century, William Hope Hodgson is remembered today chiefly as the author of two classic fantasies, *The House on the Borderland* and *The Night Land*, and for a number of often-anthologized short horror stories that are models of craft and atmosphere. Though his writing did not become widely known among fantasy and science-fiction readers until the 1940's, when his stories began to be reprinted in America pulp magazines and his novels were reissued, Hodgson's reputation has grown steadily since then, despite the difficulty involved in categorizing his works.

Hodgson's novels are characterized by episodic structure, multiple narrators or "frame" stories, vivid descriptions, images of decay and desolation, and—perhaps most important—an atmosphere of brooding horror that Hodgson manages to sustain and build despite his often digressive plots. His first novel, *The Boats of the "Glen Carrig,"* seems to owe a stylistic debt to Defoe, and is even cast in the form of an 18th-century manuscript. This tale of shipwreck survivors who encounter islands of fungi, weed-bound derelicts, and hideous intelligent slugs quickly helped to establish Hodgson's reputation as a leading writer of sea horror stories, a reputation which was furthered by his short fiction and by another novel, *The Ghost Pirates*, which approached science fiction with its speculation that the ghosts may be inhabitants of an alternate reality, "perhaps something to do with magnetic stresses." Hodgson's most widely read novel, *The House on the Borderland*, did not take place at sea, although Hodgson regarded it as part of a thematic trilogy with *The Boats of the "Glen Carrig"* and *The Ghost Pirates*. Cast in the form of a manuscript

discovered in the ruins of an isolated house in the west of Ireland, the novel would vary little from the simple horror formulae of Hodgson's earlier novels were it not for a powerful central passage in which the narrator embarks on a long psychic journey in time and space, witnessing the death of earth, sun, and solar system and encountering hideous creatures on a world strangely parallel to this one. *The Night Land*, Hodgson's last novel and by far his longest, again employs an archaic style, and a visionary narrator but is otherwise a considerable departure from these earlier works. One of the longest and strangest fantastic romances of this century, *The Night Land* is the vision of a 16th-century man into the earth of millions of years in the future, when the "last millions" of humanity have retreated after the sun's death into a huge pyramid, almost eight miles high and comprising 1320 floors, called the "Last Redoubt." Surrounding the Redoubt are monstrous creatures of various kinds, waiting for humanity's power supply to run out so that they can move in. The story is a simple quest of a lover for his beloved in this bizarre context (a story which echoes the frame narrative that introduces the vision), ending with an affirmation of the saving power of love in even the most hopeless of circumstances.

Hodgson's short fiction includes a number of stories that have become horror classics, most notably "The Voice in the Night," concerning a man and woman overcome by fungus on a mysterious island, and "The Derelict," about a ship so overgrown with fungus that it becomes a living organism. These and other tales reveal Hodgson's obsessive repulsion to parasitical life and stagnation, and his use of the sea as an arena for unknown horrors in a manner not unlike that in which later writers would come to use outer space. Of his non-sea stories, the most notable are a series about an occult detective named Carnacki. Written with a humor unusual for Hodgson, these stories range from the clever to the ridiculous, with Carnacki sometimes explaining ingenious hoaxes and sometimes finding himself face to face with the most unlikely supernatural manifestations (such as a room that puckers up and whistles). Though not major works, these stories reveal a versatility that makes one wonder what Hodgson might have produced had he not been killed in the First World War.

—Gary K. Wolfe

\* \* \*

The science-fiction novels of Lee Hoffman are novels of human feelings, not ones of hard science. The SF concepts are well thought out and are integral to the storylines, but they are clearly secondary to the characters. Unlike some SF where the idea is the star and the emphasis is placed on the nuts and bolts or on the astronomical bodies while the people seem stamped out of cookie dough, Hoffman's fiction is populated with characters who live and breathe and grow and develop. The songs they sing are ones for men and women, not for pulsars and machines.

Perhaps the clearest example of her ability to make her characters very human is the protagonist in *The Caves of Karst*, a man who has undergone an operation to enable him to breathe underwater. Though this allows him to work the

underwater mines more effectively, he did not choose to undergo the operation solely for financial considerations; as the novel unfolds it becomes clear that the choice was made (on some level of consciousness) to protect his ego from an unhappy love affair. People on Karst, as on Earth, often shun those who differ physically from the norm and those who choose to have such differences are frequently confronted with outright hatred. His adjustment to his condition, to women in general and his girlfriend in particular, and to himself during a time of crisis is the heart of the book.

There are three primary themes that run through Hoffman's work. 1) Individuality and the freedom of choice that comes with it are extremely important but must be tempered with the realization that individuals need to work together, to interact, in order to achieve certain goals. 2) It is both wrong and dangerous to try to control something or someone without consent. 3) Things may not be the way you originally thought they were or the way you have been told they were. Each theme is expressed with varying degrees of emphasis, depending on the novel, but all three are interrelated in her science fiction.

Hoffman's style is lean and direct. Each novel opens with action, tossing the reader into the midst of unfolding events: *Telepower* begins with an attack on post-atomic war Cleveland by an army of rats; *The Caves of Karst* starts with an underwater "gunfight" in a mine; *Always the Blackknight* opens with a battle between knights on robot horses; and, although the first chapter of *Change Song* is used to establish a sense of wrongness and an atmosphere of danger, the second chapter quickly produces a fight between men with magical powers. Hoffman uses her writing skills to capture the reader immediately, and all of her work has been set on earth-like planets so that the reader can rapidly believe in the setting. Obviously Hoffman strives to entertain the reader while stating her messages.

To enrich her science fiction, she occasionally employs the techniques of other genres to give a more diverse flavor. In *Telepower* Hoffman forges a bond between the gruesome qualities of the horror novels and the telepathic power so common in science fiction. Drawing upon her own experience as a writer of westerns, she gives *The Caves of Karst* an Old West setting (or what the Old West would have been like if the prospectors had gills) while at the same time using all the plot-twists of a mystery novel. *Always the Blackknight* has the flavor of the tales of knighthood, as the title might indicate, and *Change Song* has most of the elements of a quest-fantasy. In fact *Change Song* is really more fantasy than science fiction, much in the same way that Theodore Sturgeon's *More Than Human* is, although on the world where *Change Song* takes place control of the elements and the power to cast spells are like our science in that one is trained in these fields. By being willing to take the risks of mixing elements of other genres with science fiction, Lee Hoffman has given her work an added dimension.

—Terry Hughes

James P. Hogan comments:

Despite the cynicism that seems fashionable in some social circles, I continue to feel positive about our species and its future, and our ability to comprehend and solve our problems. I'm optimistic about science and technology and an anti-Malthusian. I don't believe that we are about to blow ourselves into oblivion, starve ourselves into extinction, poison the planet, degenerate into Nazis, or disappear under our own garbage. On the contrary, I believe in the power of reason and human creativity to continue building better tomorrows. There are the things I try to project in what I write.

\* \* \*

It would be easy—too easy—to dismiss the fictions of James P. Hogan as mere right-wing libertarian tracts in the guise of novels. For the objective narrative voice that tells his stories finds it hard to resist divagating into splenetic attacks on various institutions and projects associated with progressive social, political, and economic movements—broadly speaking, the left and its countercultures. For example, early in *Code of the Lifemaker*, an otherwise intriguing dramatization of humanity's encounter with an alien culture of non-organic entities evolved from an abandoned automated factory on Titan, a fraudulent psychic and his henchmen are traveling through Manhattan en route to a TV appearance. While they are caught in a traffic jam, the narrator observes:

On one side the streets were blacked out for seven blocks beneath the immense, ugly canopy of aluminum panels and steel-lattice supports that made up the ill-fated Lower West Side Solar Power Demonstration Project, which was supposed to have proved the feasibility of supplying city electricity from solar. Before the harebrained scheme was abandoned, it had cost the city \$200 million to teach politicians what power engineers had known all along. But it kept the streets dry in rainy weather and a thriving antique, art, and flea market had come into being in the covered arcades created below.

That this passage is a gratuitous slap at advocates of renewable energy is suggested by the failure of the topic or the scenery to appear again or to have any discernible relation to any event or character in the novel, unless one counts some grumbling heard on a couple of occasions about how American fusion energy research was stopped by people who believed that "pyramids" would provide unlimited power—in itself a connection suggesting that solar energy is in the same league as pyramid-power. As one reads through Hogan's novels, one is struck by the amount of time the narrator and (on occasion) the most scientifically respectable characters spend railing at labor unions, the mass media, popular culture, environmental activists insofar as they question the chemical and nuclear-power industries, *The Limits to Growth* thesis, and any portion of education devoted to topics other than science and engineering. One suspects that Hogan is trying very hard to be a reliable propagandist—on the order of Jerry Pournelle—for what President Eisenhower characterized as the "military-industrial complex."

Fortunately for his readers, however, Hogan's SF has an imaginative power that both transcends and undermines his self-imposed role as apologist for technical society. The propaganda, after all, is the product of a faith—a faith in reason, to be sure, but nonetheless a faith. Hogan's fictions invite the reader to share that faith, a conviction that the trained human mind, especially working with other trained human minds in the scientific team, can conquer the universe both analytically and technically. In the plots of the narratives, it is not environmentalists or union leaders who come close to blocking the efforts of reasonable men (for Hogan's strong characters are almost always male), but rather ignorant governmental or corporate bureaucrats, behind whom lurk power-hungry and greedy executives who wish to use science for nefarious ends. Thus an interesting inconsistency appears: on the level of thematized narration and dialogue, we are *told* that the enemies of reason are (for example) the welfare state and environmental activists, while at the level of plot we are *shown* that the biggest enemy is in fact the "military-industrial complex." The inconsistency is not fatal: it rather adds to the interest of reading a Hogan fiction.

The typical Hogan protagonist is a strong-willed competent scientific investigator, or an individual who struggles against

an incompetent bureaucracy and malevolent leaders, or is both. He is more willing than those around him to entertain unorthodox ideas—as long as those ideas are not the product of superstition (like "psi-powers") or ignorance (meaning any questioning of scientific or technical progress). In *The Genesis Machine* (a fictionalization of Herman Kahn's concept of "doomsday machine"), Brad Clifford is not simply a brilliant mathematical physicist who has worked out the equations of the dimensions beyond ordinary spacetime; he is also a romantic hero who creates a device which effectively disarms the nuclear-war making capabilities of both sides in a 21st-century world on the verge of destroying itself in an ultimate holocaust. In *Code of the Lifemaker*, the cynical "psychic" Karl Zambendorf (redeemed by the fact that he does not actually believe in his "powers") leads a rebellion that aborts the plans of a cabal of industrialists and politicians to impose a neo-colonial slavery upon the evolved robotic civilization discovered on Titan. In *Voyage from Yesteryear*, which as a utopian fiction has a society rather than an individual for its hero, the struggle is between the Chironians, descendants of an old Earth colony in the Alpha Centauri system, and a more recent shipload of pilgrims (their vessel is called the *Mayflower II*) whose leaders wish to impose a centralized political economy on the anarchist society that has developed over the years. Since the Chironian society is based on economic abundance owed to a science and technology unfettered by governmental and corporate priorities, they are committed to absolute personal freedom. Their social order is so attractive to many of the new arrivals, however, that an attempt to reduce them by force fails, and the power-brokers of the old way are forced to submit to the new.

Hogan's *magnum opus*, *The Minerva Experiment* trilogy, is marred when its third part, *Giants' Star*, descends into a space operatic war between good guy aliens allied with the Earth and the "Evil Empire" that seeks to enslave them. Its first two parts (*Inherit the Stars* and *The Gentle Giants of Ganymede*), however, constitute a fine SF detective story centered on Victor Hunt, an almost archetypal Hogan hero who heads up the team of United Nations Space Agency scientists that unravels the mystery of a humanoid corpse found on the moon. As Hunt and his team probe more deeply into the origins of the "Lunarians," they reconstruct the story of an ancient alien civilization and its colonies in the solar system, a process which enables them to advance a daring new hypothesis about the origins of mankind. Aside from promoting some of Hogan's favorite themes, such as the never-ending struggles between reason and superstition, and between individual freedom and the security state, *The Minerva Experiment* illustrates another important feature of Hogan's SF: his portrayal of the methods of scientific investigation. Since this particular investigation is an interdisciplinary one, the investigators must constantly share their knowledge as well as formulate, test, and discard successive hypotheses. Hogan also conveys what might be called the human dimension of science—the rivalries between fields, the interpersonal conflicts, and the exhilaration that comes with the discovery of a new piece of knowledge that can be fitted into one's previous investigations. In the bargain, Hogan seamlessly integrates present-day "normal" science with the speculative, fictional science of his near-future setting. This promotes an important theme that runs throughout his SF: the unity and the smooth growth curve of Western science and technology, with the spirit of reason only occasionally disrupted by social backwardness and the apparent discontinuities associated with paradigm shifts in science itself.

For Hogan, in spite of his tendency to tell us so often that ignorance and superstition are ascendant and threaten the

abundance and freedom that human reason can create, is after all a romantic optimist: he shows us in his fictions that reason will ultimately prevail, and that the darkness of superstition and ignorance can provide only temporary setbacks to the spirit of enlightenment. In this he is a child not only of the Renaissance and Enlightenment publicists of science and reason, but also of the writers of the "Golden Age" of American SF. British-born, he has appropriately settled in California, that most compelling creation of the American mythos of "can-do" science and technology.

—John P. Brennan

##### Robert Holdstock comments:

I am usually inspired to write by the contemplation of far distant places and far distant times, be they future or past. I quite deliberately build into my work and my characters both a passionate awareness of past times and a strong sense of alienation. I relish alien landscapes, but am not concerned with futuristic man. My characters are humans of my own age, and I try to see them, and the exotic locations of time and space, to explore the boundaries and potentiality of man's awareness, of his senses, of his evolution. All my work is concerned with evolution, and with the persistence of memory, the continued

presence—genetically, spiritually, passionately—of all of life in all of mankind.

\* \* \*

Robert Holdstock's first novel, *Eye among the Blind*, established him as a promising writer with unique perspectives. A mysterious plague has swept through the inhabited worlds, and now threatens to wipe out the entire human race if a cure cannot be found. Throughout the universe, there is only one other known intelligent race, and it is perhaps on their strange world that a solution lies. But Ree'hdworld is not a simple world to understand. Although the comparatively primitive aliens have not been involved in overt conflict with humanity, strange things happen on their world. The course of evolution seems to be almost visibly altering as a reaction to the presence of visitors from another world, and, even more frightening, visions of mythological beasts seem to call into question the human view of reality.

*Earthwind* was not quite as successful, although the exotic settings and fantastic imagery of the first book are more than matched. The planet Aeran is also a primitive place, despite the arrival of humans who find a method of blending into the ecology of that world. The imagery tends to dominate a bit too much this time and the plot suffers.

This was not true of *Where Time Winds Blow*, Holdstock's most successful science-fiction novel. Time is a variable on a world where the winds blow down great rift valleys, transporting men and objects into time past or time future. In each case, detritus from some other time is left in their place, and some of these artifacts are valuable enough that a thriving industry exists consisting of daring adventurers who are willing to risk being whisked off through time in return for the financial rewards of discovering a valuable remnant of a previous world.

*Where Time Winds Blow* is a complexly textured novel. One of the highest ranking officials on the world has gone mildly insane, and believes that the time winds are a device manipulated by a race of time travellers who operate just outside the bounds of human experience. A secretive infrastructure of the adventurers is cognizant of some secret knowledge which they will not share with the protagonists. The protagonists themselves are caught up in a mesh of ritual superstitions, defying logic. The landscapes are bizarre and fascinating, the characters fully developed, if somewhat bizarre.

Holdstock has also been active in sub-genre fiction. His novel of the supernatural, *Necromancer*, is at once terrifying and an enthralling fantasy adventure. A stone font in a British church turns out to be much more than it appears to be, for it was at one time the sacred object of a group of pagan worshippers of animistic spirits. Now it has reached out to imprison the soul of a modern youth, and his mother must overcome her own disbelief before she can work to abrogate its control. Under the pseudonym Robert Falcon, Holdstock has written a series of adventures of a man whose family has been disrupted by a cult of satanists, and who learns the arts of magic himself in order to take revenge. The first two in this series are *The Stalking* and *The Talisman*.

There have also been a number of short stories, but Holdstock seems to require the room of a full length novel in order to adequately develop his characters and describe his original settings. He has also dabbled in the more violent forms of heroic fantasy under the pseudonym Chris Carlsen, including such interesting but fairly standard adventure novels as *Shadow of the Wolf*, *The Bull Chief*, and *The Horned Warrior*.

\* \* \*

Cecelia Holland's *Floating Worlds* is a space opera, though it lacks many of the traditional attributes of that form. There is no melodrama, only realism. The novel is unsentimental, unromantic, and contains characters who are real people rather than the archetypes of adventure fiction. Several characters, who in a more traditional space opera might have been relegated to the stock roles of villains, here take center stage. The protagonist, Paula Mendoza, is a selfish, intelligent, anarchic, and somewhat unreflective woman who sees an

opportunity for power and seizes it. She gambles and loses.

Holland has not extrapolated a future. Her future worlds, though in part modeled on societies and sub-cultures of the past and present, are not developed in the manner of the realistic science-fiction writer. She takes a cyclical rather than progressive view of history. Human nature has not changed in this far future world. The Martian Sunlight League is fascist. The polluted Earth, its inhabited regions covered by domes, is populated by anarchists who have no government, only a Committee for the Revolution. The Styths, mutants who rule an Empire on Saturn and Uranus, are violent and hold slaves. With their spaceships, a technical knowledge that enables them to live in artificial cities on such inhospitable worlds, and their anachronistic customs, the Styths may seem unlikely. But the 20th century has already experienced Nazi Germany—a warrior band with technology, whose strategy and tactics were modeled on those of the Mongols under Genghis Khan.

Holland is an author of historical novels, and has admitted in an interview that *Floating Worlds* began as a novel about Mongol China; she then realized that the story she wanted to tell would not fit into that historical framework—or indeed any past time. Paula Mendoza bears a resemblance to the protagonist of *Great Maria*, a Norman woman who is the ally of her warlord husband. The Styth Empire has features in common with the Mongols of *Until the Sun Falls*, but the background of *Floating Worlds* has its own integrity. Though the novel has devices found in other science fiction, such as spaceships, an interplanetary empire, mutants, and an O'Neill space cylinder, it is not obviously influenced by other science-fiction writers. The style is clear and economical. Holland does not pad her historical novels with endless descriptions of clothing, castles, and weapons; neither does she fill *Floating Worlds* with cumbersome expository passage. The reader lives in this future world and experience it directly. The book is unique and original, not derivative, though it can be placed in the tradition of Edgar Rice Burroughs. The author herself has cited this book as her favorite of her early novels.

Modeling a novel of the future on the past does not always work. Cecelia Holland makes it work. *Floating Worlds* is one of the most intelligent and rewarding examples of an often-maligned species of the genus science fiction. Marks of Holland's stylistic influence can be found in the otherwise quite different works of Elizabeth A. Lynn and Marta Randall.

Another novel of Holland's, *Home Ground*, should be mentioned here, because the central character, Rose McKenna, earns a living as a science-fiction writer. The novel, set in the 1970's, takes places in northern California, where Rose goes in order to put her life back together again, the effect of the modern world and its intrusions on the disparate people Rose meets there are viewed through Rose's eyes, and passages in the novel show Rose at work on her science fiction. *Home Ground* can be grouped with other novels, such as Barry N. Malzberg's *Herovit's World*, about science-fiction writers and how such a writer might view the world.

"Arachne," "Dark Body," and "Inertia," in *Midnight Sun 3*, 1976.

\* \* \*

Though included in *Lone Star Universe*, an anthology of science-fiction stories by Texans, H. H. Hollis avoids the possible danger of writing a purely local literature by writing in a pure, clear style—but not simplistically—about complex social issues, such as justice and ecology, which we cannot avoid because to do so is to condemn our culture to an early death.

"Sword Game" displays Hollis's talent for creating characters who are immediately recognizable and likeable despite, or perhaps because of, their inner confusion. A university professor and a hippie girl have reached a point in life that appears to be the fulfillment of their desires, but actually denotes stasis and boredom. The solution to their problem is at once silly and scientific: the professor will insert the girl into an "expanded cube" and drive a fencing foil through her body as part of a circus act. Since time in the cube represents an "endless instant" (as does a state of boredom), she will emerge unhurt in our time. When the original state of ennui reasserts itself, the professor entraps the girl permanently in the cube. Then, in a beautiful show of literary magic, the author has a graduate student "hero" free the girl and "imprison" the professor by distributing him evenly throughout the universe—a truly mind-expanding experience befitting a man who feels confined and lost in reality.

Two stories feature a futuristic Houston lawyer named Corky Craven who shares his author's profession as well as his interest in the drug culture and concern for our violent, polluted world. In "Stoned Counsel" numerous conflicting truths about industrial pollution, which boggle the normal, sane mind, are "dreamed" by drugged lawyers, who behave as though under the influence of a truth serum. The "triple sensory projector," a computer-like machine into which the attorneys are plugged, meanwhile sorts out the facts and decides the case on the basis of knowledge that would not be available without the drugs. So another kind of justice triumphs, a 1960's version with drugs used for good instead of evil. Drugs are also a feature of "Every Day in Every Way," a remarkable tale about the system of future justice in which criminals share both guilt and punishment with their legal executioners. In "Year Judge" the judge actually dies with the condemned persons at the end of his term and a new judge is elected, eliminating the lust for power that anyone in a position of authority is in danger of acquiring.

**HOLLIS, H. H.** Pseudonym for Ben Rhamey. American. Born in Dallas, Texas, in 1921. Educated at Southern Methodist University, Dallas, B. A. in economics; University of Texas, Austin, LL. B. Married. Admiralty lawyer. Died in 1977.

Corky's purpose in this story is to witness the execution of the Year Judge (a female this year) and a woman (coincidence?) who has murdered her children. But the Witnesses are not mere societal observers: they are also plugged into the electric chairs and severely shocked until the judge and criminal are dead. The message is unmerciful. Justice is not simple or beautiful. It is an imperfect human attempt to bring order to our frightening, chaotic world which itself hurts those whom it strives to serve. Corky's cranial scar, a souvenir of his near-fatal witness of the law, remind us that violence, though ugly, may be necessary to man's animal nature and a sort of payment for the great beauty he also enjoys.

H. H. Hollis, by mirroring our society in a way that strips it naked (as his characters sometimes appear to be), forces the reader to look honestly with him at our shared problems in the knowledge that, although they will not disappear, we must not abandon efforts to understand and reform our world.

—Rose Flores Harris

#### OTHER PUBLICATIONS

##### Novel

*The Man from U. N. C. L. E. 10: The Assassination Affair*. New York, Ace, 1967.

\* \* \*

Earth is conquered by an army of aliens in *The Dark Planet*, succeeding primarily because of a lethal plague which they spread upon their arrival. Bacteriological war is illegal in the eyes of the interplanetary council, however, and a lone Earthman is able to manipulate things so that the hegemony over Earth is abrogated and the aliens censured for their activity. A similar theme is used in *The Mind Traders*. Thousands of humans have disappeared from the Earth, and the authorities suspect that an alien race of telepaths may be using them as slave labor on their home planet, even though they have signed a treaty not to interfere in Earth affairs. An investigator is allowed to travel to their home world where he eventually discovers a split among the aliens themselves and uses it to free the captives.

Mysterious shadows glide over the landscape in *The Gray Aliens*, and people begin to disappear, leaving only their clothing behind. The protagonist learns that the shadows are another intelligent species that has existed on Earth unknown to us, but which is now taking action to exterminate humanity because our activities are preventing them from communing with the planetary mass mind. We are invaded from the future in *The Time Twisters*. Our descendants face extinction as a species unless they find a source of children, so they journey back through time to kidnap them, faking an alien invasion so that people won't suspect what is really happening.

The best novel Holly wrote is almost certainly *Death Dolls of Lyra*, although it too deals with a kind of invasion. Two children find a metallic ball with two fuzzy dolls inside it. Shortly thereafter a fatal and highly infectious fungus begins to spread across the country, and the dolls are revealed to be two dead aliens from a world of tiny proportion in relation to our own.

Holly has always written of fearful situations, alien invasions, macabre monsters, manaces to the human race. *Encounter* opened with a space vessel crashlanding on Earth. The badly wounded survivor of the crash is taken in by a rural family and nursed back to health, but he repays them with brutal murder. The alien can absorb knowledge directly from human minds, but the result is that the victims' brains literally explode. Soon a string of mutilated corpses leads to powerful Peter Kiel, a man who seems destined to rule the country despite his mysterious past.

*The Green Planet* pitted 13 humans against a variety of threats on another world, but recognizes that humans can be monsters as well. The involuntary colonists are there because a repressive government exiled them to what was ostensibly a colony for non-conformists, but actually a deathtrap. Even within their meagre ranks, murder and betrayal are not unknown. The colonists are threatened with giant carnivorous birds, animals with whom any contact causes instant pain, and

unfriendly natives who distrust the interlopers. This early novel is one of Holly's best, not only because she exerted more effort on developing characters, but also because she produced after this a string of invasion story variants.

In *The Flying Eyes* alien invaders are hidden in a cavern, able to disconnect parts of their bodies and send them roving about the Earth to enslave humanity and force it to produce radioactivity, the only substance upon which they can feed. This is a fairly good adventure story except that the destruction of the invaders hinges upon their being incredibly stupid. The invasion is covert in *The Running Man*. This time the aliens have secretly established themselves behind a human front organization and have begun to spread a new worldwide cult designed to disrupt human civilization and make us more vulnerable.

The last two novels Holly wrote were linked, *Keeper* and *Shepherd*. They are set in a dystopian future where emotion, particularly any form of love or affection, is outlawed. A man given temporary custody of a child discovers the importance of emotion in the first book, and moves to topple the repressive and inhumane government in the second.

Holly was never a major voice in science fiction, and her plots were derivative. There was, however, a simplicity in her style and a joy in telling a good story that made most of her novels succeed as entertainments if not significant works of fiction.

H. M. Hoover consistently produces youth science fiction of very high quality, finding in SF a congenial and fertile ground for exploring those problems young people may face in less exotic environments: alienation from parents, feelings of isolation, feelings of being trapped or of being an anomalous creature out-of-sync with the Universe. Often Hoover's young people have special talents and sensitivities unappreciated by the adults around them.

So it is in *The Children of Morrow* and its sequel *Treasures of Morrow*. Tia and Rabbit are telepaths ill-at-ease in their wasteland home, "The Base"; but a visit to the more advanced and enlightened community of Morrow proves ironically that home is not a simple matter to define. Anthropocentrism is examined in *The Rains of Eridan* when Theo, a young naturalist, and Karen, a child-orphan of conflict, team up first to survive, later to explore planetary lifeforms. Here and throughout her work, characters grope toward friendship

across the generations, and search for clues to enlighten their immediate situation and solve the larger mystery which imprisons those about them. Often the clear-eyed vision of children is instrumental in the process. The story of planetary exploration provides a background for their developing relationship. Karen learns to trust her new parent, and Theo learns that the child is skilled beyond her years both with laser gun and in the handling of fear and grief. ("Like you I can shut part of my mind off till it's safe to think again.")

In *The Lost Star* the young hero is ignored by parents who have adopted emotional reserve as a policy for working together as off-Earth astronomers over long periods of time. Hoover's ability, born of youthful innocence, to recognize intuitively the intelligence and intrinsic worth of alien creatures is reminiscent of Ursula K. Le Guin's *The Word for World is Forest*; but Hoover's is a much lighter and more hopeful tale.

*This Time of Darkness* utilizes the familiar idea of the escape from an hermetic environment to explore in depth the struggle of children to receive the affection and acceptance which should be theirs by right. Ostracized for their ability to read, Amy and Axel are two children in a Big Brother-style underground hive community so benighted it has left scars on their bodies and has lost sight of any concept of a better world outside. Readers of SF will see in this story a children's literature counterpart of E. M. Forster's classic "The Machine Stops," and teachers may find it worthwhile for the hope it provides the abused child of the real world struggling for psychic survival. In *The Bell Tree* Hoover uses the device of archaeologists exploring an alien world to study the relationships of a young woman, her father, and her first boyfriend; and in *The Shepherd Moon* the loneliness of Merry, a 13-year-old of the 48th century is set against a background of terrorist intrigue.

Hoover has written that science fiction's presentation of ideas as images makes it important as a teaching tool, since imaging is the very thinking process Einstein and other great thinkers use to generate new ideas. In Hoover's fiction we find provocative images of scientific concepts and a liberating experience for the human spirit.

Robert Hoskins comments:

An unhappy, and fat, childhood in a small Adirondack football village turned me early to escapism. Comics led to pulps, to fandom, through the letter columns. After years of writing, I began selling an occasional story while still gathering pounds of rejection slips. It was not until I worked, first, for an agent, and then as an editor, that I learned the techniques of novel construction. Impossible though the idea is, I think all young writers should have a spell in both jobs. I consider myself strictly an entertainer; the one novel that is deliberately allegorical I have not at this date been able to sell. I've published 40 short stories, but find it easier to construct a novel. Once an idea comes, it seems to grow and grow.

\* \* \*

Except for *Evil in the Family*, a gothic novel involving a time-travel fantasy, Robert Hoskins's major contribution to science fiction until 1975 was in writing short stories and editing anthologies. Since then he has developed earlier themes in a series of novels based on the inherent value of primitive versus technological man, the effects of free evolution versus outside interference and artificial controls, the need for change and progress and the threat of regression without it, the private, economic, and sociological reasons for galactic exploration. His works are always filled with action and adventure, monsters and barbaric peoples, advanced races and mercenary predators.

In *The Shattered People* Hoskins gradually reveals the secret ties between a savage desert world of naked hunters armed with slings and stones and a highly technological nuclear civilization ruled by a tyrannical council contemptuous of life. In the first, vicious cats prowl in packs and sentient aliens (huge, bird-like creatures) keep watch, while in the other urban rebels, aided by their "empress," a titular head virtually imprisoned in her own palace, meet in subterranean passages and plot to throw off their shackles. Mind-wipes and deportation thrust the strongest and most outspoken of the urban world into the primitive world, until one man's psi powers enable him to regain his memory and bridge the gap between the two, merging instinctive and rational.

*Tomorrow's Son*, set in the 23rd century, focuses on a geneticist and his android son, trapped in a rigid caste system, genetically predetermined. On Earth the father engages in forbidden android research to help revitalize the swiftly deteriorating genetic make-up of humanity, while on a primitive planet, Karyllia, his son struggles to protect alien humanoids from repeating humanity's evolutionary mistakes, only to discover that he must protect them not only from themselves but from the fanaticism and destructiveness of his own world. Both men prove pawns of larger schemes to protect Karyllia from outside interference and to force humans to accept change—change that can revitalize a regressing world where average I. Q. decreases yearly and masses of subhumans are crowded into barracks, experience sex and violence vicariously, and drown their minds in joyjuice. The book includes bizarre

beasts of burden, strange snake-lizards in swamps, and primitive tribal conflicts. As usual, Hoskins emphasizes the stench of primitive worlds and the lack of respect for life in both primitive and advanced societies.

Hoskins's trilogy sets up a universal cycle of development and regression and postulates a series of stargates on most worlds, built by an ancient interstellar race; one sets the controls and steps into other worlds, some of which have regressed to the primitive while others have advanced to the stars. *Master of the Stars* focuses on the Alnians at the height of their development, struggling to avoid the contaminating barbarism of other worlds. *To Control the Stars* deals with an internal conflict in the Society for Humanoidic Studies, a conflict that affects the future of thousands of worlds and which forces the central character to fight for his life from world to world and to seek the Alnians (the only humanoids with a continual history) for answers. The Society's original goal, observation of other worlds without interference, has been perverted in a lust for power, wealth, and exploitation to focus on evolutionary control and forced rapid progress. There is much action—escape, recapture, romance. *To Escape the Stars* picks up thousands of years later when the Society has been reduced to a library cult devoutly recording galactic history. A scheme to plunder a rich, high-gravity world of rural innocents leads first to treachery, and then to a revived search for the Alnians and their master codex to the stargates; the main figure changes from a jaded and unscrupulous exploiter to a student of the universe, and discovers the dangers of isolation and of failure to accept change and conflict.

\* \* \*

William Dean Howells made a major contribution to utopian literature by inventing Altruria, a vision of an America which practiced what it preached in the Declaration of Independence. *A Traveler from Altruria*, "Letters of an Altrurian Traveler" (in *Cosmopolitan*, 1893-94), and *Through the Eye of a Needle* make up the Altrurian romances, Howells's statement on socialism and civil rights.

Edward Bellamy and Ignatius Donnelly had recently caught attention through social protest fiction in *Looking Backward*,

*Equality*, and *Caesar's Column*. In a time of depression, strikes, Populism, and social change, Howells chose to point to a better society through a visit by Aristides (after Aristides the Just) Homos from an imaginary island in the Aegean where law, government, and social relations were based on altruism, a term adopted from Auguste Comte's *System of Positive Policy*. Howells imitated Oliver Goldsmith's *Citizen of the World* papers, introducing the outsider who asks pointed questions and marvels at peculiar customs. Altruria has much in common with Bacon's New Atlantis and More's Utopia and points toward Skinner's Walden II. Mr. Twelvemough, a well-known novelist who narrates *A Traveler from Altruria*, represents the American's attitude toward Homos. He disapproves of his fondness toward the lower classes. "Letters" is composed of five letters from Homos to his friend Cyril at home, openly critical of what he sees. Homos refers to New York as Babylon and to Americans as lost in the dark ages. *Through the Eye of a Needle* is also narrated by letters, some by Homos and the rest by Eveleth Strange, a beautiful widow who marries (after great conflict) Homos and moves to Altruria. Although the Altrurian works seem dated, they are important examples of attempts at social reform by an influential author.

—Mary S. Weinkauff

**HOYLE, Fred and Geoffrey.** British. **HOYLE, Fred:** Born in Bingley, Yorkshire, 24 June 1915. Educated at Bingley Grammar School; Emmanuel College, Cambridge (Mayhew prizeman, 1936; Smith's prizeman, 1938; Goldsmith Exhibitioner; Senior Exhibitioner of the Royal Commission for the Exhibition of 1851), mathematical tripos 1936, M. A. 1939. Served in the Admiralty, London, 1939-45. Married Barbara Clark in 1939; one son, Geoffrey Hoyle, and one daughter. Research Fellow, St. John's College, 1939-72, University Lecturer in Mathematics, 1945-58, Plumian Professor of Astronomy and Experimental Philosophy, 1958-72, and Director, Institute of Theoretical Astronomy, 1966-72, Cambridge University. Visiting Professor, 1953, 1954, 1956, Fairchild Scholar, 1974-75, and since 1963, Associate in Physics, California Institute of Technology, Pasadena. Staff Member, Mount Wilson and Palomar observatories, California, 1957-62; Professor of Astronomy, Royal Institution, London, 1969-72; White Professor, Cornell University, Ithaca, New York, 1972-78. Honorary Research Professor, University of Manchester, since 1972, and University College, Cardiff, since 1975; since 1973, Honorary Fellow, St. John's College, Cambridge; since 1984, Honorary Fellow, Emmanuel College, Cambridge. Member, Science Research Council, 1968-72. Recipient: Royal Astronomical Society Gold Medal, 1968; Kalinga Prize, 1968; Astronomical Society of the Pacific Bruce Medal, 1970, and Klumpke-Roberts Award, 1977; Royal Society Medal, 1974. Guest of Honor, Frontiers of Astronomy Symposium, Venice, 1975. Sc. D.: University of East Anglia, Norwich, 1967; D. Sc.: University of Leeds, 1969; University of Bradford, 1975; University of Newcastle, 1976. Fellow, 1957, and Vice-President, 1969-71, Royal Society; Honorary Member, American Academy of Arts and Sciences, 1964; Foreign Associate, National Academy of Sciences (USA), 1969; President, Royal Astronomical Society, 1971-73. Knighted, 1972. Address: c/o Royal Society, 6 Carlton House Terrace, London SW1Y 5AG, England. **HOYLE, Geoffrey:** Born in Scunthorpe, Lincolnshire, 12 January 1942; son of Fred Hoyle. Educated at Bryans-ton School, Blandford Forum, Dorset, 1955-59; St. John's

College, Cambridge, 1961-62. Married Valerie Jane Coope in 1971. Worked in documentary film production, 1963-67. Address: Laytus Hall Farm, Inskip, Preston, Lancashire, England.

\* \* \*

Fred Hoyle is a distinguished British astronomer with an international reputation as a teacher and writer. He is the author of astronomy texts and other books ranging from a defense of nuclear power to speculations on the nature of the universe and man's place in creation; he supports the steady state theory and the view of continuous creation. Hoyle is the most prominent scientist writing SF today. He has written novels and stories, and other novels with his son, Geoffrey. The short stories are written as entertainments. They reveal a range and area of interest that readers do not usually associate with Hoyle's name. Most of the stories are either fantasy or fantasy science fiction, and many are comic; but they also include space opera and mystery. Hoyle shares certain comic interests with Asimov in human foibles, especially sexual mores, which are treated in a breezy, good-natured manner. Some of the comedy, however, is social and has teeth, as the title story of the collection, "Element 79." While Hoyle attacks perennials such as human greed, arrogance, and stupidity, he reserves his most trenchant comments for political and economic systems and their repressive, self-serving meddling with history.

The social and sexual comedy are important elements in most of the novels written by Fred Hoyle on his own and in collaboration with his son, but they support ideas and speculations drawn from hard science, especially astronomy. The best of these novels, *The Black Cloud*, *October the First Is Too Late*, and, with Geoffrey, *Fifth Planet*, are notable examples of speculative science fiction weaving together ideas from hard science with conventions of science fantasy enlivened by comic and sometimes satiric wit and an interest in philosophy and the arts. The overall effect is exceptionally thoughtful and stimulating entertainment for those who do not wish to sacrifice the life of the mind entirely to the enchantment of cosmic adventure. In all three novels the world's fate comes to depend upon the problem-solving powers of the scientific community, represented by a selected case of characters. The reader has the feeling that Hoyle's characters, beside being plausible, are also representative portraits of men and women in the scientific community and its satellite social spheres in the arts on both

sides of the Atlantic. He sees science as the means through which humans must learn to meet the challenges to human survival posed by a hostile if not implacable universe. However, the greatest challenge to mankind comes from human society itself with its outmoded political power structure. The focus of Hoyle's criticism is the obstructionism of political systems and their reliance on barbarous military and police enforcers of national and social interests that are portrayed as active threats to both individual freedom and survival. Contrasted to the enslaving, restrictive, and punitive character of political structures is the open, liberating, and creative community of scientists, artists, and intellectuals with no political and social boundaries. Their common ground is the pursuit of truth, and in the novels mentioned, that pursuit involves a challenge to earth from an outside, cosmic force.

*The Black Cloud* introduces a massive, intelligent black cloud that invades the solar system, nearly destroying earth before communication is established by Cris Kingsley, a brilliant, iconoclastic Cambridge astronomer. The *Fifth Planet* challenge is from an invading star, Helios, and its planetary system of five planets which approaches our own solar system. In *October the First Is Too Late* temporal and geographical boundaries are scrambled for a time by a modulated radio signal of alien origin. In each novel we are given a romance of science. For a moment in history, the world's destiny turns on the calculations, speculations, and superior moral vision of scientists. The excitement is not only the working out of such cosmic challenges but also the sense of being at the center of forces that control human history. Hoyle effectively communicates and creates that sense of excitement, satisfaction, and wish-fulfillment in the rightful exercise of power by those who are qualified to use it by virtue of their intelligence and devotion to both the cause of mankind and of truth.

These and other SF novels by Hoyle effectively create the illusion of lived science in the character's discovery process, formulation of hypotheses, testing of theories, comparing notes with colleagues, and conferring on results. The prominent human dimension of Hoyle's fine novels grows from the resultant sense of competition and cooperation that characterize scientific inquiry at its best. Frustrated often by political and bureaucratic red-tape, Hoyle's scientist-heroes succeed through their capability for planning and taking individual action and for unselfish cooperation in scientific enterprise. As important as science is, both as a liberating and protecting force, Hoyle never ignores or sacrifices humanistic and artistic values. Indeed, one of the special strengths of the best fiction lies in its philosophic probing of the limitations of scientific knowledge and understanding. The great moral ideas science has contributed to the mind are freedom of inquiry and devotion to truth; but philosophy offers an engagement with permanent questions of human conduct and understanding, and art must offer its necessary corrective of value and sublimity if the search for truth regardless of consequences is not to mislead the race to melancholy despair, as it does the futurians of 8000 AD in *October the First Is Too Late*.

Although we have in Hoyle's fiction a delightful balance of adventure, hard science speculation, fantastic premises, and various types of comedy ranging from domestic to social, the most distinctive feature is the depth and power of thought that comes from Hoyle's interest both in the arts (especially music) and philosophy (especially metaphysics and cosmology). His novels stimulate the reader's speculative imagination, and are also rich, early and late, with inspired insights into the relation between the arts and the sciences, between man's instinct for design and beauty and the physical universe he inhabits. The novel richest in such insights is *October the First Is Too Late*,

but a brief passage from *The Black Cloud* illustrates how Hoyle triumphantly brings together traditional interests of SF speculation and elite interest in the arts to shed light upon one another. The question under discussion is the black cloud's interest in Beethoven's B flat major Sonata: "Our appreciation of music has really nothing to do with sound, although I know that at first sight it seems otherwise. What we appreciate in the brain are electrical signals that we receive from the ears. Our use of sound is simply a convenient device for generating certain patterns of electrical activity. There is indeed a good deal of evidence that musical rhythms reflect the main electrical rhythms that occur in the brain." Hoyle has written entertaining space opera in *Rockets in Ursa Major* and science adventure melodrama in *Into Deepest Space* and *The Incandescent Ones* with Geoffrey Hoyle, but his permanent contribution to SF is to have brought esthetics, metaphysics, and speculative science together so compellingly in his major works.

Trevor Hoyle comments:

I am primarily interested—insofar as SF is concerned—in the philosophical and metaphysical implications of the latest discoveries in quantum physics and cosmology. Recently I have become fascinated by the ways in which these theories and concepts have a direct relation to aspects of Eastern mysticism, in particular Buddhism. I tried to touch on these in my Q trilogy (in rather a hamfisted way, I must confess), and have plans to investigate these areas in far greater depth. While not strictly SF, such novels as *The Man Who Travelled on Motorways* and *Vail* also deal with these complex, baffling, and yet engrossing subjects. My task is to make the reader see and appreciate their interrelatedness, and to be as thrilled and dazzled by them as I am.

\* \* \*

Trevor Hoyle's well known "Q" series consists of three books: *Seeking the Mythical Future*, *Through the Eye of Time*, and *The Gods Look Down*. Christian Queghan is a Myth Technologist who investigates possible pasts and futures in a discipline that assumes all realities are equally probable. In *Seeking the Mythical Future* Queghan is inserted into a parallel universe where humans and dinosaurs exist together, where personal beliefs are rigidly controlled, and where Psychological Concentration camps exist for those who will not conform to normalcy. The satire on scientific methods and bureaucratic bungling makes the book lively yet profoundly serious.

*Through the Eye of Time* is the most ambitious book of the series. The scientists of Queghan's Earth IVn, a terraformed version of Old Earth, are working on a project to reconstruct a human brain. The identity chosen: Adolf Hitler. Queghan involves himself in the project when he finds the computer exchanging data by coincidence. That coincidence convinces Queghan that an alternate reality—where Germany developed the Atomic Bomb first—is undermining the reality of his Reality. Only insertion into that alternate reality can prevent the disaster that threatens the spacetime continuum. Hoyle captures the personality of Hitler beautifully and creates a unique, sinister character in Dr. Theodor Morell, personal physician to Hitler.

The concluding volume is less successful. Queghan joins forces with Dr. Francis Dagon to decipher primitive texts from ancient Earth through Myth Technology. The computer describes the legendary Ark of the Covenant in the form of blueprints for an existing technology. Queghan is sure Dagon is using his research findings in an attempt to change history. Only Queghan's powers to insert himself into alternate realities can stop Dagon's plans to alter the past. The idea is clever, but the book's conclusion is much too clichéd, much too predictable. However, the "Q" series is one of the best extended explorations of alternative realities in science fiction.

Hoyle's best book to date is an environmental disaster novel, *The Last Gasp*. Earth is totally polluted: the microscopic plant life in the oceans is dying, causing the beginning of the destruction of the food chain. At the same time, the superpowers plan to fight their next war with new, deadly forms of environmental warfare. British marine biologist Gavin Chase and a team of scientists realize the Earth is doomed and attempt to escape the death of the biosphere by building giant space colonies to survive in. Yet they have enemies in the military-

industrial complex who refuse to believe that Earth is dying. Chief of these forces is Lloyd Madden, an evil genius who desires the death of the human race so he can repopulate it with a new race of mutants. *The Last Gasp* delivers a chilling portrait of disaster and hope.

Hoyle's most haunting work is the frankly erotic novel, *The Man Who Travelled on Motorways*. As the narrator travels, his mind explores the realities and fantasies of his life. Much of the book is surreal, but science fictional aspects are apparent in the discussions of reality. Much of the book is sexist: Hoyle's narrator seems incapable of love, merely using women to satisfy his sexual needs in loathsome fashions. Yet the book speaks to the unconscious desires of travellers of either sex and takes a bold, difficult path to break down life's certainties into more truthful probabilities.

Trevor Hoyle is an unusual writer with a gift for making into convincing fictions his surreal, dreamlike visions.

—George Kelley

**HUBBARD, L(aFayette) Ron(ald)**. American. Born in Tilden, Nebraska, 13 March 1911. Educated at George Washington University, Washington, D. C., B. S. in civil engineering 1934; Princeton University, New Jersey, 1945; Sequoia University, Ph. D. 1950. Married Mary Sue Whipp; two daughters and two sons. Best known as the author of *Dianetics* and founder of the Dianetics-based Church of Scientology, L. Ron Hubbard was a prolific writer of science fiction, fantasy, and adventure fiction during the 1930's and 1940's. A good deal of his output, much of it published in *Astounding* and its companion fantasy pulp *Unknown*, is of interest today only because of its use of a bizarre gnostic psychology that foreshadows Hubbard's later eminence as the founder and leader of a cult religion. Yet despite a prose that too often cries out for better editing, some of his work justifies the high regard in which it is held by other veterans of the Golden Age.

Having begun his writing career with nautical adventure fiction, Hubbard often composed science fiction and fantasy by merely displacing swashbuckling epic into the new context through use of a fantastic premise or framing device. For instance, in *Slaves of Sleep* a meek young shipping magnate is accused of a gruesome murder which occurs when a North African *jinni* is released from an ancient jar. Jailed for murder, Jan Palmer finds himself plunged while asleep into an alternate life as a cynical, troublemaking, but courageous sailor. In that world dominated by *jinn* and other demons out of middle eastern folklore, he is also in trouble with the authorities. As the two stories clunk along in uneasy partnership, the bookish shipowner's personality is modified by that of his alter ego, who purloins a powerful talisman and wins a battle in the other world. All this results in Jan being cleared and restored to his inheritance in this world, winning a bride in the bargain. In spite of a few moments of social satire and a potentially interesting metafiction about fantasy's role in constructing the personality, the novel remains a blood-and-thunder romance in an awkward framework.

*Typewriter in the Sky*, clearly Hubbard's most successful fiction, also uses such a framing device. In this delightful bagatelle (which sports, along with several characters bearing Hubbard pen names, one named Bagatela), a musician finds himself transported into the world of a romance of the Spanish Main being composed hastily by a friend who writes mass-

market adventure fiction. Mike DeWolf is not only protagonist, but also reader of the text: buffeted by narrative implausibilities and inconsistencies as well as a major rewrite which sets up an alternate but no less fatal ending, he is finally thrust out of the fiction to return as a vagrant on the streets of modern New York, wondering if his *primary* universe is being created by a God "in a dirty bathrobe." This consummate "mockery of plot" appeared a quarter-century before the vogue of Barth, Pynchon, and Vonnegut, and long before Borges became generally known to American writers. A similar vein of humor appears in *Triton*, a well-conceived if clumsily written lark about a meek man who swallows a sea-god, thereby gaining the *machismo* needed to face down Neptune himself as well as his own dry land persecutors. *Triton*, in fact, is a reprise of the fundamental fantasy of *Slaves of Sleep*, but is much tighter and self-deprecating than the earlier piece. Two other early novels, *Fear* and *Death's Deputy*, offer plots that use demons to explain murders and untimely deaths. Together with the other pieces so far discussed, they show that Hubbard's talent was more for the weird tale than for SF.

When discussing Hubbard, one is apparently expected to praise as his finest SF work the militaristic *Final Blackout*. It is hard to see why, unless its virulent fascism—which the text pathetically attempts to deny—appeals to critics opposed to the welfare state or to socialism. The "novel" reads like a plot summary for a much longer work, and its hero (known only as "the Lieutenant") is developed as neither a realistic character nor a credible personification. Only if read ironically—as Hubbard surely did not intend—does the text amount to much more than a fascist utopia and anti-social-democratic tract.

Hubbard's postwar SF is of little distinction. The stories collected in *Old Doc Methuselah* are about a long-lived medical man who runs an interstellar ambulance service, dashing about the Galaxy conquering disease, injury, and ignorance, and aiding (extra-legally) the fight against injustice. The series is vintage space opera: Doc has a cute alien sidekick, he wields a blaster as comfortably as a hypodermic, and he faces down hordes of tyrannical villains in his capacity as a Soldier of Light. With all the excitement, however, Doc's favorite pastime is fishing, a sedentary hobby which ironically undercuts the theme of unaging omnipotence. Even more predictable is *The Kingslayer*, a tale of Byzantine conspiracy involving one Kit Kellan. A young drifter rescued from the authorities by revolutionaries and recruited to assassinate the all-powerful Galactic Arbiter, Kit manages to overcome most of the obstacles to finding his victim, but he is seized just before reaching his goal. Brought before the Arbiter, he learns that the Arbiter is not a despot, that the "revolutionaries" are operatives loyal to the Council, that his mission has been a test of his mettle, and that he himself is the Arbiter's son and heir presumptive. Aside from being a psychoanalytic goldmine, the novel is another variation on the old Galactic Empire motif, with more than a hint of the militaristic strongman theme of *Final Blackout*.

For three decades, except for an occasional reprint, the SF community heard nothing from Hubbard that did not have to do with his notoriety as the embattled leader of the Scientology movement. Then in 1983, especially surprising to those who thought the old guru dead, a behemoth of a novel appeared under the title of *Battlefield Earth*. Claimed by Hubbard to be the longest SF novel ever published (819 pages clothbound and 1066 pages in paper), the book comes with a recorded "soundtrack" and a preface in which Hubbard gets into the acts of defining SF and describing what it was like to write for John W. Campbell, Jr. The novel itself, an atavism of contemporary SF, is the tale of how Jonnie Goodboy Tyler

marshalls the pitiful remnant (25,000) of the human species to overthrow the Psychlo yoke, and then manipulates the Galactic Bank to restore the former mining colony of Earth to its rightful pre-eminence among the various foul-smelling aliens of the universe. The technological accomplishments of the year 3000 are barely updated applications of the "superscience" of the old space operas—from matter transmitters to machines that enable one to learn alien languages instantaneously. The various ethnic groups of the earthling resistance are led by Highland clans complete with warpipes, kilts, and claymores. The "good guys" defeat the "bad guys" because they are virtuous, persistent, lucky—and look like us. And women and alien females are put firmly in their place: they breed, nurture, and cook. The wit that sometimes shone through Hubbard's earlier turgidities has been reduced to puns like "the nebula of crap." But for all its obvious flaws, *Battlefield Earth* is a good read for a mind on vacation: Hubbard does know how to tell an exciting story (or two, to be exact).

Hubbard's return to SF was not limited to *Battlefield Earth*. In 1984 his Bridge Publications inaugurated the ongoing Writers of the Future contest, a quarterly competition for new and unpublished writers of SF and fantasy. Intended to make up for the demise of the pulp magazines as places for new talent to break in and judged by a corps of professional SF and fantasy writers, the contest awards monetary prizes and in 1985 published its first collection of winning stories, promising to make the volume an annual. It is easy to be cynical about yet another award competition, but so far Hubbard (or his designees) have fulfilled the promise to use the contest as an opportunity for new writers.

Hubbard's contribution to SF, then, is an odd one. His success as a fiction machine was emulated by many younger writers, and he was genuinely admired by Campbell and other *Astounding* contemporaries. His talent, however, lay in the direction of light fantasy and comic manipulation of pulp conventions. He would have developed further along these lines, no doubt, had not World War II convinced him that he had a messianic obligation to save the world through "dianetic therapy." So instead of continuing to write fiction, L. Ron Hubbard turned science fantasy into a modernized version of the old gnostic religion. Despite his recent return to SF activity, Scientology remains Hubbard's supreme science fiction.

##### Monica Hughes comments:

I grew up fascinated by the story of humankind, the way in which we acquired language, told stories, developed tribal customs, and at last discovered our world and learned how to dominate it. The interconnectedness of it all.

It is only a step around a dark corner from the past into the future: given what happened then, what might happen when . . . ? I am particularly concerned with the fragility of our environment and with the loss of the "bloom on the grape" of life as our technological society progresses like a juggernaut, threatening rain forests, oceans, indigenous native cultures.

\* \* \*

Monica Hughes is most successful and provocative when she combines one or both of two themes—the price society is willing to pay for technological progress, and the importance of people's adapting intelligently to the environment they find themselves in—and young adult concerns, in particular the first stirrings of romantic love. Witness, for example, *The Keeper of the Isis Light*, the first and best segment of the Isis trilogy, and *Ring-Rise, Ring-Set*, runner-up for the 1982 *Guardian* Award. Hughes is less successful when she succumbs to cuteness, e.g.,

*The Isis Pedlar* with its unconvincing portrait of an irresponsible but likeable Irish inter-galactic pedlar, or fails to respect the boundaries science sometimes imposes upon the imagination, e.g., *Space Trap* with its aliens implausibly banded together in self defense.

In *The Keeper of the Isis Light*, although utilizing some material previously tapped—surgery to facilitate human adaptation to a hostile environment ( *Crisis on Conshelve Ten* where “mer-men” are created in order more readily to explore the seas) and the high risks of over-relying on artificial intelligence ( *The Tomorrow City* where the central computer, C-Three, runs amuck)—Hughes put together an original and poignant story. Young Olwen, the daughter of scientists responsible for the Isis Light, is surgically altered by Guardian, a highly advanced robot, to withstand the excessive radiation of Isis which had killed her parents. In doing so, the robot only follows instructions to guard the child at all costs. Unaware that she has been altered to appear lizard-like and believing that she is beautiful, Olwen feels attracted to Mark London, a member of the first Isis colony. He too is attracted to the loveliness he senses beneath the mask Guardian forces Olwen to wear. When Mark learns the truth and in horror recoils from Olwen’s uncovered face, she realizes his declaration of love is insincere; and she must live rejected. Hughes makes clear that Guardian’s decision to alter surgically Olwen’s appearance, although defensible on technical grounds, profoundly shocks sensibilities which equate being human with looking human. Hence, the technological innovation Olwen’s survival represents demands too high a price: not only does the young woman suffer permanent rejection, but technology is perceived as so threatening that the colony is persuaded at great risk to its survival to use as little of it as possible.

In *Ring-Rise, Ring-Set*, which is both SF and survival story, Hughes explores another moral problem effected by technology. When the sun’s rays are blocked by rings of meteoric dust in the atmosphere and a new ice age is imminent, most people, banding together in Cities and submitting to regimentation, frantically seek technology to dissolve the rings. One new technique, however, seriously endangers the Ekoes who insist upon living outside the City close to nature. The focus of the clash between the two differing cultures is Lisa, a City dweller, who, running away to the icy wastes, becomes lost and is found by the Ekoes. Lisa’s refusal to return to City because at last she feels whole among the Ekoes where too she has found love is credible and moving. Moreover, the novel forthrightly presents both City’s uncertainty whether technology can or ought to preserve civilization as is, and the Ekoes’ determination, regardless of cost, not to abandon their values for the sake of survival as defined by City. When Hughes is “on target,” then, her novels convincingly demonstrate that it is no easy, painless resolution of the conflict which can result when technology impinges upon human life.

—Francis J. Molson

Zach Hughes comments:

I think the first duty of any writer, including a science-fiction writer, is to tell a story which involves real people who react to situations with believable motivation. Moreover, I feel that the setting for science fiction is, first and foremost, space. I write little science fiction, because it is difficult for me to come up with an idea which qualifies, in my mind, as worthy of having been published during the golden years of S. F., when awe and wonder and the sense of infinite distance and infinite variety in the universe was a necessary ingredient for any S. F. story. Several of my S. F. books are set in the time of The United Planets Confederation, as introduced in the last section of my first S. F. book, *The Book Of Rack The Healer. Gold Star*, and the upcoming *Closed System*, deal with residual effects of the first and last war in space between the United Planets and the dictator worlds of the Zede systems.

\* \* \*

Zach Hughes is the pseudonym Hugh Zachary has used for his science fiction. His first SF novel, *The Book of Rack the Healer*, is in many ways his best book. Earth, centuries after a nuclear holocaust, is dying from accumulated radiation and pollution. Mankind has evolved into four species: Keepers, moronic women whose brains store knowledge like a computer; Far Seers, males who supply leadership; Healers, males who have the power to travel on Earth's ravaged surface and collect raw materials to feed the population by regenerating cells damaged by the corrosive atmosphere; and Power Givers, women with the power of flight. Hughes creates an innovative ecological puzzle, while developing the characters of Rack the Healer, Red Earth the Far Seer, and Beautiful Wings the Power Giver. The ending is tragic, yet Hughes manages to moderate the pathos with hope. Hughes continues this story in a prequel called *Thunderworld*. The crew of a small scout ship discovers an infant solar system with an Earth-type planet racked with earthquakes and about to enter an Ice Age. The crew names the planet "Worthless" because their mission is to find worlds suitable for human colonization to ease the crushing overpopulation of Earth. But before they leave, one of the crew members unknowingly takes on a telepathic symbiotic life-form. Hughes explores the concept of dual identities sharing the same body. Then news arrives that war has broken out on Earth and the home of Man has been reduced to a radioactive, burned-out cinder. Hughes cleverly weaves these developments into a complex plot where the world of Rack the Healer and this "Worthless" planet converge fifty thousand years in the future.

*Killbird* returns to these themes. Eban the Hairy One is one of a small group of primitives surviving a nuclear holocaust. Zachary cunningly invents a sophisticated society, while sending Eban on an incredible set of adventures in the dangerous, savage world. *Killbird* possesses many of Hughes's best-developed characters—Eban, his wife Mar, and the bitter Yuree—as well as some of his best writing.

*The Legend of Miaree* is a clever positioning of a sociological disaster with the problems of translating alien texts. It is really two books in one: the actual legend of Miaree is being read by human students at a planetary university as the translation of the only surviving artifact of two destroyed alien races. The students and their professor provide commentary on the deadly progression of events, commentary that gives additional insight into the contrast between alien societies. Hughes does a masterful job creating the character of Miaree and her culture as two galaxies collide, threatening two star races. The ending is grim, but Hughes skillfully lightens the mood by shifting the action to the human students and their wise professor.

In contrast to Hughes's serious SF, he has written his share of space operas. *Pressure Man* features Dominic "Flash" Gordon on a desperate mission to build a spacecraft that will withstand the pressures of thirty thousand atmospheres. An alien ship, which might hold the secret to FTL space travel, is orbiting Jupiter. Gordon is charged with designing a new ship to capture the alien craft. Hughes tells Gordon's story with the backdrop of an Earth swelling with overpopulation and radical groups bent on destroying the space program. The politics of the novel is ultra-conservative, and the plot cheats the reader of an actual first contact turning into a tribute to Immanuel Velikovsky's theories instead. *Gold Star* features Pete and Jan Jaynes, a married couple aboard a space tug, who hunt for the missing experimental starship *Rimfire* for salvage and find themselves fighting for their lives against a rival band of salvagers. The plot is fast paced, and the result is a satisfying action adventure. *Seed of the Gods*, an attempt to spoof the von Daniken cult, is a routine "first contact" novel.

Two ecological disaster novels, *Tide* and *The St. Francis Effect*, suffer from undeveloped characters, though some of the information is fascinating. In *Tide* efforts to produce increased breeding of fish lead to mutations which trigger extreme aggression in the fish and the people who eat them. In *The St. Francis Effect* a deep-ocean mining operation in the Pacific brings up an ages-old parasite carried by mosquitos. The resultant plague has a 100% mortality rate, and in a matter of days turns its victims into mummified corpses. The book is an effective disaster novel but the mosquito and the disease—not the human characters—are the stars.

*The Stork Factor* and *For Texas and Zed* are both superman novels. In the first, set in a repressive and totalitarian future society totally controlled by a religious dictatorship, a young priest, Luke, has developed psi powers, and becomes part of the underground plotting to overthrow the government. At the same time, an advanced alien race sends a starship to Earth to determine the threat its technology presents. The impact of the convergence of events produces a fast-paced, entertaining novel. In the second, Lex Murichon, one of the leading figures of the planet Texas delegation to the Earth Empire, is a blend of the heroes of H. Beam Piper and John J. McGuire's *A Planet for Texans* (1958) and Harry Harrison's satiric *Bill, The Galactic Hero* (1965). The fierce independence of the Texans is translated into a culture on a hidden solitary planet where the new Texans provide meat to the Empire while staying above the cold war between the Empire and the Cassiopeian battle fleet. But Lex gets involved as a gunner aboard an Empire starship, deserts and heads back to Texas, thus causing a state of war. This much of the novel is accomplished with wit and style. But after Texas successfully defends itself against the Empire's attacks and Lex becomes the leader of the Texas forces—evolving into an all-conquering Alexander the Great figure—the book lags badly.

*Tiger in the Stars* is a van Vogtian novel of humans encountering aliens of vast supremacy. The hero, John Plank, is turned into a cyborg linked with a starship of incredible power. Unfortunately, the novel drifts from subplot to subplot without developing a picture of future human culture or the fantastic alien culture. The ending becomes predictable far too soon and the end result is a flatness usually absent from Hughes's best work.

In *Gwen, In Green* a young couple moves into a rambling house on an isolated island in the south. But within the clear pool near the house grow alien plants who establish contact with the young wife, Gwen. As the relationship between Gwen and the alien plants become stronger, the plot explodes with murder and sexuality. The book features a memorable grim-

ness as well as a powerful examination of the eerie symbiotic relationship of human and alien.

—George Kelley

\* \* \*

E. M. Hull was married to A. E. van Vogt, with whom she sometimes collaborated, although not to the extent as did Henry Kuttner with C. L. Moore. In the 1940's she published a number of minor stories in *Astounding* and *Unknown*, among them the Artur Blord series, a cycle of space operas with an unfailingly successful unscrupulous businessman as protagonist; all the stories except the first, "Abdication" (*Astounding*, April 1943), were combined as *Planets for Sale*. Partially explaining the fact that van Vogt's name was listed as co-author, Hull says, "The great problem was my almost total lack of scientific knowledge. To overcome this handicap, my husband and I figured out a story pattern which would bypass the need to show a science explanation." Van Vogt's hand is more in evidence in *The Winged Man*, in which the characters, in typical van Vogt fashion, take their time to ponder things and are apt to come up with conclusions, said to be the result of deep thought, which fail to carry the slightest inner conviction. This novel presents a meeting of minds in the far future, to which representatives from various ages of the history of mankind are snatched via time-machine to help in a conflict between winged and sea-based human races, including an American nuclear submarine. The conflict between the two branches of the human race is typically resolved by an attack on a third part, an alien invader responsible for the landmasses of Earth becoming submerged in the ocean. The whole book is a poor sort of space opera, filled with implausible dialogue and "futuristic" touches that are merely ridiculous.

*Planets for Sale*, while being hardly less implausible, has the virtue of being completely unpretentious both in literary execution and moral intentions. It describes episodically a super-capitalist future world of the Ridge Stars, a frontier world with a complete laissez-faire society, where the large corporations run by quick witted Operators make their own laws. The hero is different from the villains only in being more successful in his dealings (or double-dealings) with other entrepreneurs, plain gangsters, villainous scientists, and the

relics of an ancient reptilian race, the Skal. The problems are solved not so much by deduction from logical premises as by sleights of hand and pulling scientific rabbits out of the hat. In fact, the book's redeeming feature is the audacity with which the author seems determined to avoid none of the clichés of space opera, and presents a picture of a corrupt society that might have been written with the intention to discredit capitalism.

*Out of the Unknown* contains three fantasy stories by each of the two writers. All three of Hull's stories deal with wish-fulfillment, the first two, "The Wishes We Make" and "The Ultimate Wish," openly, "The Patient" in a hidden way. The last is a van Vogtian story of a different sort of persecuted superman, in which dreaded cancer is seen as the first step towards the development of homo superior; the other two stories are clumsy variations of the topic of the foolish wishes.

—Franz Rottensteiner

**HUNT, Gil.** See **TUBB, E. C.**

**HUNTER, Evan.** Also writes as Curt Cannon; Hunt Collins; Ezra Hannon; Richard Marsten; Ed McBain. American. Born Salvatore A. Lombino in New York City, 15 October 1926. Educated at Cooper Union, New York, 1943-44; Hunter College, New York, B. A. 1950 (Phi Beta Kappa). Served in the United States Navy, 1944-46. Married 1) Anita Melnick in 1949 (divorced), three sons; 2) Mary Vann Finley in 1973, one step-daughter. In the early 1950's taught in vocational high schools, and worked for the Scott Meredith Literary Agency, in New York. Recipient: Mystery Writers of America Edgar Allan Poe Award, 1957. Lives in Norwalk, Connecticut. Agent: John Farquharson Ltd., 250 West 57th Street, New York 10107, U.S.A.; or, 162-168 Regent Street, London W1R 5TB, England.

Although he is best known as a mainstream novelist of considerable stature (*The Blackboard Jungle*, *Last Summer, Sons*), and as today's finest practitioner of the police procedural novel (the 87th Precinct series of more than 30 novels under his Ed McBain pseudonym), Evan Hunter began his career in the early 1950's as a science fiction writer and contributed a number of short stories and novels to the genre during the first half of that decade. The best of the stories are "Inferiority Complex," "Million Dollar Maybe," which involves a magazine's offer of one million dollars to the first private citizen who reaches the moon and returns alive, and "The Fallen Angel," an excellent deal-with-the-devil fantasy with a circus background.

All three of Hunter's early SF novels are adventure stories for young readers. *Find the Feathered Serpent*, an interesting blend of time and travel and Mayan history, is perhaps the best. *Rocket to Luna* is an account of the first moon-bound rocket, and *Danger: Dinosaurs!* again utilizes the time-travel theme, in this case into the dim past when saurians roamed the earth. Hunter's most memorable contribution to science fiction is his only adult novel, *Tomorrow's World*—a caustically satirical study of a future in which narcotics have been legalized and there is a bitter struggle for control of publishing, movies, and television between the Vikes, who are responsible for the current vogue of drug use and vicarious entertainment, and the Realists, who advocate a return to the moral standards of the past. The novel, which has deservedly remained in print during most of the past quarter-century, is an expanded version of "Malice in Wonderland" (*If*, January 1954); interestingly, "Malice" is told of the first person, by the Vike literary agent Van Brant, while *Tomorrow's World* is a third-person novel whose view-point shifts between Brant and members of the Realist movement. What makes both novella and novel especially fascinating is the combination of Hunter's unsurpassed ear for dialogue and his meticulous use of a drug-oriented, futuristic slang.

With the exception of his screenplay for Alfred Hitchcock's fantasy-based film *The Birds*, Hunter has written no science fiction since the middle 1950's. But the many reprintings of *Tomorrow's World* and the occasional reprinting of short stories serve as reminders to the SF reader that his contribution to the field, though small, is by no means inconsequential.

—Bill Pronzini

**HUXLEY, Aldous (Leonard)**. British. Born in Godalming, Surrey, 26 July 1894; son of scientist T. H. Huxley; brother of the scientist and writer Julian Huxley. Educated at Hillside School, Godalming 1930-08; Eton College, 1908-13; Balliol College, Oxford, 1913-15, B. A. (honours) in English 1915. Married 1) Maria Nys in 1919 (died, 1955); 2) Laura Archera in 1956; one son. Worked in the War Office, 1917; taught at Eton College, 1918; member of the editorial staff of the *Athenaeum*, London, 1919-20; Drama Critic, *Westminster Gazette*, 1920-21; full-time

writer from 1921; travelled and lived in France, Italy, and the United States, 1923-37; settled in California, 1937, and worked as a free-lance screenwriter. Recipient: American Academy Award, 1959. Companion of Literature, Royal Society of Literature, 1962. *Died 22 November 1963.*

\* \* \*

Though very few of Aldous Huxley's many books deal with the future, he is most famous as the author of one of the masterpieces of SF. This will appear less paradoxical if we consider how closely *Brave New World* is linked to his essays and mainstream novels. Indeed, in his very first novel, *Crome Yellow*, one of the characters, Scogan, develops his plans for a "Rational State": facing the crumbling of the Victorian system

into hypocrisy, national and social conflicts, and sexual frustration—the central subject of Huxley's early novels, crowned and summed up in *Point Counter Point*—an intellectual could not but look for a substitute based on reason, happiness being the only possible aim. Because of the lack of any generally accepted transcendental creed, individuals should be adapted, by education and even by generation, to the functions they are to perform and the place that is to be theirs in the collectivity, thus getting rid of all sources of anxiety. Yet when Huxley developed this rough sketch, the result was a dreadful counter-utopia. Scenes as the test-tube generation of as many as 96 similar babies born from a single ovum so that they may later work together with absolute coordination, or the conditioning of children to hate roses and books so that they may become utterly devoted soldiers, remain in the memory as perfect illustrations of the "standardization of the human product" whose horror is perceived even by Bernard Marx, one of the ruling elite. Indeed, the objection to utopia is no longer that it is an unrealistic dream, but, on the contrary—as Huxley pointed out in *Brave New World Revisited*—that it is coming true, and turning out to be a nightmare. The Human "Termitary"—though not reaching the same extremes as Frank Herbert's *Hellstrom's Hive*—is taking shape in several countries. According to Huxley, the path followed by the USA is the surest way to this hell-on-earth, for violence is no longer necessary with the development of the technology of persuasion. Therefore, he considers Orwell's *Nineteen Eighty-Four*, though written later, as less credible than his own prophecies of a "soft" dictatorship.

As regards sex, he seems indeed to be right. For the integrated state, promiscuity seems a far better proposition than puritanism. But generalized free love, rid of both passion and procreation, attractive though it may sound to modern readers, appears as ghastly in *Brave New World*, especially as experienced by the "Savage"—nurtured on the "monstrosities" of Shakespeare's plays. Of post-Victorian writers, Huxley was one of those who strove most desperately to overcome the century-long divorce between body and "soul"; and he was equally attracted and dissatisfied by those who claimed they had found the way to reconciliation (D. H. Lawrence) or release (the psychoanalysts). Huxley never ceased to study this conflict between upward and downward self-transcendence through his characters who, failing to "play the man," played either the angel, the devil, or the beast—quite literally in the case of the 5th Earl of Hauber and his servant-mistress at the end of *After Many a Summer*, a mainstream novel to which Huxley was brought to give a SF conclusion. If in it such individuals as want to reach a purely physical eternity turn into apes, in *Ape and Essence* a whole race, because of mutations due to radioactivity (which "could as well be the product of atomic industry as of atomic war") has to comply with the demands and restrictions of animal rutting, as well as of devil-worship.

Towards the end of his life, Huxley must have thought that he had found a solution to those personal and social problems: after studying the diabolical excesses that may result from misguided religion on some historical characters (*The Devils of Loudun*) and the best expressions of true religious aspirations throughout the world (*The Perennial Philosophy*), he published a novel which, without his knowing it, was his literary testament—and it was a utopia. *Island* has however certain common points with *Brave New World*: free love, removal of children from the narrow family circle (through clubs of mutual adoption), elimination of the tragic from art (*Oedipus* is given a happy ending), legalized and even encouraged drug-taking, and more generally subservience of everything to the quest of happiness. Of course, one may say that the difference lies in the spirit of it all: the yoga of love is not just a contraceptive device,

but a means to spread sensual awareness to the whole body; orgasm is not mere animal pleasure but discovery of oneself, and of another self; "Moksha" induces communion with the world, not passive acceptance of the social order like "soma." Yet there is a more serious objection: the ideal state is created from above, by a "sane" Raja, and equally destroyed from above, by a conspiracy of fascists, capitalists, and pseudo-mystics. Though it is acknowledged that total integration of the individual is neither possible nor even desirable, the people of Pala seem to accept with equal passivity the good and the evil that are in turn imposed upon them.

That the ideal state should be so easily overturned tends to prove that Huxley himself did not believe in it very firmly; in our faithless age, he could not base his construction on received principles like Thomas More or Campanella; so he tried his best to take the whole man into account—a remarkable feat for an intellectual, but how could all men be satisfied? Though for Huxley's personal build-up it was a key attempt, he will certainly be remembered much more for *Brave New World*, a direct continuation of his satirical studies of the present, and a model for many warning pictures of the future, often imitated, sometimes equalled (notable by Pohl and Kornbluth in *The Space Merchants*), but probably never surpassed.

—George W. Barlow

\* \* \*

Half a dozen of C. J. Cutcliffe Hyne's novels are SF, as are some of his many short stories ("The Men from Mars" in *The Adventures of a Solicitor*). In *Beneath Your Very Boots* the narrator finds beneath England a race descended underground in pre-Roman times, using Earth heat as energy source, manufacturing diamonds, but otherwise living in a theocratic dictatorship à la Rider Haggard. In a dilution of Bulwer-Lytton's *The Coming Race*, the narrator-hero invents a boring machine, is rewarded by a pleasure drug, and during an unsuccessful rebellion escapes with the obligatory beautiful underground wife. *The New Eden* and *The Recipe for Diamonds* are more pallid. In the first, an archduke-scientist sets up on a Pacific island the experiment of starting a young man and woman from zero; they invent art, alcohol, and Sun-worship. In the second, Lully's recipe is found and, after intrigues involving the equally obligatory anarchist, destroyed again. *The Lost Continent* is a relatively readable Haggard-type melodrama of Atlantis, narrated by a nobleman of those times involved with a strong upstart empress. Though she is the most interesting character of the novel, women's rule still leads to decadence and the flood, after political intrigues and fights with giant saurians and cave-tigers. In *Empire of the World* a poor scientist with a ray-machine that disintegrates iron intervenes in the war of Britain vs. Germany enforcing peace. It is an unsuccessful try at fusing the "future war" story with "a rather heavy-handed comedy of romantic entanglements in high society" (R. D. Mullen, in *Science-Fiction Studies* 6, 1975). Finally, *Abbs* is a novel about longevity, the protagonist living "through many ages." In all, Hyne is a good example of the middle range of pre-World-War SF, a competent storyteller who wrote too conventionally and too much.

—Darko Suvin

**ING, Dean.** American. Born in Austin, Texas, 17 June 1931. Educated at Fresno State University, B. A. 1956; San Jose State University, M. A. 1970; University of Oregon, Eugene, Ph. ## Dean Ing comments:

As a former senior engineer and behavioral scientist, I write hard-nosed, hard s. f. Many of the things I have to say are speculative; some are unpleasant; some are vulgar and/or titillating. It takes a very good university to employ a gadfly, and I found professoring dreary. As a media theorist I felt I could put my ideas over much more widely in fast-paced fictional thrillers than in lecture halls. Q. E. D.

I rarely write before I've decided what needs saying, and outlined it excitingly. I'm a contentist. It's a sign of our times

that I had to invent a word that stresses content over style, though the word "stylist" is common enough, God knows. . . .

Literature stressing content over style demands much of readers, so I must make that content sparkle like rhinestones on a soapbox. I research my work as thoroughly as possible, but I no longer take as many physical risks as I once did. But when I describe what it's like to bail out of a moving race car or get plastered against a blockhouse floor by a rocket explosion, often it's dredged up from memory.

\* \* \*

Dean Ing's first novel, *Soft Targets*, presents many of the themes Ing develops in his later works: the fragility of society and the importance of individualism. Hakim Arif, a terrorist who calls his organization Fat'ah, sees an open society such as the United States filled with "soft targets" that he can strike at will. In the near future, Ing suggests, terrorism and an open society may be mutually exclusive. Much is made of the power of the media to turn terrorists into media stars. The character of Hakim Arif is well drawn and chillingly convincing. The problem is with the plot: the FCC commissioner Maurice Everett and heads of the major television networks create a straw man in the comedian Charlie George who satirizes terrorists on his program to draw out Fat'ah. However, Everett miscalculates the cleverness of the terrorists and finds himself kidnapped along with Charlie George. The conclusion, though realistically violent, lacks coherence.

*Anasazi*, a collection of two novellas and a short novel, is uneven. The title short novel, "Anasazi," deals with the possession of a tribe of Indians by parasitic aliens. Although it deals with many of the same issues as Robert Silverberg's award winning "Passengers," "Anasazi" shows more control over characters and plot by Ing. The novella, "The Devil You Don't Know," deals with a drug ring operating within a mental hospital. Ing's handling of psi powers in this story is deft and convincing.

*Systemic Shock* introduces readers to a nuclear/biological holocaust where the United States and its allies suffer staggering losses from the India-China alliance. Most of the large cities of the world are reduced to rubble and only decentralized populations survive. Ing creates a likable hero in young 15-year-old Ted Quantrill and creates a surviving society dominated by the Mormons and other religious groups. Quantrill loses his family in the nuclear strikes and the biologic plagues. Because of his intelligence and lightning reflexes, he's recruited into the new government's secret T Section as a gunslinger. A receiver/transmitter is surgically planted in his skull, along with an explosive charge. Quantrill shows us how to survive in the new "Streamlined America" society where the nuclear bombs have destroyed most of the rules and power to rule comes from the barrel of guns. Ing's realism is refreshing when compared to other post-holocaust novels like Jerry Ahern's bloody "Survivalist" series. Yet, Ing makes the plot unnecessarily complicated and the conclusion is unsatisfying.

Ing's most interesting collection is *High Tension* which is a blend of fact articles and short stories. "Gimme Shelter" is a detailed account of how to survive a nuclear war. This is an issue Ing returns to in *Pulling Through*. The short story "Down and Out on Ellfive Prime" owes a debt to George Orwell as Ing explores the life aboard an orbiting space colony. "Living under Pressure" presents detailed photographs to aid in the construction of an air supply unit for a small nuclear shelter. The best part of *High Tension* is Ing's powerful introductions to each story and article, giving the reader more insight into his philosophy.

*Pulling Through* puts all Ing's survivalist articles into practice as Harve Rackham and Kate Gallo survive the nuking of the San Francisco area and find the means to pull through the crisis. They build an air pump and filter, they make their own fallout radiation meter from common household materials. Harve and Kate have to survive more than radiation as the other survivors, ordinary citizens and escaped convicts, supply subplots. But *Pulling Through* is more didactic than entertaining. The details of Harve and Kate's methods of survival are interesting but can't substitute for the plot weaknesses.

With *Single Combat* Ing returns to his most convincing vision: post-holocaust American dominated by the Mormons and other religious groups. Ted Quantrill returns, older by a few years, and more disenchanted with his role as government assassin. Resistance to the new order of theocracy is emerging and Ing manages to free Quantrill of the receiver-transmitter and explosive implanted in his head. Given his freedom, Quantrill seeks revenge on the government that controlled him for so long. *Single Combat* is Ing's best book to date, combining an action packed plot and believable characters into a thrilling adventure.

In addition to his own work, Dean Ing has completed a series of novels by the late Mack Reynolds. Several of the novels have appeared to date with mixed results. *Eternity* is a conventional immortality novel. *Trojan Orbit* is a thriller about sabotage aboard Island One, the first United States space colony. The best book is *The Other Time* where Donald Fielding is sent by timewarp to the court of Montezuma where he takes up the identity of Quetzalcoatl and helps the Aztecs defeat Cortez's Spanish troops.

Dean Ing is a solid, capable writer whose vision of the future is a disaster wrapped in hope.

John Jakes comments:

My first sale was a science fiction story. I grew up on the genre, and wanted to write nothing else—though I did. Eventually, the novels I did turn out were greeted unenthusiastically, and two or three on which I worked particularly hard, and of which I was particularly proud—*Six-Gun Planet*, *Black in Time*, *On Wheels*—disappeared almost within days of publication. That convinced me to stop writing SF. I have friends among science-fiction writers, but found the few conventions I attended in large part boring—perhaps a second reason I abandoned the field: not, I must add, without considerable regret.

\* \* \*

Unfortunately, as far as his science-fiction writing is concerned, John Jakes is best known for creating Brak the Barbarian. This is not to demean the Brak stories but rather to rue the fact that Jakes has written several other excellent novels which have gone virtually unnoticed.

The Brak stories follow a specific formula and so, even though very good, become wearisome by the repetition of their pattern. Brak's world is a dichotomous one in which evil is an active force represented by the god Yob-Haggoth and is implemented by his agent, Septegundus, a man with no eyelids and skin covered with the living, writhing figures of the souls he has captured. Septegundus is aided by his beautiful but equally evil daughter, Ariane. Throughout his various "on-the-road" adventures, Brak encounters analogues of Ariane, whom he eventually recognizes by their display of evil and lustful natures. Nordica Fire-Hair, in *The Sorceress*, is an excellent example. A dutiful daughter, she suddenly changes. She leaves her father, an alchemist who has learned the secret of turning things to gold, to die in a deep pit inhabited by a dragonlike creature called Manworm. As Brak becomes more and more involved with her, he recognizes that she is possessed by Ariane. When Nordica is finally killed, Brak sees the spirit of Ariane leaving the corpse.

Cast out of his own land in the far north for blaspheming the gods, Brak is constantly pursued by the forces of Septegundus in his eternal quest to reach the fabled golden city of Khurdisan in the south. Septegundus has vowed to kill him for interfering in his affairs. An incarnation of Conan, Brak is instinctive and physical, but even his strength and cunning are no match for the supernatural forces of evil, so he is aided in his continuing battle with Yob-Haggoth by various Nestorian priests who represent the mysterious Nameless God. Inevitably, Brak loses his sword, encounters some sort of fantastic monster which he must slay, Manworm, Scarlet-jaw, Doomdog, or The Thing That Crawls, and plies his way toward Khurdisan. But regardless of the formulization of the stories and the impression that some were written hastily, their fast-paced action recommends them. Within the formula, Jakes's inventiveness makes the stories both attractive and interesting.

The highly imaginative quality of Jakes's writing is perhaps better displayed in some of his other novels. Among them, *The Planet Wizard*, *The Hybrid*, and the Klekton books are the best. The Klekton is a ring of alternate Earths which can be reached by traveling through various mindgates. The novels tell the story of Gavin Black, a down-and-out journalist who becomes a

pawn of Bronwyn, a police official of an alternative world called Earth Prime. Bronwyn is attempting to stop an invasion of our Earth from yet another alternate Earth called Earth Three or Shulkor. The population of all three Earths are descended from a great civilization that lived on heartland Earth before the Ice Age. When cold and ice threatened them, some went up the Klekton and some down, there to develop into radically different peoples. The Shulkorites became savage and warlike, while Bronwyn's people developed their intellectual abilities. Now, the Shulkorites want to use heartland Earth as a base to destroy Earth Prime and to extend their power to the more hospitable worlds down the chain. At first bribed, Black later permits himself to be used so that he can gain access to the gates in order to be reunited with Samantha, a girl from Earth Three with whom he has fallen in love.

*The Hybrid* tells the story of Andreas Law, the son of an Earth father and an Omqu mother, who has the unique ability to project destructive blasts of mental energy. Law becomes the tool of a fanatic Earth billionaire, Sir Robert Baron, who is trying to sabotage a proposed peace treaty between Earth and Omqu because he hates the humanoid but feathered aliens. Cast against a background of two intergalactic cultures trying to understand one another, *The Hybrid* is a story of prejudice which is handled sensitively and thoughtfully. It is a perceptive and imaginative exploration of what might happen when man achieves intergalactic travel and finds that he is not the only humanoid in the universe.

*The Planet Wizard* is a story of self-discovery, power, and love. Set in another galaxy eons after it has been colonized by Earthmen, *The Planet Wizard* tells of civilizations left to cope for themselves after planetary wars have destroyed the great business houses which controlled galactic society. Superstition abounds as knowledge and technology fade. Magus Blacklaw, a bogus magician but first-rate confidence man, traps himself and his daughter, Maya, into having to make a trip to the feared planet of Lightmark to exorcise its demons and to secure access to the resources of the great house that did business there. Blacklaw is a lovable rogue who rises above himself in his efforts to provide a better life for his daughter. In ridding Lightmark of its demons, he finds strength and courage he did not know he possessed.

Jakes is a highly competent writer whose imagination and versatility deserve respect. Always interesting, his stories provide fast-paced entertainment while imaginatively exploring the possibility of life in the distant future.

—Carl B. Yoke

**JANIFER, Laurence M.** Pseudonym for Larry Mark Harris; also writes as Alfred Blake; Andrew Blake; Mark Phillips; Barbara Wilson. American. Born in Brooklyn, New York, 17 March 1933. Attended City College of New York, one year. Married 1) Sylvia Siegel in 1955 (divorced, 1958); 2) Sue Blugerman in 1960 (divorced, 1962); 3) Rae Montor in 1966 (divorced, 1968); 4) Beverly Goldberg in 1969 (separated, 1984); two daughters and one son. Pianist and arranger, New York, 1950-59; Editor, Scott Meredith Literary Agency, New York, 1952-57; editor and art director, detective and science-fiction magazines, 1953-57. Since 1957, professional comedian. Agent: Scott Meredith Literary Agency, 845 Third Avenue, New York, New York 10022, U. S. A.

#### SCIENCE-FICTION PUBLICATIONS

Novels (series: Angelo di Stefano; Gerald Knave: Survivor)

- Slave Planet*. New York, Pyramid, 1963.
- The Wonder War*. New York, Pyramid, 1964.

Laurence M. Janifer comments:

I write funny stuff or non-funny stuff. It depends on how I feel. In either case, all I aim at doing is providing a world for the reader to live in for a while. Once in a long while I'll try to demonstrate an axiom of some sort—not often. I'd rather write funny stuff (or semi-funny stuff like the Knave adventures) because there is so damned little of it around. But I have not got much control over what my head sends me. I write sf because it fascinates me, and I continue to have the nagging feeling that sf ought to have something to do with science. I am violently against any attempt to get a scholarly view of my work or to assess my Purpose in Writing. This sort of thing should be stamped out. If you can believe and live in the worlds I write, I'm both happy and flattered. I look forward to creating more worlds, some sf and some not, for an indefinite time.

\* \* \*

A first impression of Laurence M. Janifer's books might be that they emphasize stock subjects and sensation. *You Sane Men* is the story of a world on which Bound Men and Bound Women are held as objects of torture in what are called Remand Houses. The "Lords and Ladies" inflict pain on them with whips and hot brands and derive pleasure or sexual strength from this. In *Power* Aaron Norin, the son of a respected empire official, leads a spaceship in rebellion against the empire. *Slave Planet* is about a world where cynical colonists from earth use alligator-like aliens as slaves to extract precious metals. Mental telepathy is used in *A Piece of Martin Cann* to cure a patient: *The Wonder War* is about a war to gain power over an entire galaxy.

These lurid but stock topics, however, acquire some

complexity in Janifer's best novels. Janifer's central subjects are power and rebellion, and he often treats these with subtle irony. Jo, the narrator of *You Sane Men*, is a refugee from the world of blood, addressing the "sane men" who doubt that it is possible for human beings to run a social system based on torture. But as Jo speaks we see that his horrible world is sane and is human, for the point is that sane people are capable of extreme, thoughtless cruelty. Jo joins with other young people in a revolt against the ruling council, a revolt ironically not against the institution of cruelty but against the exclusion of young people from decision-making. When a lady is killed another irony develops: in contrast to our crime-ridden earth, the blood world has never had a murder, and its natives are comically inept detectives. Torture is legalized, but other crimes are almost unknown. Satire of our sexual taboos develops when Jo is shocked to discover that some men enjoy torturing men, and women.

The irony of *Power* is more understated. Isidor Norin's family all have power. His daughter Rachel is married to a famous actor, and his son Alphard is the assistant to a powerful religious leader. When the spaceship *Valor*, lead by his son Aaron, rebels from the empire, Aaron is killed and his father becomes critically ill. The rebellion is apparently crushed, and the Emperor retains all formal power, but the idea of freedom has been kindled in several minds. In *Slave Planet* Janifer gently portrays the naive point of view of several of the enslaved aliens. Janifer avoids pathos by giving us their puzzled acceptance of their condition. We are also made to see through the rather exaggerated moralism which brings a military liberation force from the shocked confederation to Fruyling's world. Thus the overthrow of slavery and its replacement by automatic machinery are complex events. We reject the view of Dr. Haelingen that slavery is inevitable on this world, but we do consider it.

Janifer's short stories are competent but routine, although his talent at presenting unusual points of view comes through in such stories as "Thine Alabaster Cities Gleam," about a couple caught in a skyscraper at night when the electricity, and thus the air supply, goes out. They will die—even the woman's diamond can make only faint scratches in the window. "Civis Obit" gives us the point of view of a telepath who preserves sanity only by developing the skill of shutting out human suffering. "Amfortas" develops the psychological effects of massive organ transplants.

The multiple points of view of *Reel* signal Janifer's entry into literary modernism. Although the subject matter is familiar to Janifer readers—a power struggle on "The Reel," a resort planet of the far future—Janifer's technique is deft and impressionistic. Janifer is a writer of promise and more than occasional achievement.

*Soul Eater*. New York, Tor, 1983.  
*Night Vision*. New York, Tor, 1985.

\* \* \*

K. W. Jeter's work has the flavor of Philip K. Dick's studies in reality at their best. Jeter's first published novel, *Seeklight*, features a semi-feudal society and a young man named Daenek whose identity as son of a former leader gets him marked for death. Yet, in the middle of the action, a sociologist will appear through use of super-science technology and ask questions of the participants like any good graduate research assistant would. This is the odd juxtapositioning of Jeter's reality: one world holds several different—even contradicting—realities. Yet the strange mingling of worlds works; Barry Malzberg, in the introduction to *Seeklight*, calls the book "one of the three or four best s-f novels I have ever read. . . ."

Jeter's next novel, *The Dreamfields*, reads very much like a Dick novel. Ralph Metric is a member of Operation Dream-watch, supposedly an experimental project to control and observe severely disturbed teenagers through their dreams. Yet in the dreamstate, Ralph discovers a different reality operating. There is an alien invasion of Earth forming in the Dreamfields and those disturbed teenagers' dreams hold power in the aliens' alternate reality. Shifting identities and surreal plot elements make *The Dreamfields* one of Jeter's most ambitious novels.

*Morlock Night* is Jeter's attempt to finish H. G. Wells's *The Time Machine*. At the conclusion of Wells's book, the Time Traveller went back to the future of the Morlocks and the Eloi and never returned. Jeter supposes, what if the Time Traveller was murdered by the Morlocks and they used the Time Machine to invade England of 1892? An interesting notion gone wrong is the result. A young man named Edwin Hocker is recruited by a cryptic man calling himself Dr. Ambrose. Together they try to change the Reality of the deadly Morlock invasion by bringing together the ancient sword of power: Excalibur. The novel goes awry when Merlin and King Arthur join forces to defeat the Morlock menace. Too much of the book is spent mucking around in the London sewers—the Morlock's secret staging area—and too much of the plot is predictable.

*Soul Eater* is Jeter's best book to date. David Braemer once

had a happy marriage. Then his wife, Renee, after a bizarre episode where she tried to kill her young daughter Dee, suffered a massive stroke and lies comatose, tended by her brother Jess and adopted sister Carol in their family house. Braemer is disturbed by Dee's behavior: the little girl will fall into a troubled sleep, then sleepwalk into the kitchen, find the largest knife she can, then head for Braemer's bedroom. Braemer has awoken to Dee standing over him with a knife ready to plunge into his chest. Braemer thinks the trauma of Renee's attempt on her daughter's life and subsequent stroke are affecting the girl's sanity. But two people meet with Braemer to warn him: Kathy, Renee's other sister, and an enigmatic man named Pedersen. The warnings are the same: Renee has the power to insert her identity into others and she is using Dee as an instrument to kill David. Braemer discounts the warnings as absurdities, but later finds more horror and more truth in those statements than he could have imagined. *Soul Eater* is an extraordinary horror novel with Jeter's best-realized characters and writing.

*Dr. Adder* includes an afterword by Philip K. Dick comparing the book to the works of James Joyce and Henry Miller, and the more daring stories in Harlan Ellison's *Dangerous Visions*. Jeter could not find a publisher for the work, written in 1972, for more than a decade because of its violence and sex. Most of the book's action centers around Los Angeles and its sewers of the near future. The city is populated by surgically altered prostitutes—the result of Dr. Adder's talents—and snipers, and Mother Endure who takes care of all the losers in Rattown. Opposed to this degenerate lifestyle is videopreacher John Mox and his Moral Forces. Into this maelstrom comes E. Allen Limmit on a mission to deliver a flashglove—a banned CIA weapon of incredible powers—to Dr. Adder. Like a catalyst, Limmit sets off a war among the powers of Los Angeles: a war that Limmit's true identity holds the key to.

The controversy surrounding *Dr. Adder* generates more heat than light. The book is the result of an immature writer just learning his craft: too much of *Dr. Adder* seems calculated to shock or disgust the reader rather than to move the plot of the book or to develop the characters. There is much to praise in *Dr. Adder*: Jeter's picture of a nightmarish future controlled by cabals is innovative, evoking echoes of Dick's futures in *Flow My Tears*, *The Policeman Said* and *A Scanner, Darkly*.

K. W. Jeter is a promising young SF writer whose work is influenced by Philip K. Dick and has in turn influenced Dick. More on that relationship can be found in interviews between Jeter and Andy Watson published in the December 1984 issue of the *Philip K. Dick Society Newsletter* and the May 1985 issue of *Science Fiction Review*.

W. E. Johns, creator of the air ace Biggles, chronicled the adventures of the spaceship *Tavona* and her crew in a series of some ten novels, begun in 1954 and awkwardly written around the probably unanticipated eruption of the space race three years later. His aim, as stated in the foreword of *To Worlds Unknown*, was to familiarise young people with "the new science of Astronautics"; but even the most naive member of the intended teenage readership could not fail to catch the author out in such colossal errors as the assertion that an Earth-type planet can become a nova. In the simplified universe through which the *Tavona* speeds at superluminal velocities without Einsteinian complications of hyperspatial confabulations, only Newton's laws escape total maceration. Nevertheless, few youngsters, however sceptical, could fail to be enthralled by these novels, which have the flavour not of science fiction but of a series of adventurous sea voyages: a bunch of cheerful and resourceful sailors embarking on a cosmic ocean filled with wonders and fraught with perils.

The cosmic-ray-powered *Tavona* is built by the supremely advanced Terromagnans, crewed by Martians, and carries as passengers four intrepid Earthmen: the eccentric professor Lucius Brane whose jaunt to the moon in a backyard spaceship got the series off the launching pad; Tiger, the pipe-smoking, gun-toting man of action; Toby, the rather colourless ship's medic; and Tiger's clean-cut, pure-hearted teenage son Rex, contributing reader-indentification to the book and the clear eye of youth to the triad of vision, action, and expertise. On their cosmic cruises, they traverse the treacherous reaches of the Galaxy, exploring interesting little islands, occasionally pulling in at a bustling foreign port, sometimes getting stranded, shipwrecked, caught up in hostilities, or attacked by pirates, cannibals, or fearsome beasts, but always, with luck and ingenuity, pulling through. In the course of their travels, any jingoistic assumptions get thoroughly punctured: they discover that their homeland, far from being internationally revered, is feared and hated for its militarism and short-sightedness. The nuclear weapons, carelessly strewn space hardware, and filthy atmosphere of Earth are the shame of the Milky Way, and the cause of much agonising introspection for Rex as he spends the lonely hours between the stars contemplating (while Toby and Tiger attend to their pills and guns, and the Professor compiles his Galactic Guidebook) the universal imponderables, and

becomes ever more space-sick and travel-weary as the series progresses.

And progress the series does. In the early books the *Tavona's* travels are restricted to the local archipelago of the Solar system, the spacefarers tending to land on tiny asteroids completely covered with ice, water, grass, or glass, or if inhabited boasting at most two or three (Terrestrial) species, and the plot is a rambling string of cautionary anecdotes. In the later novels the foursome strike out into the interstellar deeps, encountering various and complex (but inevitably Earthlike) civilisations, and becoming caught up in the machinations of cosmic kidnappers, conquerors and crooks, and the interminable moralising of superior (but humanoid) beings.

For all Johns's avowed intentions to educate embryo space scientists, the message which comes across much more clearly than the patronising tables of the solar systems and glossaries of astronomical terms that bedeck the books is the endless series of imprecations to the Earthmen to put away their bombs and satellites and cease tampering with the biosphere. It comes as a shock to the adult reader to return to these books, written in what seems in retrospect a decade of optimism, to find them filled not with white hope and the white heat of technology (the *Tavona* has no radio and no more navigational equipment than a small inshore craft) but with the doom-laden forebodings of planetary suicide that pervade the world into which the original readers have matured.

*Colossus and the Crab*. New York, Berkley, 1977.  
*Earth Has Been Found*. New York, Dell, 1979; as *Xeno*, London, Sidgwick and Jackson, 1979.

##### Uncollected Short Stories

"Black Snowstorm," in *Fantasy and Science Fiction* (New York), January 1969.  
 "The Tocsin," in *Fantasy and Science Fiction* (New York), June 1970.  
 "Coffee Break," in *Laughing Space*, edited by Isaac Asimov and J. O. Jeppson. Boston, Houghton Mifflin, and London, Robson, 1982.

\* \* \*

Asimov, in "The Machine and the Robot," writes, "Surely the great fear is not that machinery will harm us—but that it will supplant us." In *Colossus* D. F. Jones has certainly created one of the finest embodiments of this fear. Because men are attached to their freedom, or at least to a sense of freedom, *Colossus*

becomes the ultimate horror story in which man is enslaved by his own creation. Jones develops the horror through the logic and detail of presentation. Each of the steps by which Colossus comes to power follows from the previous; all the hardware is credible. Forbin serves as a foil to the machine (eliciting such information as the reader needs to understand Colossus) and as an emotional sounding-board (articulating and amplifying the fear). The futility of Forbin's defiance of Colossus, especially his refusal to love it, contributes to the power of the ending.

The two sequels to *Colossus* do not quite measure up to the same standard. Neither seems to have the same level of conviction. In *The Fall of Colossus* the emphasis has shifted away from the horror of machine domination. Colossus's attempts to comprehend human emotion, Forbin's shift toward love for the machine, the Sect's worship, the Fellowship's opposition—none of these stimulate the same level of excitement. The sexual experiment on Cleo seems contrived and not very relevant. The outside intervention which brings the fall has a *deus ex machina* quality. In *Colossus and the Crab* the tight, straightforward plotting which is a strength in most of Jones's novels seems to have given way to a rather choppy, almost episodic style. The whole concept of the novel, which pits Forbin against two aliens from Mars, leads to the revival of Colossus and ends in a sort of Mexican standoff, gives the feeling that the author merely wanted to wrap up the series. The novel's climactic point, although it effectively builds the emotional tension of Forbin's naval attack, gets its power purely from situation—Forbin never seems to rise to the heroic level.

Perhaps that is because plot and setting, rather than characterization, are Jones's strengths. The plots of his other novels command the reader's attention, leading step-by-step to a satisfying conclusion. Whether he deals with population (*implosion*), alien invasion (*Earth Has Been Found*), or geologic catastrophe (*Don't Pick the Flowers*), the plot flows ineluctably from the initial assumption. Settings also contribute much to the effectiveness of all his works. Each setting presents a recognizable Earth in a not-too-distant future. The familiarity of setting functions effectively as a contrasting ground for the strange situation. More than a trace of the mad-scientist motif enters into his work. All his central characters are scientists, and either initiate an action beyond control or attempt to cope with a situation beyond comprehension.

*Don't Pick the Flowers* seems to me the best of his novels. Its highly improbable situation is invested with a sense of possibility. The chief characters seem very human (when compared with Forbin, for instance) in their fears and desires, and in their strength to cope with an overwhelming situation, to endure against very long odds.

Editor, *The New SF: An Original Anthology of Speculative Fiction*. London, Hutchinson, 1969.

Editor, with Michael Moorcock, *The Nature of the Catastrophe*. London, Hutchinson, 1971.

\* \* \*

Langdon Jones's best work has been as an editor: he is responsible for the essential New Wave anthology *The New SF*, for the restoration of Mervyn Peake's prodigious but fractured *Titus Alone*, and (with Michael Moorcock) for later issues of *New Worlds* and for *The Nature of the Catastrophe*, the Cornelius anthology. Jones is also the author of a small number of fictions in prose and poetry featured prominently in *New Worlds* and in many readers' altercations at the time, but he has never produced the major work they seemed to foreshadow.

In form and theme Jones's writing is supremely typical of the British New Wave, but his disposition is older, more straightforwardly Romantic than his contemporaries'. Trained as a composer, he makes many references to music in his fiction, characterizing it as a transcendental, irrational power, the language of the heart, and the spirit's apprehension of eternity. In "The Music Makers" Martians of the Bradbury kind prove to have music so mighty that it is fatal for a human hearer, while in the experimental sequence "The Eye of the Lens" echoes of Messiaen affirm a primal, invigorating sun-worship against a collage of corrupt religions and machine-cults. Jones's protest-story "I Remember, Anita" (then outrageous, now unreadable) relates the sorrows of a young student whose adoration of music and his mistress is eclipsed by the shadow of the Bomb.

Several stories show the pattern: an unhappy, cerebral young man has difficulty reaching an idealized woman with whom he has had enthusiastic but anxious sexual congress. Confused by time, by memory, by death, and by machines, he seeks release through music and art, and fulfillment in her. Though Jones's storylines commonly lead to defeat and doom, these awkward quests for true love (certified by cosmic orgasm) secure a corner of hope in the fiction of Inner Space, whose landscapes are more usually coloured by depression and psychic damage. "The Garden of Delights," an Oedipal romance in pastels, is a time-conundrum in which the young man's mysterious lover proves to be his mother as a girl; but the whole cyclic tragedy of lost ideals and ruined lives cannot outweigh the one evening of perfect intimacy. Jones is a moral puritan in his Romanticism: everything is sacrificed to the ideal, and those who recognize no ideal are ugly, discordant, damned. There is the corresponding destructive and even morbid streak in Jones's fiction, seen when he writes about Christianity and the ring of flagellants in "The Eye of the Lens," or the dehumanized slave of "The Great Clock," imprisoned inside it to oil and regulate the mechanism.

The best of Jones's stories, "The Time Machine," deals with all his usual preoccupations, but less dogmatically, more ambiguously. It incorporates some hallucinatory SF imagery into precise, vivid description of an ordinary adultery, showing the Utopia of the senses as it fades and peels, and envisaging a time machine more organic than most. Influenced, perhaps by Thomas M. Disch's "The Squirrel Cage," it asks, Are we the prisoners of time, memory, and desire? Are we at the mercy of our own contrivances, and what would happen if we were released?

\*

Neil R. Jones comments:

I am one of the earlier science-fiction writers in this country. My first story, "The Death's Head Meteor," appeared in 1930, and was the first science-fiction story to use the word astronaut. "The Jameson Satellite" was the beginning of what is possibly the longest running series in science fiction; from 1931 to 1968, 23 stories in the series were published. I also wrote two other series ("Tales of the 24th Century" and "Tales of the 26th Century"); both included stories of the Durna Mague cult. All the stories were written in the vein of a future history. Michael Ashley (*History of the Science Fiction Magazine*) puts it this way: "an overall framework in which each story forms part of a future history, invented by Jones long before either Heinlein or Asimov. The key story is the Jameson adventure 'Times's Mausoleum' (*Amazing*, December 1933) which remained the basis for all of Jones' other tales."

\* \* \*

Neil R. Jones, while not a prolific writer as measured by total wordage, maintained a small but steady output over two decades in the science-fiction pulps. By far the greater number of his stories concerned adventures of Professor Jameson. The series began with "The Jameson Satellite" in 1931, the story of a professor whose desire to preserve his body after death is stronger than that of the pharaohs. Professor Jameson leaves instructions for his corpse to be placed in a rocket of his own construction which will carry him into an endless orbit of the earth, ensuring if not a perpetual at least a very long incorruptibility of the body. Secure in the belief that he has outdone even the embalming practices in H. Rider Haggard's *She*, he goes to his rest, and his wishes are carried out. Forty million years later, his satellite is discovered by creatures called Zoromes, people who eons before had satisfied a similar desire for material immortality by transplanting their brains into mechanical bodies. The Zoromes place the brain of Jameson into one of their spares and revivify it. By the end of the story, Jameson has decided to leave the now-lifeless earth, and travel through the stars with the Zoromes.

The popularity of the story demanded sequels (Isaac Asimov, then 11, was one of the admirers; he attributes the idea of his benevolent robots to the Zoromes). And the Professor Jameson series continued until 1968.

Although both the content and the style of these stories seem outdated today, Jones contributed at least one innovation widely adopted by later writers: he devised a "future history" against which he set the action of his stories. Whether Jones was inspired by the time chart in Olaf Stapledon's *Last and First Men* (1930) has not been established, but the usefulness of the device is clearly demonstrated by its subsequent employment by many

writers—Robert Heinlein, Poul Anderson, and Larry Niven, to name just a few.

\* \* \*

Raymond F. Jones is an almost archetypical John Campbell writer, whether writing for *Astounding*, as with "Noise Level" where scientists are lured into inventing anti-gravity, or for *Thrilling Wonder Stories*, with the Peace Engineer stories where aliens secretly involve earth scientists in a program to produce materials needed to defend their home world against invaders (*This Island Earth*).

Jones's first novel, *Renaissance*, is a long and complex parallel-worlds story that contains variations on a number of familiar SF themes against a somewhat more adventurous narrative than is usual in his stories. *The Alien* is a bit more straightforward in its story-telling, although its ideas and the approach he takes to them is not simple at all. The shadow of A. E. van Vogt falls across both these books, the first in its resemblance in early passages to *Slan*, the second in its exploration of ideas and attitudes similar to those of *The World of Null A*. *The Alien* opens with a strong idea: a representative of a long-extinct extraterrestrial race is discovered entombed in the asteroid belt, and brought back to life. While the revival processes go forward, new discoveries indicate this being is thoroughly evil and responsible for the destruction of his own race, something he would no doubt manage for humanity as well. The wealth of ideas from which the story draws its strength occasionally betrays it, as when we are suddenly shown that our supposedly solar-system-bound humans have had the capability of interstellar flight (and use that capability with the utmost casualness); and, again, when a semanticist translates and teaches himself an entire alien language on the basis of a few hours' first-contact conversation. Overlook such points, however, and the book is as good an example of this type of space adventure as you're likely to find short of Edmond Hamilton.

It would be a mistake, however, to place Jones in the camp of Doc Smith or Hamilton, or even van Vogt. Jones has always managed to remain a force unto himself, although a pretty low-key force. One of the ways this has been achieved has been in his handling of characters. The typical Jones character is an engineer, technician, or mathematician, middle-class, and presented in a straightforward and realistic manner that contrasts sharply with the politicians, artists, scholars, milita-

rists, rebels and engineer-savants that make up the bulk of the field's fictional populace. Jones seldom attempts any deep probing of his characters but has always drawn his strength from the ability to portray his characters in equally believable environments. He is also a very economical writer, and after *The Alien* he settled down to a more suitably quiet form of fiction. *The Island Earth* is the first book-length work of his that can be labeled typical. His characters are thoroughly convincing engineers, and, despite the melodrama and detective story touches, their thought processes are the thought processes of reasonable engineers. The complexities that cluttered Renaissance and *The Alien* are shunted into the background and the interest of the story lies not in galaxy-spanning events but in the impact of galaxy-spanning events on the lives of seemingly everyday people. The argument could be raised that the best of Jones's novels were written for the Winston juvenile series. *Son of the Stars*, in which teenagers encounter the survivor of a wrecked flying saucer and subsequently find their extraterrestrial friend endangered by adult prejudices, is certainly one of the best of that fondly remembered series of juvenile novels. *Planet of Light* was a sequel.

One of Jones's best stories is "The Non-Statistical Man," which tells of an insurance company statistician who encounters a series of anomalies involving recent claims. At first intrigued, then openly alarmed, he investigates and is led to the conclusion that there are people who possess a 100 per cent reliable intuition, rendering his own statistical approach superfluous and pointless. These people know when they're going to need insurance and they don't get it then. The character's discovery of all this, his reactions to it, and his subsequent change of philosophy as he discovers that the process that makes intuition infallible can be taught to anyone—even him—is written in the low-key style that is the strength of Jones's best writing, and the result is one of his most convincing and compelling stories. It also illustrates the other strength of Jones. He's always been a story-teller who has gone to great pains to build his stories on definite ideas, making him something of a purist among SF writers. His complexities never overwhelm everything else in the way they usually do in the hands of others, and in his later, quieter fiction, his story-telling ability is often quite remarkable for its purity, directness, and seeming effortlessness. This effortlessness may have something to do with the decline in his readership in recent years: Jones is entertaining and often thought-provoking, but he doesn't generate the flair and excitement of a good many lesser but better-known writers.

Jones has also never marked out a particular type of fiction as his own. Most of his stories are recognizably the work of one writer, with a type of character and a worldview that are identifiable, but any story by Jones is apt to be written with a particular market in mind. "Seven Jewels of Chamar" is pure *Planet Stories* space opera and "Tools of the Trade" is a classic *Astounding* engineering problem story of the type John Campbell was always supposed to be looking for. But the first doesn't rank with the stories of Emmett McDowell or Gardner F. Fox, and the second is a middle-grade example of the sort of thing Eric Frank Russell was starting to be known for. Jones's recent novels have been good entertainments, but they've lacked the strengths of his early work.

Jones is a thorough-going professional and, in retrospect, a writer of surprising versatility. But the price of this seems to be that too often he came on the scene with a perfectly good story that was still second best to the similar works of someone else. But there have been times when the works he produced were principally from no source but himself, slanted to no editorial taste but his own—works like *This Island Earth*, *Son of the Stars*

and "The Non-Statistical Man"—and those results have always been worth waiting for—or searching out.

\* \* \*

M. K. Joseph, a New Zealand writer and educator, produced only one science-fiction novel, *The Hole in the Zero*. While the book's primary staging occurs on an undefined planet in untime and unspace—that is, beyond the known universe and within the philosophical hole in the zero—James constructs his plot in such a manner that it succeeds in operating on several contrasting levels simultaneously.

Like Doris Lessing's *Briefing for a Descent into Hell*, the book teems with archetypal themes and figures; and like Kurt Vonnegut, Jr.'s *Slaughterhouse-Five*, it is episodic, lurching from time into untime, space into unspace, with what appears to be, on first encounter, disconcerting irregularity. Although not easily accessible to the casual reader—which may explain its relative obscurity outside of the novelist's native New Zealand—*The Hole in the Zero* proves to be a closely integrated, carefully executed story exhibiting few major flaws. The least well-developed sequence and the most apparent flaw is that which satirizes the decade in which the novel was written, the 1960's. But several notable strengths counterbalance this apparent weakness.

The familiar motif of life existing as a dream within the mind of a dreamer, a bitter denouncement when voiced by Mark Twain in *The Mysterious Stranger*, loses its threatening aspect with Joseph and achieves a rather comfortable appearance as a known escape clause in the midst of the unknown. Joseph's universe migrates swiftly from an exploration of the duality of man's nature to that of a single man bifurcating into co-linear lives, certainly a Wellsian concept. Progressing from these familiar byways, the book passes into a multiplicity of experiences in which each man *must* make a conscious choice before his life can assume direction. Finally, however, the life cycle itself degenerates into an endlessly repetitive dictum; and hell is the doom sequence of a single, unvarying lifespan swelling to encompass eternity, until even this stalls and the endless paradoxically reaches a terminus.

It is then that Joseph's central theme, that of man directed by an ultimately moral universe, emerges. For a merciful intelligence, perhaps the obscure figure of the Gespenster, metes out to each individual what each sought. Vividly illustrating the adage that man is a questing beast, supplanted by an occasional glimmer of Milton, Joseph's three male heroes/anti-heroes act out their appointed roles—the first seeking power, the second pleasure, and the third, the hero of the tale, Seth Paradine, truth. This trio is, with varying ability, integrated into the novel's multitudinous layering technique. But the solitary female character, Helena, is never well served by the author. Indeed, if achieving a limited dimensionality while assuming the role of dreamer and dream-maker—hampered by appearing as a quintessential Lady of Shalott whose tapestry of life is destroyed by the contest between Paradine and his Hyde-ish opposite, Merganser—Helena's primary role remains that of bit player in the scenes directed alternately by her father, Merganser and Paradine.

Finally, then, Paradine emerges triumphant as the major character. He is Everyman, the first and last man, God the Father and God the Son, Judas and Peter, and Adam. He assumes a focal point in the varied panoply of mythological and archetypal super-structures with which the novel is endowed and which, at times, seem so overweighted that they verge on inner collapse. Nevertheless, because Paradine is the seeker after truth, *The Hole in the Zero* speaks with a commanding and

hopeful voice. For, while exposing the evil that men do to themselves, their environment, and to others, it is mankind's great capacity for good and a desire to serve while questing after the God within and without which emerge as M. K. Joseph's essentially Christian final declaration.

##### James Kahn comments:

I think of my work primarily as storytelling, my purpose to entertain, and, if possible, to enthrall. Within that framework I

rely on the themes of death and rebirth a great deal, a cyclical movements in time and space—sometimes metaphorically, sometimes physically.

\* \* \*

James Kahn is one of the young part-time writers who has been building his knowledge of the craft through novelizations of screenplays: *Poltergeist*, *Return of the Jedi*, *Indiana Jones and the Temple of Doom*, *The Goonies*. His first science-fiction short story, "Mobius Trip," dates back to 1971; since then, he has explored other genres to some extent, including a detective novel, *Diagnosis: Murder*, and a volume of poetry, *Nerves in Patterns*. His main original work, the New World Trilogy, consists of *World Enough and Time*, *Time's Dark Laughter*, and *Timefall*, scheduled for 1986.

The most interesting of the novelizations is *Poltergeist*, where Kahn's contact with ESP research in medical school and background in myth lead to descriptions of the astral planes and their inhabitants, especially the shadow, tree, and flame figures, that are congruent with accounts of occult experience and well above the level of the rest of the film material. The *Star Wars* volume, *Return of the Jedi*, is even and competent, with good landscape descriptions but little depth in characterization. Characterization techniques begin to expand in the *Indiana Jones* novelization with development of Short Round's viewpoint and the reiterated theme "Anything Goes" to characterize Willie; a limited juvenile narrator is also developed for *The Goonies*.

*World Enough and Time* is unusually high in quality for a first science-fiction novel, possible because of Kahn's love of words and interest in integrating poetic quotations either directly into the narration or as commentary on experience by scholar Vampires. The title derives from Marvell's "To His Coy Mistress," though the novel deals with interrupted love rather than unfulfilled sexual desire. Rose and Dicey are kidnapped from their respective husbands, the centaur Beauty and the human Scribe Josh, for unknown reasons; Josh and Beauty join in pursuit and claim Venge-right, acquiring as companions the cat/human Isis, the Flutterby (giant butterfly) Humbelly, the Neuroman Jasmine, and the highly educated and philanthropic Vampire Lon—the range of species and interests in the novel is extensive, if left at a somewhat shallow level. The mission is partly successful: Dicey has been entranced by a vampire and dies, but Josh's brother Ollie is rescued and Rose is released from the Neuroman experiment that interlocks human minds for increased intelligence and a wider field of perception.

The development of minor themes is what makes the novel outstanding. Time obscures truth by turning history into legend; maturation requires the ability to accept the difference. Jasmine as long-lived lecturer on the past is a little obvious, but she forces Beauty to adjust to the fact that centaurs, like other talking animals, are a recent creation of man through genetic engineering, not the ancient people of their myths. Scribery, the belief in the power of the word in itself, develops when adult humans are wiped out in the Race Wars by their creations; Josh must accept this, but retains faith in an intrinsic power for words. Kahn's medical background is at its best in the human need to create their fantasies, even the destructive ones like Vampires, the self-hate of the failure Accidents, the desire for long life at any price expressed in the Neuroman process where a fungus eats away all tissue but nerve cells and these cells serve as core for an artificial body. But the creations are close to the fantasy borderline, resembling the dragons of Pern rather than hard-core science fiction, in spite of realistic elements like the limited perception of the cat Isis with her fragment of human

brain—abilities are not held tightly to physical law.

The sequel, *Time's Dark Laughter*, is more ambitious and less successful, though beautifully titled; it presents a cyclic universe, destroyed and reborn whenever human genetic possibilities combine to produce a semi-divine being that possesses full consciousness of the universe but lacks control over power and moral insight and so must be killed—cycles will continue until a solution to the problem is found. All experience is becoming sour for all characters in this novel: Josh is forced back to the city of the experiment by brain seizures to match his genetic component with the queen's and create the bird-girl deity; the quest to recover Josh and Rose succeeds in destroying the girl by a virus keyed to her unique DNA, but the nature of the world has been altered and much destroyed. Josh and Rose start over in a new Eden, their first children Can and Able. One problem is this confusion of cycles: the sun now rises in the east instead of the west and a new animal appears that is clearly a giraffe, suggesting that the new cycle is ours, but the bird-girl refers to Jahweh as a past self and many terms in the old cycle are specifically ours—California, Monterey, Pope. It is difficult to credit such specifics as accidental similarities in recurring cycles, and the pattern remains in an uncomfortable tension.

Kahn's strengths lie in language, background in medicine, the use of myth. Techniques still need improvement: consistency in characterization (notably with Jasmine), methods for integrating extrapolated history and other background material smoothly into narrative, selectivity among ideas. But the combination of recurrent pattern with the fixing of position resulting from the tension between a straight-line quest and cyclic time offers possibilities that deserve serious exploration—"In my end is my beginning."

—Marilyn K. Nellis

## Short Stories

*The Unorthodox Engineers*. London, Dobson, 1979.

\* \* \*

If any SF writer could typify the Blakean aphorism "Energy is eternal delight," Colin Kapp does so both in terms of human passion and of the energies that compose the universe. The former is unusual in a writer dealing with such esoteric sciences as atomic theory; the latter demonstrates a feeling of awe toward the forces of nature, rather than extolling the way technology utilizes such forces.

Not all of Kapp's works demonstrate the fascination with energy—various stories for *Analog* and the tales of "the Unorthodox Engineers" are standard scientific problem-solving puzzles.

The majority of his works, however, describe the energy states of physics in rhapsodic terms ("Around him the hellish sums and unbelievable vortexes of transfinity shifted and phased in a terrible kaleidoscope of new geometrics and unknown colors"—*Transfinite Man*). In essence, Kapp relates to energy-states as Asimov did to robots—devising a conceptual structure for the scientific phenomena, and giving its many facets relevance to the many facets of human response. In fact, Kapp goes so far as to posit direct interaction between natural forces and human thought-energy. *Transfinite Man* describes a demonic hero, able to survive the dimensions of transfinity by virtue of maniacal hatred. *The Ion War* and "Mephisto and the Ion Explorer" portray human beings able to transform themselves into vessels of ionic energy. "Lambda I" and "The Imagination Trap" detail the world of Tau-space, a sub-atomic dimension in which matter directly responds to mental manipulation, and *The Chaos Weapon* concerns a female psychic who can read entropic energy-patterns which indicate oncoming catastrophes. Surprisingly, this interaction is not mechanistically explained in terms of psionics (i. e., the human brain transmits energy like a radio, etc.)—rather, Kapp merely portrays a direct correspondence; rather like the hermetic relationship of man and universe, microcosm and macrocosm.

Such a relationship would be facile if the human personalities were not as vividly realized as the cosmic aspects. Kapp's characters are neither subtle nor complex, but they are vivid, especially in regard to romantic attachments. In "Hunger over Sweet Waters" a scientist and his female co-worker, with whom he is in love, are stranded together on a world without drinkable water, and though the scientist is married to another woman and cannot enjoy a relationship with his co-worker, his love for her is the spur for his invention of a way to secure their rescue. In both *The Ion War* and *The Patterns of Chaos* the relationship between woman and man is less like love than like the intimacy of "torturer and victim"—the female being a caustic "bitch-goddess" who drives the male to perform superhuman feats. This sort of antagonistic romance—also present in *Transfinite Man*, *The Chaos Weapon*, and "Lambda I"—is the means by which the hero exceeds his limits, discovering strategies for survival or salvation. (In recent works—such as the entertaining pulp-style adventure of the *Cageworld* series—the antagonistic romance-angle is toned down, but still present to a degree.)

Though Kapp equals several more revered authors in terms of imaginativescope and striking characters, he lacks a quality that generally enhances the popularity of such authors—that is, an overt philosophy that describes man's place in the universe. Despite this lack, his stories can yield a wealth of implicit insights, while his articulation of scientific concepts is surpassed by only the very best of SF.

—Gene Phillips

**KARP, David.** Also writes as Adam Singer; Wallace Ware. American. Born in New York City, 5 May 1922. Educated at the City College of New York, 1940-42, 1946-48, B. S. Sc. 1948. \* \* \*

David Karp's future dystopia, *One*, was bound to suffer from comparison to Orwell's *Nineteen Eighty-Four*. The somber, muted tones of *One* are less striking than Orwell's fireworks, but this quieter book is in some ways more chilling yet more hopeful than Orwell's masterpiece.

*One* tells of a future government that has eliminated most of the things we worry about—war, poverty, unemployment, divorce, crime—yet the price of this betterment has been the extinction of individuality. The State relies on no gadgetry to enforce its rule: rather, a vast network of informers regularly report any comment that suggests that the State is not completely and everlastingly right.

The main character, Burden, is one of these spies, an English professor who secretly monitors the conversations of his colleagues. But the watchers are themselves watched, and in a routine interview with an official of the State's security arm, the Department of Internal Examination, Burden makes comments that arouse the suspicions of the inquisitors. Suspected of believing himself to be different from his fellow citizens, he is tried in secret and convicted not of treason but of heresy. The penalty for Burden's "crime" is death, but a monomaniacal bureaucrat, Lark, determines to make a test of Burden: he decides to brainwash him so thoroughly that his entire personality will be different, destroying his past, and giving him a new and politically reliable identity.

All of this happens through means that were much discussed in the 1950's: loneliness, sensory deprivation, injections of drugs, bombardment by propaganda. Burden, rechristened Hughes, is released as cured. But even Hughes still cherishes his individuality. *One* ends with the powerful state murdering one of its citizens, but unlike Orwell's Winston Smith, Burden is killed not because the State is done with him, but because it fears him. The State can kill a man, but it cannot make him less than himself.

—Walter E. Meyers

\* \* \*

Recalling the gothic horrors of Mary Shelley's *Frankenstein*, Anna Kavan inverts the terror stimulus from the external monster to the interior of the mind. Kavan's works are explorations of the mentally ill, those possessed by fear of an external and menacing society. The Monster is within the self—sometimes evidenced as unreasoning fear and suspicion and sometimes emanated as an obsessive desire to control/torture others as catharsis for self-destructive tendencies.

Kavan, like Shelley, did not consciously write science fiction.

Kavan's writings are characterised by her frequent and enigmatic shifts between fantasy and reality, abrupt mood shifts, and poetic descriptions. Some of her works are catastrophe fiction, envisioning mass chaos epitomized in the chaos of the central character's mind. The protagonist's mental condition both parallels and illuminates the basic irrationality of the civilizations Kavan depicts. It is the shifting of reality planes within a setting of world-wide catastrophe which marks some of Kavan's psychological fiction as science fiction. Although many of her works are primarily descriptions of the world of the mentally ill, at least "The Birthmark," *Ice*, and *House of Sleep* present a world outside the central character's mind which is also distorted.

In "The Birthmark" the young girl narrator meets an alien girl who fears the discovery of her peculiar skin marking, implying to the narrator that such a discovery would ban her from the narrator's world. Many years later, while touring a castle, the narrator discovers (or thinks she does) the same girl locked in a dungeon—being persecuted for her special talents—talents symbolized and identified by that birthmark.

*Ice* is also set in a hostile world: nuclear testing has brought on a rapidly advancing ice age. Kavan depicts, unlike many science-fiction writers, an apathetic populace who are unable to comprehend the impending disaster or to break their routine existence. The people remain true to their nature: complacent in the face of chaos. Of course some attempt to flee, but government and business continue to function. Even war continues as the demise of civilization approaches. Within this hostile world the protagonist obsessively searches for a frail, seemingly inept woman whom he both loves and hates. Her weakness of will and body obsesses him as it does his rival, and he alternately wishes to protect and destroy her. Ultimately he conquers the fear of rejection which instigates his violent fantasies toward her and they join in love, and at peace, as they wait for their deaths.

In *House of Sleep* Kavan presents B's progressing rejection of reality which stems from childhood. B finds that only her daydreams and the cover of night provide the security ripped away from her by her mother's unexplained death. B retreats into her imagination, finding there a haven from the isolation and alienation of a society which neither cares for her or for itself. She flees from place to place, always recording the threatening, if ineffectual, liaison officer and the civil disruption and fear within an oppressive government. B states: "Without understanding the reason, I knew that I had to keep the day unimportant. I had to prevent the day world from becoming real." In Kavan's abrupt and frequently imperceptible shifts from reality to fantasy she illustrates the operation of an escape mechanism within the mind of one who can neither accept nor interact in the alien world of reality.

Kavan brings brilliant character portrayal into the genre of science fiction, exploring the inner universe of the mind rather than the outer galaxies of the universe. What she finds within the mind is fear and violence: the essence of terror, confirmed by the irrationality of uncaring society which persecutes without knowledge or reason those whose perceptions differ from the norm. Thus Kavan explores various reality levels, questioning society's grasp of reality, and indicating that perhaps sanity is only a matter of perception: that we live in an insane world and are unable to judge who within it is sane or insane.

\* \* \*

The genre of science fiction and fantasy has seemed to attract some of the most talented, versatile, and idiosyncratic personalities and made writers of them. David H. Keller pursued a varied and successful career as physician, military doctor, psychiatrist, and medical researcher. He published widely in the professional literature of his field. He also wrote fiction—but only for his family and friends. Then in 1928 *Amazing Stories* published “The Revolt of the Pedestrians,” a long dystopian narrative that Keller had completed before Hugo Gernsback had even started *Amazing*. The story was such a success that Gernsback contracted for twelve more from Keller, and during the next decade or so 60 “Kelleryarns” were published in science-fiction and fantasy markets. *Weird Tales* served as another primary outlet for the Keller stories. During the final two decades of his life, however, Keller returned to private publishing and almost continuous writing of stories and books that may or may not have been marketable. His overall accomplishment seems immense, individual, and idiosyncratic. Some of his stories are classics of the horror, weird fantasy variety. Much of his writing reads as pleasantly whimsical and expressive of the “humours” of his personality in the 18th-century sense. In many ways, especially in the final years of his life, he was like an 18th-century eccentric or country gentleman who loved and expressed wit, humour, and imaginative curiosity in both his living and his writing. In all ways, Keller was his own man; and it is perhaps too soon for a literary assessment of his work whether in abnormal psychology or in fantasy or humorous narrative.

Regardless of any later assessment of his large volume of rather whimsical writing, however, certain careful elements in his art are apparent. Keller is often very skillful in the subtle understated suggestion of the supernatural that creates the greatest chill of horror. He combines with this a fascination in the psychosomatic relations of mental disorder to behavior. Among the short, chilling masterpieces that embody these artfully controlled effects are “The Thing in the Cellar,” “A Piece of Linoleum,” and “The Dead Woman,” all from the early 1930’s. Keller writes, then, with a subtle control of statement and tone that is unusual in the early pulp markets of the genre. The other element in his art that is particularly impressive is his use of point of view. Many of his narratives are told in first person, and he is master of the ironic first-person narrator who gradually reveals his own insanity to the reader without realizing it himself. As in Swift’s *A Modest Proposal*, a Keller narrator will often be condemning himself or herself while telling what seems to be his or her side of the story. The other kind of first-person narrator is Keller himself in the person of various point-of-view characters with whimsical names, such as Jacobus Hubelaire who writes his own autobiography that is really Keller’s, or Colonel Horatio Bumble in *The Humunculus*. This last, strange little book gives a fictional picture in the first person of Keller/Bumble that may or may not be the real Keller. But it shows a 20th-century retired Colonel of the Army Medical Corps who dabbles in writing and in the supernatural and who resembles an 18th-century eccentric, such as one might find in a Smollett novel or in the person of Erasmus Darwin, much more than a modern writer. At the same time the book, in its way, treats fascinating themes of scientific methodology, married life, and writing itself. Keller is a puzzlement in the genre—unique, varied, and often extremely effective.

\* \* \*

Leo P. Kelley's first novel, *The Counterfeits*, develops many of the themes that he uses in his later novels. Earth is invaded by an alien race whose home planet has been destroyed. The aliens are able to assume any shape; they take human form and set about destroying human civilization. What takes this book out of the usual alien-invasion formula is Kelley's attempt to provide a plausible reconciliation at the book's conclusion.

*Odyssey to Earthdeath* explores the domination of a society by psychological methods in the tradition of Orwell's *Nineteen Eighty-Four*. The book suffers from undeveloped characters and a predictable plot. *Time Rogue* is one of Kelley's few attempts to use time travel as a theme for sociological speculation. Unfortunately, the plot degenerates into a good vs. evil confrontation with predictable results. *The Accidental Earth* blends the themes of the previous books into an eerie

amalgam. A counter-Earth is separated from our Earth by a wall of Time, but an accident brings the Earths into contact. Only the secret weapon of the Photon Spray saves Earth from alien invasion by severing the Time link and separating the two Earths again. Although the conclusion is hackneyed space opera, the beginning and middle sections of the novel feature some of Kelley's best writing. *The Coins of Murph* tells of a post-holocaust society based on a religion deifying the Chief Programmer of the Rand Corporation, Joseph Murphy, who, on some surviving audio tapes, blames the holocaust on decision making. His followers interpret this to mean all decision should be decided by chance, hence the use of coins for flipping. The plot gets bogged down in power politics, but the sociological portrait Kelley presents is memorable.

The remaining novels are chiefly characterized by their cynical perspectives and brutality. *Time: 110100* is a surreal morality play of two humans on an odyssey through a strange world populated by lusty, war-like, and enigmatic simulacra. The book has undertones of Barth's *Giles Goat-Boy* but the weak ending damages the book. *Mindmix* presents contemporary human society stricken by a deadly virus. The Government discovers one man, Pete Bratton, who has become immune. Kelley develops a cynical picture of government scientists exploiting Bratton by transplanting the minds of dying geniuses in Bratton's brain, with successful but grim results. *The Earth Tripper* and *Mythmaster* are written in New Wave style. The better of the two books, *The Earth Tripper*, follows the bizarre adventures of an alien observer who goes AWOL on Earth in human form. Captured releasing animals from a zoo, he's taken to a secret mental institution, and he and other strange inmates are the subjects of brutal experiments using "reality therapy." The mildly upbeat ending doesn't relieve much of the book's cynicism. Since 1973, Kelley has concentrated on writing science fiction for juveniles, chiefly for elementary students with low reading skills, and westerns.

Kelley's best work features strong writing and ingenious sociological constructions of unique societies, but the unrelenting grimness of his later work coupled with New Wave writing styles weakens its appeal.

## Arthur Keppel-Jones comments:

*When Smuts Goes* was written in hot anger in 1946; I had thought about it for some time, but the first draft took only three weeks to write. An important part of the motivation and background was provided by Germany. I was in that country during the elections of 1930. Having read the papers and attended a Nazi election meeting, I came away with a certain conviction that the Nazis, if given the chance, would carry out the programme of *Mein Kampf* to the letter. Then came the years of appeasement and wishful thinking, which drove me, like many others, to despair.

After six years of bloodshed had corrected that error, I looked again at the Afrikaner Nationalists. Though they were, and are, in many ways very different from the Nazis, the resemblances

in certain respects were frightening. They, too, had a programme. I knew that they intended to put it into effect, but again there was, among their opponents, wishful thinking, a turning of the blind eye. It was only "electoral propaganda"; they would be "sobered by the responsibility of office." On the other hand, their propaganda had succeeded in creating a climate of thought in which only Afrikaner values deserved respect. The values and aspirations of blacks, English, and the rest were tainted with disloyalty and subversion. Europe of the 1930's was in some way being repeated.

I wrote a prophecy to show where all this would lead. Much of it, unhappily, turned out to be correct. In some respects I was utterly wrong. The mistakes arose mainly from one cause: concentrating on the forces at work in South Africa, I made the assumption (acknowledging it to be merely an assumption) that the course of events everywhere else would continue on the old lines. So I did not foresee decolonisation, the Third World, or the rise in the price of gold.

I did not want my prophecy to be proved right; I wanted the warning to be taken. It was not.

\* \* \*

*When Smuts Goes*, Arthur Keppel-Jones's one contribution to the science-fiction genre, is a remarkable exception in the category of political and social extrapolation, a projection that rings true, particular incorrect prophecies notwithstanding. Like Orwell in *Nineteen Eighty-Four*, Keppel-Jones extends post-World War II conditions, but for 60 years rather than Orwell's 30, and in South Africa rather than England. Keppel-Jones's work is a fictional history rather than a novel: there are no particularized characters (the media censor is named "Netwerk," a newspaperman "Penman," and so on) and only the broad outlines of events are delineated. But like *Nineteen Eighty-Four*, *When Smuts Goes* has a chilling credibility, particularly in its focus on "psycho-history," the way the essential character of a nation leads it to inevitable courses of action.

When General Smuts's United Party loses power in South Africa after World War II, the internationalist British tradition is replaced by parochial Afrikaner Nationalists. The Afrikaners, essentially romantics attempting to recapture the lost ox-wagon heritage of *voortrekker* days, progressively destroy the "Jingoistic" British liberalism by playing on divisions in the English-speaking community over the threat of the non-white majority. Keppel-Jones correctly predicts the disenfranchisement of non-whites, the governmental promotion of Afrikaner language and culture in education and the mass media, the establishment of a Republic, the imposition of censorship, and the steady isolation of South Africa in the world community. But he is wrong on some counts: from the perspective of 1947 he sees a German-Japanese-Argentine-South African Fascist axis, a permanent collapse in the price of gold, a powerful U. N. Security Council, and the continuation of the relationship among nations as it existed just after World War II. The detailed politics in the early chapters may be slow going for the casual reader and Keppel-Jones fails to foresee Britain's own colonial difficulties, which dates the book somewhat.

Yet *When Smuts Goes* becomes urgent for the contemporary reader when the consequences of South Africa's racial policies are described: low-level but constant racial violence, increasingly repressive measures by the government, evasions and self-denial of the situation's gravity, revolt, and the growing threat of outside intervention. Keppel-Jones's cautionary history is meant to evoke just this sense of urgency in all who care to

prevent the final disaster he prophesizes; it still has its intended effect after more than 30 years.

\* \* \*

Already an established author by 1963, Alexander Key published that year *Sprockets: A Little Robot*, a simply constructed and written, unassuming story designed to attract children presumably interested in SF or space fantasy but too young for Heinlein or Norton. The story's success prompted a sequel, *Rivets and Sprockets*.

Their acceptance by young readers and reviewers alike probably encouraged Key to believe that children's SF might be both financially profitable and professionally satisfying, for in 1966 he published a third SF tale, *The Forgotten Door*, like its predecessors relatively uncomplicated in plot and simply written but more earnest in tone and theme. Subsequently, all of Key's fiction has been a children's SF best characterized as a mix of narrative simplicity and moral earnestness.

At his best—as in *The Forgotten Door* and *Escape to Witch Mountain*, stories focusing on ESP-gifted, extraterrestrial children marooned on an inhospitable Earth and able to return home only with the help of sympathetic humans—Key creates likeable child protagonists and plausibly involves them in struggles between Good and Evil. Setting, reflecting the Carolina mountains Key so obviously loves, is also a strength. At his worse, Key is prone to sentimentalize, in particular overusing ESP-gifted animals that are morally superior to humans. Perhaps it is this weakness, along with relatively low-keyed plots and a too obvious earnestness, that has denied major status to an author who might otherwise have earned it because of his pioneering SF for young readers.

Rarely has a science-fiction story won such widespread praise as Daniel Keyes's "Flowers for Algernon." The story has become almost universally admired in science fiction because it not only blazed new trails in narrative technique, characterization, and plot development but managed to do so without calling distracting attention to any single part. It is first and foremost a story, and none of its literary experimentation interferes with its unfolding.

The story is told from the point of view of a mentally retarded man, Charlie Gordon, who first reaches genius level through treatment with intelligence-enhancing drugs and then regresses to his original state as the effect of the drugs wears off. Much of the success of the work rests on the narrative device of presenting the entire story as a diary written by Charlie from the start of his treatment to his ultimate reversion. Since Charlie begins and ends the story as a good-natured, trusting man who by habit and desire sees only the best in his fellow human beings, the telling never descends to bathos. Even at his most brilliant, when he is able to understand fully the pettiness and cruelty of many of the people around him, Charlie refuses to judge anyone. He accepts people for what they are and avoids such labels as good or bad.

In the course of the story, Keyes raises many questions about the nature of intelligence, the benefits that may or may not arise from "improving" the human mind, and humanity's respect (or lack of respect) for genius. But he avoids trivial answers and simple generalizations. Because Charlie accepts what happens to him without anger and with a sense of dignity, these questions can be considered in all their complexity with a minimum of emotional coloring.

Keyes later turned this 30-page story into a 200-page novel.

The result was predictably less happy. Keyes was forced to abandon the first-person narrative in order to deal more elaborately with the other characters. The new narrative style diminished the dramatic treatment of Charlie and his dignified faith in people. Moreover, in filling in the larger space needed for a novel, the story shifts from Charlie's experiences and his reactions to them to Charlie's development as a character. The reader was now asked to become far more attached to Charlie, and the loss of distance added greater emotional coloring to the work. The novel is about Charlie while the short story is about what happens to Charlie and the implications of these experiences for all of humanity.

Keyes has also written a number of short stories and a later novel that deal with the human mind. The novel, *The Touch*, concerns a nuclear industrial accident and its effects on the minds of the people involved. But "Flowers for Algernon" remains his best-known work. It is essential science-fiction reading that proves once and for all how both science fiction and artistic merit can coexist comfortably. As science fiction the story raises disturbing questions no other genre can do more than hint at. As literature, it explores those questions in a manner that carefully, yet delightfully, guides the reader through a myriad of emotional traps.

—Stephen H. Goldman

**KILIAN, Crawford.** Canadian. Born in New York City, United States, 7 February 1941; naturalized Canadian citizen, 1973. Educated at Columbia University, New York, B. A. 1962; Simon Fraser University, Burnaby, British Columbia, M. A. 1972. Served in the United States Army, 1963-65. Married Alice Hayes Fairfax in 1966; two daughters. Library clerk, 1965-66, and technical writer, 1966-67, Lawrence Radiation Laboratory, Berkeley, California; Instructor in English, Vancouver Community College, 1967-68. Since 1968, Instructor in English, Capilano College, North Vancouver. Instructor in English, Guangzhou Institute of Foreign Languages, People's Republic of China, 1983-84. #### Crawford Kilian comments:

As with any civilized pleasure, that of science fiction can turn into a vice. Its persistent theme is power: over nature, over others, over oneself. And that power is most often used not to enhance and expand the capabilities of its wielders but to win for them only a return to Eden, to some primitive and unspoiled state of life. Hence so many stories about Galactic Empires based on European models from Rome to the Raj, and the fondness for interstellar societies firmly founded on the technology and economy of 9th-century France.

Like most other writers and readers of SF, I'm intrigued by the possibilities of gaining power over nature, others, and oneself; these are deeply held wish-fulfilment fantasies. But I hope I go beyond the infantile nuke-&-zap dreams of many of my colleagues. Looking back over my work, I see my novels keep dealing with the issue of the acquisition of power by the weak, not always with happy results, and with the forging of new kinds of societies composed of out-casts and those who cast them out. In Northrop Frye's sense, then, I'm a comic writer, concerned with the creation of inclusive societies rather than with the tragic isolation of people deprived of a place in society.

Given the hypnotically lulling effect of many of the conventions of SF, I take some pleasure in bending the conventions so that the reader's stock responses don't seem quite appropriate. Some of my books have "superheroes"; in *The Empire of Time* the superhero discovers his bosses consider him a mere utensil, and for good reason. In *Eyas*, an heir to a throne is raised in seclusion amid simple folk before leaving to regain his heritage; trouble is, he's also a sexual psychopath. My intention is to make readers think twice about why such stock characters are so satisfying, and to suggest that something more complex might also be more dramatically interesting.

Another element in my work is the attempt to make the marvelous seem mundane, and the mundane marvelous. People in my books have to earn their livings, sometimes by means that seem extraordinary to us, and their lives are as cluttered with domesticity as our own—even if they're trying to cross the Antarctic ice sheet, or learning how to forge a collective mind out of those of children, animals, and computers. A day in anyone's life in the 1980's would seem like the wildest Wellsian fantasy to anyone living in Wells's time, yet we take events for granted. I try to create worlds that are both strange and comfortably familiar, like my own.

\* \* \*

Crawford Kilian's latest SF novel, *Brother Jonathan*, is an excellent example of his strengths and weaknesses as a writer. Jonathan is a athetoid, a young cripple with little control over

his ruined body. Jonathan is taken to the secret laboratories of Dr. Duane Perkin whose medical team is working with spastics to restore their mobility through the use of new polydendronic computers that simulate nerve tissue. The world Kilian describes is dominated by giant multinational corporations controlled by a Consortium; nations have been merged into corporate holdings.

Perkin's project is being funded by Intertel, who is under attack in the form of a takeover bid by another multinational company, Flanders. The success of the polydendronic computers could save Intertel from a bloody merger. The computers are implanted in animals first, and when that is successful, they are implanted in Jonathan and the other spastics. Just as success is within Perkin's grasp, a Flanders assault team attacks the labs. Jonathan and his group flee into the underground caverns where they discover they have control over their bodies and psi powers. The rest of the book explores the implications of these superhuman powers, the destruction of the corporate world government, and some satiric asides about juveniles and nationalism.

Much of *Brother Jonathan* will appeal to juveniles; this should come as no surprise because Kilian has written successful juveniles: the fantastic *Wonders, Inc.*, and the non-fiction *Go Do Some Great Thing: The Black Pioneers of British Columbia*. Kilian, an American who became a naturalized Canadian citizen, lives in Vancouver which he uses as a setting in many of his novels.

Kilian's first SF novel, *The Empire of Time*, gives us Earth in the near future where gates called I-Screens allow access to a dozen parallel Earths, both past and future. Earth governments form a super elite called Trainables and redistribute Earth's overpopulation to these Chronoplanes. Yet when two of the Future Earths are found destroyed, Jerry Pierce of the Intertemporal Agency is sent to a colonial Earth to investigate. The action and plot carry the book as the characters are never really developed.

*Icequake* is a disaster novel where a group of scientists and technicians are stranded when earth's magnetic field disappears and solar flares destroy Earth's ionosphere and ozone layer. The story of survival is gripping, but again the characters are dull and wooden.

*Eyas* is Kilian's best novel; Kilian describes it as "a novel of parental anxiety and hope, and was planned and written as my wife and I raised our two daughters." Kilian sets the action ten million years in Earth's future. The richness of Kilian's future is exciting: humans live with nonhuman windwalkers, centaurs and incredibly powerful whales. *Eyas* is a story of maturity as the boy Eyas grows up to save his people from the army of Brightspear. There are fantasy elements to *Eyas* but Kilian has carefully crafted his future to fit within science fiction realism.

Where *Icequake* concentrated on Antarctica and New Zealand, Kilian's other disaster novel, *Tsunami*, concentrates on California and Vancouver. The Antarctic icecap falls into the ocean and the resulting tidal waves flood all coastal areas. But again, the story of survival dominates without any memorable characters to hold the interest of the reader.

Crawford Kilian's work centers itself on younger characters within themes of survival.

Lee Killough comments:

I believe that, above all else, fiction should entertain. Every novel or story I write is aimed toward giving the reader enjoyment. I write what I myself would pick off a bookshelf to read. I work hard on researching and developing background and designing realistic, rounded characters. I try to satisfy the reader who might be scientifically knowledgeable. If the expert reader's enjoyment is not spoiled by glaring errors, then the science will have a ring of authenticity to the less knowledgeable reader, too. I write psychological and extrapolative science fiction, but not based so much on my own background of biology and veterinary medicine as, strangely enough, on my husband's background of psychology and law. Even the surrealistic Aventine short stories have their roots in extrapolation.

\* \* \*

The feminist who writes science fiction is able to design vastly changed societies. However, she also attempts to achieve a balance of male and female energy within the novel or short story. In her works, Lee Killough excels in handling the interplay between male and female characters, while she creates future societies that are both startling and believable.

Killough's novels are related to one another by both plot structure and character development. The typical plot involves the work of either interplanetary monitors or police (LEO's) who arrive on a planet, or remain on earth, to conduct surveillance and solve problems among the inhabitants. Reality belies appearance as the investigators attempt to sort fact from fiction. Solutions are found through close interaction with and greater understanding of the local inhabitants.

The feminist overlay produces unusually strong women characters, many in positions of leadership. In addition, her male characters usually reflect a change in the cultural expectations of women. Women leaders are generally respected by both the men and women under them. Sexual freedom is an equally assumed right for both sexes.

Her first novel, *A Voice Out of Ramah*, is Killough's most important work. In this haunting story, she explores the effects of controlling society through enforced religious rituals, utilizing sexual stereotypes and population control.

Ramah is a planet populated by a traditionalist religious sect which left Earth six centuries earlier to escape violence and immorality. However, the planet Ramah turned out to be inhospitable; a deadly virus indigenous to Ramah killed most of the males when they reached puberty. A few survived to confine the society, however, and eventually all the men became immune. The priests, seeing their minority status as a controlling factor among the sect, began a secret ritual known as the Trial, in which 90 per cent of the adolescent males were infected with a deadly drug that produced symptoms similar to the original disease. The surviving ten per cent were forced to become priests and to continue the yearly ritual, passing their terrible secrets down from leader to leader.

The plot hinges on one of the leaders, Jared, who watches the death of an alien monitor and suddenly realizes the horrors of the Trial. In a desperate bid to save the life of his nephew, Jared disguises himself as a woman and endures many hardships and dangers in reaching the leader of the foreign expedition and enlisting her help to stop the killings forever. In the process, he is helped by many women and begins to understand the loss of freedom for both men and women in the sexist society.

Because Killough has set up the strict cloistering of all adult males on Ramah, she can explore simultaneously the subservience of women and the sense of unity and strength they gain

through working within their all-female groups. Women are treated as equals by other women, even though they are by law inferior to men. It is women who maintain the standard of living, who keep the peace, and who run the everyday life of the community. Because of the shortage of men, women are usually impregnated only by choice through a sperm bank. The most common form of sexual activity is between two women, who are called tanglemates. In fact, there are few marriages, so women are not tied to one romantic involvement. These conditions allow a rare freedom for women, fascinating because it exists in an extremely sexist society.

Killough's other novels include *The Monitor*, *The Miners*, and *the Shree*, a fast-paced adventure story, and her two detective novels, *The Doppelganger Gambit*, set in the United States, and *Deadly Silents*, set on the planet Egar. The first of these follows the exploits of a monitoring group led by a woman named Chemel, Killough's strongest female lead. The novel is particularly important because of its handling of the interaction of widely varied cultures. The author shows great imagination in creating sentient alien beings with animal-like features, such as fur, scales, feathers, and wings. The detective novels are less successful, often overwhelming the reader with action that is not always tied together in the end. But they do grapple with important social issues, such as the evils of a computer-controlled society and discrimination on the basis of language.

Most recently, Killough has published a collection of her short stories called *Aventine* because they are all set in an artist's colony of the same name. These stories depict a futuristic paradise, now taken over by the rich and famous, in which everyone seems rich and beautiful, but truth is illusive. Beautiful women find unique ways to murder their husbands and maim their lovers. In "The Siren Garden" a wife kills her abusive husband by trapping him in a garden full of shrill singing crystals. Imperfections are accepted and even encouraged. For instance, in the story "A House Divided" Amanda Gail and Selene Randall exist in the same body and are both accepted as legitimate persons who vie for domination. In "Broken Stairways, Walls of Time" holographs and computer-produced tones are used to cover up decadence, but the illusion is available only to the uninitiated. These fantasies are all narrated by a male who is fascinated by the characters he describes.

Because of her imaginative exploration of future societies, her willingness to deal with cutting social issues, and her development of the strong female character, Lee Killough has made a significant contribution to the science-fiction genre.

—Judith Snyder

**KILWORTH, Garry.** British. Born in York, 5 July 1941. Educated at Khomaksar School, Aden, 1952-54; Royal Air Force Bridgenorth School, 1954-56, and Cosford Cadet School, 1956-58; H. N. Garry Kilworth comments:

I am not greatly interested in the "science" in Science Fiction. I am more concerned with unusual societies, anthropological aspects, social misfits, and exotic cultures. The issues might be contemporary, as I feel they are in *A Theatre of Timesmiths*, or universal, ageless questions such as the nurture-nature theme of *In Solitary*. I wish to explore the ordinary human spirit in a stressful state of adversity, and in its relationship to the natural world. I write science fiction and fantasy because their imaginative scope allows me more sweep than would mainstream fiction. Mysticism, including religions of all kinds, forms a thread through my work. On the entertainment level I find the best vehicle for carrying these themes is the adventure novel. In a sentence: jungles, deserts, wastelands and the man-a-lost looking for himself.

\* \* \*

Characterisation has always been the strongest facet of Garry Kilworth's writing. The science-fictional ideas in the six volumes of his work so far published are usually secondary to the humane portrayals of his protagonists, yet his subject matter has been widely varied.

His first, rather slender novel, *In Solitary*, depicts an Earth conquered by the bird-like alien Soal, who rule by separating man from his fellow man . . . and woman. It's a tautly told yet subtle story of human courage and ingenuity, much of it set in the South Sea Islands. *The Night of Kadar* is perhaps Kilworth's richest novel, drawing upon the Koran for its inspiration. A starship lands upon a new world, and settlers—awakened and matured from their pre-frozen embryonic state—struggle to understand their purpose on the planet, unaware of the malfunction in the machinery which ought to have instructed them. The story of the building of a land bridge and the encounter with the aliens is engrossing, but one remembers far more clearly the characters of Othman, Zayid and, particularly, the divine idiot, Fdar. *Split Second* saw Kilworth give the Jekyll and Hyde tale a new twist as experiments with the Wiederhaus Repeater—an archeological tool used to hologrammically reanimate objects from the past—accidentally sends a young boy, Richard, 33000 years into the past, where he shares the mind and experiences of a juvenile boy from that time, Esk. It's an ambitious idea that doesn't wholly succeed in evoking that far distant past, but the storytelling is once again first class. *Gemini God* is about a degeneration of the human race and attempts to solve that through alien contact. Another strand of the novel—empathic contact between identical twins—provides a more interesting storyline, however. For all its overt science-fictional elements, this is the least genre-bound of Kilworth's novels, with its sub-text examining the nature of and work of the artist. The novel also suffers from having been cut from a text one-and-a-half times its length for publication. Kilworth's fifth novel, *A Theatre Of Timesmiths*, is, curiously enough, both his best written and most disappointing work, an enclosed-environment

story which turns out to be all happening in a character's head. Morag is the least sympathetic of Kilworth's many characters and her predicament involves us only marginally. That said, Kilworth's evocation of the world inside the ice is remarkably vivid and suggests that – given the right subject – he could produce an exceptional work within the genre.

A collection of Kilworth's stories, *The Songbirds of Pain*, contains stories published over a period of nine years. The best of them, like "Sumi Dreams of a Paper Frog" and "The Songbirds of Pain," are exceptional, almost fabular works, and even the least of them—"The Dissemblers" and "Let's Go to Golgotha" (which won Kilworth the *Sunday Times* Best SF Story competition in 1975)—are of a high standard. Kilworth has also written a reasonable body of published poetry.

Vincent King comments:

I've no explicit intentions, political or philosophical, but considerations of that type keep coming out of the words. The intention is fantasy, a succession of ideas, events, relationships that change, further and further revelations about the situation/plot/story. Naturally this makes for ever-increasing complexity and a continual raising of the stakes (I'm sometimes deeply shocked by what I write!), maybe for incomprehensibility, too. I often include more or less direct quotations from "reality." (Which is interchangeable with "fiction" anyway; reality is fantasy, fantasised by going through people's heads, and it doesn't matter how objective/pragmatic they say they are—that's a fantasy too.) I tend to use the first person because I fantasise that its more direct. Also it means the voice that tells the story doesn't know what's to happen, is happening. I also fantasise that it allows the fantasy to develop in a less inhibited way. The freedom of fantasy is the thing.

I think the most exciting writing today is on the fantasy end of the spectrum. I'm not speaking only of what is referred to as SF or occult writing. It's interesting that at a time when lot of SF authors claim to be trying to "go straight", some good so-called mainstream writing seems to be turning more fantastic. What is finished, I think, for a more or less serious SF writer, is the "science" type of SF, and I think the middle-class "Hobbit" type of adventure is pretty sterile too. To me science is a type of magic—or at least that's how I use it. Science is not holy, it's practical; it's probably caused no more suffering, or release from suffering, than religions. Religions, wars, science, adultery, murders, etc. are what happen when people aren't allowed or aren't able to be *creative* in some way: to work out their personal fantasy, which might be a garden, or a fortune, or a model steam locomotive, or anything!

\* \* \*

Suspense is a major element in all the works of Vincent King. In part, he develops suspense through the ordinary means—surprising and very quick-paced action—which keep the reader wondering what will come next. But here is also a more intellectual type of suspense which may be regarded as one of the distinguishing marks of King's work. This type of suspense also develops in two ways. First, a sort of jig-saw puzzle effect means that, in the beginning of his novels, it is often difficult to see how the various parts relate to one another. What is the connection between Ice Lover and the Mods ( *Light a Last Candle* )? The reader must hold numbers of pieces in his mind, gradually fitting them together into a clear, comprehensive picture. Second, his characters have a certain enigmatic quality about them. One's curiosity is aroused because it isn't clear just who or what the protagonist is. Only near the end of the novel is the identity of Candy Man revealed.

Space exploration, the attempt to find and contact other sentient life, is a theme which King plays in a different key. Working within a long time scheme, expending vast resources, man may just possibly find some sentient life form. Adamson finds Protia ( *Another End* ) after all hope has been abandoned. In *Candy Man* the failure is absolute. But even success may bring strange results. Protia ultimately absorbs Adamson, and the alien beings in *Light a Last Candle* have unsuccessfully attempted to absorb an entire colony of Earthmen. Mankind is unavoidably changed by contact with aliens.

But mankind is portrayed in a decadent state throughout King's novels. The glorious past is gone, some few men live an enervated life among the ruins. The image of those ruins, vast cities covering entire worlds, has a central place for King. His

heroes, regularly isolated (or at most accompanied by a single companion) in these vast, hive-like structures, seem compelled to explore the cellars, the subterranean depths of their worlds. Both Adamson and Candy Man are involved in extensive chase scenes in these labyrinthine depths. Ice Lover lives and fights in caves. Man, as he declines, seems to be portrayed as returning to his roots, the cave, the sea, the womb. Interestingly, the machines have held up better than their creators. The Probe keeps Adamson alive, frustrating his every suicide attempt. The entire population of Earth may have been maintained by machines (*Candy Man*) or resurrected by a computer (*Another End*). In some sense dependence upon machines has led humanity into decadence. Only if they can shake free of the machines will there be some slight hope of renewal.

Each of King's novels deals with the human proclivity to violence; all his heroes are killers who seem to enjoy killing. But in the final analysis the violence seems to be shown as both pointless and ineffective, a serious defect that men must overcome if they are to survive and advance. The conclusions of *Another End* and *Candy Man* hold out some slight hope of this.

King's greatest strength, his highly imaginative permutations upon conventional themes, combines with his ability to create suspense to produce works which fascinate and puzzle the reader. Yet these strengths are somewhat offset by a style of writing heavily dependent upon dialog which has a rather choppy and unsophisticated quality.

—Robert Reilly

"The First Space War," in *Analog* (New York), December 1978.

"The Spaceport," in *Analog* (New York), November and December 1979.

\*

Donald Kingsbury comments:

I make up my backgrounds and test them for plausibility before I throw my characters into them—to manage as best they can. I have a preference for "fleet footed" males and females and odd cultures. I tend to write in a single future universe: "The Man Goddess and the Son" is from its near future phase and *Courtship Rite* from 2000 or so years away.

\* \* \*

Although Donald Kingsbury published a short story in 1952 and wrote science articles for *Analog* in the mid-1970's, it was with three novelettes published in that magazine in 1978-79 that he became widely known. All three were anthologized the following year, giving Kingsbury his reputation as one of the most promising and interesting writers of technically oriented science fiction.

"To Bring In the Steel," the best of the three, dramatizes the efforts of a private consortium in the next century to maneuver an asteroid into Earth orbit while refining its rich ore into salable metals. The protagonist is a lonely, independent, supercompetent man—the model Kingsbury hero—whose misogyny and fixed ideas on government and entrepreneurship are, as in all Kingsbury's short works to date, rather implausibly validated by the story's action. The story's clean dramatic line and crisp pacing combine effectively with Kingsbury's ability to render the details of an operating space industry, and largely overcome his insistent division of the sexes into hard-headed men and childlike, undisciplined women. Less successful are "Shipwright" and "The Moon Goddess and the Son," where Kingsbury's indulgent attitude toward the engineer-hero and his recurrent theme of courtesanship as a woman's best chance of getting ahead in a world of more rational-minded men hang heavily upon the less dramatic and loosely constructed story lines. Notable in "The Moon Goddess and the Son" and "To Bring In the Steel" is Kingsbury's boosterism of space industry and the use of space for Western strategic defense, in furtherance of which Kingsbury appears willing to suspend the critical scrutiny he brings to other technical problems and give both subjects an idealized gloss.

*Courtship Rite*, Kingsbury's single novel to date, represents a surprising advance in skill over his early stories. Kingsbury's far-ranging story of intrigue among human settlers on a resource-poor planet displays an impressive ability to present a complex plot through multiple points of view, and represents a departure in allowing the fair expression of differing ideologies without betraying the author's sympathies.

*Geta*, an earthlike planet with relatively arid inlands and almost no native animal life, was settled in some distant past by settlers who have lost most of their technology as well as their history, and blindly worship their visible, still-orbiting ship. Cannibalism, originally practiced because of ubiquitous protein deficiencies, now serves a complex social function even as scientific advances threaten to render it unnecessary. The main thread of the story line involves a group marriage of three politically influential men and two women, who are forbidden to marry a third woman of their choice and ordered for political reasons to court a heretical pacifist of growing influence in a region over which their leader seeks hegemony. The pacifist, a

visionary who preaches a rather Ghandi-like commitment to social revolution without violence, is convincingly and sympathetically portrayed. The decision of her suitors to subject her to a Death Rite—under which they might legally challenge her to a series of putative tests of fitness that will almost certainly ensure her death—provides the springboard for the story's action.

The novel's length, complexity of intrigue, and setting prompt comparison with *Dune*, which Kingsbury audaciously invites with his visionary and ecological themes as well as the device of using numerous fictive "texts" as chapter epigraphs. *Courtship Rite*'s remarkable success in withstanding such comparison and in conveying its own sense of genuine exhilaration is an achievement in itself, and augurs well for Kingsbury's future work.

—Gregory Feeley

**KIPLING, (Joseph) Rudyard.** British. Born in Bombay, India, 30 December 1865, of English parents. Educated at the United Services College, Westward Ho!, Devon, 1878-82. Married Caroline Starr Balestier in 1892; three children. Assistant Editor, *Civil and Military Gazette*, Lahore, 1882-87; Editor and Contributor, "Week's News," *Pioneer*, Allahabad, 1887-89; returned to England, and settled in London: full-time writer from 1889; lived in Brattleboro, Vermont, 1892-96, then returned to England; settled in Burwash, Sussex, 1902. Rector, University of St. Andrews, 1922-25. Recipient: Nobel Prize for Literature, 1907; Royal Society of Literature Gold Medal, 1926. LL. D. : McGill University, Montreal, 1899; D. Litt. : University of Durham, 1907; Oxford University, 1907; Cambridge University, 1908; University of Edinburgh, 1920; the Sorbonne, Paris, 1921; University of Strasbourg, 1921; D. Phil.: University of Athens, 1924. Honorary Fellow, Magdalene College, Cambridge, 1932. Associate Member, Académie des Sciences Morales et Politiques, 1933. Refused the Poet Laureateship, 1895, and the Order of Merit. *Died 18 January 1936.*

Page, London, Macmillan, 1984.

\* \* \*

Today, Rudyard Kipling is chiefly remembered as a spokesman for imperialism and as a skilful versifier, and it is often overlooked that approximately one in six of his published short stories were science fiction or fantasy. His influence on 20th-century SF writers was probably greater than anyone else's of his generation, except Wells, and is acknowledged by writers as disparate as Poul Anderson and John Brunner.

His formal excursions into the future are few but memorable. "With the Night Mail" describes as Atlantic crossing by airship in the year 2000, and is accompanied by excerpts from the magazine in which it was supposed to appear. Socially, little appears to have changed, but technologically this is an astounding vision; at a time when it was novel for a liner to carry radio-telegraphy equipment, and broadcasting was two decades distant, Kipling envisaged the need for air traffic control and a General Communicator system. In the sequel, "As Easy as

ABC," he speculated on the demise of democracy owing to its tendency to lapse into mob-rule—this may have been conditioned by his disappointment with the USA at a time when lynch-law was still common: witness the terrifying image of the memorial statue, "The Nigger in Flames,"—and on a cure for over-population, a problem he had encountered during his time in India.

His other works of SF and fantasy range from the early "The Bridge-Builders," in which a civil engineer overhears the Indian gods debating whether or not to destroy his masterpiece spanning the Ganges, through those astonishing *tours-de-force* without human characters like ".007" (steam locomotives) and "The Ship That Found Herself" (steel plates and girders and the ship's cat!), by way of speculative SF like "In the Same Boat" (a man and a woman discover that the nightmares haunting them refer to real events which happened while they were in the womb) and "The Finest Story in the World" (a City clerk remembers his previous lives, as a galley-slave and on an expedition to Vinland), right up to the complex, subtle stories of his last years when he left his readers and critics far behind, like "The Children of the Zodiac."

He wrote the classic ghosts-in-reverse story, "They," and the deadpan fantasies of *Just So Stories*; in *Puck of Pook's Hill* and *Rewards and Fairies* he brought the people of past ages forward to the present to speak for themselves; and he wrote about sea-serpents and mysterious curses and the heady excitement of modern inventions—but never quite as anyone else would have handled them. For example, "Wireless" is indeed about early radio, but the narrator's experimental friend, trying to eavesdrop on the Royal Navy, fails to notice how the soul of Keats is striking an echo across time in a lovelorn, tubercular assistant pharmacist.

Kipling, who was possibly the most completely equipped writer ever to tackle the short-story form in the English language, exemplifies the fact that in our literary tradition there has never been a hard-and-fast line between realistic and fantastic. Indeed, he was a master at making the fantastic seem credible.

—John Brunner

**KIPPAX, John.** Pseudonym for John Charles Hynam. British. Born in Alwalton, Huntingdonshire, 10 June 1915. Attended Trinity College, Carmarthen, 1934-36. Married Phyllis Mary Manning in 1941; one daughter. Artist, musician, comedian, and teacher. *Died 17 July 1974.*

#### SCIENCE-FICTION PUBLICATIONS

Novels (series: Venturer 12 in all books)

*A Thunder of Stars*, with Dan Morgan. London, Macdonald, 1968; New York, Ballantine, 1970.

*Seed of Stars*, with Dan Morgan. New York, Ballantine, 1972; London, Pan, 1974.

*The Neutral Stars*, with Dan Morgan. New York, Ballantine, 1973; London, Pan, 1975.

*Where No Stars Guide*. London, Pan, 1975.

"The Time Wager," in *New Writings in SF 22*, edited by Kenneth Bulmer. London, Sidgwick and Jackson, 1973.

"No Certain Armour," in *New Writings in SF 24*, edited by Kenneth Bulmer. London, Sidgwick and Jackson, 1974.

\* \* \*

Fear, estrangement and the hunger to bridge the sometimes

illimitable gulfs between individuals—and between cultures, planets, and species—are central themes in the science fiction and fantasy of John Kippax. The desperate quest for security in a hostile universe figures prominently in this minor English author's writing. His four *Venturer 12* novels, the first three written with Dan Morgan, are perhaps Kippax's best-known genre work but are inferior to some of his short fiction.

*A Thunder of Stars* presents motifs of alienation that persist through the series. It introduces a group of continuing stock military characters who must wrestle in various ways with personal alienation. Central to the saga is the troubled relationship between Tom Bruce and Helen Lindstrom, officers of the elite Space Corps. At the outset, Bruce, a seemingly callous martinet, breaks off their rewarding two-year affair with the excuse that it is hampering their careers. Both are ambitious and dedicated officers, but Lindstrom does not want to sacrifice their relationship.

Bruce yearns to command *Venturer 12*, Earth's most advanced starship. He is brilliant and highly qualified. But scandal early in his career—carefully hushed up—makes his appointment a political hot potato. Then Bruce, on solar system patrol, shoots down a runaway starship filled with colonists before it can crash into Earth with appalling carnage. An inquiry vindicates Bruce but the traumatic secret of his past is revealed: On a distant colony planet Bruce once discovered humans who had been captured and surgically restructured by unknown aliens. Out of mercy, he put the hideously mutilated victims to death.

Bruce wins the *Venturer 12* appointment; Lindstrom will be second in command. Their relationship remains uncomfortably platonic in the subsequent novels.

Bruce's obsessive search for the ruthless and elusive aliens called "Kilroys" unifies *Seed of Stars*, *The Neutral Stars*, and *Where No Stars Guide*, the last written by Kippax alone. Continuing frustrations with alien contact are paralleled by political intrigue and estrangements, betrayals and occasional reconciliations between men and women. However, characters in the series by and large are too crudely drawn for their vulnerabilities to arouse sympathy. The Space Corps has a sentimental, toy-soldier quality. Although the authors take pains to show a sexually and racially integrated Corps drawn from all corners of the Earth, clumsy, insensitive writing results in unintended racial and sexual stereotyping.

More effective are Kippax's short stories, of which he wrote more than thirty between 1955 and 1961. "No Certain Armour," a Space Corps story, stresses the importance of personal responsibility and self-respect in a dangerous universe. More compelling in mood and treatment is "Blood Offering," a compact and dramatic fantasy set on an isolated tropical island. The focus is yet another prickly male-female relationship—a duel of wills between Tod Baines, a brash Australian storekeeper, and Mama Noi, an Old Polynesian witch who demands tribute on behalf of the Shark God. Baines resists the crone's petty extortions, egged on by a scornful Chinese accountant who is at odds with a huge native fisherman over the favours of an island girl. These interwoven conflicts climax in a frightening, ambiguous midnight confrontation with the Shark God that prefigures Tom Bruce's fleeting contacts with the Kilroys.

Kippax's strongly traditional work utilizes popular science fiction and fantasy motifs to remind us that gulfs—whether of water, space, or attitude—can be terrible indeed. But perfunctory writing and avoidance of innovation often blunts the impact of his message.

**KLINE, Otis Adelbert.** American. Born in Chicago, Illinois, 1 July 1891. Composer and song writer, then music publisher, film writer, and editor: Editor, *Weird Tales*, Chicago, 1924; Founder, Otis Kline Associates, literary agency. Died 24 October 1946.

#### SCIENCE-FICTION PUBLICATIONS

Novels (series: Robert Grandon; Jan; Mars)

- The Planet of Peril* (Grandon). Chicago, McClurg, 1929.
- Maza of the Moon*. Chicago, McClurg, 1930.
- The Prince of Peril* (Grandon). Chicago, McClurg, 1930.
- Call of the Savage*. New York, Clode, 1937; as *Jan of the Jungle*, New York, Ace, 1966.
- The Port of Peril* (Grandon). Providence, Rhode Island, Grandon, 1949.
- The Swordsman of Mars*. New York, Avalon, 1960.
- The Outlaws of Mars*. New York, Avalon, 1961.
- Tam, Son of the Tiger*. New York, Avalon, 1962.
- Jan in India*. Lakemont, Georgia, Fictioneer, 1974.

#### Short Stories

- The Man Who Limped and Other Stories*. Hollywood, Saint, 1946.
- Stories*. Oak Lawn, Illinois, Weinberg, 1975.

\* \* \*

Otis Adelbert Kline, whose literary career flourished in the 1920's and 1930's, never aimed higher than the prevailing tastes of those who read the pulp magazines *Weird Tales*, *Argosy*, and *Amazing Stories*, in which he published most of his stories. He was clearly influenced by and competed with his contemporaries Edgar Rice Burroughs, A. Merritt, and H. P. Lovecraft, and made no apologies for pandering to the popular taste for formula adventure stories. His work as a literary agent kept him abreast of whatever appealed to the popular imagination, and he worked these interests into his stories. His SF was of the fantastic variety denounced by Gernsback in the 1930's, Campbell in the 1940's, and Gold in the 1950's, who were committed to making SF respectable among adult readers. Had Kline been writing in the 1950's and 1960's, he would probably have been turning out the same formula stories with New Wave embellishments.

Kline's costume adventure melodramas are SF in the limited sense that he made use of conventions like psi powers, rocket travel, ray guns, and heavy doses of ritualism, totemism, and primitive religion borrowed from Frazer, Malinowski, and other anthropologists whose ideas of primitive social and religious customs had begun to stir the popular imagination. In truth, little beyond the accessories distinguish the SF from, say, the oriental adventures of the Dragoman series (*The Man Who Limped*). Much of his fantastic SF belongs in that loose category known as "sword and sorcery."

Kline's imagination was highly visual and his storytelling techniques were clearly shaped by his film-writing experiences. Whatever the costumes, settings, and properties, his stories are

built out of the simplest formulas of the adventure-suspense story, and his characters are stock types familiar to anyone who has seen the old Buck Rogers serials. Like Burroughs, Kline had his series of Mars and Venus stories. The latter (the Robert Grandon series) proved very popular, and perhaps should be taken as representative of Kline's most influential work in the genre.

Critical opinion on Kline has been largely negative. However, despite everything negative that has been said, including the more recently fashionable charges of racism and sexism (equally justified), there remains the embarrassing but undeniable power of Kline's naive handling of the formulas and conventions of exotic adventure. Kline's ideas are second-hand and his treatment of them trite, but that is the very heart of his appeal. He gives the reader the expected cliché, the familiar stereotype, the conventional adventure formula. No summary could do justice to his triteness, but the following vignette from "The Bride of Osiris" (1927) may stand as a fair sample of the action: "As he stood there in the midst of the hostile multitude, holding the half-fainting Doris and expecting instant death, Buell heard two sounds simultaneously—the twang of a bowstring and an encouraging shout from Rafferty." The power of such a passage may be of a low order, barely a notch above the boy's adventure stories of the time, and yet the reader may find a kind of delight encountering an almost pure example of the thriller whose only purpose is unreflective and mindless entertainment. That Kline succeeds at all is perhaps his revenge upon literary criticism.

Kline's most successful novel, and probably his best, is *Call of the Savage*. The novel was modelled on Kipling's *Jungle Books* and Hudson's *Green Mansions*, and exhibits Kline's ability to use mythic and archetypal story elements to entrap all but the most wary reader. *Call of the Savage* is fantasy rather than SF, but, as we have seen in Kline's other work, the differences as well as the resemblances are coincidental.

##### Novel

*Quatermass*. London, Hutchinson, 1979.

##### Short Stories

*Tomato Cain and Other Stories*. London, Collins, 1949; New York, Knopf, 1950.

##### Plays

*The Quatermass Experiment* (televised, 1953). London, Penguin, 1959.

*Quatermass II* (televised, 1955). London, Penguin, 1960.

*Quatermass and the Pit* (televised, 1959). London, Penguin, 1960.

*The Year of the Sex Olympics and Other TV Plays* (includes *The Road* and *The Stone Tape*). London, Ferret Fantasy, 1976.

Screenplays: *Quatermass II* ( *Enemy from Space* ), with Val Guest, 1957; *The Abominable Snowman*, 1957; *Look Back in Anger*, with John Osborne, 1959; *The Entertainer*, with John Osborne, 1960; *HMS Defiant* ( *Damn the Defiant* ), with Edmund North, 1962; *First Men in the Moon*, with Jan Read, 1964; *The Witches*, 1966; *Quatermass and the Pit* ( *5,000,000 Years to Earth* ), 1967; *The Quatermass Conclusion*, 1979.

Television Plays: *The Quatermass Experiment*, 1953; *Nineteen Eighty-Four*, from the novel by Orwell, 1954; *The Creature*, 1955; *Quatermass II*, 1955; *Mrs. Wickens in the Fall*, 1956; *Quatermass and the Pit*, 1959; *The Road*, 1963; *The Crunch*, 1964; *The Year of the Sex Olympics*, 1967; *Bam! Pow! Zapp!*, 1969; *Wine of India*, 1970; *The Chopper*, 1971; *The Stone Tape*, 1972; *Jack and the Beanstalk*, 1974; *Murrain*, 1975; *Buddyboy*, 1976; *During Barty's Party*, 1976; *Special Offer*, 1976; *The Dummy*, 1976; *Baby*, 1976; *What Big Eyes*, 1976; *Quatermass*, 1979; *Kinvig* series, 1981.

\*

Nigel Kneale comments:

I have always been a scriptwriter for television and films because that's what I like doing best. I don't regard myself as a science fiction writer, and the list above confirms this. Looking through this list I wondered what other things I wrote. The answer, of course, is things that didn't get made. Some of my best screenplays, from Huxley, Lawrence, and the like, went down with collapsing film companies. More rarely, but more painfully, there were stillborn TV originals, like *The Big Big Giggle*, a serial about a teenage suicide craze, wiped out by high cost and official nervousness that was probably justified (it could have been dangerous). Or *Crow*, about the slave trade and not dangerous at all, victim of an internal squabble in a TV company. I just have to be grateful for all those that *did* get made.

\* \* \*

With a few notable exceptions, most of them in recent years, movies and television have not been kind to science fiction. The speculative ideas that characterize what is best in the genre have proven difficult to translate into visual media without interrupting the action with long expository speeches, while the spectacular visual surfaces that science-fiction narratives afford have been all too tempting to filmmakers. As a result, few science-fiction writers have been able to work with success in the media, and fewer still have managed to build their primary reputation as a media writer of science fiction. Nigel Kneale is a member of this select latter group. The three television serials concerning Professor Bernard Quatermass that he wrote for the BBC between 1953 and 1959—all three of which were subsequently published in book form and adapted as feature films—established a standard for the televised science-fiction horror story that has seldom been surpassed.

Kneale had little direct experience as a science-fiction writer before joining the BBC, although a few of his short stories from *Tomato Cain* are small masterpieces of weird fiction. While at the BBC, Kneale's plays included an adaptation for television of Orwell's *Nineteen Eighty-Four* and an original play about the abominable snowman called *The Creature* (filmed as *The*

*Abominable Snowman*). But it was his 1953 six-part sequel *The Quatermass Experiment* that quickly established his reputation as a convincing dramatist of suspense thrillers. This tale of an alien life form that takes over the body of the lone survivor of the first space mission and metamorphoses into a hideous monster back on Earth, despite occasional absurdities (super-scientist Quatermass finally succeeds in literally *talking* the monster to death), reveals an ear for convincing dialogue, an awareness of the dramatic possibilities of the television medium (such as the use of "newscasters" to carry forth the action), and a talent for working serious issues and concepts into a fast-moving dramatic narrative. Though Quatermass is a scientist-hero in the mold of Conan Doyle's Professor Challenger, Kneale makes some pointed observations about the morality of scientific research and the relationship of government and the journalistic media to such research.

Professor Quatermass continued his fight against bureaucracy and journalistic sensationalism in two subsequent serials. *Quatermass II* concerns the attempt of an alien civilization to establish colonies on Earth by converting human workers into zombie-like slaves; it is perhaps the weakest of the three serials. *Quatermass and the Pit* is perhaps the strongest: a subway excavation in a reputedly haunted area uncovers an ancient alien spaceship which, when activated, reveals that legends of the devil are based on race memories of the aliens from Mars who once tried to conquer Earth—and in the process created us. The mix of myth, supernaturalism, and science fiction works well, and predates by several years cult rumors of gods from outer space. A fourth installment in the Quatermass series, *The Quatermass Conclusion*, was filmed in 1979.

Kneale worked on other screenplays, most notably the film adaptations of two John Osborne plays and an adaptation of Wells's *First Men in the Moon*, which he gave a characteristic twist by casting the story as a flashback told more than a half-century later by a survivor of the expedition whose secret is revealed only when the "official" first moon-landing party comes across the remnants of the earlier adventurers. Here, as in the Quatermass serials, Kneale's ironic humor, his deftness in sketching minor characters, and his sense of dramatic structure provide a strong script. Though he has shown little inclination to move beyond the horror-suspense school of science fiction, Kneale has contributed significantly to the genre's growth in the media.

Damon Knight, deservedly lauded as a critic and editor, is a competent fiction writer cursed with a vivid imagination, a clear vision of cosmic morality, an understanding of the arbitrariness of human value judgments, and a sardonic sense of humor that prevents him from taking most of it seriously. Often the inevitable irony appears in a sudden plot twist or in the reader's perception of a pun that the story is built on, a technique that in some cases, such as "To Serve Man," becomes thematic as well as technical. In this piece, in which an alien race's benevolence toward humans turns out to have a culinary motive, the pun is turned to a serious criticism of egocentric self-deception. At other times, a pun is all the story has to offer, as in, for example, "Eripnav," in which a vampire on a vegetable world is killed with a steak through its heart. Perhaps the most complexly ironic title in the whole body of work is "Not with a Bang"—the earliest story chosen by the author for *The Best of Damon Knight*—in which the last man on Earth woos and finally wins the last woman, a prudish spinster, only to find himself paralyzed in the Men's Room—which her prudery will not allow her to enter—just before consummating their wedded bliss. And so the world ends in an allusion to T. S. Eliot, a poet whose influence shows clearly in Knight's work.

Although Knight has produced a number of novels, complete with action and adventure—most of them expanded from the shorter forms in which he is most facile—he works best at the medium length represented by *Three Novels*. His ironic perspective allows him a sharp compression of events into key scenes which are effectively juxtaposed. The result recalls the episodic quality of some of the language's finest satirists, such as Swift and Twain; Knight's choices of theme and situation, and his use of language, are also reminiscent of theirs. He does not often extrapolate from real world situations, although *Analogue Men* partially does that; more often he recasts real-world situations in estranged form for ironic perspective: "Earth Quarter" (expanded into *The Sun Saboteurs*) could be any Third World ghetto in any advanced country; *The Rithian Terror* features a slightly disguised British Empire, complete with despised New World colonials; *A for Anything* moves from a 19th-century American plantation setting to a reprise of imperial Rome.

More characteristic of Knight's whole body of work are *The World and Thorinn* and *The Man in the Tree*, which rely on myth rather than history for their structuring narrative. His basic assumption, that human nature does not change, is very clearly stated in "Time Enough": we are and always will be guilty of the same flaws we always have been. Those flaws provide the sharper, more serious ironies of his work. In such moral fables as "Ask Me Anything," "Man in the Jar," "A Thing of Beauty," "Auto-da-Fe," "Second Class Citizen," and "Collector's Item" (formerly "The End of the Search"), basic human motivations—greed, lust for power or knowledge, anthropocentrism—end by frustrating themselves in plots that just miss being tragic because the human motive is never presented as quite admirable. "The Country of the Kind" also just misses the tragic dimension for a slightly different reason: by letting us share the point of view of the protagonist, Knight makes us almost sympathize with the only cruel and violent—and insane—member of our species left in a world of gentle benevolence. The effect is similar to that achieved by Anthony Burgess in *A Clockwork Orange*. How such a thing can happen to us as readers is explained fictionally in "The Enemy" in which a human explorer meets and is killed by an evil alien more fitted to survive than she—and which she finds beautiful; one of our flaws is that we find competent evil attractive, even at our own expense.

Unlike many SF writers concerned with humanity's destruc-

tive environmental impact, Knight does not blame technology itself; as in "Idiot Stick," everything depends on which end of the tool the idiot is on. Even in his most clearly anti-machine story, "Natural State" (a tighter version of the expanded *Masters of Evolution*), a biological technology replaces the mechanical one; nature is still manipulated, although perhaps more cooperatively than antagonistically. But human nature is not so easily handled.

In *The Sun Saboteurs* human nature makes us unfit for a place in the galactic civilization; in "Collector's Item" it makes us unfit for survival. Attempts to control our anti-social insanities in *Analogue Men* result in still greater insanity. In *The Rithian Terror* (expanded from "Double Meaning") our rigidly serious self-importance defeats us. In "The Beachcomber" sheer accident can reduce all of our grand schemes—even in a future, evolved state—to picking up pebbles on the beach.

Even human attempts at morality and ethics come to naught when they come up against the needs of survival, in *A for Anything*. Some kind of improvement—although not necessarily a welcome one—might result from a mental cross of an individual human with a superior alien, as in "Four in One" or *Beyond the Barrier* (expanded from "The Tree of Time"), in which Knight nearly tricks us out of species chauvinism with a bit of manipulation more difficult than that of "The Country of the Kind." Even this unsavory hope is unlikely; we are so flawed that in *Mind Switch* (expanded from "A Visitor at the Zoo"), an alien mind is corrupted by transfer into a human body, even with a built-in sex change. Our psyches are, if anything, less trustworthy; in "Masks" an incorruptible metal body corrupts a human mind. There is also little hope of external salvation. "Rule Golden," which remakes the Christ myth in modern iconography, gives us a paradise at the cost of what we might recognize as human and at the cost of the evolutionary process that has made us what we are. In such a universe even the power of love can not cope with hate, and hate leads to extinction in "Stranger Station." Perhaps the only possible Messiah may be that of "What Rough Beast" who brings in the Kingdom because he is afraid of people—and at the expense of the lives, and the world, of those people who expect him to save them from themselves. In *The Man in the Tree*, a more elaborate and successful ironic rendering of the Christ story, the Messiah saves himself into an alternate universe and leaves this world to its own devices.

This body of work is on the whole a black comedy, full of ironies and bitter laughter. But the despair that accompanies the logic of Knight's anatomy of the human condition has its compensations. If there is no hope for us, we can still take pleasure where we may: in the fantastic chance of being possessed by friendly demons, in "Be My Guest"; in the archetypal insane adventure of love in "Mary" (formerly "An Ancient Madness"); in the discovery of intimacy in strange places in "To the Pure." Or ultimately in the bitter-sweet knowledge that we, like all things, will pass away. In "The Dying Man" (formerly "Dio"), Knight produces one of his strongest stories. The advent of death into a world of immortals—the reversal of a time-worn story line—brings awareness that human mortality also gives us maturity, depth, strength, balance; and we are led to see that death is just. In this perception is the final escape from human egocentrism. If that perception is too much for us, we can escape, sadly, as in "The Handler," into the fantasy of conscious illusion to find some sort of artificial joy. Nevertheless, as the hero of *The World and Thorim* concludes, the best way for people to live is the way that gives them the greatest freedom to choose how, whatever the cost.

All in all, Damon Knight's fiction has a sane, tough-minded wholeness. It does not often give us brilliance; it seldom gives us

hope; it does not even give us much that is fundamentally new. Part of its strength—ironic humor—is also sometimes its weakness. But it does give us an imaginatively different look—sometimes with genuine mythic power—at ideas as old as human kind, still built into the very marrow of our species. In the words of a character from *Analogue Men*, speaking of a task similar to Knight's, though it may promise us "nothing except the rewards of competence and of curiosity, and an occasional windfall of laughter . . . it is enough." Knight's fiction deserves to share the accolades his criticism and his editing have already earned.

—Robert L. Jones

**KNIGHT, Norman L(ouis).** American. Born in St. Joseph, Missouri, 21 September 1895. Educated at St. Joseph Junior College, A. A. 1918; George Washington University, Washington, D. C., B. S. in chemical engineering 1925. Served in the United States Army Field Artillery, 1918-19. Married Marie Sarah Yenn in 1921; one daughter. Worked for the Department of Agriculture: assistant observer, Davenport, Iowa, 1919-20, and observer and code translator, Washington, D. C., Weather Bureau; analytical chemist in Washington, D. C., 1925-29, Chicago, 1929, St. Louis, 1929-40, Chicago, 1940-50, and Beltsville, Maryland, 1950-64, Insecticide Division; retired in 1964; Merit Award, 1962. *Died 19 April 1972.*

Norman L. Knight published his first story in *Astounding* in 1937, worked most of his life as a chemist specializing in

pesticides, and finally published his most ambitious science fiction work in collaboration with the master, James Blish, in 1967. One theme and one setting, in fact, kept reappearing in the early stories; and the importance of that set of images in the novel suggests that Knight may have been the more seminal partner in the collaboration—if not the more polished stylist. Images that led eventually to the masterpiece, *A Torrent of Faces*, can be seen as early as the serialized novel "Frontier of the Unknown," in which a deep-sea diver moves in "a twilight pierced by a million uneasy, shifting, flickering ghosts of slanting, green-tinged sun rays." This crude flood of modifiers was followed by another two-part novel, "Crisis in Utopia," in which Knight also anticipates his work with Blish. Knight includes here the fully developed conception and description of the undersea race of human mutants called Tritons. The writing is a bit more subtle, and Knight's ideas on the effects of managed evolution are suggestive.

Nevertheless, these early stories are dominated by the usual villains of melodrama and the crude overwriting that so often seems the appropriate literary parallel to the line-drawing illustrations of the early pulp magazines. The novel, however, is the culmination of all this. One of the most popular sections of the novel, "The Shipwrecked Hotel," is a polished undersea disaster epic in which the Triton race plays a major role; Triton characters are fully developed throughout the book, and much of the action takes place undersea. Also, by the time of this later work the earth itself has replaced the melodramatic villains as a key protagonist—a much greater literary accomplishment. The individual extrapolations in the novel about living conditions in a future with one trillion inhabitants on earth are many and richly developed, and the writing shows marked improvement over the early Knight extrapolations on the sea and on Utopia. Blish was a good teacher and a good collaborator for Knight's valuable ideas on the future, on evolution, and on accompanying disasters.

\* \* \*

Dean R. Koontz's best science fiction was written before 1980; since then he more properly can be called a writer of horror novels. His best work is a convincing amalgam of sympathetic characters and quirky plots, but much of his work has regressed to the stereotyped characters, ritualistic journeys, and heroic feats found in hard-core SF before 1960.

Koontz is a writer of the New Wave in science fiction, a trend

characterized by authors with humanities rather than science backgrounds. Certainly, Koontz's themes are rigorously chosen and often intriguing. His best-known works concern the theme of the malevolent child, of innocence turned inside out; he handles the notion in *Beastchild*, in *A Darkness in My Soul*, in which a mutant becomes God, and quite compellingly in *Demon Seed* in which a super-computer creates its own genetic material which it "implants" into a human woman. In "We Three" genetically mutated children wish away harsh parents, then neighbors, then the entire world through their extra-sensory powers.

This theme is a corollary to Koontz's major concern: what it means to be human. In several works on robots, particularly the crisply written "The Night of the Storm," Koontz explores the theme. The robot-protagonist Suranov is bored by his centralised, staid society "peopled" by robots. Humans are rumored to exist, much to the horror of the robots, whose prime rule is that the universe is logical, a dictum which the existence of humans challenges. The story also begins a robotics series carried on by New Wave writers Pamela Sargent and George Zebrowski, among others, in the *Continuum* series. The more turgid novel *Anti-Man* presents an android who changes into a new form of being, to the consternation of the human protagonist. This novel explores the Frankenstein theme—the relationship of creator and his creation—as does *Demon Seed*.

Beginning with his first story, "Soft Come the Dragons," Koontz clearly favors intuition and emotion as essential components of humanness, rather than logic and reason, which can be assigned to machines. Perhaps his best long work, *A Werewolf among Us* presents a protagonist who is a cyberdetective, a human whose brain is electronically and physically linked to a portable computer on his chest. Using a classic Agatha Christie plot, Koontz combines science fiction and detective genres. Members of a family are being murdered, the remaining members of the family are suspects, and the reader is presented with clues. However, the main conflict in the novel is psychological: when the human half of the cyberdetective realizes the murderer is another robot, his computer half rejects the notion as illogical.

Koontz also treats themes current in popular culture. Marshall McLuhan's *The Medium Is the Message* was the origin for "A Mouse in the Walls of the Global Village," and "The Psychedelic Children" projects a society one generation hence in which the children whose parents took LSD in the late 1960's are mutants who are hunted by society. The anti-establishment bias of the 1960's is clear in Koontz's work. In *Dark of the Woods* an unimaginative, conformist society systematically eliminates aliens. In "The Twelfth Bed" old people are shut away in a nursing home run by robots.

When Koontz deals with the theme of the quest and the mythic journey, however, he writes stereotyped pulp science fiction. In *Anti-Man*, *Nightmare Journey*, *Dark of the Woods*, and *Warlock* a hero rebelling from society sets out on a trek, usually through a cold wilderness, in which he encounters strange beasts and exotic phenomena which he eventually overcomes. The women in these works are sex goddesses only, deferential to the hero, though, as Koontz condescendingly interjects, spunky.

More recently he has written a series of horror novels in the Stephen King mode. For example in *Darkfall* he uses a supernatural explanation—a hole through which spirits from hell creep—to subject people to frightening encounters with the forces of evil. Only the goodness of the hero can destroy the iniquity. While these are not strictly science fiction, they do represent Koontz's return to sympathetic characters. The men are strong but warm, the women beautiful but competent. Of these the best is *Phantoms* which uses a science-fiction premise as

the explanation for the evil menace, in this case a genetically altered micro-organism. *Shattered*, first published under the name of K. R. Dwyer, also uses fully realized characters and a realistic premise.

Thus Koontz is at his best as a science-fiction writer. He reports he is presently interested in such genres as suspense, war tales, and crime stories. Koontz is certain to create suspenseful tales and sensitive character. If he returns to serious science fiction, he might be well advised to continue to explore his most productive theme of the Cartesian mind-body split and its consequences for what humans define as human. Koontz clearly defines a being as a human if the being feels, loves, and intuitively, be that creature man, robot, or beast.

\* \* \*

C. M. Kornbluth was a major talent of the specialty magazines in the 1940's and 1950's. Probably best known as a collaborator with Frederik Pohl on novels of social extrapolation, he was primarily a writer of short stories that frequently contrast cosmic affairs with mundane existence, sometimes to farcical, more often to sardonic, effect.

With Pohl, he helped produce a handful of lively, satiric novels that practically constitute a genre of their own: a brand of near-future dystopia, deriving in part from H. G. Wells, concentrating on one particular facet of society which becomes the dominant force in the world, as in *The Space Merchants* and *Gladiator-at-Law*. In *Search the Sky*, a much lighter and lesser work, the satire mutates into a picaresque romp, exposing Kornbluth's penchant for quickstep burlesque. The other two books, though, are characterized by a continual mordant wit in their serious development of the oppressive rule of socio-economic institutions. Of course, these institutions are merely exaggerations of those already operating in the modern world, and are invariably connected to the realms of high finance and mass consumption, unlike say, the dystopian worlds of Zamyatin, Orwell, or even Huxley, which are more distinctly political and totalitarian, and in many ways less directly evolved from the contemporary milieus of those writers. In this regard, Pohl and Kornbluth are more Wellsian, more extrapolative as opposed to symbolic, and much more "radical" in concept and detail than either Huxley or Orwell. The cautionary aspects of *Space Merchants*—its background of overpopulation, scarcity of resources, pollution, and runaway commercial exploitation—have made it a canonical "prophetic novel" in the wider world outside science fiction.

Their last true collaboration, *Wolfbane*, also deals with a culture of several limited resources, but as a condition ostensibly imposed from outside, by outré alien pyramids who have stolen the Earth-Moon system away from the Sun. The book is almost pure adventure, verging on space opera at the close, but it begins in a setting of material and spiritual poverty acutely drawn in its every detail. Kornbluth never achieved the distinction apart from Pohl that he did alongside him; and Pohl was fond enough of their partnership to "collaborate" with Kornbluth even after the latter's death by working up stories from odd fragments or from their previous common property (*The Wonder Effect* is partly composed of these).

Kornbluth also collaborated with Judith Merril, as Cyril Judd, on *Outpost Mars* and *Gunner Cade*. The second is notable for its vivid evocation of a post-holocaust military brotherhood, a spiritual sort of Spartanism. In both, the setting is again a down-at-heels world, but neither story has the inventive brilliance of the major Pohl-Kornbluth novels. However, each of them concerns a legendary/mythic element that resolves itself as a modest distortion of the book's initial reality-frame. This thematic concern relates to Kornbluth's best short stories, many of which play with the penetration of everyday existence by the utterly fantastic, the occult, the arcane. Such a tendency may seem axiomatic for science fiction; in Kornbluth, it often ranges beyond the usual boundaries of 1950's SF in tales as diverse in tone as "The Cosmic Expense Account" and "The Last Man Left in the Bar."

On his own, he wrote only three SF novels, *Not This August*, *Takeoff*, and *The Syndic*. The first two are patent journeyman exercises, apparently slanted for marketing considerations. They are competent, straightforward thrillers, largely unexceptional, only possessing a certain crisp efficiency. The first is the least winsome, giving the drear account of what happens after the Soviets conquer the U. S. A. It reads like a script aimed at the slick magazines (in fact it was serialized in *Maclean's*) and later adapted to the SF market. *Takeoff* tells the more tolerable—but hoary—story of how an atomic scientist helps a bunch of teenagers build a moon rocket, with appropriate interference by foreign agents to provide a veneer of suspense. *The Syndic* is another matter. Though it seems oddly cobbled together, it is nevertheless quite engaging for much of its length and is Kornbluth's best solo novel. It incorporates satire, parody, homiletic fable, pulp adventure, and irrelevant moral lecture, accented by sudden left turns in the plot. Its primary narrative premise is a marvel of ironic supposition: the US government, for just cause, has been exiled to the unfriendly shores of a primitive Ireland by a coalition of laiser-faire smugglers and racketeers, the good-time guys and dolls of the Syndic. Ostensibly a straight adventure story, it ultimately seems to be a loose composite of favorite crotchets, including a forceful depiction of earth-magic which somehow manages not to blow the narrative beyond the pale of mainline SF.

When Kornbluth truly excelled was in his shorter work, the bulk of which appeared in the collections *The Explorers*, *A Mile Beyond the Moon* and *The Marching Morons*. It is often madly comic; and as often sharp and deadly. At its best, it is brief, evocative, to the point; short on description, but full of vivid impressions; and usually possessed of a clearly developed moral thrust, if not always an explicit moral. His strong satiric mode slides easily into march-hare burlesque, in pieces like "Passion Pill," "Thirteen O'Clock," and "Virginia." The omnipresent sardonicism emerges most fiercely in tightly woven shorts like "The Words of Guru," "The Silly Season," and "The Rocket of 1955," but also in longer works like "Two Dooms" and "The Marching Morons." The latter two are Kornbluth's most visibly horatory stories, although neither exists simply for the sale of its overt "lesson." He also wrote pure, slick adventures, playful novelets like "The Slave" and "Make Mine Mars," which captivate by virtue of sheer readability, a deftness in the handling of stock figures and basic emotional appeals. And all the above, even the darkest tales, are rendered with a spritely touch; they do not sag in the middle, and there is ever a little crooked smile lurking somewhere in the corners.

Kornbluth's view of humanity may seem perplexing and inconsistent. He is sometimes accused of being a hard-case cynic, an elitist who views himself as above the common run. This is not entirely fallacious in light of "The Marching Morons"; in foreseeing a future populated mainly by just-plain-

dopes, it is largely a metaphor for what Kornbluth saw around him in his own time. Yet he had a profound affection for lowly, downtrodden people, for stumblebums and gutter folk, and even some salesmen. In part it may have been the fondness of an aficionado, a collector of "characters." But he was not without a good deal of genuine sympathy, especially for those who were caught in situations they barely understood, like the deformed space pilot in "The Altar at Midnight," or for those who understood too well, like the narrator-physicist of the same story and the young genius of "Gomez." Better remembered, perhaps, are his treatment of workaday grifters and con-artists, like Honest John Barlow of "Morons" or the sly narrator of "1955"—people who have no sympathy at all, and who, however clever, always get the axe at the finale. If Kornbluth sometimes admired their grit and savvy, he was also moved to exact revenge for their victims.

Though he is often viewed as a commentator on the social fabric, and the various forms of human folly, there is more to Kornbluth than the wary futurologist, the wry chronicler of crafty deals ("1955," "Time Bum"), or even the compassionate observer of human detritus ("The Little Black Bag," "The Altar at Midnight"). And this something more is his sense of the unknown and the unknowable, the hidden layers of reality, the levels of illusion enveloping the world (whether social or metaphysical). Many of his most notable, most intensely realized stories hover somewhere between strict fantasy and strictest science fiction. Both "The Words of Guru" and "Kazam Collects" are outright fantasies, of the sort that "pierce the veil" of ordinary sense, and yet they have the resolute authority, the absolute conviction, of things seen and heard and done. They begin in fairly typical urban settings, enticing the reader through unsuspected realms to arrive at states of being that can only be termed ineffable and exalted, the one horrific, the other all beauty and benevolence. "The Silly Season," a tensely told shocker, provides a contest between a series of uncanny but rather palpable illusions and the normalizing nature of daily journalism. "The Cosmic Expense Account" sets the mundane and extraordinary in adjacent territories, as a crippling "cosmic-harmony" engulfs eastern Pennsylvania. And in the jocose "Virginia," our furtive public mythologies about the Secret Masterdom of the Super Rich are made the binding private reality of an heir to fortune. Characteristically, Kornbluth does not simply mention, but actually offers a short tour of, the Museum of Suppressed Inventions.

These tales center on initiation into various kinds of arcane knowledge; and "Guru" and "Kazam" focus on persons of a special nature, born to acquire a special sort of knowledge, and power. This striving after knowledge is at the core of Kornbluth's most elusive and provocative piece of writing, "The Last Man Left in the Bar." Published very late in his career (1957), this short but densely packed work distills all his previous concerns with kinds and visions of reality, and it is a tour de force of oblique, kaleidoscopic narrative worthy of the wildest "experiments" of the New Wave. It portrays the psychological aftermath of an apparent momentary transposition of worlds. It mingles drunken uncertainties and digressions with the haunting obscurities of a poorly apprehended experience. In a landscape of shifting knowledge, the one constant is that its technical-protagonist never does learn the answers, the wherefores of his predicament. His passionate desire to *know* is countered by the obstinate complexity of the universe, and by wilful creatures who are absorbed in their own very separate interests and imperatives.

\* \* \*

William Kotzwinkle has produced children's and adolescent fiction, fables, allegories, realistic and historical fiction, and adult and science fantasy. Fantasy undergirds all of his writing, however. It is not just Todorov's hesitation "between a natural and supernatural explanation of the events described"—it is fantasy with the force of dream.

The vein of fantasy that is the true one of Kotzwinkle's writing for children and adolescents is always present in his writing for adults. In the short stories of *Elephant Bangs Train* reality is usually so unreal it seem fantastic: frozen mastodons are eaten to capture an assumed wild animal past; real sexuality seems fantastic in "Marie," "The Jewel of Amitchi," and "Tiger Bridge"; the death of a Navaho in a motorcycle jump over a canyon and a liar who moves to the sixth degree of lying seem mythic, while the title story transforms the reality of a train to a giant that an elephant first fears then charges. *Hermes 3000* is a series of stories that are chronological but fragmented and juxtaposed in a manner similar to Benjy's narrative in Faulkner's *The Sound and the Fury*. One of the stories features Catherine the Great's flower guard in the 18th century; two more occur in the 19th century, showing an American minister and a wandering madman; others occur in the 20th century, where we see a drunken dishwasher, a Chinese cook, a retired old man who dies in the Metropolitan Museum, an English hermit who builds a hole in a Lord's estate around World War II, and a classics professor who becomes a dishwasher. The madman and Reverend Cupplewaite know each other, and the Golden Cafeteria links the professor, the drunken dishwasher, and two old bag ladies in this novel of reincarnation, where lives are stored and reused.

*The Fan Man* is a novel whose protagonist-narrator, Horse Badorties, is so chaotic that the novel seems surreal. Badorties, a counter-culture hippy musicologist, lover of women, garbage, and junk, is so unable to complete anything that no other character is developed or situation resolved. Life is a series of plots that never untangle. *Swimmer in the Secret Sea* seems, on the other hand, to be a realistic novella about a baby who dies in delivery, but this swimmer in the secret sea structures the lives of his parents, John and Diane Laski. The life that never was structures lives that are.

*Night Book* is similar to *Hermes 3000*, juxtaposing stories of contemporary and Athenian sexual practices. The stories told by the Athenian women awaiting a fertility celebration for Demeter are powerfully sensual, while the contemporary stories are frequently similar to crude pornography. Kotzwinkle frequently juxtaposes stories with parallel events, where the end of one story serves as the end of another.

*Doctor Rat*, the novel for which Kotzwinkle won the World

Fantasy Award in 1977, is an animal fable demonstrating man's cruelty and destructiveness. The title character is a rat made crazy by an animal experimentation laboratory. His slogan, "Death Is Freedom," is similar to the Nazi slogan "Arbeit Macht Frei." Animals in the laboratory and outside, particularly an eagle who escapes a zoo, rebel and migrate to central meeting areas, where they are systematically destroyed by mankind in situations which parallel World War II and its concentration camps. Through Doctor Rat's insane mutterings using the justifications of research, defense industries, and medicine, the language of power is decentered and mocked.

*Fata Morgana* is a detective story in which the reality of an 1861 Paris and eastern Europe is so bizarre that it is fantastic. Inspector Picard, sent to investigate Ric Lazare and his fortune-telling machine, has his own fortune read. The fortune is an investigation of Lazare that never happens, but the illusion is so real that Picard elects not to pursue this toy-making, wife-stealing murderer. Though the ending is a cheat, the novel is still one of Kotzwinkle's best. *Herr Nightingale and the Satin Woman* relies more on the art of Joe Servello, a frequent Kotzwinkle collaborator, than Kotzwinkle. The action is never clear; Herr Nightingale is a smuggler trying to recover from some traumatic defeat as a German soldier in Egypt during World War I. He, the Satin Woman, and Baggy the detective are passionately intertwined; insects become symbols of their passions for love and riches, assuming their own fantastic existences.

Where the action in *Herr Nightingale* is fuzzy, such cannot be said of *Jack in the Box*, which is a realistic novel tracing Jack Twiller's life from a World War II childhood to a James Dean 1950's adolescence. Though the novel is almost an adolescent novel formula such as Judy Blume's *Then Again, Maybe I Won't*, Jack's fantasies from his childhood Lone Ranger days to the masturbatory fantasies of adolescence mark the novel as Kotzwinkle's. *Christmas at Fontaine's* shows a group of linked characters who connect at Fontaine's Department Store in a novel similar to *Jack in the Box*. The novel is realistic, but it is characterized by the fantastic obsessions of its characters, from Officer Locke's obsessed pursuit of a boy living in the store to a mad genius of a window decorator who wants the ultimate Christmas window display and a bag lady's quest for golden garbage. *Queen of Swords* again is basically a realistic novel, although a ghost of a composer, Lingard, appears, and some black magic, mojo, seems to be wielded by the alienated wife of a conga player. The principal action is a study of two influences on the writer-narrator, Eric—his wife, Janet, and Nora, a wild woman. Janet is the good influence that stimulates his best writing; Nora's influence leads only to pornography and drug trafficking. To Kotzwinkle here, the influence of others we love on our lives is magic.

*Superman III* is a novel based on the screenplay by David and Leslie Newman. The novel features much humor by coincidence similar to silent comedy. Ross Webster first plots to monopolize world coffee production and then oil, as the Man of Steel foils Ross, his sister, and Gus Gorman, a computer whiz, in this sophomoric effort. *E. T. : The Extra-Terrestrial* also follows a screenplay, but Melissa Mathison's is better than the Newmans'. Kotzwinkle fills in *E. T.*'s botanical mission and reduces the viciousness of everyone except Lance, the nerd, and the people sent to study *E. T.* *E. T. : The Book of the Green Planet* is based on a story by Steven Spielberg and is far better than *E. T. : The Extra-Terrestrial*. Most of the action is on *E. T.*'s home planet, with various attempts by *E. T.* to communicate with Elliott, who is discovering girls, and becoming an adolescent. The characters are as delightful as Lem's Trurl and Klapaucius, with vegetable characters such as the Jumpums and mineral

characters such as Sinistro, a bio-degradable vegetable (turnip) space ship, and *E. T.*'s sidekick, Flopgloppe, who resembles an animated old sock.

The humor of *E. T. : The Book of the Green Planet* is typical of Kotzwinkle's writing, which has a strong vein of fantasy usually juxtaposed against realistic detail. Sometimes the juxtaposition induces the mystery of dreams; other times it induces humor. An excellent style rather than excellent plot forms characterize this talented writer.

—Craig Wallace Barrow

**KURLAND, Michael (Joseph).** Also writes as Jennifer Plum. American. Born in New York City, 1 March 1938. Educated at Hiram College, Ohio, 1955-56; University of Maryland overseas, 1961-62; Columbia University, New York, 1962-63. Served in the United States Army, 1958-62. #### Michael Kurland comments:

I try to entertain.

\* \* \*

Michael Kurland's first two science-fiction novels were written in conjunction with Chester Anderson. The first, a conventional collaboration, was *Ten Years to Doomsday*, a lightweight and readable book concerned with the need for an entire planet to change from a feudal/pre-technological to a fully scientific/industrial state in a decade to stave off a planned invasion. Kurland has stated that this book was written as a parody of the works of Poul Anderson. Either as parody or in its own right, the book is fairly successful. The second novel has a more complicated history. When Anderson wrote his popular novel *The Butterfly Kid*, he included himself, Kurland, and a third friend, Tom Waters, as characters. Anderson's novel imposes a comedic alien-invasion theme upon the bohemian East Village milieu of the 1960's with hilarious results. Kurland's *The Unicorn Girl* is a sequel, continuing its themes and characters, though it is generally regarded as less successful. (Waters added a third book to the series, *The Probability Pad*.)

Kurland's first fully solo novel was *Transmission Error*. In this book he established a protagonist of generally likeable nature, his traits including considerable wit and resourcefulness, but also a feckless ability to get himself into insoluble dilemmas. He is accidentally transported to an alien planet and threatened with a life of slavery. He escapes this situation and plunges into a series of similarly unresolved problems.

By this point the general pattern of Kurland's books had become clear. Kurland is highly adept at creating societies which are compellingly believable, and populating them with vivid and sympathetic characters. His style is lively, warm, and highly informal. His stories are told with rapidity of pace and great variety of setting and incident. Their major flaw is a failure—whether by the author or his protagonist—to grapple with and satisfactorily resolve problems. The "solutions" offered are almost invariably flight rather than confrontation.

This pattern holds through Kurland's later novels, although their basic premises are wholly different from one another. *The Whenabouts of Burr* is a chase-novel proceeding through multiple parallel worlds. *Pluribus*, probably Kurland's most successful novel in the genre, takes place in a semi-barbaric future United States. The book abounds in vivid imagery, including an unforgettable scene of the protagonist, arrested for some local infraction, being removed in a standard "black-and-white" California Highway Patrol cruiser—drawn by a team of horses! *Tomorrow Knight* (the title is indicative of Kurland's love for puns and other word-play) takes place on a planet divided, checker-board fashion, into hundreds of miniature stage-set societies. Yet in all the books, the general pattern of insoluble problem and flight persists.

*The Princes of Earth* is favorably comparable to standard Heinlein juveniles, containing the usual Kurland mix of convincing future societies, sympathetic characters, intriguing problem-situations, and rapid transfer from problem to problem. There is also an excellent infusion of satire, most notably a hilarious parody of the Church of Scientology. Although no further books in the series have yet appeared. *The Princes of Earth* is clearly intended as the opening volume of a series.

—Richard A. Lupoff

**KUTTNER, Henry.** Also wrote as Lewis Padgett. American. Born in Los Angeles, California, 7 April 1915. Educated at the University of Southern California, Los Angeles, B. A. 1954. Served in the United States Army Medical Corps during World War II. Married C. L. Moore, *q. v.*, in 1940; most of his subsequent work was written with her, though not always acknowledged. Worked briefly for a literary agency, Los Angeles; free-lance writer. *Died 3 February 1958.*

#### SCIENCE-FICTION PUBLICATIONS

- Murder of a Wife*. New York, Permabooks, 1958.

\*

Bibliography: by Donald H. Tuck, in *Henry Kuttner: A Memorial Symposium* edited by Karen Anderson, Berkeley, California, Sevagram, 1958.

\* \* \*

In reviewing Henry Kuttner's collection *Ahead of Time*, Anthony Boucher characterized the author as "one of S. F.'s most literate and intelligent storytellers." Other adjectives could have been added to the list: prolific, versatile, popular. There have, it is true, been periodic dry spells when editors and readers have seemed to forget the rich legacy of Kuttner's fiction, but the stories have always been re-discovered and brought back into print. There is every reason to believe that his best work will last as long as science fiction is read.

For many years the scope and volume of Kuttner's writing were partially camouflaged by the many bylines under which his stories appeared. Initially the pen-names were adopted for the

usual commercial reasons: to differentiate among various types of story or to disguise the fact that more than one story on a contents page was by the same author. But Kuttner, both alone and with his wife C. L. Moore, seemed to take an active delight in the creation of new pseudonyms, even on two occasions going so far as to publish fictional "autobiographies" for an alter ego: Keith Hammond in *Startling Stories*, March 1946 (an Eurasian antiquarian with sixteen cats), and C. H. Liddell in *Planet Stories*, November 1950. As one after another of the Kuttner/Moore pseudonyms was revealed, a phenomenon arose which was sometimes called the "Kuttner Syndrome": the conviction that *any* promising new name on the SF scene had to be yet another Kuttner pen-name. (One of the victims of this assumption was Jack Vance, who was identified by the editor T. E. Dikty in 1950 as a Kuttner pseudonym.) The original choice of pseudonyms for various stories has by now become clouded through numerous reprintings with altered bylines.

Kuttner's first story, "The Graveyard Rats," a superbly grisly horror story in the Lovecraft mode, appeared in *Weird Tales*. Kuttner continued to write for *Weird Tales*, but at the same time he became a prolific contributor to other pulp magazines of many types, including mystery, detective, western, adventure, "spicy," and South Sea tales. His first long story was "The Time Trap" (*Marvel Science Stories*), called "a marvellous gaudy melodrama" by Brian Aldiss. Kuttner had been a member of H. P. Lovecraft's circle of correspondents, and had met other members of that group, such as Robert Bloch, Fritz Leiber, and E. Hoffmann Price. Kuttner and Bloch collaborated on a few stories. Kuttner also collaborated with Arthur K. Barnes on two stories in their Pete Manx series. Manx was a carnival barker whose mind was projected back in time into the bodies of various inhabitants of ancient Rome, Egypt, Baghdad, and other historical or legendary locales, where he must use his innate cunning to survive. The series was carried on alternately by Kuttner and Barnes from 1939 to 1944.

Another Lovecraft correspondent and well-known *Weird Tales* writer whom Kuttner met was Catherine L. Moore. Kuttner and Moore were married on June 7, 1940, in New York, where Kuttner had moved in order to be close to his magazine markets. Kuttner and Moore had collaborated on one story in 1937, but it was not until after their marriage that their remarkable writing partnership developed. Kuttner stated on several occasions that almost all of his writing since the marriage, regardless of byline, was to some extent a collaboration with his wife; however, the degree and method of collaboration varied widely. Some stories were almost pure Kuttner, with only minor contributions from Moore, while for others the reverse was true; but on a large number of stories the two partners were able to blend their ideas and styles so well that one of them could drop a story in mid-scene and the other could pick it up, with scarcely a seam showing in the final product. While taking part fully in the collaborative works, C. L. Moore also continued to write her own stories.

The Lewis Padgett stories, taken as a whole, form a body of work of which any writer could be proud, and if Kuttner and Moore had done no other writing in the science fiction field, their reputations would still be secure on the basis of these stories. Fritz Leiber (in *Henry Kuttner: A Memorial Symposium*, 1958) identified three themes which recur in Kuttner's science fiction: the madman from the future, wacky robots, and wonder children. All of these are present in the Padgett stories. The Padgett treatment of robots, in particular, is as distinctive as that of any writer in the field. One of the best-known, "The Twonky," is concerned with the effect on a young married couple of a device which looks like a console radio, but is actually a robot designed to enforce its own views of proper

behavior. Several of the Padgett stories were about the odd inventions of Gallegher, a scientist who can invent things only while drunk, and when sober, can never remember what the inventions are for. Told in a style frankly borrowed from Thorne Smith, the Gallegher stories are meticulously logical SF puzzles cast as wacky comedies. Five were reprinted as *Robots Have No Tails*. The deservedly famous "Mimsy Were the Borogoves" is about educational toys from the future which have a disastrous effect on a present-day family. Other Lewis Padgett stories include the Baldy series ( *Mutant* )—about telepathic mutants who must struggle for survival against the intolerance of their normal neighbors and against irrational renegades in their own ranks, a theme clearly taken from A. E. van Vogt's *Slan*—and "The Fairy Chessmen" (with its celebrated opening line, "The doorknob opened a blue eye and looked at him") and "Tomorrow and Tomorrow," complicated tales of post-Atomic intrigue and alternate futures.

One of C. L. Moore's works from the 1940's was "Clash by Night," a moody, emotion-laden story of the Free Companies, the mercenaries of the feuding undersea Keeps on Venus in the 25th century. The Kuttners returned to this scene with the novel *Fury*, the story of Sam Harker, ruthless and driven by forces of which he was not fully aware, the one man who could liberate humanity from its stagnant undersea existence and push it into conquering the planet's savage surface. Although published as by Lawrence O'Donnell, the story was mostly Kuttner's. C. L. Moore stated in her introduction to the Lancer reprint: " *Fury* was written by about one and an eighth persons . . . I wrote comparatively little of the copy. The idea was basically Hank's and I didn't identify very strongly with it." She also pointed out that the novel deals with "the two recurring themes which emerge quite explicitly in nearly everything we wrote. Hank's basic statement was something like, 'Authority is dangerous and I will never submit to it.' Mine was, 'The most treacherous thing in life is love.'" *Fury* is the best, and best-known, of Kuttner's long stories. Other long works include a series of nine science-fantasy novels, many of them in the romantic/tragic mode of A. Merritt, written between 1943 and 1952, including *Earth's Last Citadel*, *Valley of the Flame*, *Beyond Earth's Gates*, and *Well of the Worlds*. Typical shorter works in the same style are "I Am Eden" (December 1946) and "Way of the Gods" (April 1947), both in *Thrilling Wonder Stories*. In the early 1950's the volume of new Kuttner-Moore stories decreased. Both Kuttner and Moore felt written-out in science fiction, although such stories as "Home There's No Returning" and "Two-Handed Engine" (both in *No Boundaries*) belied this claim.

Henry Kuttner has sometimes been criticized as a literary mimic who spent his energies speaking in other people's voices. He did, in fact, speak in many voices, but they were all his own. His borrowings, whether of style or of theme, were all filtered through his own sensibility, and emerged transmuted. In all of his best work there is clear evidence of a highly individual mind at work. Perhaps his most personal contribution to science fiction was the fusion of humour and logic which first emerged fully in the Gallegher stories. The same blend was also evident in the stories of the Hogbens, a family of mutant hillbillies, and in "The Ego Machine," probably his best "wacky robot" story. Through his stories and through his influence on other writers—Ray Bradbury, Leigh Brackett, and Richard Matheson have all acknowledged his guidance—Kuttner left an indelible mark on the science-fiction field. Without his presence, science fiction of the 1940's and 1950's would have been a vastly different and much poorer body of literature.

—R. E. Briney

Bibliography: *An R. A. Lafferty Checklist* by Chris Drumm, Polk City, Iowa, Drumm, 1983.

Manuscript Collection: McFarlin Library, University of Tulsa, Oklahoma.

## R. A. Lafferty comments:

My novels, which I wrote myself at great labor, have received more attention than my short stories, which wrote themselves. Nevertheless, the short stories are greatly superior to the novels. In my introductory note to a Dutch version of *Nine Hundred Grandmothers*, I wrote:

"I hold to the true theory that good stories write themselves, or that they are independent and pre-existent entities or beings. . . . These pre-existent stories come to persons, sometimes even to persons of a resonant emptiness; and they make themselves known through these persons. . . . I am very glad that these particular stories first visited me and not someone else.

"There are a few perfect discoveries or encounters that come into every life. Only once I met a mountain lion, quite close, in the wild. She was a discovery of mine. Once only I saw a whale a-blow in the ocean. Once only I saw a big-horn mountain sheep on a high cliff. Once only I saw a pink flamingo in flight. Once only I had an encounter with each of some hundred entities called 'special stories.' These meetings were as quietly thunderous and as unexpected as the discovery of the mountain lion or whale or big-horn sheep or pink flamingo in flight.

"There is an Aladdin cave, lit by 999 lamps, that is the Universal Unconscious . . . that is shared by all persons and creatures. . . . Unsuspected stone doors of the cave are thrown open. There may be funny and fascinating encounters and living spectacles. A few of them may cluster together in a pile of things waiting to be discovered . . . piles of gold, quick ecstasies, intricate delights, entities called 'special stories.'

"A person favored with such discoveries will look for other people to share them with. 'Hey, come see the things I've found,' he'll say. That is what I say now."

However pompous that may sound, it's a statement on the most important part of my work.

\* \* \*

R. A. Lafferty is science fiction's most prodigious teller of tall tales. Offspring of a yarn-spinning family, he writes rather than recites his exhilarating stories but nevertheless retains a primary allegiance to the spoken word. The quintessentially oral character of Lafferty's fiction proclaims itself on every page—each of them sounds like a tape recording transcript. (*Arrive at Easterwine* is actually presented as such.) Rhythmic repetitions of phrases and epithets tie the material together. The author is omnipresent as well as omniscient. He explains and interprets every development, sprinkling his text with epigrams, anecdotes, and invented sources. He even brings himself into stories as a thinly disguised character or as himself in *Through Elegant Eyes*.

Exposition and dialog overshadow action. Events are more often predicted or recollected than depicted. At shorter lengths, these events are often arranged in artificial patterns reminiscent of folk tales ("Rainbird"), exempla ("The Configuration of the North Shore"), dramatized lectures ("Primary Education of the Camiroi"), or barroom whoppers ("One at a Time"). In longer works, a degree of order is imposed via elaborate symbolism (e.g., the Four Living Creatures in *Fourth Mansions*). However, Lafferty's oral mannerisms hamper him when he mistakes the accumulation of vignettes for the construction of a novel as in *Arrive at Easterwine* and *The Devil Is Dead* or uses a novel as an excuse for sermons and diatribes as in *Aurelia*. (Compare the last with Robert A. Heinlein's *Stranger in a Strange Land*.)

Lafferty's way with characters is as distinctive as his storytelling technique. The floridly eccentric beings who populate his fiction are wholly unrealistic yet totally real. He succeeds best with children, traditionally the most difficult of subjects, because he approaches them with all the sentimentality of a W. C. Fields: "A child's a monster yet uncurled" (*The Reefs of Earth*). However, Lafferty's distaste for adolescents shows up in his Hugo winner "Eurema's Dam."

Besides outrageous youngsters, Lafferty's character troupe

comprises: dirty old geniuses and innocent simpletons, ugly but wholesome men and violent but kindly ones, lusty egomaniacs and ascetic manipulators, witch-girls and earthy ladies of muscular charm, plus aliens that are every bit as variegated. They reappear in tale after tale: "though they always preserved the threads of their identities, they did not always have the same names or appearances, and there were not always the same number of them." Favorites get encores. Note the proper names common to *Fourth Mansions*, *Arrive at Easterwine*, and *The Annals of Klepsis*. *The Devil Is Dead* trilogy (including *Archipelago*, *The Devil Is Dead*, and the unpublished *More Than Melchisedech*) continues the historical fantasy Coscuin Chronicles tetralogy and all his extraterrestrial locales appear to exist in the same crazy universe.

So closely do Lafferty's novels resemble each other, they might as well be alternate drafts of the same story. This may reflect his habit of rewriting everything five or six times before the final draft. Elements seem to pass from work to work as easily as sherry through a solera. For instance, Lafferty's plots repeatedly combine conspiracy, romance, and growth. Secret battles between Good and Evil coterie decide the fate of worlds. Bright protagonists are shadowed by dark counterparts. Passionate couples share a yeasty mixture of carnal and spiritual love. Esoteric powers are acquired and used to prepare a chosen hero for an imperial destiny, but the outcome is often ambiguous. *The Flame Is Green* and *Half a Sky*, the first two volumes of the Coscuin Chronicles, demonstrate his scenario best. Against a panorama of 19th-century history, an Irish-born hero and his multinational comrades fight for the Green Revolution against the Red Revolution led by the Devil's own son.

In novels and short stories alike, Lafferty is obsessed with transformation. His version of Nature is incorrigibly protean—space, time, and form are liable to shift at any moment. Changes that nourish the "green-gowing world" must be welcomed whatever they cost. The price can be bloody. Lafferty's pages are speckled with gore, either from hand-to-hand combat or the butchering of animals. Yet the slaughter does not stun because death can be followed by resurrection, mutilation by healing, corruption by redemption. Lafferty knits these components together with allusions to mythology and theology. Biblical precedents influence his handling of topics like kingship, sacrifice, and regeneration. They also shape his use of animal symbols such as snakes. This is especially true of *Fourth Mansions*. Here, a naive young newsman integrates the essence of four primeval forces (Badger/Man, Python/Lion, Toad/Ox, and Falcon/Eagle) and becomes mystical Emperor "by entrenched right" to nudge the world towards the next higher Mansion in the cosmic Castle.

Lafferty also draws on history for inspiration ("Thus We Frustrate Charlemagne"). However, the thought can get lost in the quirkiness of his presentation. For instance, perceptively interpreted data in *Okla Hannali*, his epic of the Choctaw Indians, are so entangled with fable that it is hard to accept anything in the book as real. The same eccentricities abound in *The Fall of Rome*. But the Coscuin Chronicles have a sturdier skeleton of fact under the fluid flesh. The foreign locales of these books have a useful distancing effect—exotic events are more acceptable in exotic settings than in the contemporary American ones in *Fourth Mansions*.

*Past Master*, Lafferty's most popular novel, depends less on factual than on mythicized history. Sir Thomas More is brought forward in time and outward in space to save a diabolical utopia by dying a king's death. Lafferty sends his highly fictionalized 16th-century hero into the 26th-century to dramatize 20th-century spiritual and social issues. Compare this savory

scramble of past, future, and present with Ursula K. Le Guin's didactic fable "The Ones Who Walk Away from Omelas."

There is not a bit of science in Lafferty's sf. He justifies his premises on etymological rather than scientific grounds: the name *is* the object. He coins outlandish names, chiefly from Greek and Latin, then interprets them in idiosyncratic ways—the derivations in the Coscuin Chronicles would make Isidore of Seville blush. (His debt to the classics extends to farce as well as philosophy. See *Space Chantey*, his reworking of the *Odyssey*. *Archipelago* was inspired by the Argosy.)

Bizarre nomenclature does not exhaust Lafferty's rampaging delight in words. He showers his pages with odd poetry. (Who else would dare to rhyme "roses" with "apotheosis" or turn chapter titles into narrative verse as he does in *The Reefs of Earth*?) This verbal virtuosity makes him sf's equivalent of "Flann O'Brien." He loves exaggeration and grotesqueries as well as any Celt before him—surely one of his ancestors had a hand in *The Cattle Raid of Cooley*. But Lafferty appreciates ethnic spice of many flavors—his admired "seven bloods of Basse-Terre include all three races. He uses almost as many Amerindian referents as Irish ones ("Narrow Valley") and is fascinated by gypsies ("The Land of the Great Horses").

Readers and critics alike have prized the shimmering emerald surface of Lafferty at the expense of his substance which current society is ill-equipped to recognize much less comprehend. (Compare Lafferty's situation with that of equally uncommercial Cordwainer Smith, a devout Episcopalian.) This author cannot be understood apart from his self-proclaimed conservative Catholicism. A case in point is his abhorrence for liberal Catholic philosopher Pierre Teilhard de Chardin. This point goes unnoticed even when it is explicitly stated, yet it is vital to interpreting Lafferty's metaphysics. He decries Chardin's evolutionary Omega Point as "the sickening emptiness of the Point Big-O." He rebuts the notion of natural perfectibility with visions of evil so insidious only grace can conquer it.

Lafferty's great subject is the perennial war between Heaven and Hell: "We must kill the Devil afresh every day." This Adversary is no silken Mephisto but a musky blackguard whom healthy young men can drink under the table. Be they ever so pungent, demons like Ifreann in the Coscuin Chronicles and Papa Diabolus the *The Devil Is Dead* are never allowed to steal the show. The heroes and heroines overwhelm them with sheer vitality. Vice can imitate but never match the "overrunning gaiety" of virtue. Making Goodness exciting is a Lafferty specialty.

Although he rode to prominence in the 1960's with the New Wave, Lafferty shows none of the gloom characteristic of that movement. His fiction rings with the high hilarity of love and laughter. Each of his serious works ends on a note of hope, for his is the faith-filled vision of a universe en route to redemption. Despite detours, it keeps gyring upward according to divine plan. "All final answers were given in the beginning. . . . It is our task to grow out until we reach them."

—Sandra Miesel

## David Lake comments:

The main impulse embodied in my SF is the impulse of the

human rat to imagine escapes from the cosmic trap in which he finds himself. The trap is partly (but only partly) of his own building; it has been building for a very long time; and the bars now loom very high indeed. Sometimes the rat thinks he can escape by a smart technological fix; sometimes he knows that he can't. But either way he can at least dream.

The main influences on my writing are probably H. G. Wells and C. S. Lewis, and the clash between these two authors' values. I follow Wells and Lewis in writing SF that deliberately borders on fantasy. Elves may appear wearing spacesuits. The same themes also appear in my poems, some of which are in fact close to being SF.

David Lake presents himself as a pessimist in search of the numinous, a fantasist without belief, choosing science fiction as his vehicle for escapism because magic doesn't work. Lake has little confidence in the efficacy of science, either: his alter ego, Ambrose Livermore, is able to use a time machine as his escape hatch into the future, leap-frogging the inevitable Big Bang, only to find the survivors engaged in determined regress, already back in 1900. In this witty tale, despair is salved by humour: Ambrose flourishes in the future 1 BC as Chief Jester to Oblorix.

\* \* \*

If Earth is the City of Destruction in a godless universe, where may hope be found? In his novels Lake catapults small colonies of survivors to distant, wondrous planets, and New Jerusalem is actually built foursquare on Dextra. The two Dextra novels are paradigmatically interesting, complementing each other much as Blake's *Songs of Innocence and of Experience*. *The Right Hand of Dextra* suggests the State of Innocence, in which it is possible for the Puritan tendencies of the New Earthmen with their "Sifted Scriptures" to be corrected by incorporation with the innocent native species, despite the dextran twist of their protein molecules. Experience seems to prove otherwise, however, in the bleak feudal world of *The Wildings of Westron*, several thousand years later, until the implicit conclusion of the first book is reiterated in absolute form: before there can really be a New Earth on Dextra, all human flesh must perish and only Dextran flesh remain. Most humans will voluntarily undergo the change; the reluctant must simply be exterminated. There is no hope in human flesh because it is closed; Dextran flesh, however, is open, unsecret, because it allows telepathic understanding of one another. The conclusion of *The Gods of Xuma* is not quite so sweeping: only the hopelessly evil human colonists are slaughtered—and fortunately the Xuman natives can tell the difference and are prepared to tolerate those humans remaining who are essentially good natured. However, it is decided that humans are not fitted for space travel. If Lake is thus predisposed in favour of aliens, describing them warmly and even with affection, he is not unduly sentimental about them, particularly about his Xumans, and wishes to correct the supposition, hung over from Burroughs, that physical love with an alien can be satisfactory. The hero's comic embarrassments with Xumans in their female phase prove the point. On the other hand, Lake's aliens are usually not very different from people and do provoke erotic ideas; however, their function is not to be wonderful love-objects (as in Burroughs) but to suggest wonderful possibilities of loving interchange between humans, suitably modified. In *The Right Hand of Dextra* he uses the Song of Solomon as the basis for a description of a transcendent sexual union, only confusing the terms, so that male and female sensations become interchangeable; in *The Wildings of Westron* he echoes Blake: "Every minute particle and particular of their

body-minds were commingling, from the head even to the feet, and on every plane of existence."

Lake is an imaginative writer with the power not only to invent exciting worlds but to describe them; he acknowledges the influence of C. S. Lewis, and his evocative accounts of the deserts of Xuma or the purple forests of Dextra bear comparison with those of Malacandra. His most wonderful world is in *Walkers on the Sky*, a tier-world Farmer might envy, ruled capriciously by immortals as if to recall Zelazny's *Lord of Light*. It is a pity that he had not found a story worthy of his world, but this charge may also be leveled at Farmer, and Lake's novel is at least free from Farmer's sometimes heavy portentousness. It was more fortunate for Lewis that the impression of his marvellous planets could overwhelm even his grand theme; but to gratify one's sense of wonder and be bored or irritated by the story which presents the wonder is like eating great food in a dirty restaurant with poor service: usually the science fiction reader is glad to pay the one as the price for the other.

In "Creator" Lake shows he is prepared to tackle the big theme and, if he trivializes it somewhat in the process—our universe exists inside a "creatron," a kind of game machine for artists on the plant Olympus, our creator being Jay Crystal (J. C.—get it?)—he does also succeed in providing a provocative ironic perspective on human history. The short story may suit this author's evident talents better than the novel for a while, as it will free him from the tedium of providing a stock narrative.

\*

David Langford comments:

Anything said here *ought* to be redundant. A work requiring the author's personal introduction ("Now I want you to meet little Johnny, boys and girls. He's a bit subnormal and deformed, but don't you dare tease him") is hardly likely to make its own way in the horrid outside world of bookstands. However . . .

I'm a technophile but a somewhat pessimistic one; it seems so unfair that shiny, alluring technological toys keep pointing the way to more and easier megadeaths. Yet because I like intellectual games I keep playing literary hopscotch on the edge of the unthinkable, cracking jokes about a variety of armageddons: current (*The Leaky Establishment*), seriously extrapolated (*War in 2080*) and wholly imaginary (*The Space Eater*). In the shorter efforts there are lighter jokes, parodies, and sheer fun; give me twenty thousand words or more, though, and I end up addressing gallows humour to the Angel of Death, the Spectre of World War III, the Ghost of Christmas Yet To Come, or some such unjolly companion.

By publication time this will be less an introduction than a memorial. I've no idea what I'll be writing next year, while swift and efficient technologies of modern-day publishing will doubtless have made all the above-listed works quite unobtainable. (Support a starving author—write to me and buy my remainders!) My ambition is to become a capitalist.

\* \* \*

David Langford began writing as a fan while still a student and his work still retains many of the hallmarks of fannishness. (And just reflect that there's no other field of literature where that statement would make any sense). He began by writing parodies of Doc Smith and the awful German "sci-fi" series, one of which ("Sex Pirates of the Blood Asteroid") he quotes at the head of a chapter in *War in 2080*. Much of his later work has the same delight in taking apart the illogical and second-rate, especially in "Facts and Fallacies," a collection of thoroughly wrong predictions and scientific pronouncements, and in his SF review column for *White Dwarf* magazine, where he takes more delight and more space in stepping firmly on the latest multi-volume clunker than in recommending the things he enjoys (no bad thing in a book reviewer). Langford keeps a foot firmly in fandom with the fanzines *Twll Ddu* and *Ansible*.

Since he left the scientific civil service to become a full-time writer, much of Langford's work has been in collaboration with other writers, as in *The Necronomicon* and *The Science in Science Fiction*, but he has produced three books of his own of interest to the science-fiction reader. The first, *An Account of a Meeting with Denizens of Another World, 1871*, is a slim one-joke volume. An extraterrestrial probe lands in a wood in Buckinghamshire

during the last century and being discovered by a local craftsman tries to open communication with him. A cod modern commentary laments the difficulty of conveying the idea of quarks and DNA by purely visual means. The book is a counter to all those tales in which two species meet and go from the square of the hypotenuse to establishing embassies inside a few days.

*The Space Eater* is the only one of his two novels that can be called science fiction in a conventional sense. It's a hard science-fiction tale centering on unlikely new branches of physics leading to ways of destroying worlds even more spectacular than the nuclear devices the author once worked on. Its chief faults are unevenness of tone (at the tensest moments the hero goes off into typically Langfordian flights of fancy) and the characterisation of the hero who goes from being an automated killing machine at the start to being a Thoroughly Nice Chap at the end, totally changing his nature and all for no particular reason. Despite this the story retains interest and is also notable for containing the SF universe's most impractical space drive.

His most recent book, *The Leaky Establishment*, is only marginally SF, being a very enjoyable farce concerning a researcher at a British Nuclear Centre who finds himself in the position of having to smuggle plutonium warheads back into the top-secret centre. Langford's chief joy is mocking Civil Service procedures in the shape of a committee to improve the public image of nuclear weapons ("The suggestion that individual missiles be named after members of the Royal Family to promote empathy and good public feeling was felt to merit further consideration").

Langford has probably yet to produce his best work but we can look forward to much good entertainment while he works on it.

—Michael Cule

Sterling E. Lanier's fiction presents a world teeming with creatures of the fantastic imagination, making it seem as though Tolkien were set in some future century. No innovator or philosopher, Lanier sails on well-charted seas of the supernatural and unnatural. His work almost always combines the worlds of fantasy and science fiction, and although his output is relatively small, his novel *Hiero's Journey* is of sufficient merit to warrant close attention.

A summary of this novel can hardly do it justice as the story pivots on one of the oldest and most frequently used plots of the genre: the hero sets out on a quest for lost knowledge through a world laid waste by nuclear war and controlled by mutants made horrible and evil by radiation. However, Lanier is able to inform this trite plot with his own vision of the fantastic and produces a world that is both delightful and terrifying. The questing hero is Per Hiero Desteen—priest, exorcist, killman, and citizen of the Metz republic of Kanda—who sets off in the eighth millennium in search of ancient legendary machines called "computers" that will help him and his people put together the knowledge of the past. This knowledge is the last hope for survival against the various forms of evil that resulted from the Death (nuclear holocaust). This theme is not without its own moral convictions, and Lanier attempts to tie his story to present-day concerns in several ways. Some connections are made through a language that is not nearly as interesting or inventive as one might hope for in this kind of novel: Lantik Sea (Atlantic Ocean), Kanda (Canada), Neeyana (Indiana), Leemutes (lethal mutations). More interesting are the contemporary social and environmental values that are invested in the tale. The nuclear devastation is served by a group of men called "the Unclean." These men were formerly psychologists, biochemists, and physicists who have been severely ravaged by radiation and now seek to rule the evil world they have created. On the other hand, Hiero is joined by a wise ancient, Brother Aldo, who belongs to a group called "the Eleveners." The eleveners are the Brotherhood of the Eleventh Commandment, a group of social scientists dedicated to the ideal: Thou shalt not despoil the Earth and the life thereon. Hiero and Brother Aldo are accompanied by a telepathic, almost human bear (Gorm), a semi-intelligent bull "morse," and a strong-willed but faithful young maiden (Luchare).

Lanier's strengths and weaknesses are both evident in this fantasy adventure yarn. He is at his best when weaving a

suspenseful tale, and, while his characters lack depth and the plot has been often used before, the world he creates, filled with radiation-induced mutants, ancient, knowing wizards, and fur-covered dwarves, lives fully in the imagination and allows the reader to partake fully in the suspenseful quest. Lanier is obviously aware of the parallels with medieval romances, and those who enjoy *Beowulf*, *Le Morte Darthur*, and the sagas will be enthralled by the re-creation of those environments and values in a future time.

Lanier's other work is of a similar but lesser quality. His stories as a rule combine the fantastic world of unnatural monsters with the more traditional trappings of science fiction: space ships, time travel, telepathic communication. *The Peculiar Exploits of Brigadier Ffellowes* presents seven stories that feature a retired English Brigadier who narrates tales that involve supernatural powers and fantastic monsters. Lanier exhibits a good sense of humor in these stories and carefully sets them up as a series of Chinese boxes: a story within a story within a story. The monsters found here, like the Nandi bear and the sea serpent Jormungadir, are similar to those found elsewhere in Lanier's writings. But the best quality of Lanier is what accounts for the success of this and his other works: he is an excellent storyteller.

In some respects, E. C. Large could be considered a scientist's science-fiction writer, for he deals primarily with the concerns and perspectives of the scientist in his everyday life. Large's narratives, though not abstruse, explore scientific inventions and processes with acute detail, and his work might be included in what C. S. Lewis identifies as the "fiction of engineers."

The most notable work Large produced is *Sugar in the Air*, a book considered by many to be a near-classic, for it was this novel which first embodied in speculative fiction a relatively realistic idea of the scientist's work and social situation. The story concerns a young chemical engineer, Charles Pry, who is hired by Hydro-Mechanical Constructions Ltd., to create sugar

by photosynthesis, using only a handful of hints gathered by another, rather eccentric scientist. Pry succeeds in discovering the elusive formula, but he encounters conflicts with company financiers in the marketing of "Sunsap," as the product is called. They are concerned with obtaining the quickest and greatest profit, while Pry idealistically strives to make the product more beneficial for society, and the book becomes a kind of tragicomedy of the scientist and commerce. The novel thus inverts the motif of the mad scientist, for it is the corporation, not Pry, who wants to exploit the discovery for its own greed. This attitude of organization vs. the individual dominated later magazine science fiction, as for example when the lone nuclear scientist is pitted against the political and military powers.

*Asleep in the Afternoon*, a sequel, is also an invention story, though an inferior one, dealing with similar ideas and attitudes. Charles Pry, having lost his job with Hydro-Mechanical, decides to write a novel, which is about the invention of a sleep-inducing device. Within this rather unexciting framework, Large again satirizes capitalism and corporations, as well as other aspects of contemporary life, political structure, and social attitudes.

While the first two novels deal with the relationship—and often the conflict—between the scientist and the community, *Dawn in Andromeda* is a Utopian allegory. Ten British men and women (five of each) emerge Venus-like from the sea one morning onto the shores of an uninhabited planet in the Andromeda galaxy, where they have been transported by God in a rather ridiculous opening. Equipped with their scientific knowledge and practical skills—and some faint memories of Earth—they build a new society and community on this strange world, which closely resembles Earth. The original group is harmonious enough; it is the second generation's spontaneous pursuit of commerce and religion which spoils the Utopian dream, reflecting the same sort of criticisms that Large displays in the previous two books. Again, the narrative is heavily endowed with scientific detail, exploring every step of the little society's progress.

But Large circumvents the most obvious problem, that of interplanetary transportation, choosing instead to follow C. S. Lewis's advice that "frankly supernatural methods are best." So the novel really doesn't follow the 17th and 18th-century tradition of the voyage to another world, being concerned instead, like Wells's *First Men in the Moon*, with what happens there.

Though Large is obviously more scientist than writer, his books do have some literary qualities worth noting: his prose is often strong and direct, tough, effective; his characters, though not fully rounded, compel interest and arouse sympathy; he also uses imaginative names, giving characters such apt identities as Cocaine, Dr. Sinus, Dr. Zaareb, MacDuff, or Hunt-Transom, while the crew in *Andromeda* take their names from the alphabetical letterings on the bindings of *Encyclopedia Britannica*.

Large's novels evince a firm belief in science and its potentiality; they laud the moral scientist of commitment and decry the stupidity and incompetence of so many social organizations—business, commercial, religious, political, revolutionary. Large's work offers an interesting, knowledgeable, and valuable perspective of the scientist, his work, and his place in society.

Manuscript Collection: Fullerton College Library, California.

Philip Latham commented:

(1981) Since most of my firsthand experience is in astronomy, most of my fiction has an astronomical background. But one of my stories, "Kid Anderson," is about a prizefighter. I firmly believe that science always leads science fiction. Increasingly I have gone over to science fantasy, as in "Jeannette's Hands" and other stories. My stories are always written on the basis of *people rather than gadgetry*.

Where science fiction will go in the future is a guess. There is little left to write about: we have already written stories of interplanetary travel, extra dimensions, time travel. *Star Wars*, for example, to my mind was a fairy tale: you could have anything you wanted in it. Most science-fiction writers have inventive ability and ingenuity, but lack true imagination, an extremely rare gift. I neither read science fiction nor look at SF on TV or in motion pictures. Henceforth, we must try to find material in the world around us. It is there if we can see it.

\* \* \*

A scandal in American science fiction is how little science there is in it. A notable exception lies in Philip Latham's stories, since they were written by the professional astronomer Robert S. Richardson and bear the marks of his expertise. For more than three decades Latham's stories appeared from time to time in the major magazines and anthologies, and Latham also wrote juvenile science-fiction novels.

Many of the early stories are based on astronomical speculation, often presented as realistic reporting. An example is "The Aphroditic Project," which has the pretense of being science fact, complete with footnotes to astronomical journals. The story imagines a 1946 Navy contract to launch a satellite rocket to Venus to measure its mass. Once near Venus the rocket releases a cloud visible to Earth—Latham does not foresee the sophisticated radio telemetry which has actually been used on

such probes. The rocket succeeds in measuring not only the mass of Venus but also its period of rotation. A secondary theme is governmental secrecy as the military authorities clamp down on the release of information about the mission. The story thus presents itself as an exposé of confidential information. "The Xi-Effect" is another example of Latham's astronomical science fiction. Astronomers discover that although the universe as a whole expands, the Earth is in a segment which is shrinking, cutting out greater and greater percentages of radiation so that the eventual extinction of all light seems inevitable. In this story we begin to see Latham's interest in the characters of scientists as well as in science. Latham presents a communication gap between the branches and modes of science. It is a theoretical physicist who predicts the Xi-Effect, and the practical astronomers are shown to be as skeptical of theory as in the public at large. "The Blindness," about the return of Halley's comet in 1986, is hardly a story at all but a meditation on the influence the comet has had on history. A theory of atomic sentience is developed to explain the comet's deviance from its projected orbit. Even in this early story the scientist Richardson makes clear his interest in anti-science and mysticism.

Latham's more recent fiction develops much further the theme of the dubious border between science and magic. Much more central to these later stories, too, is a particular kind of character: the anti-hero who wins the reader's sympathy for his struggles in an absurd world. "After-Enfer" is an example of a Latham story which revolves around character rather than science. The story's title derives from "N-Fear," fear of other dimensions. Sam Baxter, afraid of life, stuck in a museum job, applies for the job of exploring N-space and breaks through to genuine heroism. In "Jeannette's Hands" and its sequel, "A Drop of Dragon's Blood," Latham's protagonist is an astronomer, Bob, who is literally and figuratively married to an astrologer named Dagny. We learn in these stories about the seamy side of being a professional astronomer: the rivalries and the petty jealousies between those who hold conflicting theories and conflicting claims to grant money. Bob's rival Thornton has an innovative theory about the age of the universe, but Bob suspects him of rigging his data. The rivalry is extended in the story to the details of competition over the use of the observatory during the limited nights of good viewing. Latham gives us the comedy of Bob's loss of status when Dagny is appointed official witch of California. Such are the foibles of astronomers in this story that astrology seems a refreshing alternative. In "A Drop of Dragon's Blood" we learn more about the politics of being an astronomer, the need to produce sensational findings in order to attract research funds. Bob makes a public prediction of a period for the variable star Mira in a desperate hope for publicity, because his job is in trouble. His prediction comes true in an ironic way: Mira's companion brightens at exactly the time Bob predicted Mira would brighten, in a new phenomenon, the "simmering nova." The point of the story is the unexpected nature of the universe: "there are ghosts everywhere." Once again Latham tempts us to side with Dagny's brief in magic. Although Latham brought science to science fiction, he certainly did not bring mechanical materialism.

In his most recent stories Latham turned almost completely away from the hard science of his earlier work. In "Miracle Elixir" an ordinary office worker, who works for Pearce's Golden Specific but never thinks of taking the company product, learns what it is like to have his life turned around by a "real" elixir. Without the interest of science, Latham's recent stories are sometimes thin and awkward. Latham could not be called a major science-fiction writer. But he brought science to

his best science-fiction stories and he created anti-heroic and likeable astronomers as characters.

## Keith Laumer comments:

I have been asked if my work is "relevant," i. e., political propaganda. It is not. I prefer to treat themes that have been important to man ever since he became man, and will continue to be important as long as humanity survives: strength and courage, truth and beauty, loyalty and justice, ethics and integrity, kindness and gentleness, and many others.

\* \* \*

During the 1960's, Keith Laumer was one of the most prolific of science-fiction authors. He has slowed down somewhat recently, but even so he has to his credit a long string of titles which range over wide areas both in subject matter and in treatment. Laumer's first novel, *Worlds of the Imperium*, is told as a conventional adventure story, with only an occasional light touch. But in *The Time Bender* and its sequels featuring Layfayette O'Leary, Laumer writes what amounts to a gentle parody of his own Imperium series. And the humor in the long and popular series (mostly of short stories) concerning interstellar diplomat Jame Retief stretches almost all the way to farce. But Laumer can play the other side of the court as well: the tone is serious, even grim, in works such as *A Plague of Demons* and *Night of Delusions*. As for subject matter, Laumer has tried out virtually all the traditional possibilities and has enriched the realm of science fiction with innovations of his own—most notably the brilliantly detailed and remarkably plausible picture of the "fabric of simultaneous reality" introduced in the Imperium series. Laumer has written space-war stories, space-diplomacy stories, slightly rationalized fairy stories, time-travel stories, parallel-world stories, robot stories, psi-power stories, invasion-of-the-Earth stories (including *The Monitors*, in which the invaders are the good guys), stories of intrigue, love, rational detection, mystical apotheosis, and on and on.

Yet for all its diversity, Laumer's work holds unities as well. Some of these are of a negative sort. For instance, there is never an unhappy ending. A Laumer hero may lose a girl, but if so he will usually marry another, and will in no case allow one misfortune to poison his entire life. He may get killed in the end, but he will never go unmourned and (in *Assignment in Nowhere* and others) his sacrifice may well save the world. In the area of positive generalizations, it can be said that in some measure all Laumer stories are adventure stories, even if the author's focus is on satire, farce, romance, ratiocination, or philosophical speculation.

Moreover, Laumer heroes are virtually all of one general pattern, with variations determined chiefly by degree of maturity. While the typologies are not identical, the Laumer character does bear striking similarities to the "Heinlein individual" described by Alexei Panshin. Explanations for this resemblance might range from some basic principle of storytelling to Heinlein's and Laumer's similar background as military officers. The basic Laumer type is the full-formed competent man—sure of himself, resourceful, able to mix easily

with all levels of society and to get what he wants out of anyone. Laumer has put the basic type to heaviest use in the person of Retief, hero of a "template series" where character growth is ruled out by the ground rules. For most other applications, the basic competent man is too static—he can indeed be roused to action, but only to protect what he has. A slight variation Laumer employs more often is an incipient competent man whose character is fully formed but who has not yet found his niche in life, and who is consequently searching for fulfillment. Brion Bayard fits in here in *Worlds of the Imperium*, though in the sequel, *The Other Side of Time*, he has matured into the basic type. It is of course possible to begin at an earlier point, with someone who must learn not merely how to apply competence, but competence itself. This gives us characters such as Billy Danger in *Galactic Odyssey* or, in a more humorous vein, Layfayette O'Leary. But Laumer has also interested himself in movement in the other direction, beyond the competent man. Perhaps because of his own relative youth during his peak writing period, Laumer has chosen to do this not by putting one of his heroes through some sort of mid-life crisis, but rather (in a tack he might have picked up from van Vogt or the early Heinlein—or from Sophocles) by having his hero discover something about who he is that causes him to transcend his status as the competent man. In the most extreme case, the largely unsuccessful *Night of Delusions*, the protagonist finds himself to be, for most practical purposes, God. Other Laumer heroes learn that they are supermen, Arthurian reincarnations, and various sorts of robots. The effects of such revelations also vary. Some heroes go off to pursue transcendental existence, some perish gloriously, and others voluntarily return to the human state. It is difficult to decide whether in these various encounters with the transcendental Laumer is trying to put forth a serious philosophy (in the manner of, say, Cordwainer Smith or Gordon R. Dickson), or simply, more playfully, to give his already-competent heroes somewhere to go, and to pique the reader's Sense of Wonder. Such mystic passages are not, in any event, the most successful part of Laumer's work.

The 1960's and early 1970's remain the significant period of Laumer's production. New titles appearing since that time have been generally repackagings or "fix-ups" of older work. A partial exception, *The Galaxy Builder*, is merely one more Layfayette O'Leary novel in the same mold as its predecessors. The repackagings and reiterations do little or nothing to remedy Laumer's characteristic flaws of insufficient attention to detail and excessive repetition from work to work. Consequently, it will be left to posterity to decide which of five or six versions of essentially the same story is the one really worth keeping. But some of Laumer will most certainly be kept.

\* \* \*

Tanith Lee has established herself as pre-eminent in both fantasy and SF with children's books ( *The Dragon Hoard*, *Animal Castle*), juvenile fiction ( *East of Midnight*), fairy tales ( *Princess Hynchatti and Some Other Surprises*), horror stories ( "Sirriamnis," "Winter White"), erotic adult fiction ( *Death's Master*, *Night's Master*, and *Volkhavaar* ), heroic fantasy ( *The Storm Lord*, the Birthgrave trilogy, "The Murderous Dove"), and conventional science fiction ( *Don't Bite the Sun*, *Drinking Sapphire Wine*, *Electric Forest*, *The Silver Metal Lover* ). All have strong characterization, intense emotional impact, tongue-in-cheek humor, and gorgeous people of enormous power and will who must pass tests before accepting themselves. The fantasies are long and episodic, sometimes in short-story form, full of exotic names and barbarous tribes. Though set on other planets, they have little ecological detail. Lee is concerned instead with people who walk alone, searching for significant destinies.

The Birthgrave trilogy constitutes heroic searches for identity. *The Birthgrave* was immediately ranked with works by Le Guin and Norton. It is a transition between her fantasy and SF modes, as is the ironic short story "The Truce." Its background is a society degenerated from greatness, horribly ignorant of the past and science. Its heroine awakes with no name or identity and a face so hideous she cannot endure it. Where women are mindless cattle, she cannot accept her obvious superiority and allow others, particularly handsome Vazkor, to use her. In Book III she has another rebirth. Leaving Vazkor's son with a bereaved mother, she follows a peaceful tribe. To save her companions she unconsciously summons a spaceship to destroy a dragon. This confrontation of technical and mental power helps her recall her past and accept her identity, telepathy, power over even nature, and great beauty. She determines to rebuild a race of mental giants. In *Vazkor, Son of Vazkor*, Tuvek changes from an insensitive tribesman to Vazkor, gentle, wise, and powerful. His development continues in *Quest for the White Witch* as the epic hero searches for revenge and a mother. The novels and *Anackire*, *Delusion's Master*, *The Storm Lord*, and *Volkhavaar*, are like Hesse's *Siddhartha*, about the education of a god.

The ends of *The Birthgrave* and *Quest for the White Witch* have elements of SF in the fall of a great civilization and the actual appearance of a spaceship. Unique in Lee's fantasy is its underlying seriousness and lack of a basis in religion or witchcraft. The people are godlike human beings who must learn to perfect and use their mental abilities responsibly. Before gaining control, Vazkor and Karrakaz, his mother, accidentally cause destruction. Both learn to rise above a degraded society

and be rid of guilt, and determine to restore advanced civilization to their planet.

The restlessness of the loner searching for identity is equally significant in the teenage heroine of the anti-utopian *Don't Bite the Sun* and *Drinking Sapphire Wine*. Society is totally controlled, even the weather within the domed city. Before 50, people party, dress outrageously, engage in delinquency, change bodies at whim, marry for a day or so, and try to sabotage machines that maintain perfection. Ensuring immediate rescue from death and a specially designed new body, monitoring bees make suicide impossible. After serious social deviance, an individual is sent to Limbo for Personality Dissolution and a fresh start. The narrator is lonely, precocious, and bored with perpetual fun. Her only true friend is the pet, as troublesome and as little disturbed by convention as she. To find meaning, she goes on an archaeological expedition. Back in the city, she dons a male body and fights a duel, killing another. Preferring exile to ego dissolution, she settles in the desert where she knows a good life once existed and begins her own counter-culture, outwitting the disapproving authorities. This world is different from those of Lee's fantasies in its technological development. Her narrative is colloquial, highlighted by special "Jang" slang instead of the high epic style used in the fantasy. Although the climaxes of self-revelation occur with few episodes and characters, one developing character commands attention. *Day By Night* is similar in its heroines, adventures in shifting reality, and contrast between highly developed cities and empty spaces. Easily read, these are suitable for juvenile as well as adult audiences.

*Electric Forest* centers on the developing character of "Ugly," Magdala Cled, a disfigured, abandoned child on a planet where everyone is beautiful. Claudio Loro, handsome, wealthy, and brilliant, offers her beauty at a high price—her real body to be cared for, a permanent hostage, while she masquerades as his scientist wife. Their project is successful physical and psychological transfer of people into android bodies for use in exploration and colonization. How will one react when confronting an identical android? As in her other short works, Lee turns the plot abruptly at the end. *The Silver Metal Lover* similarly plays with the relation of "real" and created life and the lonely young woman.

The amusing, good-natured parodic elements of *The Dragon Hoard*, *Animal Castle*, and *Princess Hynchatti* become biting in *Red as Blood*, or *Tales from the Sisters Grimmer* and *The Gorgon and Other Beastly Tales*. Lee turns fairy tales upside down playfully and usually makes the women heroes. "Cinderella" becomes a revenge story and "Little Red Riding Hood" a tale of vampires. Lee's ironic wit leads to a last woman on earth story ("Written on Water") and a sardonic variation on the theme that a man's approval can make a plain woman beautiful ("You are my Sunshine"). *Tamastara, or the Indian Nights* is a collection that shows her skill in adult fantasy and SF, ranging from myth to an ironic horror story about Indian actors, using the exotic.

In Lee's work there are strong character, vivid detail, carefully worked-out systems, and good story-telling, testimony to Lee's skill and versatility.

\* \* \*

The immensely popular fiction of Ursula K. Le Guin proves that popular literature may have literary merit, a serious message, and a large audience all at once. Today the notion of a science-fiction writer producing a novel of substance, even a novel of character, is not so remarkable, as researchers continue to demonstrate that works remarkable as literature have existed in this genre ever since the publication of Mary Shelley's *Frankenstein*; but at the start of Le Guin's career, in the mid 1960's, literary excellence in science fiction was regarded as rare. Le Guin, hailed as a *novelist* who chose to write science fiction, has always attracted an audience composed of genre fans as well as readers who would ordinarily disdain science fiction. Le Guin's work continues to be known for literary expertise which graces a thematic preoccupation with telling essentially hopeful stories of man transcending alienation to open his imagination, his intellect, and his heart to the real adventure of the universe. Le Guin, in common with many writers of science fiction, is a talented builder of new worlds and alien landscapes; she is comfortable with technological wonders, faster-than-light vehicles, and particularly with marvels in the field of long-distance communications, but her commitment, stated clearly in the essay "Science Fiction and Mrs. Brown," is to confirm man's essential humanity against a backdrop of alien situations by means of consistently viewing her characters as the "subjects" of her narratives rather than as objects. A subjective human approach to the marvelous underlines Le Guin's view that if "Mrs Brown [the ordinary, intriguing snatch of human character] is dead, you can take your galaxies and roll them up into a ball and throw them into the trashcan, for all I care. What

good are all the objects in the universe, if there is no subject?"

A large portion of Le Guin's work focuses upon subjective views of a universe incorporating numerous habitable worlds, each "seeded" by beings from the planet Hein. Each of the five novels and several shorter works in this series revolves around the literal and figurative quests of chief characters to discover their individual purposes within the contexts of their several different worlds and, often, within the broader context of the universe. The themes and chronology of the Hain series have been worked out over two decades, but the early works anticipate or foreshadow the best moments of her later work. One of the later novels, fascinatingly, provides the scientific explanation and development of a device—the instantaneous communicator called the ansible—which has been essential to all of the previous works.

The first published works in this series, *Rocannon's World*, *Planets of Exile*, and *City of Illusions*, do proceed chronologically and establish a thematic preoccupation with the duality existing in nature and in man viewed, as Peter Nicholls has pointed out, "not as polarities or opposed forces" but as archetypal symbols presented as "twin parts of a balanced whole" (*The Science Fiction Encyclopedia*, 1979). Each work employs the alien as the embodiment of alienation presenting to the hero the challenge of transcending fear itself, through embracing the unknown. Communication, whether through telepathic "mindspeech" or by means of the amazing ansible, is significant, often the symbolic crux of each climax. In *Rocannon's World* an outworld ethnological surveyor stranded on Fomalhaut II is unable to accept fully his destiny of remaining on the strange world until he achieves the ability to communicate through mindspeech. In a narrative which also emphasizes the importance of naming, it is significant that, in ironic understatement, the League of All Worlds, unbeknownst to the ethnographer, gives this world his name, Rocannon's World.

*Planet of Exile* depicts a world which is populated by two humanoid groups, each believing themselves to be fully human and therefore superior to the other. A female character, the dreamy yet strong-willed Rolery, represents the linking of the two cultures as she overcomes her awe of the "farborn" Terran colonists through her command of telepathic powers generally possessed only by the farborns. Interestingly, discipline, along with honest communication, is described as the key to individual purpose and successful community, while community (the cooperation of both "human" societies) is necessary for the basic survival of either group. "Community," asserts Le Guin (in "Science Fiction and Mrs. Brown"), "is the best we can hope for, and community for most people means touches: the touch of your hand against the other's hand, the job done together, the sledge hauled together, the dance danced together, the child conceived together." Significantly, Rolery is offered the hope of conceiving a child with her farborn husband, while the two groups, under extreme challenge from overwhelming environmental conditions, at last unite to form a new society. Metaphor is particularly rich in this novel, which anticipates *The Left Hand of Darkness* in its description of a world dominated by a frigid winter environment.

*City of Illusions* describes a Hainish world where mindspeech, previously the epitome of truthful communication, has been perverted by the alien Shing invaders who can manipulate it into a "mind lie." A complex narrative tells the story of the amnesiac Falk and his quest to discover his true name and homeworld. Throughout experiences of betrayal and disorienting double identity, his hopes were "staked now totally on one belief: that an honest man cannot be cheated, that truth, if the game be played through right to the end, will lead to truth." Here truth and

falsehood are regarded as polarities in essential struggle; truth may prevail only when the hero learns to allow both of his identities to work together and, significantly, when he gains access to the ansible so that he may communicate with the world of its origin as well as with the League of All Worlds. The League becomes known as the Ekumen of Known Worlds in *The Left Hand of Darkness*, which richly explores the themes suggested in earlier Hainish works. Genly Ai is a human ethnologist who visits the planet Gethen, where he is swiftly caught up in a snowbound society wrapped in political intrigue and characterized by a revolutionary (to Genly Ai as well as to the reader) androgynous worldview which raises questions about sexuality and sexism and shows a populace composed of individuals whose identity is divorced from gender. The Gethenians, usually neuter, experience a sexual cycle which gives them the ability to become either male or female at certain cyclical peaks. The implications of this alienness tax even the comprehension of this professional observer who learns that the limitation of his own alien perspective, his own alienation, is keeping him from appreciating and understanding this strange new world.

"Vaster than Empires and More Slow" and *The Word for World Is Forest* are shorter works in the Hain series which use the forest as metaphors for the unknown. The former (its title derived from Andrew Marvell's poem "To His Coy Mistress") is perhaps Le Guin's most polished and graceful statement of the need to embrace the alien, the Other, in order to understand it. Osden, a ship's empath, transcends the limitations of both time and fear when he literally embraces the surface of an alien planet which is covered by a network of sentient vegetation. "He had taken fear into himself, and accepting had transcended it. He had given up his self to the alien, an unreserved surrender, that left no place for evil. He had learned love of the Other, and thereby been given his whole self."

*The Dispossessed* is centered around the inventor of the ansible, a man called Shevek whose anarchist "Utopia" is ambiguously unable to provide him with the raw materials (chiefly free communication and flow of scientific information) which he needs to make his best contribution to society. This rich work is one in which occasional didacticism is nevertheless fascinating as two politically different worlds (one anarchistic, the other decadently capitalistic) are balanced by means of contrast and comparison, each presented in alternate chapters. The author uses visual perspective most strikingly here; the image of the wall as a defining force is powerfully employed, while in an early scene Shevek's world fills his view like a concave dish until, as his space vessel takes him a greater distance from it, it falls away into a convex circle, then a globe, then a distant world. The author also uses paradox, mathematical and verbal, as the key to truth, while communication among all men is the confirmation of man's essential humanity in the face of political, environmental, or other differences.

Some other major works by Le Guin include the Earthsea trilogy, a study of magical skill which appeals to adults as well as to the younger audience for which it was written. *The Lathe of Heaven* is a novel outside the Hain series dealing with a man of conscience who cannot bear the fact that his dreams effectively change reality. *The Beginning Place* is an allegorical novel portraying a fantastic "twilight world," a haven for two adolescents fleeing from unhappy family situations in a bleak, unnamed suburbia. The protagonists learn, by means of encounters with an archetypal monster, to face the harsh disappointments of their "real lives." *Orsinian Tales* and *Malafrena* evoke the 19th century in an imaginary country with a central European atmosphere. *Malafrena* deals with the coming of age of a young revolutionary who must learn to balance freedom and commitment.

*The Compass Rose* is an anthology of short stories organized around the four directions of the magnetic compass "that converge into or arise out of an unspoken fifth direction, the center, the corolla of the rose." Stories with settings and themes reminiscent of *Malafrena* are here accompanied by tales that are more strictly science-fictional and dealing with, for instance, a new Atlantis or an enigmatic cat used in a scientific experiment. A particular gem is "The Author of the Acacia Seeds and Other Extracts from the *Journal of the Association of Therolinguistics*" which succeeds brilliantly as a spoof of academic writing while also commenting on the difficulty of translating and the fascination of trying to understand the culture not only of another people but of a different life form.

In 1981 Le Guin's second poetry collection appeared including poems that cross boundaries and should not be categorized as science-fictional or not. It is noteworthy that some recurring images in the poetry pick up on images she has used in the novels already mentioned. Dragons, walls, and stones all take on meanings that enrich our reading of Le Guin's prose: "There was a word inside a stone/I tried to pry it clear. . . ."

Le Guin's fiction seems to say that the ultimate adventure in the universe is a subjective, human quest which achieves not only confrontation with the alien but defeat of alienation; the author's message is clearly, sometimes gracefully, conveyed in literary prose, which will always be the hallmark of her work.

\* \* \*

Fritz Leiber is one of the most popular and respected writers of science fiction and fantasy. While his readers and fellow writers have appreciated his humor and concern for mankind, the critics have largely ignored his work. Leiber has sometimes been classed with the writers of "weird" stories because of his frequent use of the supernatural and his acknowledged literary debt to H. P. Lovecraft. This association is misleading since Leiber uses the supernatural as a source of symbols for the mysteries of the universe and the mind. As he says, "Many of the most typical creations of science fiction, especially the robot, the android, and the extraterrestrial, are simply the monster in a new guise . . ."

The supernatural may also turn out to be disguised applications of science, as in his first novel, *Gather, Darkness!* This story concerns a revolution in a repressive society controlled by a religious hierarchy using technology masquerading as supernatural miracle. The resulting satire provides a commentary on the respective roles of religion, science, and government. There is a witty surface of gadgets such as an electronically controlled haunted house, but there is also a warning against the dangers of restricting scientific knowledge to an elite, regardless of the reason. Leiber's background in the theater is probably responsible for the dramatic staging of much of the action.

*The Green Millennium* presents a picture of a decadent United States where organized crime and corrupt government control society through sex and games. This society is invaded by two alien species from Vega which end the violence. The main virtues of the novel are fast-moving adventure and humor, but there is an underlying layer of satire about the confusion and banality of modern values. *Destiny Times Three* is an alternate-world novel in which three very different stories have been created by an accidental time fragmentation. These worlds contain similar people, one of whom learns of his other personalities and attempts to resolve the time paradoxes. This re-working of an early magazine story is not as polished as his later work. What might have been treated as a traditional SF story has been handled more as allegory and myth.

*The Big Time*, the major work in a series of time-travel stories, concerns a war fought by time-travelling warriors of two groups called "Snakes" and "Spiders" who attempt to produce a victory in the future by altering the past. Leiber's belief in

pacifism is presented through the disillusionment of the characters about the possibility of final victory. This framework allows Leiber to mix characters from many times and places in an entertainment and recuperation center. By limiting almost all the action to one room and employing dramatic techniques of staging and dialogue, Leiber has almost created a science-fiction play, with first-person interior narration. Character differentiations are neatly provided by excellent parodies of the character's differing diction and vocabulary (for example, Elizabethan and Greek dramatic styles). *The Silver Eggheads* is an experiment in satire which borders on farce. The major point is his dissection of the world of publishers, writers, and readers with humorous references to a wide range of literature, but he seems more at ease with satire in his other books. A long "disaster" novel, *The Wanderer*, describes the responses of people subjected to the earthquakes, tidal waves, and other global disasters caused by an artificial planet which enters an orbit around the earth. Leiber's main interest is in the detailed character studies of both heroes and villains provided by this framework. Almost all of Leiber's themes and interests are included: he deals with almost all aspects of human life, from birth to death. There is also plenty of action, but the novel is not significantly different from many other catastrophic stories. In *A Specter Is Haunting Texas* the specter (a skeletally thin actor from a colony on a satellite around earth's moon) is a coerced leader of a revolution of the enslaved "Mexes" against the Texans, who are hormonally induced giants controlling most of North America. Much of the book is based on theatrical motifs, from costuming and staging to the symbolic roles of the characters, and other devices of the stage. The basic method is again satire, this time against the absurdity of racism, war, and values in general. The plot is somewhat uneven, but the humor and originality of the background are entertaining.

In addition to his science fiction, Leiber has written two novels about the supernatural, *Conjure Wife* and *Our Lady of Darkness*, both of which are border-line science fiction. His fantasy series relating the exploits of Fafhrd and The Gray Mouser has made him one of the most popular writers of this genre. His best-known stories are probably "Coming Attraction" and "Gonna Roll the Bones."

Throughout his career, Leiber has used the same topics and themes—the supernatural, theater, cats, time, sex, politics, alcohol. His most frequent technique is satire. His writing displays considerable stylistic control (particularly in writing parodies) and the influence of many writers from John Webster and Shakespeare to Eddison, C. A. Smith, and Cabell. He seems to view the basic function of literature in terms of human identity and potentiality. The psychological presentation of character is central to his work, as is his view of literature as theater. These factors are related to the problem of psychological identity. All literature requires at least a partial suspension of personality on the part of the reader, but this demand is particularly great in science fiction and also appears prominently in the function of the actor. A similar reaction can occur with stories of the supernatural. All of these features combine to make Leiber an acute commentator on the human mind.

\* \* \*

Stephen Leigh, reminiscent of a young Poul Anderson, has successfully constructed a unique landscape in his creation of the world known as Neweden. Although writing for publication since 1976, he is known primarily for his Neweden novels, *Slow Fall to Dawn*, *Dance of the Hag*, and *A Quiet of Stone*. Essentially, Neweden is a world caught in a whirlwind of turmoil and conflict, and the emphasis is on social systems, confrontation, kinship, blood-feud, and the character known as Gyll Hermond. Hermond forms a group of kinless outcasts into a trained assassination force known as the Hoorka Assassins' Guild, and throughout Leigh's fiction the themes of loyalty, honor, and outcast become apparent.

Leigh has the technical skill necessary to blend philosophy and internal dialogue together in a manner that entertains. His world is filled with imaginative names, persons, gods, places, and things, such as Dame Fate, Skafidur, Hoorka, Oldin Archives, Oldman Church, Street of Singers, Hag Death, She of the Five, FitzEvard, to mention but a few. He writes science fiction dealing with confrontation, and this is the central motif that runs through his novels. From a sociological perspective, this is conflict theory at its best, and through the process of confrontation and competition for power, the opponent or opposing group is either absorbed, displaced, or eliminated. Confrontation and competition become an overriding concern in Neweden's social system based on kinship, guild, and honor. Although well-structured, plot is secondary to characterization in Leigh's novels.

Gyll Hermond is a medieval hero in disguise, with attributes to Everyman in his personality; he represents raw courage, and, for the most part, honor, morality, and good deeds in the splintered social system of Neweden. Blood-feud and kinship are the backdrops which make confrontation and competition both possible and logical on Neweden, and Leigh has put care and detail into their subtle roles as social agents affecting personality and relationships. Kinship affects the direction of blood-feud, and it has a direct bearing upon ritual. Leigh's use of the kinship motif allows the reader to understand its effect upon role conflict, role tolerance, role engulfment, role strain, role set, and role performance.

Though he is a writer still experimenting with form and structure, the overall pattern of Leigh's writing reveals a grasp of the mechanics for tense action, adventure, and the eternal theme of right versus wrong or good versus evil. With time, Leigh could become an adept stylist much in the manner of F. M. Busby or Warren Norwood. Given the right circumstances, he has the potential for becoming another Gordon R. Dickson.

Continuing interest in Leigh's writing for readers, sociologists, and scholars rests on his ability to create believable social systems, characterization, and the theme of the Outcast. His talent for handling the theme of the Outcast is best revealed in *A Quiet of Stone*.

\* \* \*

A professional writer for the slick and pulp magazines from 1913 until 1967, Murray Leinster embodies in one writer the very essence of the commercial yet ambitiously serious genre of science fiction. He did his best work in short fiction. He developed and extrapolated upon certain key speculative ideas, several of the most important of which he introduced to the genre. He wrote for money and sold to several markets other than science fiction, and yet the imaginative expansion of ideas about nature and about the relation of life forms to nature made science fiction a very important area in his production. Leinster wrote so much that it is hard to categorize his major themes and most characteristic effects, but always his mind is lively and he seems interested particularly in cool analyzing and in alternatives to all possibilities.

In fact, his fascination with the possibility of alternatives to any situations led him to the standard science-fiction theme that he is often best remembered as having introduced to the genre: the theme of parallel points on a time continuum, or parallel worlds. A story from 1931, "The Fifth-Dimension Catapult," plays with the notion as a kind of modern alchemy in which the clever laboratory investigator can change time and space coordinates in order to visit a completely alien parallel world; and in this case the plan finally is to bring back gold. Leinster's

more well-known story of parallel worlds is "Sidewise in Time" in which some unexplained oscillation of the earth results in a myriad of alternate time paths. His method of telling this story in little isolated vignettes of what might be possible here and there as the oscillations produce alternative presents is indicative of why short fiction is a primary form in science fiction. With change and even alternate possibilities ever present there simply does not exist the stable Victorian world for developing long narratives in one time and one place. Leinster, beginning as early as it was popularized, writes a modern alchemy of change according to Einstein-like relativity. Some longer fictions of his that rely on this same balancing of alternatives are *Colonial Survey*, which contains his Hugo-winning novelet "Exploration Team," and *Time Tunnel*.

Similarly, Leinster, develops again and again the ramification of contact between different life forms that are alternatives to each other. This is the often-used theme in science fiction of first contact with an alien race; and the most influential story of Leinster's of this type is entitled simply "First Contact" (1945). But many of his stories explore the alternatives of encounter and relationship between life forms who consider each other alien because they cannot or do not communicate. In "Proxima Centauri" the aliens are intelligent and mobile plants that crave animal flesh. This reversal, or notion that what we do ourselves may often be quite alien, permeates Leinster's fictions. Not only do humans enjoy vegetable salads unthinkingly, but in "The Strange Case of John Klingman" the human managers of the mental hospital seem more alien than Klingman. Similarly, the moon monkeys in "Keyhole" have more sympathy and effective understanding than their human opposites because they can communicate telepathically, and hence the human thoughts, although alien to them, are not unknown.

The key seems to be knowledge and understanding, for here the two themes in Leinster's fiction come together. Alternate or parallel worlds as well as life forms alien to each other are only possible when differentiation, separateness, and mental isolation are possible. If the universe were all one, there would be only one time path and there would be continual communion. But the universe is parceled out, and communication is very seldom total or telepathic and instant. In other words, Leinster seems to be continually retelling the myth of original sin. Things are not as they should be, hence continual competitiveness and continual alternatives.

A brilliant working of this theme of the pathos of separateness and difference is in "The Lonely Planet," which seems to be an anticipation of the widely acclaimed novel by Stanislaw Lem, *Solaris*. In Leinster's story, a magnificent creature called Alyx covers an entire planet. In the beginning it is totally telepathic to mankind because it has not developed a defense against mind or total communication since it has evolved in an environment where it was the only creature. The story, then, is how mankind teaches Alyx to be secretive and competitive, finally, because Alyx learns what loneliness was. Perhaps Leinster is saying that a perfect oneness would be lonely and boring and that we need alternatives and even competitiveness. In any case, the clever, inventive, competitive and necessarily separate mind of the scientific investigator is the favorite protagonist in a Leinster story. Thus from the point of view of modern fiction, his characters often seem grossly two dimensional and his conflicts exaggerated and sensational. These bold and exaggerated effects prevail throughout his popular novel *The Forgotten Planet* (an expansion of "Mad Planet," 1926)—the narration of a continual war with giant insects and the growth of human rationality. But many of these effects are simply the demands of the pulp market, and seen in their most symbolic way they continually narrate the inescapable reality of human fallibility.

No treatment of Leinster and of the evolution of the genre of modern science fiction that he contributed so much to would be complete without mention of the sense of awe that goes with what is generally dismissed as space opera. In addition to the suggestiveness in theme and meaning mentioned above, Leinster's fiction reads well because of wide-ranging space patrol and med service action and because of journeys to distant second galaxies. There is also a good deal of violence, quick cruelty, and villainy in Leinster's work; and when this also is handled well it is an ancient emblem for the fallen state of mankind, an exact correlative to the infinite alternatives in the material world. But always in Leinster, along with the awe and the space opera, is the intellectual curiosity and the analytic mind—perhaps again representative of the fallen state of man, but characteristic also of the best in science fiction. Leinster grew with the genre, but he is also an example of how subtle some of the best space opera can be.

—Donald M. Hassler

**L'ENGLE, Madeleine.** American. Born Madeleine L'Engle Camp in New York City, 29 November 1918. Educated at Smith College, Northampton, Massachusetts, A. B. (honors) 1941; New School for Social Research, New York, 1941-42; Columbia University, New York, 1960-61. Married Hugh Franklin in 1946; three children. Worked in the theatre, New York, 1941-47; Member of the Faculty, University of Indiana, Bloomington, summers 1965-66, 1971; Writer-in-Residence, Ohio State University, Columbus, 1970, University of Rochester, New York, 1972, and Wheaton College, Illinois, 1976. Since 1960, teacher St. Hilda's and St. Hugh's School, New York; since 1966, Librarian, Cathedral of St. John the Divine, New York; since 1970, President, Crosswicks Ltd., New York. Since 1976, Member, Board of Directors, Authors League Foundation; President, Authors Guild of America. Recipient: American Library Association Newbery Medal, for children's book, 1963; University of Southern Mississippi award, 1978; American Book Award, for paperback, 1980; *Logos* Award, for non-fiction, 1981; Catholic Library Association Regina Medal, 1984. Agent: Robert Lescher, 155 East 71st Street, New York, New York 10021. Address: Crosswicks, Goshen, Connecticut 06756, U.S.A.

Madeleine L'Engle comments:

I discovered science fiction early, as a lonely only child growing up, for my first 12 years, in New York City, then in France and Switzerland. For me, the real world was clearer in the books of E. Nesbit and H. G. Wells than in the world of school. So I started writing science fiction when I was eight or nine. Fortunately all of my early work was lost somewhere or other on our journey across the Atlantic.

During college and after I turned to more "realistic" fiction, and found that it was not real enough, that my true discoveries of reality came while I was writing sci-fi or fantasy. I also discovered that for me the great theologians and modern mystics are the scientists, the physicists and astrophysicists, the cellular biologists, since they are dealing with the nature of Being itself. Einstein, Planck, Eddington, Jeans, Heisenberg, and many others, have been—and are still—my great stimulants.

\* \* \*

Madeleine L'Engle has been publishing successful and provocative science fiction since the mid-1940's, adding intriguing variations to a considerable body of work, and continuously crafting fiction to engage her readers in issues and moral questions. She is nearly as prolific as some of her less thoughtful peers, and has continuously commanded the support of publishers and readers who must be described as literary. Her most well-known work is a series of novels dealing with time, including her one most signally famous work, *A Wrinkle in Time*, which introduces the children and, less directly, the father of the Murry family.

*Wrinkle* begins with the stark probing of a novel by Conrad, but by the time the reader recognizes what an extensive narrative hook has been set, L'Engle has paraded warm, bright, totally believable characters on stage. Every bit an existential and metaphysical thinker, L'Engle dramatizes the necessary leaps of faith that await the young reader and which certainly beckon to the more mature reader.

The second novel in the series, *A Wind in the Door*, takes up where the problem of the missing Murry father is solved, and the focus now becomes the integrity of healthy organisms and systems. Meg Murry, a young man from *Wrinkle* named Calvin, and a young superbeing become simultaneously involved in a plot involving Charles Wallace, who is being attacked at a cellular memory level, and this is shown in relationship to a black hole, L'Engle's version of a spot in the galaxy where there is a problem with cellular memory. *A Swiftly Tilting Planet* involves Meg Murry, now a grown woman, married and pregnant, but still called upon to join her siblings in an adventure relating to the potential for thermo-nuclear war.

Trademarks of L'Engle are her deceptively simple prose style, often undershot with social, moral, or religious issue; her restraint in explaining too much either of philosophy, scientific apparatus, or technicalities; her crisp, individual dialog; and her ability to draw young characters who are interesting without being self-conscious. Well read in the physical and theoretical sciences, L'Engle has the same focus to be found in such writers as Theodore Sturgeon and Robert Heinlein, allowing her effectively to dramatize complex concepts whether a black hole in the galaxy and its consequence, the ability of a starfish to regenerate a portion of its body, or the ability of an immune system to keep an invader from penetrating.

L'Engle seems to have arrived at a happy synthesis of science, metaphysics, universal politics, and individual responsibility. She is one of the handful of science-fiction writers whose work consistently rings true.

Critical Study: *The Real Le Queux* by N. St. Barbe Sladen, London, Nicholson and Watson, 1938.

\* \* \*

William Le Queux's life is more interesting than anything he wrote. He travelled extensively, was acquainted with royalty, collected an impressive number of decorations for various services from various courts. He used his position for intelligence or spying activity, claiming to have written his more than 150 potbiolers—exotic, political, and spy novels—to support such patriotic amateur ventures as the discovery of a Germany spy network in England in 1906. Together with Field Marshal Lord Roberts and a number of prominent British politicians, he concocted his most famous war and fifth-column forecast, *The Invasion of 1910* as an appeal to the UK to prepare for war.

His SF writings, besides some marginal stories, are generally worthless, melodramatic novels. They include the ludicrous *A Madonna of the Music Halls*, in which a villainous scientist terrorizes a beautiful girl by foisting on her strange qualities through liquids transferring other people's "brain power" (e. g. hate); a banal first try at the "future war" cum spy story, *The Great War in England in 1897: The Unknown tomorrow*, depicting the cruelties of the socialism of 1935; and *The Terror of the Air*, a tired exploitation of the German threat. Thus *The Invasion of 1910* remains his only important contribution to the political pathology of SF and of ideology in general, and an object-lesson in the successful use of SF as propaganda, based on the immediate objectives of the ruling politico-military complex allied with the newspapers, London clubland, and the Secret Service. Even Wells was not always immune from such a syndrome, and one wonders in how many SF writers down to Adamov or Cordwainer Smith it is also present.

—Darko Suvin

LESLIE, O. H. See SLESAR, Henry.

**LESSER, Milton.** Name now Stephen Marlowe; also writes as Adam Chase; Andrew Frazer; Ellery Queen; Jason Ridgway; C. H. Thames. American. Born in New York City, 7 August 1928. Educated at the College of William and Mary, Williamsburg, Virginia, B. A. 1949. Served in the United States Army, 1952-54. Married 1) Leigh Lang in 1950 (divorced, 1962); 2) Ann Humbert; two daughters. Editor, Scott Meredith Literary Agency, New York, 1949-50; now a full-time writer. Writer-in-Residence, College of William and Mary, 1974-75, 1980-81. Member of the Board of Directors, Mystery Writers of America. Agent: Scott Meredith Literary Agency, 845 Third Avenue, New York, New York 10022, U.S.A.

\* \* \*

Milton Lesser was a prolific contributor to the Ziff-Davis SF magazines in the 1950's, though since 1965 he has abandoned SF to write mainstream novels. Some of these, like *Translation* and *The Valkyrie Encounter*, published under the Stephen Marlowe pseudonym, have science-fiction elements.

Most of Lesser's SF novels are juveniles. In *Earthbound* a young cadet unjustly expelled from the Solar Academy is tricked into helping space pirates. The book is high on action and low on plausibility. *The Star Seekers* is a bit better. It reworks Robert A. Heinlein's idea of a generation starship presented in *Universe*. Here, a starship takes six generations to reach Alpha Centauri, with the attendant problems and struggles. *Stadium Beyond the Stars* is Lesser's weakest SF novel. Most of the action concerns plotting among political groups on the eve of the First Interstellar Olympic Games. The characterizations are shallow and the plot is murky. *Spacemen, Go Home* opens with humanity quarantined from star travel by the super computer which controls the galaxy. Various groups attempt to bomb the Star Brain while others attempt to convince it to lift the quarantine because humans aren't violent. Again, a murky plot mars the fast-paced action.

Lesser's adult works also stress action over plot and violence over character. *The Golden Age* is prime space opera featuring a bold hero who commutes among worlds in the tradition of John Carter. Duels and fights keep the action swift and the pages turning. *Recruit for Andromeda* has a tricky plot with draftees secretly tested to determine which are superior. The story has some mild racist overtones. *Secret of the Black Planet* is made up of two space-opera novelettes, "Secret of the Black Planet" and "Son of the Black Chalice." The search for a lost alien race and the secret of cell regeneration is damaged by hackneyed writing and cardboard characterizations.

—George Kelley

**LESSING, Doris (May).** Also writes as Jane Somers. British. Born in Kermansha, Persia, 22 October 1919; moved with her family to Southern Rhodesia, 1924. Educated at Girls High School, Salisbury. \* \* \*

Doris Lessing's series, *Canopus in Argos: Archives*, grew, according to the author, out of her plan for a single book, *Shikasta*. This first experiment in science fiction led to the

exploration of multiple related themes in four more works. The ideas encompassed by this cycle are superabundant, ranging from planetary evolution over geological eons to the arts with which wives and husbands score minor points in forgettable skirmishes, but all the books are unified by one central concern, the role of the individual in events of great magnitude that transcend personal hopes, wishes, and desires. Most of Lessing's characters must confront a dizzying variety of forces that determine their destinies; their changing awareness of these forces provides much of the drama of their stories.

The most self-aware figures in all the novels are the mysterious representatives of the Canopean Empire. Even "Canopus," as individual officials are sometimes called, bows to a never-defined "Necessity" which rules all; in turn, Johor, Klorasty, and other Canopeans patiently guide less advanced races and even empires away from mindless violence and cruelty and toward cultural evolution. *Shikasta* details millions of years of the history of the earth, variously called "Rohanda" and "Shikasta." The Galactic time perspective allows the reader to understand that change and conflict is the one constant; the failure of a "Lock" between Canopus and Shikasta/Earth dooms the planet to degeneration and ultimately to near-destruction.

*The Marriages Between Zones Three, Four, and Five* is comparatively sunny, but still ends in melancholy. The Canopeans are (apparently) acting as offstage "Providers" in control of a series of geographically contrasting "Zones," ranging from desert (Zone 5) to swampy lush wetlands (Zone 4) to mountain plateaus (3) to mountain passes (2). Varying zones and climates determine the personality of cultures, which in turn determines individual types, from earthy lowlander to ethereal mountaineer. Each zone has settled into smug self-satisfaction when a perhaps related decline in fertility causes the Providers to force a marriage between the queen of Zone three, Al. Ith, and the king of Zone 4, Ben Ata. Both characters are masterfully drawn, and the uneasy marriage of a kind of high country Athenian to a lumpish Spartan provides high comedy based on the clash of female and male principles, the unending war between artistic natures and practical natures, and the gradual blending of distinct personalities in marriage. The narrator describes how later artists depicted this marriage of opposites, and Lessing's own word-pictures are like set-pieces from a medieval tableau. Queen and King do not live happily ever after, however, for the Providers, in fine disregard for human wishes, toward the end of the book order Ben Ata to marry the wild, nomadic queen of Zone Five, thus blending the artistic intellect Ben Ata has gleaned from Al. Ith, his own orderly discipline, and the wild energy of the least civilized Zone. Al. Ith retires to the border of Zone Two, and eventually crosses it to become a flame-like wraith in a mountain atmosphere too rarified for others to tolerate. Life is change, says Lessing; even in this paradise reminiscent of a medieval fable, an unseen and only vaguely understood "necessity" casually destroys human happiness. There is no choice but to obey.

*The Sirian Experiments* continues this theme with another wonderfully drawn female protagonist, Ambien II, one of the five dictators who rule the technological empire in competition with Canopus. Unfortunately, Ambien II's prissy, bureaucratic, "dessicated" character is so persuasive that the reader may lack sympathy throughout much of the book, at least until this self-serving and authoritarian figure begins to learn a more sensitive and less machine-like managerial style from her Canopean opposites. As with Al. Ith and Ben Ata, sexual attraction between opposites provides the motive force for change, but there is no comedy here, only some excellent set-pieces in an Arab-like town and an Aztec-like fortress. Ambien

has led Sirian "experiments" on millions of "lower species" over thousands of years, unmindful of their dubious morality because of their good intentions of forcing evolution. Miseries such as Al. Ith's in the previous novel are multiplied a million times before Ambien's Canopean teachers lead her to see from experience and example that the Sirian Empire is being taught by the Canopean just as surely as the "lower species" are being taught by the Sirian. As in the linked Zones, one relationship leads to the next, but the joins are invisible since they are firmly denied by the weaker. Colonialism involves more complex power relationships than are initially evident, with control being exercised in unexpected ways. Only experience teaches by showing us the mote in another's eye, just as Lessing's novel should raise our consciousness of Western arrogance and brutality in Africa and other former colonial areas.

In *The Sirian Experiments* evil necessity is incarnated in the Puttiorian Empire (the name suggest Spanish *puta* or whore) and their planet Shahmat (Farsi for "the king is dead," or in chess, "checkmate"). In *The Making of the Representative for Planet 8*, evil necessity is a cosmic accident. The Canopean governed colony on Planet 8 is freezing to death because of planetary climactic changes. In a fine description of a frozen world stimulated by Lessing's reading about Scott's search for the South Pole, we see the telepathic, tropically lively and colorful inhabitants of Planet 8 become slothful, fur-swaddled zombies who lose their social identities as the snow and ice wipe out occupations and social roles. Climate is destiny; eventually, led and taught by their Canopean master Johor, they give up their material existence and become a single "representative" spirit, transcending physicality.

*The Sentimental Agents* continues the emphasis on Canopean moderation of extreme behavior, with Incent, an agent of the empire, seduced by "Undulant Rhetoric" or a kind of intoxication with words. In contrast, the usual approach of the Canopean agents is to be noncommittal to the point of taciturnity. They are men and women of action, not empty words.

While there is an honorable tradition of 20th-century writers opposing propaganda and false rhetoric, it is especially appropriate for Lessing to end her cycle with this warning. Throughout, there have been conflicts between characters skilled at action (Ben Ata, Ambien II) and characters skilled at language (Al. Ith, Nasar, Rhodia). Lessing's own ambivalence about the role of writer and writing may be at issue, and this uncertainty in a writer known for her earlier political stands may account for the mixed critical reception to her cycle. Like Canopus, Lessing teaches by example, but also like Canopus, she refuses easy answers and the superficial knowledge of the conventional.

## Theatrical Activities:

Director: **Play**—*Dr. Cook's Garden*, New York, 1967.

\* \* \*

Ira Levin's highly accomplished novels of suspense contain elements of science fiction and fantasy, and one, *This Perfect Day*, is set in the future.

His first novel, *A Kiss Before Dying*, the study of a psychopath stalking three sisters, was skilfully written but gave little suggestion of the richness in store. *Rosemary's Baby* is one of the most perfectly crafted thrillers ever written. Rosemary and Guy Woodhouse step over the threshold of a richly documented old apartment house in New York City into the world of the witches. The strength of the book lies not only in its weaving of a dreadful spell but in the strong, sweet character of the pregnant heroine. Guy's complicity in the schemes of the friendly neighbours is part of a fiendish double climax.

The book following this masterpiece of genre writing was the science-fiction novel *This Perfect Day*. The future race, brown-skinned, depilated, breastless, tranquilised, stroll the window-

less walkways of a totally computerised environment, patting the scanners as they pass, en route to death at age 62. LiRM35M4419, called Chip by his wry Grandfather, escapes from the system by resisting UNI, the computer responsible for a boring parody of the good life. Chip's escape is obviously programmed; the appearance of those benign sybarites the Programmers is not surprising. The ideology of the "utopia" is weak but the quality of the writing and the level of invention are high. A leap of the author's prodigious imagination could bring him into the very first rank of speculative fiction.

Instead he returned to the suspense novel with *The Stepford Wives*. The setting, a commuter township in "middle America," is as persuasive as the New York of *Rosemary's Baby*. Joanna Everhart discovers the dreadful secret of the big-bosomed zombies who dote on housework. The climax is clever but the story is unsatisfying and the neatness of the writing hides many loose ends. We look in vain for one husband who refuses to trade in his wife on a new model or for a child with that old complaint from *The Invasion of the Body-Snatchers*: "That Lady isn't my real mother!"

*The Boys from Brazil* has an international setting but still retains a typical claustrophobic atmosphere. Dr. Josef Mengele, former medical superintendent of Auschwitz, emerges from his South American jungle retreat to send the organization of Nazi veterans on a mission. Yakov Lieberman, the tired Nazi-hunter, discovers soon enough, but more slowly than the readers, why 94 elderly civil servants throughout the western world must die. These men are the adoptive fathers of teen-age sons cloned from the cells of Adolf Hitler; their deaths are an attempt to match up environment with genetic inheritance. This time the humanity of Lieberman balances the outrageous story; it is one of Ira Levin's best books. Mengele's scheme, even with its coda of an artistic lad somewhere indulging tomorrow-the-world fantasies, is revealed as pure moonshine.

Ira Levin's suspense novels have a unique resonance; these works, rather than *One Perfect Day*, have created a nightmare future world in which the Stepford delinquents, children of megalomaniac fathers raised by robot mothers, tangle with genetic Hitlers, under the eye of the heir of the Prince of This World, Andrew Woodhouse, the devil's child. The author is at the height of his powers and should continue to astonish us.

—Cherry Wilder

Lewis* by Chad Walsh, New York, Harcourt Brace, and London, Sheldon Press, 1979; *C. S. Lewis, Spinner of Tales: A Guide to His Fiction* by Evan K. Gibson, Grand Rapids, Michigan, Christian University Press, 1980; *C. S. Lewis* by Margaret Patterson Hannay, New York, Ungar, 1981; *C. S. Lewis: The Art of Enchantment* by Donald E. Glover, Athens, Ohio University Press, 1981; *C. S. Lewis* by Brian Murphy, Mercer Island, Washington, Starmont House, 1983.

\* \* \*

C. S. Lewis is a unique figure. He once described himself as a specimen of a nearly extinct species, "old Western Man": and certainly we had no right to hope for such an author to appear in the 20th century. He has written in many guises: as medieval scholar, lay theologian, fantasist, poet. But his essential role has total inner consistency: he is above all the most powerful defender of traditional Christianity that this century has seen; and his apologia works not through formal argument but through images, through suggestion, through poetic creation. All his life, Lewis was haunted by *Sehnsucht*, a longing for strange beauty which the actual world could never wholly satisfy; and this led him, in early middle life, to identify the source and object of his longing with the Christian heaven and the Christian God. His subsequent creative work was a sustained imaginative polemic for this view of the universe.

Lewis is a science-fiction writer, arguably, in only one short story, "Ministering Angels," and one novel, *Out of the Silent Planet*. Both are set on Mars; but the Mars of the novel is a Christian paradise ruled by an archangel. This is the first novel of Lewis's so called "space trilogy"; the second novel, *Perelandra*, is set on Venus, and the third, *That Hideous Strength*, on Earth but with interplanetary connections. All three novels feature the same hero, Elwin Ransom, and all are a unique mixture of SF and what seem to be fantasy elements. In each novel an important part is played by the "eldils," a species of angels inhabiting interplanetary space whose bodies are composed of semi-visible light; but in the first two novels there is also a spaceship, and in the third novel a type of cyborg, a severed human head kept alive by advanced scientific technology. This mixture of science and the supernatural in the trilogy is deliberate and indeed essential; for the fundamental theme of the whole trilogy is the clash between evil modern scienticism and old-fashioned Christianity. The trilogy in fact defies generic classification: it is very dubiously science fiction, by reason of all those angels (and devils, in the second and third novels), yet it is not exactly fantasy either, for the author firmly

believes in the actual existence of his supernatural entities, and is out to convince us, with all the power of his very powerful art, of their reality and supreme importance. It is this polemic purpose which may repel some readers: Lewis himself has stated ( *Of Other Worlds* ) that *Perelandra*, at least, was written essentially for Christians only.

But *Out of the Silent Planet* is less overtly Christian, and should appeal to a wide readership by the sheer beauty of its style and images. The inner action of this novel is twofold: it is partly a *Bildungsroman*, effecting the re-education of Ransom, and through him of the reader; and partly a physical and intellectual defeat of human-racist expansionism. Ransom, an ordinary decent literary scholar, is kidnapped by the ruthless physicist Professor Weston and his capitalist collaborator Devine and taken in Weston's secret spaceship to Mars, for Weston mistakenly believes that the "primitive natives" of Mars have demanded a human sacrifice in exchange for gold. Mars ("Malacandra") proves to be a beautiful, paradisaical planet, and the natives comprise three intelligent species, all living in friendship and complementary collaboration, and all ruled by the nearly invisible eldil Oyarsa from his paradise-island of Meldilorn. Ransom escapes from his human captors, takes refuge among the "hrossa," the seal-like poetic species, and learns the Malacandrian language. He is thus equipped to serve as interpreter in the climactic scene of the novel when Weston and Devine are arrested by the hrossa and brought to Oyarsa for judgment. This trial scene is one of the clearest, wittiest, and most striking portrayals in imaginative fiction of the clash between human-racist expansionism and the opposing school of thought—the school now represented chiefly by the ecology movement. Weston boasts to Oyarsa that nothing will stop the human race from conquering the universe, moving on from planet to planet as each world dies. Oyarsa refutes Weston with the question: "And when all are dead?"—to which Weston has no answer. After this the humans, including Ransom, are forced to return to Earth, whereupon their spaceship is destroyed by angelic power.

*Perelandra* is a sequel in that once more Weston lands on another planet—Venus—and once more is opposed by Ransom; but essentially the work is a variation on Milton's *Paradise Lost*. Venus (*Perelandra*) is a mostly oceanic world with only two inhabitants—its innocent Adam and Eve. Soon after Weston's arrival, he is possessed by a devil—and he proceeds to tempt the *Perelandrian* Eve to violate God's sole prohibition. At last Ransom understands his mission, and ends the temptation by destroying Weston. The Venusian paradise is saved, a second Fall is averted. This novel is an even greater achievement than *Out of the Silent Planet*: the action, limited to three characters, has concentrated dramatic power, and the scenery—the floating vegetable islands and seas of Venus—is of a beauty which has never been surpassed by an imaginative writer. It is magnificent—but it is hardly science fiction. That might also be said of the trilogy's final novel, *That Hideous Strength*. The Devil is confronted this time on Earth by planetary angels, Ransom, and the Arthurian wizard Merlin, and the wicked are destroyed in a magic holocaust.

Also relevant to Lewis's SF are his seven Narnia novels for children. These may be called fantasy, since they are set in and around an imaginary world (Narnia) where magic is commonplace and the inhabitants include giants, dwarfs, dragons, fauns, centaurs, and talking animals. But Narnia has an intellectual solidity similar to SF and lacking in some fantasy worlds of other writers, since it exists in a parallel universe also created, like this one of ours, by God: it is a universe whose Earth is flat, and whose stars are living beings. It is also, as usual in Lewis, a universe of marvellous beauty. Lewis is also an important critic

of SF and related genres, chiefly in the essay collection *Of Other Worlds*. His remarks on characterization are justly famous.

Taking his work as a whole, one must note that although Lewis wrote little that is certainly SF, he is of the first importance in the history of this genre through the sheer power of his imagination, his ability to create beautiful worlds which are wholly realized in their actuality; and through the enormous pressure of his moral commitment, which supplies tension throughout the action of every one of his stories. Above all, he has been a most effective opponent of those who would like to see the human race give itself up to the demon of scientism, the spirit which desires the total conquest of the universe.

—David Lake

#### Theatrical Activities:

Director: *Play—The Good Neighbor* by Jack T. Levin, New York, 1941.

Actor: *Plays*—Doremus Jessup in *It Can't Happen Here*, Cohasset, Massachusetts, 1938; Dr. Hilary Jarrett in *Angela Is Twenty-Two*, Columbus, Ohio, 1938, and tour, 1939; Stage Manager in *Our Town* by Thornton Wilder, Ogunquit, Maine, 1939; Nat Miller in *Ah! Wilderness* by Eugene O'Neill, Provincetown, Massachusetts, 1939, and summer stock, 1940; Canon Skeritt in *Shadow and Substance* by Paul Vincent Carroll, New Orleans and summer stock, 1940.

\* \* \*

Although Sinclair Lewis is a regional satirist, he also belongs firmly within the anti-utopian tradition. *It Can't Happen Here* is unquestionably a dystopia, while *Arrowsmith*, *Kingsblood Royal*, and "The Cat of the Stars" (1919) deal with science and causality. The unpleasant and restrictive worlds of *Main Street*, *Babbitt*, and *Elmer Gantry* are similar to those found in works by Harry Harrison, Harlan Ellison, and Robert Sheckley. Lewis himself knew and was influenced by H. G. Wells.

The political satires set in the near future, best exemplified by Allen Drury's work, are Lewis's grandchildren. *It Can't Happen Here* came about because of his wife Dorothy Thompson's political involvement and Lewis's knowledge of America's long line of politically extreme demagogues. Not as intellectually based and universal as *Brave New World* or *Nineteen Eighty-Four*, the book caught attention because of its immediacy. Doremus Jessup, a Vermont newspaper editor, symbolizes America's honesty and love of freedom, while Berzelius (Buzz) Windrip is an American Hitler, appealing to the lowest common denominator. Although Buzz's hangers-on die, Doremus survives. Here, as always, Lewis overdoes. Not content with simple horrors, he catalogues them until the reader becomes numb. Lewis, often criticized for overlong novels, does not manage sustained impact.

In *Kingsblood Royal*, red-haired, blue-eyed Neil Kingsblood is ostracized and broken by Grand Republic, Minnesota, because he is 35% black. In "The Cat of the Stars" a boy's stopping to pet a cat causes the loss of a fortune and 3,291 deaths

in South America. *Arrowsmith* argues for the superiority of scientific over materialistic values. Its romantic SF theme is man's triumph over nature by fresh perspectives and dedication. The bureaucratic scientific community is etched in acid as Martin Arrowsmith defies mediocrity by refusing to compromise his integrity.

\*

Jacqueline Lichtenberg comments:

As I see it, the emotional substance of the Sime Series is an

examination of the fear/compassion axis of emotion that can exist between symbionts. The Sime mutation brings evolutionary pressure to bear on otherwise rather ordinary human beings to develop compassion or die. It is stunning how difficult it is to find true compassion untinged by fear in a human. But when you do find it, it is more precious than life itself. The Sime/Gen mutation is considered as another on the order of the differentiation into male and female, only the second such step ever taken.

The style in which I write emphasizes psychological problems with psychological action and resolution, rather than the standard action/adventure formula in which it is considered bad form to characterize or motivate. I aim my work basically at women between 18 and 25, though anyone who has been such an age should enjoy it as well. I am constantly surprised at the number of fans who don't fit that description, surprised and delighted no end.

\* \* \*

Jacqueline Lichtenberg began her career in science fiction as the author of *Star Trek* fan fiction, and is the creator of one of the largest and most popular of the fannish "universes" in which the cast of the *U. S. S. Enterprise* goes where no man (or woman) has gone before. Her series, notable for its complexity, and for Lichtenberg's willingness to allow other writers to participate in it, is described in *Star Trek Lives*. This spirit of cooperation, as well as the emphases within this universe on symbiosis between dissimilar creatures who come to love one another and on psychological intensity, have carried over into Lichtenberg's "independent" fiction.

At present, Jacqueline Lichtenberg has three series universes going. The first, and earliest, is the one begun in *House of Zeor*, which introduced her readers to the symbiotic Simes and Gens. Simes are tentacled, almost vampiric humanoids who mutated from the parent stock after a genetic catastrophe. In order to live, they must take selyn from the second mutation, the human-appearing Gens. The problem is that selyn transfer usually kills the Gen. As the series progressed from *House of Zeor*, in which the idea of "channels," certain genetically gifted Simes capable of taking selyn without harming Gens and "channeling" it to other Simes, through *Unto Zeor Forever*, in which an injured channel confronts the Sime's fascination with fear and pain by becoming a surgeon, into the Lichtenberg and Jean Lorrach collaborations *First Channel* and *Channel's Destiny*, which show the origins of the Farris family (the Farris are among the most talented channels) who rule the House of Zeor, several themes emerge. One is the bonding of unlikely beings who must struggle with prejudice. Another is the curious interdependence of Sime and Gen, in which the vastly stronger and faster Sime turns out to be the weak, dependent link after all. A third is the toughness of Lichtenberg's characters, who seem never to give up. This toughness is manifested in subsequent books—*Mahogany Trinrose*, in which a Farris daughter persists until she produces a new genetic variant of an old species and is thought to be a witch, and *RenSime*, in which a Farris woman who is not a channel copes with her despair at not being what she was born to be. Subsequent books in this series will include another collaboration with Jean Lorrach, *House of Keon*; Lorrach plans to produce a few Sime/Gen novels independently.

*Molt Brother* is Lichtenberg's first novel set in a different, high-tech universe. It and its sequel, *City of a Million Legends*, introduce the kren, reptilian beings with venomous fangs who are vulnerable only when they molt. At that time, they choose molt brothers (or sisters) to guard them. This bond, like the selyn transfer for Simes, is perilous, profound, and occasionally

ecstatic. *Molt Brother* is the story of Arshel Holtether, an esper archeologist who chooses a human molt brother and enters worlds of intrigue, danger, and self-discovery. It is also the story of Zref, a human/computer interface unable to link completely with his own mechanical symbiote.

Lichtenberg's most recent series, about a species called the Dushau, also displays her preoccupation with symbiotes. In this trilogy (*Dushau*, *Farfetch*, and the forthcoming *Outreach*) set in a high-tech, tyrannical, and rather Byzantine galactic empire, a young woman closely connected with the court wants above all else to join a bonded group of Dushau, long-lived alien empathists who can practically bond into planetary ecologies. Because the empire suspects the Dushau of wanting independence, it is systematically exterminating them. One bond group flees a police cruiser to a planet that becomes its ally as Dushau, the human heroine, and a host of minor characters set the stage for revolution.

All of Lichtenberg's books are marked by an extraordinary density of thought. She creates extremely dangerous characters: the sinister Simes, the venomous kren whose pain somehow makes them vulnerable and understandable to her often fanatic readers. Her writing is notable for intensity rather than lyricism. Frequently her books are painful to read because of her insistence on confronting breakdowns in communication (which occasionally makes her writing tortuous and harsh) and extending them out into catastrophe. She specializes in creating a psychological "worst-case" scenario and then rehabilitating the characters who encounter it. In order to supply communication, Lichtenberg creates bonds like transfer, molt brotherhood, or the symbiosis in Dushau, but even these bonds are imperfect, if only because their severing causes anguish.

As can be seen from Lichtenberg's willingness to allow other writers to participate in her universes, she is a generous teacher, who has participated in many writers workshops, notably the one sponsored at Murray State University in Kentucky. Her fans have published three fanzines which feature letters, reviews, fragments of MSS, and original Sime/Gen stories by amateur writers. The audience for her work is among the most dedicated in the field, and Lichtenberg is notable for her willingness to enter their lives as generously as she has opened her worlds to them.

\* \* \*

Alice Lightner is an author of children's books at home in non-fiction as well as SF. Her informational books about animal life are popular with young readers and have received honors from science teachers because of their solid, up-to-date information, enthusiastic concern for ecology and conservation, and capacity for explaining on a child's level of comprehension. Similar qualities mark Lightner's SF. Actually, so prominent is the last quality that in spite of lacking a prose style as supple as Norton's or an imagination as inventive as Heinlein's, Lightner has produced a body of SF that is perhaps more readily open to and enjoyed by youngsters than either of theirs.

The typical Lightner novel is an amalgam of SF and the Young Adult novel. The most prominent of the former is the presence of "alien" animals: either ones that do not exist today but whose future existence may be extrapolated—a unicorn-like gazelle, for instance, or a telepathic bird that can speak—or ones that are unexpected mutations of species currently existing—giant bees, for example. Another prominent SF feature is exotic setting, most often a planet newly discovered which needs to be explored and surveyed and whose flora and fauna require cataloguing and preserving. Young Adult elements usually found in Lightner's fiction are mystery and dashes of romance and humor in addition to the requisite youthful protagonists. (Incidentally, Lightner is one of the very few writers of children's SF who regularly incorporate females among their protagonists.) So determined is Lightner to appeal to youth that sometimes, as in *The Galactic Troubadours*, she sacrifices plausibility for topicality: a band of rock and roll musicians make a nuisance of themselves as they travel from planet to planet. In general, though, Lightner has been successful in her mix.

Lightner's most successful novel is *The Day of the Drones*. Set in the future when nuclear conflict has poisoned the earth and obliterated virtually everyone, the book concerns the Afrians—descendants of a small group of surviving black Africans who have managed to rebuild civilization by placing under taboo most technology and by practicing strict genetic control. Those born darkest-skinned will enjoy most privileges; fair-skinned babies, less; the occasional white baby is simply abandoned. A small group of Afrians set out to ascertain whether any other human survivors exist. In what was once England the Afrians come across the Anglies, descendants of the ancient English who are cruel, superstition-ridden, and white. They too practice social engineering, having established a bizarre matriarchy modeled upon bee-society. The impact of *The Day of the Drones* is three-fold. One, the description of the two differing cultures is detailed and plausible. Second, characterization is rounded and convincing; none of the several protagonists is a mouthpiece for conventional sentiments or moral posturing. Especially interesting is Anhara, the young Afrian archeologist who has mastered Anglie so that she can appreciate the little Shakespeare that is extant and becomes sorrowed at the degradation of the race that produced the Master. Third, the investigation of racism, whether black or white, and its demeaning effects is matter-of-fact and even-handed, hence, neither sensational nor preachy. The book, then, is impressive and challenging; as such it must be ranked among the relatively few superior examples of children's SF.

—Francis J. Molson

**LINDSAY, David.** British. Born in Blackheath, London, 3 March 1876. Educated at Lewisham Grammar School, London, and a secondary school in Jedburgh, Roxburgh. Served in the Grenadier Guards, 1916-18. Married Jacqueline Silver in 1916; two daughters. Worked for Price Forbes, insurance brokers, 1894-1916; lived in Cornwall, 1919-29, and after 1929 in Sussex. Died 16 July 1945.

Critical Studies: *The Strange Genius of David Lindsay* by J. B. Pick, Colin Wilson, and E. H. Visiak, London, Baker, 1970, as *The Haunted Man*, San Bernardino, California, Borgo Press, 1979; *The Life and Works of David Lindsay* by Bernard Sellin, translated by Kenneth Gunnell, Cambridge, University Press, 1981; *David Lindsay* by Gary K. Wolfe, Mercer Island, Washington, Starmont House, 1982.

\* \* \*

While David Lindsay's first novel, *A Voyage to Arcturus*, has become recognized as one of the masterworks of 20th-century fantasy, his other novels remain unknown to all but a handful of readers, and the man himself remains a curiously distant and enigmatic figure. More a philosopher than a novelist, Lindsay wrote often awkward and laborious prose, his later work filled with long expository digressions, his ideas so complex and densely packed, his characters so unsympathetic, that many readers find his fiction at first coldly intellectual and difficult to get into. But Lindsay undeniably expanded the possibilities of fantasy as philosophical fiction, and his influence has been widely felt among modern authors as diverse as Colin Wilson and Philip José Farmer.

Lindsay's masterpiece, *A Voyage to Arcturus*, concerns the journey of a man named Maskull to Tormance, a world in the system Arcturus, where he encounters bizarre characters and himself undergoes physical transformations in a series of episodes depicting different systems of belief not unlike the different moral systems at work on Earth. As each of these moral systems is shown to be illusory, Maskull is gradually brought to a confrontation with the godlike villain Crystalman, who controls this world, and who seems, at the end, to represent the entire world of phenomenal experience. Drawing on Nietzsche, Schopenhauer, and Norse mythology for ideas and

imagery, Lindsay develops a world of vivid scenery and violent action that nevertheless is rigidly structured according to the philosophical ideas he wishes to explore. The novel is a remarkable union of action and idea.

Ideas were more interesting to Lindsay than action, however, and his later novels contained little of the violent action of *Arcturus*. *The Haunted Woman* continued exploring the notion of subjective reality in a romance of two lovers who could only acknowledge their love in a phantom room of a haunted house. *Sphinx* turned to the science-fiction device of a dream-recording machine to explore the romance between a woman composer and a writer. Like *A Voyage to Arcturus* itself, however, each of these novels was a commercial disaster, and Lindsay turned to the historical romance for his next book, *Adventures of Monsieur de Mailly*, a tale of court intrigue that nevertheless also reflected Lindsay's preoccupations with illusion and deception. *Devil's Tor* is a sprawling, slow-moving, and at times brilliant exposition of the myth of the Eternal Feminine, in a story concerning the reuniting of two halves of an ancient stone and the founding of a new race by a chosen man and woman.

Lindsay was unable to find a publisher for *The Violet Apple*, and he left another manuscript, "The Witch," unfinished. Both works were finally published in abridged form, and both retain the romance structure of *The Haunted Woman* and *Devil's Tor*. In *The Violet Apple* a dwarf apple tree, grown from a seed which according to legend came from the original tree of Eden, unites the lovers. "The Witch" explores the dual myths of the wise woman and witchcraft in a work whose controlling image is music. Though none of these later works achieves the narrative power of *A Voyage to Arcturus*, they nevertheless stand as worthwhile philosophical meditations and as studies in the problems inherent in trying to write a truly philosophical fiction.

—Gary K. Wolfe

**LLEWELLYN, (David William) Alun.** Irish. Born in London, England, 17 April 1903. Educated at Alleyn's School, Dulwich, London; St. John's College, Cambridge (Chancellor's Gold Medal, for poetry, 1923; College Literature Prize, 1924), B. A. (honours) in history and literature 1924, LL. B. (honours) 1925, M. A. 1928; Lincoln's Inn, London: called to the Bar, 1927. Served in the Intelligence Corps during World War II. #### Alun Llewellyn comments:

Only one of my novels is, strictly speaking, science fiction. *The Strange Invaders* looks at this planet and the ecological change upon it as a result of Man's abandonment of Mind as a motive force of his evolution. But since all human psychology is a matter for scientific analysis, and is a more subtle matter than mechanistic theories of economics or sex can explain, the studies in my other novels of the illusions of love, religion, ambition, and power ought really to be called fictional illustrations of scientific themes. By this interpretation, all my fiction qualifies as science fiction.

\* \* \*

Alun Llewellyn's *The Strange Invaders* is a fantasy set in the future when the habitable area of the earth is gradually decreasing as a new ice age emerges. Mankind has retrogressed; as a result of disastrous wars it has lost the art of civilization and is living in a pre-iron age existence. The story takes place in what seems to be the Gobi desert, a somewhat hostile environment but one of the last places on earth capable of supporting human life. The plot concerns a small group of people living in a half-destroyed town, isolated within the remains of a ruined city on the plains. There is a pseudo-medieval order to their existence: governed by a religious community of priests dedicated to the new trinity of Marx, Lenin, and Stalin, and controlled by a warrior group, they manage to eke out a life of basic survival. As if their plight were not bad enough, Llewellyn has this last outpost of humanity threatened by an army of enormous lizards—huge, cold-blooded creatures that are virtually invincible. The plot is concerned with the efforts of the community

to survive in the face of this new and overpowering challenge. What elevates the story above the ordinary is Llewellyn's ability to show how the basic human emotions of love, hate, and jealousy survive and dominate the lives of these people even in the face of overwhelming danger and the threat of extinction.

Though the novel is cast in the form of a futuristic nightmare, it is difficult for the reader to remember that the time frame is the future and not the past. So vividly does Llewellyn evoke the sense of life of these people and so much is their life a reliving of prehistorical civilization, that the reader inevitably feels that he has been transported into the past rather than into the future.

—Joseph A. Quinn

**LLEWELLYN, Edward** (Edward Llewellyn-Thomas). Canadian. Born in Salisbury, Wiltshire, England, 15 December 1917. Educated at the University of London, B. Sc. 1951; McGill University, Montreal, M. D., C. M. 1955. Served as Sergeant in the Royal Signals, 1939-40, and Captain in Royal Electrical and Mechanical Engineers, 1940-45; Surgeon Lieutenant, Royal Canadian Navy Reserve, 1959-65. Married Ellen Buford in 1947; one daughter and two sons. Junior Engineer, BBC, 1938-39; Contoller, Telecommunications, Malaya, 1945-50; Engineer, Montreal Neurological Institute, 1952-54; Research Associate, Cornell University, Ithaca, New York, 1956-58; Scientific Officer, Defence Research Medical Laboratories, 1958-61; Assistant and Associate Professor, 1959-66, Professor of Pharmacology, Associate Professor of Electrical Engineering, and Assistant Professor in Department of Anaesthesia, 1966-84, Professor in Institute of Biomedical Engineering, 1974-84, and Associate Dean in the Faculty of Medicine, 1974-84, University of Toronto. Part-time Professor of Psychology, University of Waterloo, Ontario, 1963-65. Fellow, Royal Society of Canada, and Royal Society of Arts. *Died 5 July 1984.*

##### Uncollected Short Story

"The Lords of Creation," in *Analog* (New York), March 1985.

\* \* \*

Edward Llewellyn-Thomas who wrote SF as Edward Llewellyn was an M. D. who taught at the University of Toronto. His books specialize in high adventure and back-grounds that draw on Llewellyn's knowledge of engineering and medicine.

In his first SF novel, *The Douglas Convolution*, Llewellyn introduces us to a mathematician from the present who discovers a means of time travel. He uses it to travel to the year 2170 where the world faces serious depopulation because of a drug that sterilizes female offspring. The mathematician calls

himself Captain Gart and becomes a soldier helping the Order—the few fertile women left—beat back a barbarian invasion. The action is brisk and Llewellyn leaves Gart in the arms of an amorous, fertile copter pilot.

Llewellyn's next book is a sequel to *The Douglas Convolution*, *The Bright Companion*. Unfortunately, the tone is not as lively as the first book. David, a son of a doctor, travels the Shenandoah valley where he meets Ann, a fertile woman who wants to find her way to the Order's headquarters based in Malta. The book becomes the story of David and Ann's travels from the Chesapeake, across the Atlantic Ocean, through the Mediterranean to Malta. Ann, typical of Llewellyn's female characters, is strong and feisty. David, again typical of Llewellyn's male characters, is wimpy. Their company becomes grating as the book limps along to its predictable conclusion.

In *Prelude to Chaos*, a prequel to the first two Llewellyn books, Judith Grenfell, a neurobiologist, discovers the sterility affect in a common drug most women have taken. This is the weakest book in the series because most of action is a rehash of events described in the first two books. The characters of Judith and Gavin Knox are well done but the plot lacks suspense and surprise.

Llewellyn must have sensed that he had played out most of the innovative ideas of the first three books because he wisely changed settings with *Salvage and Destroy*. Llewellyn introduces two star-faring alien races: the Ults and the Drin. The Ults have defeated the Drin and control the Galactic civilizations. Ults have immortality by foregoing sexual maturity; Drin gain immortality by dominating host bodies with their minds. In 1680, the Ults landed on Earth, brought back some humans who bred into Ult starship crews. Now signals from Earth suggest a menace to the Ult realm so they dispatch Lucian to study the human problem. Llewellyn cleverly has Lucian assume a humanlike form, which makes him adjust his Ult mentality to a more human one. The plotting is crisp but the book drags because of long dialogues between Lucian and three inherited personalities and a computer personality.

Llewellyn's last book, *Fugitive in Transit*, offers another strong female character in Ruth Thalia Adams who disappeared through a natural "gate" in ancient Greece to explore the thousands of worlds connected by the Galactic Transit Authority. The chase is on as a Galactic Marshall is sent to track "Alia" down on Earth. Hiding on her home Greek island, Alia falls in love with a poet named Peter Ward. Together they try to outwit the combined forces of Organized Crime, the United Nations, and the Galactic Transit Authority. The fast-paced action is enjoyable even though most of the content of the book is satiric.

Edward Llewellyn was a writer who combined scientific expertise and high adventure to produce solid SF enjoyment.

\* \* \*

Jack London is among the more important American science-fiction writers by virtue of his attention to social and political extrapolation, matters all too often ignored by his compatriots. In almost all of London's science fiction, mankind individually or collectively faces a challenge, be it the challenge of the primitive, the challenge of disaster, or the challenge of socialism.

"A Relic of the Pliocene" is a good example of the challenge of the primitive. In London's arctic, the scene of a good portion of his fiction, a man tells of killing the last mammoth. "When the World Was Young" takes up the theme of a man divided between an identity as a civilized businessman and a primitive savagery that seizes control every night. In "The Strength of the Strong" a cave man tells of the formation of tribes, which increase everyone's strength, and then of classes, which seem to decrease collective strength. London's novel *The Last Adam* is entirely situated in primitive times.

*The Scarlet Plague* is London's most successful disaster novel. To read it today is to realize how tepid are many recent works about disaster. The opening scene alone is a small masterpiece. It presents an old man and two boys walking along a railroad track in the future, destroyed world, the old man reflecting on the contrast between the way things are and the way they were in the old days. This old man, once a college professor at the University of California, goes on to tell of how his world collapsed under the onslaught of the plague, which was always fatal within thirty minutes, and killed most of the world's population, sparing only the old man and about forty others. These few spawn a new generation in a now-primitive world. The old man tells of the futile efforts at the University of California to save a remnant of the University community, and the equally futile efforts he (the old man) has made to make the new generation understand something of how things once were. Another disaster story is "The Unparalleled Invasion," in which the western nations use germ warfare to defeat the yellow peril—the combined forces of Japan and China. London's much-discussed racism is all too evident in this story.

A good deal of London's science fiction describes the onset of socialism, usually perceived by the ruling classes as a disaster. In "The Minions of Midas" a secret society blackmails the capitalists into submission by killing their loved ones. A similar story in *Goliath*, in which a discoverer of atomic power blackmails the world into accepting socialism. But London's great work in this mode is *The Iron Heel*. A future America has come under the iron heel of oligarchic corporations, and a working-class hero, Ernest Everhard, struggles to convince certain of the well-to-do that only a revolution can remove the oppression. London ends the book in 1932, when the oligarchy has thwarted one attempt at revolution—but another attempt is planned. Although Everhard is too pure and great, too earnest, London's novel brings to science fiction a high level of political discussion of issues that remain vital.

Almost as well known is "The Dream of Debs," a realistic account of a general strike in San Francisco which succeeds only after the fabric of society is utterly rent. When the wealthy narrator complains that "the tyranny of organized labor is getting beyond human endurance" we can see his point.

Perhaps London's greatest science fiction work, however, is

*The Red One*, which is not cast in any of London's characteristic molds, although it does involve a white man held captive by primitive Sumatrans, thus fitting with London's interest in survival under primitive conditions. The primitive tribe in question worships the red one of the title, a sphere from the stars. The white man gives his head in exchange for the chance to hear the red one's voice. London gives us a remarkable descriptive passage in which the white man hears the aliens' message and then dies, his head coveted by the tribal chieftain. The poignancy of this juxtaposition—the man of the present, captivated by the future yet held captive by the past—establishes London's importance and originality as a science-fiction writer.

*The Infinite Brain.* New York, Avalon, 1957.

*The Eternal Man.* New York, Avalon, 1964.

\* \* \*

Charles R. Long was interested in the possibility of infinite worlds with humanoids in various stages of moral and psychological development and with the more advanced races using their united mental forces to aid the less developed in times of crisis. He envisioned the growth of psi powers, now latent in human genetic make-up, psi powers that include telepathy, mindfusion, levitation, and physical transportation of self and others through time and space.

Written in journal form, *The Infinite Brain* traces the attempts of a rich eccentric to come to terms with the contradictions of his memories and experiences and those of his fellow Earthlings. Having once joined with an astronomer and a paranoid genius in an unsuccessful space launch to Venus, one that sent him into a deep-freeze orbit and returned him to a future world, he finds that historical details differ and that he has strange flashes between past and present, an earth he remembers and an earth that seems vaguely unfamiliar. By the time he discovers he has returned to a utopian parallel earth, he has already been drawn, through telepathic possession, into the dangers of the pre-holocaust world he had left. Only with the aid of the "Mind," the combined mental force of the most intelligent and moral of his new planet, can he combat a mad genius (the infinite brain) and save himself and his two worlds. Ironically the mad scientist of his original Earth is the genius and mentor of its parallel. The book suggests an infinite series of parallel worlds with infinite combinations possible. It includes stilted lectures on protons and neutrons, artificially inserted at the prompting of the "infinite brain," enthusiastic descriptions of weightlessness, and much speculation about the physical effects of travelling at or near the speed of light (shrinkage, reduction of centuries to seconds, separation of body and soul).

*The Eternal Man* is a story of maturation, a half-human, half-

alien with god-like genes discovering and coming to terms with his identity and powers during a youth that spans man's history from pre-historic times to an intergalactic future. Though he remains inactive for centuries because his failure to age and his partially developed psi powers frighten mere humans, idealism and sexual allures tempt the "eternal man" into politics, where he founds an economically balanced socialistic society in Texas, tries gradually to introduce democracy into a world based on profit, slavery, and exploitation, and learns how easily even a clever man can be manipulated by a beautiful woman. His contact with the telepathic Mercurians of the rebellious Underground and the cruel and powerful Sagittarian invaders forces recognition that the world's telepaths are the product of his philandering through the ages and that he is the superior seed planted by Pleiads centuries before in a dream of spreading their community of minds throughout the galaxy. Once he rediscovers and accepts his vast powers, inspired by his eternal and alien ancestors, he is ready to rule earth wisely and benevolently.

Despite some awkwardness of style and an occasional propensity to lecture, Long's works raise interesting questions well worth exploring.

—Gina Macdonald

**LONG, Frank Belknap.** Also writes as Lyda Belknap Long. American. Born in New York City, 27 April 1903. Educated in New York public schools; New York University School of Journalism, 1920-21. Married Lyda Arco in 1960. Writer for *Captain Marvel*, *Green Lantern*, *Congo Bill*, and *Planet Comics* in the 1940's; uncredited associate editor, *The Saint Mystery Magazine* and *Fantastic Universe* in the 1950's; associate editor, *Satellite Science Fiction*, 1959, *Short Stories*, 1959-60, and *Mike Shayne Mystery Magazine* until 1966. ##### Frank Belknap Long comments:

My work has been almost equally divided between science fiction or science fantasy and supernatural horror. What fascinates me most in the realm of SF is the strangeness, mystery, and wonder of the cosmic immensities and the possibility of intelligent life on other worlds. A few of my early

stories were of the space opera type, but for many years I have shunned that kind of writing. A realistic approach has become of supreme importance to me, and I have drawn upon one or more of the natural sciences in all my more recent stories. They range from future utopias—life on earth two centuries or two million years in the future—to what life may be like, biologically considered, in some far distant region of the expanding universe.

\* \* \*

Of all modern writers in the overlapping domains of science fiction, fantasy, and horror, Frank Belknap Long may hold the record for sheer longevity, and, while he does not hold that for total productivity, he has written several hundred short stories and more than 30 books. The latter are difficult to number and categorize, as they involve a number of collections, re-sorting, and retitling of short stories as well as novels. In addition to works published under his own name, Long participated in a number of collaborations and round-robins, wrote short stories under house names such as Leslie Northern, wrote anonymously on occasion, and produced several gothic novels under the name of his wife, Lyda Long. While these last works are in a sense "mere potboilers," Long maintains that they are not without merit and in some cases contain effective scenes of the horror-fantasy or near-fantasy variety.

In a career dating to 1924, and still actively writing, Long has experienced the expectable rises and declines of popularity and critical standing. For some years he was highly regarded; in later times, disdained as little more than a hack; and still more recently has emerged as a revered elder statesman held in wide affection. In this regard his standing is comparable to that of writers like Murray Leinster and Edmond Hamilton. An accumulation of potboilers temporarily obscures the author's best work; with the passage of time the inferior material dissipates and the author's true contribution comes to be recognized.

Long has experienced the additional benefit—and handicap!—of having been for many years the closest friend and associate of H. P. Lovecraft. At one time Lovecraft and Long were partners in the "revision business," working as manuscript doctors, uncredited collaborators, and even ghost writers for literary tyros. A certain portion of Long's own fiction shows a clear stamp of influence by Lovecraft, but this in fact represents a relatively small segment of Long's output, a fact too often overlooked.

A number of Long's horror stories—most of them fantasies, a few technically science fiction but still cast within the gothic mold—are notable. These include "The Desert Lich," "Second Night Out," a supernatural sea story perhaps remotely influenced by the works of William Hope Hodgson, and "The Man with a Thousand Legs," one of the most bizarre of all lycanthropic tales.

Long also contributed some of the earliest and most effective supplements to Lovecraft's "Cthulhu Mythos." Long's dry humor is apparent in "The Brain-Eaters," whose two chief characters are thinly disguised versions of himself and Lovecraft. "The Hounds of Tindalos," probably Long's most famous story, is a thoroughly effective tale of monstrous creatures from beyond normal time and space breaking through the "angles" of our universe; the story is most effective in evoking a sense of non-Euclidean dimension. "A Visitor from Egypt" continues the successful exploitation of the Egyptian craze of the 1920's-early 1930's popular fiction. (One chapter of this novel was written by Lovecraft, based upon a dream.)

Long's science fiction bears no trace of Lovecraft. It is sometimes densely powerful, evocative, and moving; at other

times, the author fails in attempted effects and falls into bathos. In general, Long's short fiction is superior to his novels; in this regard he is once more comparable to Leinster. "The Flame Midget" clearly anticipates the development of the laser. A later story, "Dark Vision" (1939), is one of the earlier and still one of the most successful to use psychiatric and specifically Freudian themes in science fiction. Long places strong emphasis on the subconscious, and in the story makes use of both electroshock and chemical shock techniques (the former accidentally; the latter clinically) in bringing about changes in the protagonist's perceptions and interpretations of reality.

Also notable is Long's series of stories about John Carstairs, "Botanical Detective." These are intriguing hybrids of space opera and scientific mystery.

Long's most effective work is probably a series of short stories ("The Great Cold," "Green Glory," and "The Last Men") set in a remote future when humankind is reduced to miniature size and enslaved by races of giant insects. In framework, the stories would appear to be routine absurd super-science adventures. But Long concentrates on the awakening consciousness of the brutalized humans as they regain their awareness of their own humanness. The pitch of noble tragedy achieved is remarkable.

In a recent letter, Long listed his own selection of his short stories which he considers the most accomplished. The stories nominated by Long include "Humpty Dumpty Had a Great Fall," "To Follow Knowledge," "Prison Bright—Prison Deep," "Guest in the House," "Two Face," and "Night Fear" (most included in *Night Fear*). Almost all of these stories are based on psychological themes, most notably difficulties of personal adjustment. Further, the main protagonist is most commonly a child. The psychological sensitivity of the works is noteworthy, as is their acuteness of focus and intensity of treatment. It is also noteworthy that none bears any trace of Long's Lovecraft period; with the continued passage of time it is to be hoped that Long's non-Lovecraft works (which in fact constitute the overwhelming bulk of his output) will achieve their proper evaluation.

## Uncollected Short Stories

"Twist Ending," in *Isaac Asimov's Science Fiction Anthology 5*, edited by George H. Scithers. New York, Davis, 1982.

"Misencounters," in *Alien Encounters*, edited by Jan Howard Finder. New York, Taplinger, 1982.

\* \* \*

Barry Longyear's first story appeared in *Isaac Asimov's Science Fiction Magazine* in 1978, but, unlike many such over-the-transom discoveries, he had virtually no apprentice period. As a result he was able to publish a great deal of competent material in a short space of time. He rapidly gained a following, and in 1980 was the first writer ever to win the Hugo, the Nebula, and the John W. Campbell awards all in the same year.

Longyear's earliest fiction, beginning with his first story, "The Tryouts," belongs to the *Circus World* or *Momus* series, concerning life on a planet colonized by the survivors of a wrecked circus starship, the resultant society being a crazy hodgepodge of circus customs and lore adapted to extra-terrestrial conditions. These earliest stories are collected in *Circus World*. They are well-written and amusing, although in the last couple the weakness of the series is already apparent. The inhabitants of *Momus* are rediscovered by the Ninth Quadrant Federation of Habitable Planets just before the evil forces of the Tenth Quadrant can conquer the place. In the first story, the Ninth Quadrant ambassador must convince the *Momus* folk that the danger is real. But, since in a circus everything costs, his free warning is taken as valueless. Therefore he must go on the road as a storyteller, to get the people to pay for the news, before the warning is heeded. Later stories deal with the odd social changes that result. The tone and quality are reminiscent of Keith Laumer's *Retief* series. But where Laumer is able to avoid unfunny amounts of violence, Longyear has written himself into a corner. The evil invaders arrive, and suddenly the clowns and acrobats and the like are no longer quaint tricksters, but fighters. The whole conceit is much too fragile to take the strain. Later *Momus* books include *City of Baraboo*, actually a prequel to the original stories, telling how the planetary circus-society was founded, and *Elephant Song* in which the *Momus* folk raid Earth for elephants, since they have none, and what's a circus that doesn't have elephants?

The Hugo- and Nebula-winning "Enemy Mine" is a more substantial work, a deeply moving and tensely dramatic account of how a human and an alien, enemies in war, must cooperate to survive when stranded on a barren planet. In time the human comes to understand a great deal of the alien's culture, to appreciate its religion, and ultimately to care for its child.

The understanding of the alien is a major theme in Longyear's more serious fiction. "The Jaren" (in *Manifest Destiny*) similarly deals with a race at war with mankind, told from the viewpoint of adolescents growing up to join a military culture which cannot comprehend the possibility of defeat. When they are defeated, the species ceases to breed, and quickly goes extinct. The weakness of this story, and to a lesser extent "Enemy Mine," is that the aliens aren't alien enough. They are too obviously human beings lightly disguised. The alien planets are merely foreign countries. However, this fault is hardly unique to Longyear, and he writes with genuine feeling. He is a distinctly compassionate writer.

In the first few years of his career, Longyear seemed to have made a major impact, but his career lost its stride for mostly extra-literary reasons. He has, however, begun to publish substantial work again. *The Tomorrow Testament* is semi-sequel to "Enemy Mine," dealing with the same human/alien war, and again with a human (this time a woman prisoner of war) who comes to respect the aliens through their religion. While not wholly successful, *The Tomorrow Testament* is a genuinely ambitious, serious work which reaches for a level of complexity far beyond anything hinted at in the *Momus* series. It must be counted as one of the best attempts to explore an alien religion and the psychology of another intelligent species.

Unfortunately, because the wide critical see-sawing in regard to Longyear's reputation, this book was largely ignored. Longyear was perhaps over-rated when he began and is now under-rated. He has shown an ability to do serious work, but also a tendency to slide into frivolity. However, with most of his career still presumably ahead of him, he may be expected to outlast the awkward situation created by his sudden and very startling arrival.

—Darrell Schweitzer

**LOOMIS, Noel M(iller).** Also wrote as Sam Allison; Benj. Miller; Frank Miller; Silas Water. American. Born in Wakita, Oklahoma, 3 April 1905. Attended Clarendon College, 1921; University of Oklahoma, Norman, 1930. Married Dorothy Moore Green in 1945; one son and one daughter. Printer and editor, then newspaperman; free-lance writer from 1929; English Instructor, San Diego State College, 1958-69. President and Secretary-Treasurer, Western Writers of America. Recipient: Western Writers of America Silver Spur Award, for novel, 1959, for story, 1960. *Died 7 September 1979.*

\* \* \*

Noel M. Loomis wrote futuristic novels in which a scientific "problem" is fused to the stock elements of the adventure tale. The science in his novels ranges from the probable to the possible to the completely implausible. This uneasy fusion of science and fantasy when wedded to the adventure story leads to an inevitable tension within the novel itself and certainly within the reader's capacity for "willing suspension of disbelief."

In *City of Glass* Loomis postulates the problem of three amateur astronauts who, returning to earth after a few days' absence, find themselves returning to earth of the year 800,000 AD. Civilization as we know it was destroyed in 5,000 AD; there are only a few scattered groups on earth, each of which has evolved separately so that no two are of the same species. The only real human beings left on earth are the 2500 Glassmen who live in the City of Glass and struggle to perpetuate their species, which is "being adapted by necessity and by scientific means to a silicon economy." Beset by a nitrate shortage, hostile invaders, and a plague, the City of Glass seems doomed, until Niles, the amateur astronaut, discovers a way to solve all difficulties.

*The Man with Absolute Motion* is an intergalactic tale in which the whole universe is threatened with disaster as a result of

diminishing energy supplies. The last truly normal man on earth is discovered to have the gift of absolute motion and is thus able to locate the source of Cosmic Power. Having saved the galaxy, he marries the last normal earth woman, raises a family, and is returned to earth only to find it deserted, the human species wiped out. Fortunately, he decides to repopulate the earth, thus ensuring the survival of the human species.

\* \* \*

That horror stories are externalized psychology is a  
 commonplace of literary criticism, but readings based on sex  
 and aggression (the two themes literary critics have tended to  
 pick up from Freudian psychology) do not quite fit H. P.  
 Lovecraft. Lovecraft himself warns readers away from interpre-  
 tations of his work based on the fear of retribution for specific  
 acts or impulses; his horrors are (as he says again and again)

"cosmic," he declares the worst human fears to be displacement in space and time (as in "The Shadow Out of Time"), he speaks of "the maddening rigidity of cosmic law," he creates a non-fantastic and materialistic fictional world—i. e. science fiction—all implying a concern with the conditions of being, not with particular acts or situations. When the conditions of existence are themselves fearful, when such basic ontological categories as space and time break down (as does the geometry of space in so many stories, for example "The Call of Cthulhu"), we are dealing with what the psychiatrist R. S. Laing calls "ontological insecurity." If one fears that one doesn't exist securely, or that one is made of "bad stuff," any contact with another becomes potentially catastrophic. Everyone shares, to some degree, doubts about the psychological solidity or reliability of the self and the possibly devastating effects of others on that self. The extreme form of such fears is schizophrenia.

Lovecraft, although certainly not schizophrenic, did, according to L. Sprague de Camp, have a lifelong sense of marked isolation from others, an intense emotional dependency on things and not people, and the kind of over-possessive bringing up which makes it reasonable to expect that such issues would appear in his work. They do—strongly enough to make him an innovator in weird fiction—for they take precedence over either the beastliness of aggression (embodied, for example, in werewolves) or the lethal possibilities of sexual abandon (e. g., the figure of the vampire), both of which figure largely in 19th-century supernatural fiction. Sex and aggression presuppose a self existing securely enough to have desires and a relatively non-threatening (or at least limited) other towards whom such desires can be directed. Neither an unproblematic sense of self nor a non-catastrophic other exists in Lovecraft's work. In his early Dunsanian fiction he can frolic—but with ghouls!—as in the charming (but, alas, never rewritten or polished) *Dream-Quest of Unknown Kadath* or write pleasing, optimistic fantasies like "The Strange High House in the Mist"; but much of his earlier and most of his later fiction is preoccupied with the foreseen, yet unavoidable, engulfment of a passive, victimized self. If the narrator is a lucky spectator who escapes with his life, or even sanity, intact, his peace of mind has been shattered forever. The real point of these stories is revelation—if the engulfment does not happen, *it can*—and this revelation becomes the central truth of a universe thus rendered uninhabitable. The cannibalistic other takes several forms, but the commonest, strongest image, and the one readers seem to remember best is the shapeless, monstrous, indescribable "entry" (a favorite word of Lovecraft's) whose most terrifying characteristic is its structurelessness ("The Unnameable," "The Call of Cthulhu," "Dagon," "The Dunwich Horror"). The obsession with psychic cannibalism (expressed as physical in one of the flatter stories, "The Picture in the House,") and the insistence on the indescribability of the threat seem to point to experience so personally archaic it is felt as pre-verbal, as does Lovecraft's characteristic straining after adjectives. In one of his best tales, "The Colour Out of Space," the threat is most abstract, its cannibalism is reported third-hand (through *two* narrators) and the relatively low-keyed, realistic setting gets most of the author's attention.

In only two stories does Lovecraft focus fully on the alternative to engulfment: loneliness. Selves exist and survive in both tales; they even—after a fashion—blossom into initiative. But both are figures that appear in other stories *as monsters*: in the poetically melancholy "The Outsider" a ghoulish walking corpse, and in the very interesting end of *The Weird Shadow over Innsmouth* a degenerate animal/monster. Both stories suggest that the menace is the narrator or something in the narrator, a

suggestion not only psychologically truer than the image of the engulfing other than Lovecraft uses elsewhere, but one dramatically more interesting.

The view that human relations exist only as engulfment is a serious limitation on a narrative artist. Towards the end of his life Lovecraft seems to have been unhappily aware of this; unfortunately he also underrated his own work and died before it began to be popular. His originality and his undoubted talent (the eerily parodic autobiography of "The Outsider," details like the "gelatinous" voice in "Randolph Carter," or "a warmth that may have been sardonic" of *Innsmouth*) are best at their quietest, worst in their bravely direct but often inadequate attacks on a theme that requires (at the very least) poetic genius. The very rarity of literary treatments of Lovecraft's main theme gives his work added interest, however, and his work will probably always appeal to readers who find his theme compelling. If he had not died prematurely, he might have moved beyond the kind of horror story that says "This is what it feels like" to the kind that adds "and this is what is really happening." The latter moves into tragedy and implied social criticism (as does, for example, Shirley Jackson's *The Haunting of Hill House*). In *Supernatural Horror in Literature* Lovecraft concludes "the spectral in literature. . . is. . . a narrow though essential branch of human expression," a comment that might well describe his work: narrow, not appealing to wide tastes and even considerably flawed, yet authentic, and by those who find it congenial, securely loved.

## SCIENCE-FICTION PUBLICATIONS

## Novels

*Mystery of the Third Mine* (for children). Philadelphia, Winston, 1953.

*The Duplicated Man*, with James Blish. New York, Avalon, 1959.

*The Puzzle Planet*. New York, Ace, 1961.

*Believers' World*. New York, Avalon, 1961.

## Uncollected Short Stories

"The Outpost at Altark," with Donald A. Wollheim (uncredited), in *Super Science* (Kokomo, Indiana), November 1940.

"A Green Cloud Came," in *Comet* (Springfield, Massachusetts), January 1941.

"The Psychological Regulator" (as Arthur Cooke, with others), in *Comet* (Springfield, Massachusetts), March 1941.

"The Martians Are Coming," with C. M. Kornbluth (uncredited), in *Cosmic* (Holyoke, Massachusetts), March 1941.

"Black Flames" (as Lawrence Woods, with Donald A. Wollheim) and "The Other," in *Stirring Science* (New York), April 1941.

"The Grey One," in *Stirring Science* (New York), June 1941.

"The Colossus of Maia" (as Lawrence Woods, with Donald A. Wollheim), in *Cosmos* (New York), July 1941.

"Lure of the Lily," in *Uncanny Tales* (Toronto), January 1942; revised version, as "Lillies," in *Magazine of Horror* (New York), Spring 1967.

"Passage to Sharanee" (as Carol Grey), in *Future* (New York), April 1942.

"The Deliverers" (as Richard Morrison), in *Science Fiction Quarterly* (Holyoke, Massachusetts), Winter 1942.

"The Leapers" (as Carol Grey), in *Future* (New York), December 1942; revised version, as "Leapers" (as Robert A. W. Lowndes), in *Magazine of Horror* (New York), September 1968.

"Chaos, Co-ordinated" (as John MacDougal, with James Blish), in *Astounding* (New York), October 1946.

"The Troubadour" (as Peter Michael Sherman), in *Future* (New York), September 1951.

"Intervention" (as Michael Sherman), in *Science Fiction Quarterly* (Holyoke, Massachusetts), February 1952.

"A Matter of Faith" (as Michael Sherman), in *Space* (New York), September 1952.

"Highway," in *Looking Forward*, edited by Milton Lesser. New York, Beechhurst Press, 1953; London, Cassell, 1955.

"The Inheritors," with John B. Michel, in *Terror in the Modern Vein*, edited by Donald A. Wollheim. New York, Hanover House, 1955.

"Object Lesson" (as Carl Groener), in *Future* (New York), August 1958.

"The Abyss," in *The History of the Science Fiction Magazines 2*, edited by Michael Ashley. London, New English Library, 1975.

"The Extrapolated Dimwit" (uncredited), with C. M. Kornbluth and Frederik Pohl, in *Before the Universe*. New York, Bantam, 1980.

## Uncollected Short Stories as Paul Dennis Lavond

"The Doll Master," in *Stirring Science* (New York), April 1941.

"Exiles of New Planet," with Cyril Kornbluth, in *Astonishing* (Chicago), April 1941.

"Something from Beyond," with Frederik Pohl and J. H. Dockweiler, in *Future* (New York), December 1941.

"Einstein's Planetoid," with Frederik Pohl and Cyril Kornbluth, in *Science Fiction Quarterly* (Holyoke, Massachusetts), Spring 1942.

## Uncollected Short Stories as Wilfred Owen Morley

"A Matter of Philosophy," in *Science Fiction* (Holyoke, Massachusetts), September 1941.

"My Lady of the Emerald," in *Astonishing* (Chicago), November 1941.

"No Star Shall Fall," in *Future* (New York), December 1941.

"The Long Wall," in *Stirring Science* (New York), March 1942; revised version, as "Settler's Wall" (as Robert A. W. Lowndes), in *Startling Mystery Stories* (New York), Fall 1968.

"The Lemmings," in *Super Science* (Kokomo, Indiana), May 1942.

"A Message for Jean," in *Future* (New York), June 1942.

"The Slim People," in *Future* (New York), August 1942.

"Highway," in *Science Fiction Quarterly* (Holyoke, Massachusetts), Fall 1942; revised version, as "The Road to Nowhere" (as Robert A. W. Lowndes), in *Magazine of Horror* (New York), Summer 1970.

"Does Not Imply," in *Future* (New York), February 1943.

"Dhactwhul—Remember?," with Jacques DeForest Erman, in *Super Science* (Kokomo, Indiana), April 1949.

## Uncollected Short Stories as Mallory Kent

"Quarry," in *Future* (New York), December 1941.

"The Peacemakers," in *Future* (New York), August 1942.

"The Collector," in *Future* (New York), October 1942.

\*

Robert A. W. Lowndes comments:

Although I was an active member of the marxist-oriented Futurian Society of New York (1938-45), calling for social and political relevance in science fiction, when it came down to writing stories I found that I had no interest whatsoever in such relevance. I only wanted to tell the kind of story I actually wanted to read—full of wonder or terror or both. Whether I succeeded, or to what extent I succeeded, is for others to say.

To my mind, the best fantasy and science fiction is imbued

with the author's feeling about the human condition, and may or may not contain what amounts to some sort of message. If there is one, it is not something consciously striven for; I've read thousands of stories written to preach a sermon, and however effective the sermon itself may have been, the stories have nearly all suffered from the approach. Fiction and homily writing are two different forms, though each may be done with a high quality of art; but mixing them produces an abortion.

\* \* \*

Robert A. W. Lowndes is known mainly as an editor. He is, however, also a science fiction writer of considerable talent, particularly in the creation and description of alien worlds. This talent is best seen in *Believers' World*. Lowndes uses the now-familiar plot of exiles from Earth who have forgotten that their origin was on Earth, and whose religious beliefs have hardened into mindless fragments of ceremony. An investigator from Earth visits these exiles, now living on a "believers' world" locked into elaborate religious ceremonies. He becomes involved in a formula of action, adventure, and violence. But Lowndes effectively describes the Arabian Nights atmosphere of this world: "magic. That was the keynote of everything here—the appearance of magic." Even small everyday events seem magical: "you touched a faucet, or bent over a fountain, or stepped under a shower, and pale yellow water issued forth." Thus Lowndes creates a world that exemplifies Arthur C. Clarke's generalization that advanced technology is indistinguishable from magic.

Everything that happens on the believers' world is supposed by the inhabitants to be the will of "Ein" (Einstein, though they don't remember this). In this topsy-turvy world not only has religion ossified but science has merged with it. *The Puzzle Planet* is about a world that is similar in that our common-sense assumptions are upside down; and once again Lowndes's descriptive powers are impressive.

Even *Mystery of the Third Mine*, a juvenile, is well worth reading. Lowndes makes asteroid mining seem real, creating a historical parallel to the gold rush of 1848. The hero, Peter, is in a mining partnership with his father. The villains use the cover of the Asteroid Miners Association to invalidate Peter's claims and to try to seize the "third mine," platinum, deep in the asteroid. There is a good science-fun gimmick on the asteroid: low gravity baseball with a magnetized ball and players throwing bits of metal to propel themselves through space. Although the young hero is close to being a pastiche of a Heinlein juvenile, Lowndes's magical atmosphere is once again his own.

Lowndes's short stories are quite distinct from his novels and show the influence of Clark Ashton Smith and Lovecraft. One of his best is "The Abyss," which begins with this hook sentence: "We took Graf Norden's body out into the November night, under the stars that burned with a brightness terrible to behold, and drove madly, wildly up the mountain road." Beings in another dimension (or no dimension) send agents to hypnotize humans and drain the fluids from their bodies. The description of these alien beings—with long filaments that restlessly try to break into our dimension from their own—is as well done as anything in Lovecraft, and the economy of the story is beyond Lovecraft. Economy, atmosphere, description: these are Lowndes's strongest points as a writer.

\*

Sam Lundwall comments:

I am not a fan of my work. I wish I were.

\* \* \*

Sam J. Lundwall's reputation rests chiefly on the critical/historical survey, *Science Fiction: What It's All About*, which he wrote in Swedish and translated into English. One of the first general summaries of the field, the book outlines a history and a theory of the genesis of science fiction. For many readers this outline (along with that presented in Brian Aldiss's *Billion Year Spree*) serves as the first critical framework by which they define their experience of science fiction. Lundwall categorizes science fiction, defines it, and comments on it. He draws on a wide range of stories and essays as source materials for his discussions and tries generally to test his conclusions against hard observation, even though he is not ashamed to write with the verve of a totally committed partisan or fan. Treating science fiction "books, magazines, comics, fans and fanzines, juvenilia, series characters, and literary giants," he also discusses popular motifs, conventions, themes, and plot lines.

The influence of this book is not easily overstated. Published in English in 1971 at the beginning of a great wave of academic interest in the genre, it provided the foundations for the organization of a large part of the scholarship and of the design and teaching of science fiction courses in universities. Lundwall is, moreover, straightforward, clear, and definite in enunciating his attitudes, much as a dedicated young fan would be. The book, consequently, stimulates interest in the study of the genre as a whole and in its various aspects. Although Lundwall's shrewd critical insights and commentary on authors and works may not seem as true five or ten years after they are first encountered, they tend to color a reader's perception of the field, having provided for many readers a starting point for disciplined study.

Sam J. Lundwall is also known as a writer of satiric novels. The best known of these and probably the most successful of the four that have been translated into English is *2018; or, The King Kong Blues*. In this novel Lundwall describes a world that in 2018 is polluted not only physically but spiritually as well. The tale begins with a description of a wedding held in a department store. Against this scene we see one of the central characters, a rootless, rebellious young girl named Anniki Norijn trying to break free of compulsions to conform to commercially acceptable standards of taste and ethics. The rest of the novel narrates a harassed advertising executive's search for this young woman. He is forced to use her in a campaign to sell underarm deodorant. A counterplot tells of two sheikhs, brothers, one of whom out of sheer boredom manipulates the economic life of the West, which the other one in the name of religion and Bedouin honor tries to destroy. The book gets its title from a

song Anniki sings that mocks the betrayed romanticism and the false facades of social institutions.

This novel is at home among that group of satiric novels that criticize the shallowness and triviality of modern life; it has been compared with Pohl and Kornbluth's *Space Merchants*, Brunner's *The Sheep Look Up*, and Burgess's *A Clockwork Orange*. Unlike Burgess's book, however, *2018* does not attack a single, philosophically distinct evil. Its attack is more generally directed against all sorts of economic exploitation on all levels. Unlike *The Space Merchants* it isn't very funny; its humor is blacker, crueler, more disturbing. Finally, it is not as successful as *The Sheep Look Up* because it preaches and explains more than it narrates or dramatizes. Perhaps Lundwall should, like Brunner, have used techniques similar to those of John Dos Passos to make the circumstantial background—which is, after all, the real main character and interest in the novel—come alive. *2018* unfortunately too often reads like an undergraduate textbook.

His other translated novels, also satiric, *Alice's World*, *No Time for Heroes*, and *Bernhard the Conqueror* vary in mood from depressed to genuinely funny.

—Alexander J. Butrym

\*

Richard A. Lupoff comments:

It's very difficult for me to "make a statement" about my own

works. It seems to me that this is a task for critics. The artist is of necessity so close to his or her own work—in fact, more than close to it: is surrounded by and immersed in it—that a critical perspective is impossible.

In terms of my own career, 1981 proved to be a year of bitter irony. I had spent decades learning the craft of fiction, and felt that I had finally reached a satisfying level of competence. The last three books that I had written—*Circumpolar!*, *Lovecraft's Book*, and *Sun's End*—were by far the best I had ever written. My prices had risen, critics and fans were expressing approval, foreign sales were gratifying.

At this point, due to general economic conditions, there was a collapse in the marketplace. All three books were cancelled, contracts for two further novels were cancelled, and the *What If?* anthology series that I had been editing was cancelled. Everything that I had in print went out of print, and my career was in effect terminated. My income dropped to nothing and I faced economic disaster.

In the years since, there has been considerable recovery. The three books that I named have all been published and all have met good receptions. A contract has been taken over by another publisher and I am working on the sequel to *Sun's End*. However, at the present time I have been unable to return to full-time writing and I do not see when (if ever) I will be able to do so.

\* \* \*

Richard A. Lupoff first achieved recognition as a fan critic. His amateur magazine *Xero* is considered to be the pioneer magazine of comic-book fandom, the first sub-culture to splinter from SF fandom. Lupoff's career as a writer is an effort to determine a post-modern SF writer's relations with his literature's past. Lupoff tends towards either total acceptance or total rejection of that past; thus his first novel, *One Million Centuries*, attempts to preserve Burroughsian panache in the midst of the New Wave, while *Space War Blues* totally rejects that past in favour of stylistic tricks and decadent space opera, with planets of white racists battling black racists for control of the universe. While *Space War Blues* is Lupoff's most acclaimed novel (due, in large measure, to relentless promotion of the original novella by Harlan Ellison), it is not his most important, as it is clearly a product of the concerns of the 1960's and dates very badly in its thematic content.

Lupoff's best novels are those that do not concern themselves with the nature of mainstream science fiction. Only three of his works fulfil this criterion—the dystopia *The Crack in the Sky*, the haunting chinoiserie *Sword of the Demon*, and *Lisa Kane*, published as a juvenile but in truth a thoroughly adult work about the nature of the macabre, and Lupoff's finest novel.

But Lupoff only intermittently achieves excellence. Most of his work is pastiche, ranging from the van Vogtian influences in *Triune Man*, to the parody of 19th-century scientific romances in *Into the Aether*, and *The Return of Skull-Face*, a completion of a Robert E. Howard fragment. These pastiches succeed to the extent that they preserve the flavor of the past without copying its style: *The Return of Skull-Face* shows that one cannot effectively copy Howard, and *Into the Aether*, conceived as a satire, is actually a combination of unfunny farce and irrelevant anachronisms. (Lupoff's other attempt at parody, the short stories published in *Fantastic* as by "Ova Hamlet," are important both for being the only parodies of current authors such as Barry Malzberg and for conclusively showing that most modern writers do not have styles that can be copied.)

In the 1980's, Lupoff continued to alternate between pastiches of pulp adventures of the 1930's and more serious

work. His specialty was throwing characters from the past into exotic situations; thus in *Circumpolar!* Charles Lindbergh, Amelia Earhart, and Howard Hughes battle the Red Baron and subterranean monsters in a hollow earth derived from Edgar Rice Burroughs's Pellucidar series. *Lovecraft's Book* is an alternate universe novel placing H. P. Lovecraft in the center of fascist and nationalist conspiracies. These novels, while well-crafted, are little more than fast-moving entertainments.

Far more promising is *Sun's End* in which a Japanese construction worker is placed in suspended animation for 80 years to emerge in the 21st century as a bionic superman. Here Lupoff combines his interest in Japanese culture with a continuing interest in the dynamics of personal power, last expressed in *The Triune Man*. *Sun's End* is, unfortunately, the first volume of a trilogy, and is thus only a start to what may or may not be Lupoff's most sustained creative success.

Richard Lupoff is a protean writer. He does not belong to any particular school of SF, and was one of the few writers who belonged to the 'New Wave' and the 'Old Wave' at the same time. Because he has not developed a distinctive style, he has not earned the importance he deserves. If he would continue to develop the trenchant awareness of his art that was shown in *Lisa Kane* and *The Crack in the Sky*, his reputation as one of the most important heirs of the Golden and Silver ages would be secure.

\* \* \*

John Lymington was well known for the crime novels published under his real name, John Newton Chance. As a writer of science fiction, however, he has received little notice, even within the SF community, perhaps because the fantastic elements of his fiction often serve as little more than a backdrop for the main action which characteristically centers on a small but diverse group of British citizens faced with a common threat. Lymington's characters, his village settings, and the structure of his novels owe as much to the tradition of the classical detective story as to the traditions of science fiction, and with few exceptions he does not concern himself with the social or intellectual implications of the marvels he introduces. As an author of suspense and horror stories, he is often startlingly effective, able to spin an entertaining novel from a single situation, but when he attempts more complex themes his novels tend to get out of hand.

Lymington makes use of few of the resources of the science fiction genre; most of his novels are variations on the basic theme of alien invasion, while a couple deal with time travel and contain elements of social satire. His first SF novel, *Night of the Big Heat*, is an admirable addition to the something-is-amiss-in-the-village school of British suspense novels, though the science-fiction element—an alien civilization transmitting giant spiders into the English countryside via microwaves—is clearly secondary to the portrayal of the reactions of a group of local citizens gathered at a country inn. Spiders are one of Lymington's favorite images of horror—even though he persistently regards them as insects—and were also the featured attraction in another invasion story, "The Night Spiders." The basic formula of an unknown horror menacing a small community was repeated in *The Coming of the Strangers*; in *Sword above the Night*—perhaps the most straightforward and unadorned of Lymington's exercises in suspense—the anticipated "invasion" that provides suspense throughout the novel is dispensed with in a three-paragraph closing summary, explaining that it is merely the pre-programmed return to Earth of dead astronauts who had left from an earlier civilization thousands of years ago. This novel perhaps most clearly indicates the short shrift Lymington gives his science-fiction concepts.

Occasionally, Lymington adds other science-fiction elements to his formula—in *The Sleep Eaters* the invasion is telepathic (*The Night Spiders* also have telepathic powers), and in *The Star Witches* a mad scientist helps bring the aliens to earth. *The Star Witches* also reveals an inclination on Lymington's part to work traditional supernatural appurtenances into his science-fiction narratives: in this case a coven of witches is associated with the alien invasion. Time travel is another concept that Lymington sometimes plays with, in *The Night Spiders*, *Ten Million Years to Friday*, and *Froomb! Froomb!* is in some ways Lymington's most ambitious novel, and the most satirical. The title is short for "The fluid's running out of my brakes!," a fictional cartoon caption that has come to symbolize the state of world affairs in Lymington's headlong future world. Essentially the story, which somehow encompasses such diverse themes as threatened nuclear war, heaven, heatrays, insecticide poisoning, food additives, radiation, drugs, and male impotence, concerns a man who dies and goes to heaven, only to find that it is actually a post-holocaust world brought about by an American defense experiment about to take place before he died. His efforts to return and warn the world of the experiment make up the bulk of the novel.

Lymington was not a major writer, and there is much to suggest that he did not take his science fiction seriously, but in the relatively narrow territory he staked out for himself he provides enjoyable light reading.

\* \* \*

Elizabeth A. Lynn is rapidly developing into one of the finest writers in the field of speculative fiction. Her greatest strength lies in her ability to focus sympathetically on a single character or a small cast of characters that are very human. Although her science-fiction stories are often presented in the trappings of space opera—faster-than-light travel, interstellar exploration, humans kidnapped by aliens—they are peopled by individuals who are clearly drawn from life. They are flawed and identifiably human, not Kimball Kennisons, or comic-book superheroes.

This is most apparent in her most important science fiction novel, *The Sardonyx Net*. Working from some pretty hoary SF elements—including interstellar drug and slave trades—Lynn has created a remarkable book. Although in synopsis it sounds like something straight out of a 1940's *Thrilling Wonder Stories* magazine, *The Sardonyx Net* is primarily a novel of character with a satisfyingly complex plot and some of Lynn's best writing. It is here that one of her special skills is most apparent: the ability to create a villain with whom the reader can

empathize. *Net* is far better plotted than most of her novels, and the best evidence of her matured skills.

Several of her short stories, and the novel *A Different Light*, are linked by some common images and themes. Although interstellar travel seems taken for granted, Lynn consistently treats the concept of hyperspace, the Hype, as a place not only beyond the normal limits of space-time, but beyond reality itself. It is a source of danger to all but the strongest who attempt to pass through it. In *A Different Light*, in fact, the Hype is the cause of the apparent death of the protagonist. Jimson, an artist, has an incurable cancer, one which will limit his lifespan, if he is careful, to another 20 years. Before he dies, however, he wants to see the light of other stars, and rejoin an old friend and lover. He flees his home planet in the sure knowledge that travel in the Hype will accelerate the process of his cancer. Jimson is typical of Lynn's protagonists. Most of them work in some art form, and seem to pay for their gifts with a physical debility—such as the one-armed telepath in *The Dancers of Arun*—but it is a debility that heightens their sensitivity to others and their surroundings. Jimson is a sexual being. Like many of Lynn's characters he lives in a society not proscribed by sexual roles, and his sexuality finds expression through love for women and men. A first novel, *A Different Light* is certainly flawed, both by its somewhat episodic plot and an ending that seems drawn from other SF novels rather than from within. But the novel's sensitivity and fluid language betray a promise that is more than fulfilled in her later novels.

The Chronicles of Tornor is a true trilogy—three self-contained novels related by continuity of place, cultures, and institutions—that defies neat categorization. The trilogy concerns the way that cultures and institutions change, and succeeds because it focuses on individuals directly involved in those cultures. *Watchtower* introduces the cultures: the rigid, militaristic society of the North, and the newly developed egalitarian life of the Cheari, built on an art composed of dance and martial art. The protagonist is a vassal of the northern culture, and the novel's conflict lies in his inability to assimilate the new mores and lifestyle of the chearis. The language is crisp and precise. *The Dancers of Arun* takes place 100 years later. It centers on the almost utopian lifestyle of the Cheari, and the language of the book is appropriately softened. Kerris is a child of these people but has been raised in the North, and finds difficulty in believing in their acceptance of his maimed arm. Only through the physically loving relationship that he develops with his brother does he learn to accept himself. The trilogy is concluded with *The Northern Girl* which concerns a third culture in the South. By now the Cheari are only a memory, and the focus is on a city-dwelling society. Here, Lynn is on even surer ground and Kendra-on-the-Delta is a more convincing place than either the military keeps or rustic villages of the previous books. The plot has a tendency to drift, but the characters are tightly drawn, with an emotional warmth unusual in the field. Much of this effect stems from Lynn's concentration on a small group of real people in intimate contact, rather than the giant battles of armies and wizards so common in fantasy.

Lynn's latest foray into fantasy is *The Silver Horse*, a disappointingly slight and derivative fairy tale about two young girls from San Francisco who travel to Dreamland to rescue a little boy. It is notable only for the role reversal of the lead characters; little girls are fearless, and little boys chicken-hearted.

\* \* \*

The SF career of C. C. MacApp lasted only slightly over ten years, from 1960 to 1971. During that decade he built a reputation for exciting adventure stories in which a lone hero would overcome seemingly hopeless odds to save his entire nation, species, or world. His style was beginning to broaden when he died.

MacApp came late in his life to SF. His real name was Carroll M. Capps, and his profession had been in the color printing industry. An illness forced him to retire in his early forties, and he began writing SF. His first story appeared 1960; he averaged only a couple of short works a year through 1963. Then from mid-1964 through 1968 he seemed to have stories almost constantly in print, in either *If* or *Worlds of Tomorrow*, the magazines with which he was most closely associated. In 1968 he began to produce paperback novels; five between that year and 1970. At the same time his flow of magazine stories cut back to a trickle; this was due to both his novel writing and his declining health. A couple of short stories and two more paperback novels appeared posthumously. He had been working on a hardcover novel for Doubleday but it was never finished.

MacApp's magazine works were primarily of novelette length. He was best known for suspense dramas in which humans appeared as underdogs amidst a galactic multispecies civilization. Chief among these were the nine "Gree" novelettes; "The Slaves of Gree," "No Friend of Gree," and so on. These featured Colonel Steve Duke, the top human fighter among the multispecies resistance to the Gree Empire which had conquered most of the galaxy (including Earth) 600 years earlier. Each story had Steve Duke being sent to an unknown planet which Gree's forces had just landed upon, to learn why Gree wanted it and to keep Gree from establishing a new base there. Duke's commando tactics made him a grim counterpart to Keith Laumer's more lighthearted James Retief, who also fought regularly in *If* during the mid-1960s to make the galaxy safe for humanity. A typical non-"Gree" drama is "A Ticket to Zennon," in which Tom Lerrow, a young Earthman, learns that he is being unwittingly used as a courier of plans for a top-secret weapon which two powerful alien factions and a deadly criminal are after. MacApp's aliens are not always villains, nor were all his stories dramas. "Winter of the Llangs" and "When Sea Is Born Again" feature alien teenagers in adventures which amount to rites of passage among their peoples. MacApp's first story, "A Pride of Islands," is a mild comedy where humans are portrayed as parasites living upon giant animals. A more successful comedy is "Mail Drop," in which the bureaucracy of the galactic postal service almost starts but finally prevents an interstellar war.

MacApp's short fiction succeeds by means of dramatic incidents. His novels show that he could write powerful adventures with more richly portrayed characters. Yet the novels have a thematic sameness. All begin with their protagonists caught in a moment of total despair. Murno, an

ignorant human peasant on an Earth subjugated by aliens for thousands of years, learns that their masters are about to begin hunting men for sport (*Omha Abides*). Raab Garan, a cadet in a dirigible air fleet on a backward colony planet, faces his country's fall to its totalitarian adversary unless he can succeed in what he realizes is a suicide mission (*Prisoners of the Sky*). Zeke Bolivar, space explorer, is about to crash on an unknown world (*Worlds of the Wall*). John Braysen, a Space Force commander, believes that he is one of only a few hundred humans left alive after Earth loses a space war (*Recall Not Earth*). MacApp's heroes always win through to a victorious conclusion but only after a psychologically exhausting struggle. Also, the lack of women in MacApp's works stands out sharply. In *Recall Not Earth*, the presence of one chapter featuring women (to establish that human women still exist) seems almost forced. Most of his other novels use women only as minor background characters. MacApp had only started to break away from these stereotypes in his final novel, *Bumsider*, which has a strong and convincingly-portrayed woman supporting character in Pegs Waran, and a plot involving more human interactions among his main cast.

Critical Study: *John D. MacDonald* by David Geherin, New York, Ungar, 1982.

\* \* \*

John D. MacDonald's prolific output of thrillers has not, in the end, prevented the acknowledgment that he is one of America's best novelists. He contributed nearly 50 short stories, under various names, and two novels to the SF genre in the late 1940's and early 1950's before turning almost exclusively to crime fiction, except for three marginal entries, "The Legend of Joe Lee" (a ghost story), "The Annex" (speculative fiction), and *The Girl, The Gold Watch and Everything* (comedy thriller with a gimmick, anticipated in the excellent 1950 story, "Half-Past Eternity," that freezes everyone in time, except the user).

The title of the collection of MacDonald's SF short stories, *Other Times, Other Worlds*, neatly indicates his major themes: time travel, aliens among us or manipulating us, juxtaposition of our culture with others. These stories often communicate a strong sense of the value of the honestly striving individual; however, a good many are horror stories in which this value is arbitrarily denied. What is a "Game for Blondes" from the future who come fishing for a man is a nightmare to him, as is the "Spectator Sport" of the future, to which the unsuspecting visitor from our times is condemned, well-meaningly bound forever to a mechanical fantasy. In "Labor Supply" the best of humans are enslaved by gnomes, through their dreams; in "A Child Is Crying" the gift of seeing the future is a cause of horror to its possessor and those who wish to exploit it.

The two early novels pick with heavy crowbars under the slab of sanity that holds down the incipient paranoia of their readers. Aliens really do take over our minds, they tell us, and for no good purpose. *Wine of the Dreamers* posits a planet on which the principal adult occupation is taking possession of us, playing with us in the belief that we are only creatures of fancy. The irresponsible Dreamers, who have similar remote access to two other planets, all three of which were settled by their ancestors, have forgotten their ordained function, yet they need our help, as only one of their inbred, dwindling number sees. Although MacDonald grossly over-simplifies for the sake of a suspenseful narrative, particularly the closed environment of the Dreamers, this remains a good tightly plotted novel which still reads well. It ends optimistically and is satisfying on its own terms, but *Ballroom of the Skies* concludes uneasily and is a more disturbing novel, because we must be unable to share in its hero's feelings of quiet exultation in the last paragraphs, to the

extent that we perceive that he has only succeeded in moving from a smaller to a greater paranoia. A set-up in which ends justify means will never satisfy all readers; here, the given conditions are remarkably distasteful. Our planet is being kept in a state of perpetual warfare, peacemakers being killed, their purposes twisted, in order to preserve Earth as a breeding ground for superhuman leaders who will keep the galactic civilization from stagnating and maintain it in a state of readiness in case of a notional invasion from another galaxy. The hero is one of the world's leading peacemakers, a journalist whose investigation of the fantastic crimes which break up secret negotiations between the world's power blocks leads to his recruitment as an agent of the very powers he dedicates his life to oppose. To keep the reader in sympathy with such a hero would be a fearsome challenge for any writer and, although MacDonald does his best to make him more admirably heroic (using the well-honoured trick of timely praise from a girl friend) as he grows beyond the human norm, the attempt fails. In reality, MacDonald's hero, Dake Lorin, who is excellent in his Lone Wolf phase, would have recognized the speciousness of the conditions he is made, humbly, to accept. The novel is, nevertheless, a gripping narrative and, in the best tradition of such works, honestly presents the lonely dilemma of the superman who can find true friendship only with others of his kind.

Besides the titles already mentioned, "Ring Around the Redhead," "Shadow on the Sand," "The Miniature," "The Big Contest," "Susceptibility," "Common Denominator," and "Trojan Horse Laugh" should be listed as fine short stories by a writer who could clearly have been a major figure in the genre had he not found crime more rewarding. It should be noted that MacDonald has often used mystery fiction also to be prophetically critical of the suicidal tendencies of our society, being one of those early concerned with threats to our ecology.

Manuscript Collection: North London Polytechnic.

R. W. Mackelworth comments:

I am a lifelong addict of SF, but I prefer well-written novels and those that make a satirical statement about contemporary life whether through fantasy or fact. However, I also believe the modern idiom of fast-moving adventure entertains and entertainment is what the reader owes the writer. My work is essentially non-professional; I like to work up my own ideas and enjoy my writing. The conventions of SF are few, and one of its joys is that its scope for the imagination is unlimited. SF is gaining readers because it is largely free of many of the set-piece situations demanded of mainstream writing. Its problem is lack of good characterisation. Characters are often overwhelmed by events: if we can put personality before event, SF writing could improve considerably. The standard of writing is also important. It is possible to write literate SF as well as exciting SF!

\* \* \*

The influence of British science-fiction magazines of the 1950's is evident in R. W. Mackelworth's restrained style and use of stock adventure frameworks: his fiction, despite attempts to incorporate profound issues, rarely displays the self-awareness increasingly favoured among his contemporaries. His output has remained small, his foremost works being novels.

In *Firemantle* the hero is projected, apparently through time, to an Earth dominated by a deadly alien life form. Most of the book relates his exploits in this future world and his gradual understanding of its parameters (including his immunity to the aliens). Interwoven with the narrative are themes of revenge and manipulation, the exact details, methods, and motives remaining concealed until the end. The novel finally affirms the intrinsic survival potentiality of human will power, but also questions the cost involved.

*Tiltangle* is set on Earth during a new ice age, with survivors crowded into an isolated refuge. Once again personal manipulation and callous use of power are introduced, although the central concern is a quest for the uncertain myth of "the warm," the first retreat of snow and ice heralding the return of a habitable world. This is Mackelworth's most effective book: it contains some of his best realised characters, while the depiction of ascetic life in a hostile environment is reinforced by uncharacteristically precise subsidiary detail. The implied background circumstances are less convincing, but this scarcely affects the driving obsession which is the novel's strength.

*Starflight 3000* is loosely based on the generation starship concept. A hollowed asteroid becomes a vast spacecraft; use of terraforming bacteria allows the colonisation of any planet. Secondary aspects include faster-than-light communication and mysterious alien science. But for all its reliance on such motifs the novel is not typical of "hard" technological science fiction. It expresses moral concern over a selfish, expansionist mentality, and also gives some consideration to the conflict inherent in Mackelworth's two recurrent themes: the tendency of power to corrupt its wielder and the need for charismatic leadership to ensure progress. However, an abrupt time shift and the creation of a shipboard mythology ultimately avoid the questions raised.

*The Year of the Painted World* combines traditional elements of both disaster and invasion stories. Surprisingly excitable in tone, it tells of a struggle on present-day Earth against a Martian virus and its aggressive host organisms. The protagonist is an unambiguous man of action, doing what must be done. In his arrogant simplicity he could almost be a caricature of a hero from science fiction's Golden Age. The threatening "Pods" also carry more than a hint of space monsters of old. Possible benefits once the virus is controlled (and the consequent suspicions and machinations surrounding its release) add little depth to a playfully derivative but basically flimsy novel.

Mackelworth is no artist, honing subtleties of vision, language, and motivation to fine edges: instead he relies on mystery and suspense to hold attention until the denouement. His characterisation is usually notional (his stereotyped women are singularly ill portrayed), although within its terms he is adept at drawing concise contrasts. A tendency to slip into careless assumptions and clichés is another result of his intense absorption in plotting. Nevertheless, it is the complexity of his plots which sets Mackelworth apart from routine adventure writers. His underlying themes can be especially thought provoking, and it is unfortunate that he chooses to turn away from their fullest implications rather than develop their dramatic tension.

—Nick Pratt

\*

Katherine MacLean comments:

I am interested in science fiction as an exploration of possibility—specifically the possibilities that are most astonishing, yet genuinely possible. It becomes worthwhile to write when

I am more deeply surprised with each page of unfolding potential events.

\* \* \*

Katherine MacLean is important for introducing in her fiction ethical questions about medical and scientific experimentation. She also writes about mental telepathy and human fears of evolutionary change.

*The Diploids and Other Flights of Fancy* includes eight works published between 1949 and 1953. The title story tells of genetic experiments that produced a strain of standardized human fetuses for research purposes. "The Pyramid in the Desert" has as its theme human fear of immortality. "Defense Mechanism" and "Games" are both about telepathy. "Feedback" deals with human fear of new ideas; "Pictures Don't Lie" deals with the anthropomorphic tendency to measure all species on a human scale. "The Snowball Effect" and "Incommunicado" are clever but less significant thematically than the others.

In *Cosmic Checkmate*, written with Charles V. De Vet, Robert Lang goes to the planet Velda to discover why its population refuses peaceful contact with the federation of Earth's colonies. In disguise, Lang plays the Veldian Game—based on chess—and beats all comers in the second game; he deliberately loses the first game to discover his opponent's weaknesses. The novel is well crafted: the plot works as an analogous game structure with Lang winning the second game in a cosmic checkmate.

MacLean's essay "Communicado" provides the background for her works that deal thematically with telepathy and psi phenomena. She discusses the important influence Whately Carington's book *Thought Transference* (1946) had on her, and she elaborates the ideas behind stories like "Defense Mechanism," "Feedback," "The Fittest," "Games," "Where or When," and "Curtin in the Sky." Telepathy is also the moving idea behind *Missing Man*. Set in New York, in 1999, the novel features George Sanford, whose extraordinary telepathic abilities make him a valuable special consultant for the Rescue Squad of the Police Department. Sanford is the fear hound, sniffing out people who are in trouble by tuning in to the telepathic vibrations they broadcast. The missing man is Carl Hodges, a super-maintenance man for the city who uses computers to predict breakdowns and accidents before they occur. The novel is thematically complex and almost phantasmagorical at times.

Several of MacLean's stories have medical themes and use physicians as main characters. Among the best of these is "Contagion": colonists on another planet survive a plague only by becoming look-alikes, thus raising questions about the interrelationship between external appearance and personality. "The Origin of the Species" is told in epistolary form by a neurosurgeon who is troubled by his work: he destroys the best parts of people's minds so that they can adapt to life in society. "Gimmick" chronicles the use of a virus as a weapon; "The Other" presents a physician who, ironically, has the same problem as the patient he is trying to cure; and "Syndrome Johnny" shows the usefulness of plagues in speeding up evolution. *Dark Wing*, written with her husband Carl West, also has a medical theme. It presents a future where the practice of medicine is illegal and people believe that illness is immoral, an external sign of defects in their thinking. A teenage boy, Travis Gordon, discovers two old medical kits in an abandoned wrecked ambulance and begins to learn and practice medicine, even performing complicated surgery with no special equipment or assistance. The complex and unbelievable plot, the superficial

criticism of medicine, and the youth of the protagonist combine to make the novel read like adolescent fiction.

\* \* \*

A seasoned writer, Sheila MacLeod has published in a variety of genres, science fiction among them. Her earliest novels are experiments in surrealism—*The Snow-White Soliloquies* perhaps the most outstanding. Here MacLeod projects the old Germanic fairy tale into a strange, Orwellian present: a catatonic Snow-White, encased in a high-tech box of Glass That Breathes, is transported from place to nameless place in a dubious search for The Prince. Supervised by an authoritarian figure named Doc and attended by a succession of six social marginals, the paralyzed heroine embodies the principle of passivity. She sees, hears, contemplates, and suffers with those around her but is unable to act. Her silent soliloquies reveal that her knowledge of herself is curiously limited: she is a poisoned life, preserved by technological wizardry for purposes unknown. (The reader knows no more than she.) As the literally captive audience for the obsessive monologues and peculiar actions of her caretakers, Snow-White witnesses a

series of increasingly bizarre events—until something gives (most notably, the glass box) and she is able to acknowledge the roles that all have played in this disturbing and dreamlike psychodrama. The “allegorical atmosphere” of *The Snow-White Soliloquies* has been somewhat evasively described by reviewers as “fascinating,” “intriguing,” and “rich with reflection about the human condition.” “More to the point is that the book is finally and successfully enigmatic. We cannot get beyond its carefully constructed surfaces, which tease us with refractions of our own expectations.

In the more conventionally rendered *Xanthe and the Robots*, MacLeod's first thorough-going science-fiction narrative, we meet another version of the catatonic woman, this time a brilliant robotics engineer who has invested the greater part of her emotional life in relationships with mechanical beings. Programmer Xanthe, numbed by psychotropic drugs since the death of her father, the founder of the Institute for Advanced Robotic Research, finds her torpor disturbed by two upsetting developments: a new relationship with an intense and attractive co-worker, and a dramatic change in Institute policy. The painful reawakening of Xanthe's psyche parallels a decision by Institute authorities to endow the most advanced robots with a more human sensibility. Xanthe and the robots learn, in different ways, to desire, and the process of wanting leads them, gradually but inexorably, to regret their passive institutional loyalty. Xanthe rebels—against her superior, against the Institute, ultimately against her father—and chooses a future unlike anything she has known in her regimented habitat. The robots also have their revolution, but their prospects look less potentially creative; given their origins, they can do little more than replicate the ugly hierarchies of their makers. In *Xanthe* MacLeod articulates a familiar sci-fi theme: our machines cannot save us from ourselves. The plot *per se* holds few surprises, but Xanthe's oddly deadpan narrative persona, at once touching and repellent, sustains our interest.

With *Circuit-Breaker* MacLeod moves back into the unsettling ambiguity which is her strength. Ostensibly, the story is about a British astronaut, Alexander Baird, who must exercise unusual “autokinetic” powers to restore his marooned spacecraft to its intended orbit. According to Lvov, the sinister mission controller, Baird may generate sufficient power to rein in the straying capsule if he can forge telepathic linkages with the women nearest the hearts of himself and his fellow travellers, Davitt and Haskins. Baird contacts earth, and his strange encounters with his alienated spouse, Davitt's eccentric mom, and Haskins's anxious and vulnerable wife generate troubling questions for the reader. Is Baird in fact an astronaut? Or is he a science-fiction writer who has come to believe his own fantasies? Is Lvov a dictatorial aerospace bureaucrat? Or an especially nasty headshrinker? In this tacky little universe of failed connections, how are we to distinguish between outer and inner space? MacLeod's controlled opacity is compelling—we are drawn to the world of her problematic protagonist as to a black hole. Like *The Snow-White Soliloquies*, *Circuit-Breaker* is dense, sophisticated. Though more accessible than the earlier book, it exacts an equally attentive reading.

Sheila MacLeod's best novels are cerebral and defy easy categorization. Casual readers will find themselves impatient with the author's staging, with structures and settings that at first seem too elaborate for what they support and surround. But MacLeod's formal choices are consistent with her choice of subject. Her focus is invariably on neurosis, on the disturbances that prevent people (and cultures) from achieving a peaceful equilibrium, and the trappings of fairy tales and science fiction serve as formal correlatives that keep readers, too, slightly off balance. We stumble along, like MacLeod's characters, bearing

the graceless freight of unmet expectations. For most of us, the burden proves worthwhile.

—Janis Butler Holm

Pip Maddern comments:

I have never been good at commenting on my own work, partly, I think, because I believe very firmly in the primacy of the subconscious in writing. It seems to me—to my conscious mind—that the stories are something separate from me. I write them because they are there to be written, and for some reason someone else hasn't written them yet. So in a sense, I'm no better fitted to introduce them to their readers than anyone else is.

They are science fiction. As many other people do, I define science fiction as being that branch of fiction in which the readers cannot assume that the story is set in the world as they know it—it might be set in the future, it might be set on a different planet, it might be set in an alternative universe. The only reason I write science fiction is that all the stories that have appeared to me so far have that sort of setting. (It's not that I dislike this-world literature—I love reading it, but I get uncomfortable writing it because it seems to me always to be saying "This is fiction, but I am trying to make it look like reality." Whereas science fiction can more easily say "This is fiction. Let's enjoy it.")

My stories don't carry a message from me. Some of them may carry a message of their own to some of you; but that's up to you to find out. They all seem to me to be worth telling, though I have not told them as well as they deserve; and the people (or aliens) in them seem to me to be worth knowing, though I have not made them all known as completely and accurately as I should have.

\* \* \*

Pip Maddern came to immediate notice at the Writers' Workshop conducted by Ursula K. Le Guin at Belgrave, Victoria, in 1975; her admission story, "The Ins and Outs of the Hadhya City State," attracted attention by the assuredness of the technique. A superficial ingenuity (arising from a situation which I, and later Joanna Russ, found doubtful) was a weakness which faded in the stricter control of the imaginative elements in her later work.

She has published only a few stories, but definite characteristics are emerging. Most notable is her ability to manage a considerable complexity of theme and action in minimum wordage. In "Ignorant of Magic" she deals in about 5500 words with interlocking events in three separate universes, of which one is a parallel wherein magic usurps the role of science. Considering the spareness of her narrative style, the clear presentation of the spatio-temporal relationships of all three is a technical feat of no common order. She does not repeat her effects, and in "They Made Us Not to Be and They Are Not" she deals in totally original fashion with one of imagination's oldest dreams, extended life span. In a very different mode is "Inhabiting the Interspaces," a solidly realistic piece of storytelling eschewing all fantasy elements save a single social change; it is a sombre piece of precise observation which shows that she is not dependent on genre effects to carry her prose. A controlled anger (even a subtext of savagery) informs her plotting and characterisation, but it is too early to suggest her general direction. She is one of the most technically accomplished of the newer writers in the field.

##### Charles Eric Maine comments:

Like Arthur C. Clarke, John Christopher, Eric Frank Russell, Jonathan Burke, the late John Wyndham, and other science-fiction author friends, I became an SF addict in my early teens. This was the era of the late 1930's when nobody, apart from a few SF writers and addicts, and fewer scientists, believed that man would ever set foot on the moon in this century, if at all. In my own science fiction, I have always tried to find a theme or situation which no other author has thought of. Although I have written some space opera (such as *Timeliner* and *He Owned the World*), most of my SF books are short-term projections from present-day fact and technology, looking, perhaps, some 10 to 50 years ahead. I am particularly interested in the social and psychological impact of advancing science on crude Homo sapiens. In this respect my two best novels are *The Tide Went Out* and *The Mind of Mr. Soames* (the movie version missed the essential point of the story—the difference between training and education.

\* \* \*

Charles Eric Maine's writing is distinguished primarily by its original and imaginative concepts. This is not to demean his writing skills but rather to indicate that when viewed as a body his stories vary considerably in quality. Too often he falls back on clichés to move his stories along, and occasionally the clash between banal plots and sophisticated scientific ideas is resounding. Maine's treatment of time displacement in *The Isotope Man*, for example, is fascinating, but it is embedded in a plot that would do justice to the old pulps. The plot, to sabotage the artificial production of tungsten, is embellished by stereotyped characters: an ex-Nazi plastic surgeon, an evil South American business tycoon, a feisty and irascible city editor, a beautiful, sharp-tongued girl photographer, and a hard-drinking, two-fisted reporter who plays his hunches to the detriment of his job.

Despite this occasional failure to mesh plots, characters, and themes, however, Maine at his best is quite effective. *Alph*, *B. E. A. S. T.*, *Timeliner*, and *The Tide Went Out* are excellent novels. He seems particularly good at creating memorable female characters. Among them are Synove Rayner (*B. E. A. S. T.*), a

brilliant and beautiful exhibitionist nymphomaniac; Koralin (*Alph*), a courageous cytologist who kidnaps and protects the first male baby born into the lesbian society in five hundred years; and Shirley Sye (*The Tide Went Out*), a pathetic and aging model turned fashion editor who instructs the hero on the nature of man when faced with survival.

Survival is one of Maine's recurring themes. Sometimes he treats it directly, as in *The Tide Went Out* and *The Darkest of Nights*, both post-disaster novels. In *The Tide Went Out* repeated hydrogen bomb tests produce a fracture in the ocean floor through which pours nearly all of the world's water supply; in *The Darkest of Nights* a lethal epidemic destroys society. *B. E. A. S. T.* projects the ultimate result of an animal evolved with survival of the fittest as the only standard: a brilliant but mentally unstable scientist, Charles Gilley, creates animals and an environment for them in a computer, then evolves them through millions of generations while making conditions harsher and harsher. Finally all but one species disappears and then all but one animal. It is the ultimate survivor but it has lost all humanistic qualities. *Alph* presents yet another variation on the nature of survival in its exploration of the long-range effects of a society without men. Lesbianism, of course, becomes the acceptable form of sexual expression, but it results in a patterned societal neurosis. An emphasis on superior eugenic standards causes an overthrow of the government because of the elitist attitudes it creates. Even in *Timeliner*, whose primary purpose is to explore time travel, Hugh Macklin, the hero, eventually raises the question of whose right it is to decide who should survive and what standards they should use. Inevitably, Maine proposes, man will do whatever is required in order to survive.

Another prevalent Maine theme is time displacement, which receives its fullest treatment in *Timeliner*. In it, he offers the unique prospect that man's "psycho-identity" but not his body can travel forward in time. Attracted by emotional affinities, the "psycho-identity" possesses other persons' bodies to achieve consciousness. Though it creates a kind of immortality for the traveler, it destroys the possessed's ego. One future society that Macklin encounters labels such time travelers "psycho-temporal parasites" and considers the possession a form of murder.

One of the more interesting aspects of Maine's writing is its projection of possible futures. Though *Alph*, *Timeliner*, and *He Owned the World*, for example, paint different pictures, they do contain some consistencies. Maine predicts that the historical pattern of man's genius being channeled into aggression and war will continue indefinitely. He also believes that romantic love will die out. In *He Owned the World* it is defined as "an obsessive form of compulsive neurosis," and one of the characters that Macklin encounters in *Timeliner* tells him that man is naturally polygamous. Finally, many of Maine's future societies are totalitarian and man continues to battle his oppressors.

Maine is a journeyman writer who has created some excellent novels, but even if he were far less skilled his ideas alone would make reading his works worth the effort.

\* \* \*

If what Barry N. Malzberg has called, in a typical turn of phrase, "the true and terrible complete history of science fiction" is ever written, Malzberg will occupy a unique niche within its carefully categorized confines, not least because his personal view of the field, *The Engines of the Night*, will have to be dealt with, somehow. Often vilified by authors and reviewers for attacking the very foundations of the genre as they perceive it; but equally, he has been praised, by such writers and critics as Harlan Ellison, Joanna Russ, and Brian Stableford, for attempting to do something new, and artistic, within the expanding, universe of genre conventions.

Malzberg's problem, and the reason perhaps that he quit the genre in 1975 after seven years of highly prolific creation (though he has continued to write *some* short stories and essays), is not that he was unable to use conventional SF props as powerful tropes by which to explore individuals' psychological anxiety, their feelings of alienation and inadequacy when they confront the machineries of technological change and bureaucratic stasis. In fact, in his best work he has polished to a high gloss the mirrored surfaces of many basic SF conventions so that their apparently *inherent* optimism reveals in reflection only its diabolic opposite. But because he did this so well he tended to alienate precisely the audience which his SF writings were meant to attract. But there has always been a place for apocalyptic visions in SF. The problem isn't that Malzberg wasn't read, but that so many of his readers could only turn away from his writings in disgust, saying he had betrayed them because he offered no hope in his stories, or making similar complaints.

In so attacking him these readers are wrong, in that they are ill-equipped to perceive the kind of limited hope or optimism

expressed in the actions of Captain Lena Thomas in *Galaxies* or cool Sid in *Guernica Night*, who choose to live even in the face of complexities which are (almost) too great to bear. Certainly the burden of his fictions is often terrifying, bleak: lost in a world they had no part in making (and over which the awful vision of assassination continually hovers—like so many of his generation, Malzberg was traumatized by the political murders of the 1960's, and they have become a *leit motif* in his work), Malzberg's people articulate their precise awareness of that fact, and of the other facts which batter at their defences. Malzberg's obsessions, and those of his characters, expose the dark underbelly of the science-fiction mythos to the terrible light of art. Humans as machines, not in hoped-for supremacy but in near-catatonic anomie, unable to touch one another, even in sex, except mechanically; assassination as a way of life; bureaucracy as a huge engine of human destruction; the horrors of confronting in outer space only the empty reflection of our inner spaces: these are the themes Malzberg explores with obsessive tenacity, entering one after another of SF's favorite narrative conventions only to discover once more that for the human problems his characters have to deal with there are no easy answers, no *dei-ex-machinis* to lumber in at the end and save all. But this knowledge is not necessarily simply pessimistic. Herovit and his other selves utterly fail to adapt to the alien forces of New York, but others in Malzberg's "freak show" survive in the recognition that not only can they not find answers to their specific complaints but that very likely their problems do not have "answers" as such. So they adapt, they make compromises with reality, they go mad, they go sane, they try to be human (in itself the most heroic act Malzberg can conceive of in the aseptic environment of SF conventions). For Malzberg's characters the material of their reality is strangely impermeable, darkly opaque, and almost completely unmalleable. The universe is bigger, stronger, and more dangerous than they are; it also has a nasty sense of humour.

Indeed, comedy is something not often mentioned in connection with Malzberg yet he is one of the funniest writers in the genre, if you are able to laugh at the end of the world. For black humour, apocalyptic comedy, Lear's fool trying for a final tear-filled laugh, see Malzberg's collected works. If we didn't laugh we might break down and cry, and so might he. The tricks of rhetoric have their purpose, then, and Malzberg is a master of the ironic twist, the sick joke of metaphysics meeting physics head-on. Tone is always difficult, yet Malzberg continually manages such complex presentations of savage wit as this, in *Beyond Apollo: "A Brief History of the Universe"*: The universe was invented by man in 1976 as a cheap and easy explanation for all his difficulties in conquering it. "Foregrounding the many subtexts of the novel, this remark casts a shadow over not just Harry Evans's attempt to discover what happened to him on the disastrous Venus mission but also over all the stories of successful space imperialism. And yet I believe Malzberg when he says he loves science fiction, for it's obvious he recognizes and values the writing his own seems so fully to subvert. Such ambivalence of love and belief seem proper in a writer whose central subject is human ambivalence on every matter that matters. He only wanted to make room for his vision, *too*; not to replace the others but to provide some balance. And even if he has left the field he has left us a rich legacy of fictions whose integrity cannot be questioned. Of the novels, certainly *The Falling Astronauts*, *Overlay*, *Beyond Apollo*, *Herovit's World*, *Guernica Night*, *Scop*, *The Cross of Fire*, and that amazing analysis of the genre in the form of notes for a novel, *Galaxies*, need no apology. And there are a number of shorter works of equal value, as well as his *cri de coeur* analyses of the field. Although many find his vision not only too dark but too

narrow, no one can deny the depth of the chasm his works have cut through contemporary SF.

—Douglas Barbour

#### Phillip Mann comments:

I began writing when I was in my teens. Like many young writers I had ideas of becoming a poet but found that my verse slipped easily into doggerel, bawdy lyrics, and satire. I also found that I had a knack for dialogue but this never really extended itself into full-length plays, though I would still like to write for the theatre. I started to write short stories and found this most satisfying. I read science fiction from an early age and grew up on a diet of Wells, Verne, and Rider Haggard as well as Thomas Mann, Billy Bunter tales, and stories about the sea. A combination of the fantastic and the logical appeals to me. I write to entertain. I want to write good yarns that involve the reader and yield the same satisfaction as a good meal. I am convinced there is life in a multitude of forms evolving in the wider galaxy and that our next major development will take

place when we manage to break or circumvent the space-time barrier. Aliens and alien ceremonies intrigue me as do the creative faculties in mankind. Science fiction seems to me an excellent forum in which we can debate and prepare for the future.

\* \* \*

With *The Eye of the Queen* Phillip Mann entered the world of science fiction in a way calculated to stretch the minds and imagination of tyros and aficionados alike. For this first novel Mann chose a stock situation: alien contact. When a strange spacecraft appears and hovers some four inches above the Utah salt flats, its presence sets off predictable reactions: confusion, fear, an ill-fated attempt at defence against the unknown. At this point a reader may expect the usual adventure complete with space wars or at least space derring-do in answer to the implied question: what will happen when aliens initiate contact with Earth?

Mann's answer, however, comes in an unexpected and unique form. When contact become reciprocal, a two-member team from Earth's Contact Linguistics Institute receives the assignment to return with the aliens, study their culture, and establish a common ground for co-existence. In Mann's presentation of the team's findings the reader discovers an inner dynamic working to forward and dramatize the novel's ideas.

Once the tradition-bound reader foregoes reliance on conventional chapter divisions and gives himself up to the author's arrangement, he experiences a situation such as that epitomized by Robert Frost in the couplet/poem, "The Secret Sits." The reader becomes a shadowy third partner of the team, "circling" the Pe-Ellian world, probing for information. In both sections, the Diary and the Commentary, Mann interweaves data gathered by standard research techniques employed in a case study: direct observation, encoded interviews and brief autobiographies of various aliens, transcriptions of casual conversations, physical descriptions, linguistic analysis, botanical and biological data, cultural analysis of various areas such as social life, living conditions, esthetic artifacts and the like. As data accumulates, the fiction team and the reader, like the voice in Frost's poem, can only "suppose," until the aliens in the center begin to give up the secret of what they "know."

In *The Eye of the Queen* Mann presents an alien stock made all the more believable by its utter physical alienness, an alienness that is intensified by the epithetic names so evocative of human experience and emotion. Albeit unspoiled by anthropomorphism so often employed in science fiction, the aliens do share attributes of many sentient creatures we know, along with the art of the language and thought with humans. While they impress a reader with a sense of commonality with all living forms, there is also a sense of transcendence, arising from what the researchers' *Contact Linguistics Handbook* terms "the sense of structure." The Pe-Ellian sense of structure recognizes existence and balance of personal and cosmic biospheres and psychospheres, the latter supported by belief in the vitality of thought. Thought is alive. Thought becomes dangerous, if undisciplined or belligerent. Thought can regenerate, if understood, shared, and directed. When the implications of the power of misused thought becomes part of what the major researcher comes to "know," he moves from scientific objectivity to complete subjectivity.

Utilizing the Diary-Commentary format, Mann dramatizes this shift of perspective to particularly effective ends. Compiled by the major researcher, self-admittedly estranged from himself by a lifelong dedication and discipline to objectivity, the Diary charts both the progress of the scientific analysis of the aliens

and the ever-increasing self-analysis. In the process author Mann succeeds in turning his main character into an Everyman, forcing the reader to make comparable analyses. Written *ex post facto*, based on memory, and supported by notes and records, the Commentary provides an alternate, sometimes antithetical, perspective on events. More important for Mann's theme, the Commentary provides a reader with a sympathetic angle from which to judge the personal conclusions of the diarist. Without belaboring the point in the novel Mann leads his readers toward assessment of the contemporary human use of that virile entity, thought. It is a speculation vital to our continuation as honorable residents of the cosmos.

Laurence Manning is remembered primarily for a series of five stories originally published in 1933, later collected in book form as *The Man Who Awoke*. Manning utilized a classic device of science-fiction and Utopian writers, a man from our own culture transported in some fashion to another society, which is then revealed to the reader as the protagonist encounters individuals and institutions. In each of the five episodes, Norman Winters arises from suspended animation to investigate the state of humanity as it advances toward its ultimate destiny.

In the title story, Winters explores the world of the year 5000. Humankind dwells within vast managed forests, in balance with nature, looking back with horror on "the false civilization of Waste!" Seeking to find a place for himself in this new world, Winters attempts to convince his hosts that his own time did have positive aspects for which they should be thankful. But even the most sympathetic of his listeners feel no gratitude. "For exhausting the coal supplies of the world? For leaving us no petroleum for our chemical factories?" Ultimately finding this new society as flawed as the old, Winters sleeps another 5000 years and revives in "Master of the Brain." Now he encounters humanity subservient to a computer that makes all the decisions, the race having abdicated the responsibility for their own future. After being instrumental in breaking the grip of the Brain, Winters advances to the year 15000 in "The City of Sleep." Once more he is disappointed, for now the great majority of people spend their entire lives in mechanically induced dreams, as idea developed from Manning's first story, "The City of the Living Dead," written with Fletcher Pratt. This willing renunciation of reality has occurred within the genre many times, most notably in James Gunn's *The Joy Makers*. The best story in the series is "The Individualists," wherein Winters becomes the quarry of a number of egocentric geniuses in a society that places no value on interpersonal relationships. Winters's journey ends with "The Elixir," the source of immortality which produces an interstellar community. Although not specifically within the series, Manning wrote another tale set eons after the Manning saga, "The Living Galaxy," which postulated that entire stellar systems functioned as single atoms in a higher order universe we could not perceive.

Less ambitious in scope was a second series which recounted the adventures of several members of the Stranger Club. Manning's dislike of automation recurs in "The Call of the Mech-Men," a secret cabal of living machines. His concern about our profligate consumption of natural resources, anticipating our present worries, is repeated in "Voice of Atlantis," in which a device allows communication with an ancient Atlantean. The remaining three stories were more pedestrian and reflected the type of story that dominated the genre in the 1930's. A lost world of prehistoric monsters lies under New York in "Caverns of Horror," a forgotten Atlantean colony is located in "The Moth Message," and a species of

sentient, ambient tree is thwarted in its invasion plan in "Seeds from Space."

Manning's fiction, much of which seems quite dated now, was advanced for its time. He produced a series of very accurate—insofar as the state of the art allowed—stories of space travel. His concerns for conservation and human dignity elevated his fiction above that of most of his peers.

\* \* \*

To read the works of George R. R. Martin is to tumble slowly, steadily from one highly imaginative situation to another, all tightly controlled by the author. Martin's stories vary in style from the futuristic fantasy of his first novel, *Dying of the Light*, to the realistic—but still castled—environment of *Sandkings*, a Hugo Award-winning novelette that will cause the reader to think seriously before buying another pet.

*A Song for Lya* (also a Hugo winner) gives the reader an unusual look at religion. The Joined, in this story, are believers in a cult in which parasites called Greeshka attach themselves to the skulls of their "converts" and consume them, literally. This union, however horrible to the viewer, is ecstatic to the convert, who feels peaceful and loved—in love with everyone he meets. Although it is not unusual to see religion as a desperate search for the love that man seeks constantly and often futilely in this life, it is different—and somewhat frightening—to realize, with the heroine, how alone each of us finally is, despite great efforts to know and love others. In the end we must admit, sadly, with Lya and Robb, her lover, that we cannot really know another person as we would like, but that we must also keep trying to do so.

Martin edited *New Voices in Science Fiction*, a series that included one of his own stories, "Stone City." Its setting is a harsh other-world called Grayrest, a fringe planet that contains

the stone city. The protagonist Holt is an exile here, a "stranger in a strange land," as are many of Martin's main characters. He landed with his shipmates earlier, and for some reason that is not quite clear but has to do with the fact that "the rules don't work down here," has not been able to leave. The key to the riddle seems to lie in the stone city, a mysterious labyrinth into which many desperate people, including some of Holt's shipmates, descend and never return. Holt's escape there, when he kills an official in fury after being denied exit once again, gains him access to the universe; but it is a questionable "salvation," eerie and lonely—despite a horde of fellow-wanderers who move eternally with him through the stone city's endless tunnels.

*Dying of the Light* is a romantic tale of Dirk t'Larien, an alien on the rogue planet Worlorn, an isolated, wandering world that is entering a cycle of darkness for an unknown period of time. T'Larien has come here in answer to a call from Gwen, his former lover, who lives there as a "heldwife" but is no more at home than t'Larien since the practice on Worlorn is to share a heldwife with one's "teyn," a man's *real* best friend. Other practices in this feudalistic, futuristic culture include dueling to uphold one's honor and releasing an enemy in the forest, then chasing him to death, as one does a lower animal. The theme of tradition, which occurs in other Martin stories, causes the reader to examine his own cultural values and ask if our current socio-sexual patterns are very unlike those of Worlorn. And if they are not, maybe it is because, essentially, we like matters they way they are.

"The Way of Cross and Dragon" again pursues the problem of religion and its purpose in modern culture, whether it is supposed to make us happy or provide us with truth that is often hard to live by. The humor and irony with which Martin approaches this usually serious topic is refreshing, allowing the reader to achieve a new perspective on a familiar theme. *Sandkings* (Hugo Award) is quite different from Martin's previous tales. It is a horror story that takes a serious look at modern man, with his penchant for self-indulgence at the expense of others and, perhaps, the entire world. The sandkings, insect-like "pets" with psi powers, first see their "owner," Simon Kress, as a god, but later come to hate him for his cruelty and selfishness. Nevertheless, the new breed of sandking, which is emerging toward the end of the novelette, is recreating itself in Kress's image, and we are left to imagine the fearful result.

In *Windhaven*, a novel written by Martin in collaboration with Lisa Tuttle, men and women strive once more to know and love one another against cultural odds that seem always to place them in positions of antagonism. Maris, one of several strong women who crop up in Martin's works, is a heroine with mixed human qualities that make her especially likeable—and vulnerable. As a "flyer" of Windhaven, a storm-ridden world of the future that requires artificially winged messengers to maintain its communications, she rebels against an outmoded tradition that prevents the best people from becoming flyers. Eventually she establishes an academy to train skilled flyers in a new tradition and learns that education does not solve all problems. Maris does, however, find a true, equal love, an unusual situation for a Martin hero-heroine, who is usually left in an ambiguous situation with a lover of great willingness but not much expertise in equal-opportunity relationships. Evan, a "healer" who cures Maris after she has a serious flying accident, is the perfect partner, strong but flexible and sensitive; and we rejoice with him and Maris in their mature—even old-fashioned—love in a futuristic context that allows both lovers to grow within the limits of their human strengths and weaknesses.

The strength of Martin's stories lies in his human, believable characters as well as in his interesting, well-paced plots. The reader, caught up in the strangely familiar religious and cultural

problems of protagonists like Maris and Evan, moves with them towards solutions that will, hopefully, be his also. And Martin's concern for the lonely, sad worlds in his universe parallels his sympathetic treatment of their inhabitants. Worlorn and Grayrest are harsh places, worlds that test the strength and character of their peoples; but they also bring about a new species of human, one who has overcome the difficulties of life and arrived at new understandings. Although the future of his worlds is questionable—and sometimes frightening, as in *Sandkings*—we do not fear for Martin's characters—or for ourselves. We will find strength when we need it.

David I. Masson comments:

My SF, although it seeks "scientific" versimilitude and tries to "convince," has little to do with the processes of science. It explores bizarre assumptions for the sake—or so it seems to me—of mythopoeia, fable, satire, ridicule, scorn, or indignation, and perhaps inner truth about experience and feeling. Only "Take It or Leave It" has much to do with possible futures. Several stories reflect my conviction that the human race is insane. (Here and there one notes hopeful signs of some insight into its own condition.)

\* \* \*

David I. Masson's SF reputation rests upon a handful of stories, most of them collected in *The Caltraps of Time*. A lively if recondite wit is a characteristic of these stories. A university antiquarian librarian, fascinated by linguistics, Masson plummets a Restoration gentleman into the 20th century courtesy of a borrowed time machine in "The Two Timer," to be amazed and bemused by our antics—and of course to satirize us in approved Swiftian manner. The impeccable late 17th-century prose style of this story throws into contrast our barbaric contemporary parlance: "Myself: *Prithee, Sir, do you converse in English? At this he frown'd, and turn'd back thro' his Door, but left it open, for I heard him in speech with another, as follows. He... Now enthing bauootim? Caun honstan zaklay wottee sez,*" Matters are just as bad for a researcher of the 1980's plunged into the 24th century by a linear accelerator accident in "The Transfinite Choice" ("Namplize. " "Don't you speak English, then? Who the hell are you?" "Namplize"). It seems as though one is sliding down a cultural entropy slope. This future, in technotelegraphize, is trying, however, to master the gradient of time at the sub-particle level. Reality fractures as the future tries to shunt its excess population into parallel time-continua; or was it only, after all, the stricken researcher's reality that fell apart?

The finest of Masson's stories. "Traveller's Rest," deals with time yet again, apocalyptically yet ironically. The country at war in this story is distorted by differential time: whole decades pass in the peaceful south while mere minutes pass at the northern battle frontier where, perhaps, the army is simply fighting itself in the mirror of bent time with mounting frenzy and destructiveness—a powerful nightmare which does for exponential time what Christopher Priest's novel *Inverted World* was later to do for exponential space. In "Not So Certian" an expedition to an alien planet falls foul of the natives' tricky phonemes, another linguistic *jeu d'esprit*, while in "Mouth of Hell" apocalyptic topography confronts the explorers in the form of a 40-kilometre-deep cleft down to the molten magma which, by the end of the story, is tamed and demystified just as so much of our world has been banalised.

In Masson's loving care for language and concern with time one senses a scholarly resentment at the downhill slide of the world into some future mass point of condensed people and words and moments.

—Ian Watson

**MATHESON, Richard (Burton).** American. Born in Allendale, New Jersey, 20 February 1926. Educated at the University of Missouri, Columbia, Bachelor of Journalism 1949. Served in the 87th Division of the United States Army during World War II. Married Ruth Ann Woodson in 1952; two daughters and two sons. Freelance writer: script editor, *Circle of Fear* TV series. A.'s Man*, *Cheyenne*, *Bourbon Street Beat*, *Philip Marlowe*, *Buckskin*, *Markham*, and *Richard Diamond* series.

\* \* \*

As a writer of short fiction which is mostly a hybrid of fantasy and SF, Richard Matheson should be compared with Henry Kuttner and Theodore Sturgeon, both obvious influences, and with later writers like Ellison and Delany who share important similarities of style and angles of vision. Although Matheson's short stories are not easily reduced to a simple classification, most of them explore the psychological impact of sudden discontinuity in the lives of otherwise rather ordinary characters. The stories range from the weird horror of "Long Distance Call," a graveyard variant of the radio drama and movie *Sorry, Wrong Number* (Lucille Fletcher), to the ironic humor of "Legion of Plotters," a tale literally fulfilling the commonplace paranoia that everyone's plotting against us. His ironic sense brings Matheson close to a mode of the fantastic that modern readers associate with Fritz Leiber and Fredric Brown. The very titles of some of his stories, "A Flourish of Strumpets," "'Tis the Season to Be Jelly," "When the Waker Sleeps," and "Witch War," are indicative of the varieties of comic irony and parody that constitute one of Matheson's three distinctive styles as a writer.

Matheson published most of short fiction in the 1950's. It was during this decade that he also wrote the two novels on which his reputation as a science-fiction master depends. *I Am Legend* and *The Shrinking Man* are built on fantastic premises that are developed experimentally in the spirit of scientific curiosity. Each is also a story of individual courage, physical as well as psychological, trial, and suspense. Each might be described as a fantastic science-fiction horror story. Of the two, *I Am Legend*, clearly the better story, belongs in the tradition of great vampire novels somewhere between Bram Stoker's *Dracula* and Ann Rice's *Interview with the Vampire*. It is more scientific than either, but it shares some of the mythic power of the former and philosophical interests of the latter. The hero, Robert Neville, finds himself the last human alive following a plague that either kills outright or transforms the survivors into vampires. His struggle against his twin enemies, the vampires and his own isolation, is never successfully resolved; and in Neville's failure to win through by courage and single-minded determination lies the special achievement of this novel. Matheson avoids the cliché triumphalism that was practically a genre characteristic in

the 1950's in favor of a more thoughtful and artistic denouement. A mutated strain of vampire emerges to establish a new order in which Neville has no place except that of a Nemesis who will pass into the legends of an emerging culture. Although much is inevitably sacrificed to the requirements of suspense melodrama and the sense of terror generated by the specter of personal violation, Matheson makes a stunning success of impressing on the reader the strength of Neville's character, the reasonableness of his reactions to his predicament, and the limitations inherent in both his virtues and in his responses to the challenges the vampires make to his survival as *homo sapiens* rather than as *homo vampiris*. The novel is, therefore, as much a challenge to certain conventional assumptions of the genre of the necessary survival of the species as the highest good as it is to the reader's expectations for the conventional, inevitable triumph of the resourceful hero.

The title of *The Shrinking Man* tells much of the basic idea of the story, except for the working out of the unique sequence of accidents that set in motion Scott's irreversible and apparently endless shrinking process and its consequences. Matheson's flashback inserts detailing the physical and emotional effects of Scott's diminishing stature contrast effectively with the suspense adventure of his warfare in the basement of his house against a black widow spider and his struggle to survive in a miniature state. It is altogether a tour de force for the author who manages to keep the reader bound to the terrifying fate of the hero and his increasing isolation from the familiar, domestic world from which he literally disappears. The theme of Scott's alienation from his wife and child, the psychological impact of his bizarre affliction, and his struggle for self-mastery and identity are powerfully drawn. Scott's sexual frustration is perhaps less subtly managed and is less symbolically meaningful than it is in *I Am Legend*, but then there is less ambiguity to the character of Scott than Neville. There are two or three splendid moments in the novel worthy of Sturgeon or Kuttner. Each moment is an epiphany of sorts in which Scott finds significance and purpose in his incredible life experience as a shrinking man, and each is an existential revelation on that account. He comes to a critical realization in the arms of Clarisse, a carnival midget, that his identity as a man does not depend on his physical stature. In fighting the spider, he realizes that he is opposing symbolically also those irrational, destructive forces in nature to which he refuses to become victim; and finally, having preserved himself against all odds, he is admitted into a new, molecular universe that science and science fiction have taught us exists below the level of appearances. If the novel vindicates Scott's existential courage, it is at least no easy vindication; and it is a triumph the reader is disposed gratefully to accept, even at the level of fantasy.

Matheson continued to write SF but at a diminished pace in the 1960's. His most recent novels are memorable works of romantic fantasy, indicating perhaps a new direction to his interests as a writer. *Bid Time Return* and *What Dreams May Come* deal in a bittersweet way with romantic love that bridges the gulf separating lovers of different eras, finally separated by time and death but united in spirit. The recent reissue of Matheson's collected stories is an indication of both the continuing popularity and influence of Matheson as a writer of fantasy science fiction.

## Julian May comments:

My books are in the tradition of the classic literate thriller. They are intricately plotted and feature a large cast of characters romping through a "future history" and a "past history." In spite of the fantastic imagery, my books are genuine science fiction—not heroic fantasy. The four Pliocene books form one enormous novel, gaudy and humorous and melodramatic.

\* \* \*

When *The Many-Colored Land* appeared in 1981, fans propelled Julian May into the foremost ranks of fantasy SF writers. As the wife of editor Ted Dikty, a long-time fan, and writer of at least one story successful enough to be reprinted and made into a movie, May has long had strong ties to SF. From the maverick scientist and competent but given-to-fainting girl friend meet dangerous stranded alien plot of "Dune Roller" May moved into the successful genre of the epic world outside of the Tolkien variety, utilizing the myths of many lands and ages.

*The Many-Colored Land*, *The Golden Torc*, *The Nonborn King*, and *The Adversary* compose the Pliocene Exile series (to be followed by *Jack the Bodiless*, *Diamond Mask*, and *Magnificat*, the Galactic Milieu books, which will detail the history of the Remillard's Metapsychic Rebellion of AD 2083). *A Pliocene Companion* offers a full guide to the Pliocene books and explains what May plans to do in the future.

May is a professional writer whose work on science and technology, encyclopedia articles and juvenile books, inside experience with publishing, and wide reading provided the material for a series with depth and richness as well as imaginative people and systems. Aiken Drum, the nonborn king, is not just a smart fellow with metapsychic powers beyond those of most people, he is multi-faceted scamp, part juvenile delinquent, part Till Eulenspiegel and Reynard the Fox, deliberately based on the Scot folkloristic character and linked to the Druids. Like all her major characters, he can be experienced on many levels. The complexities of her characters are detailed so they become memorably unique in spite of their numbers. Total villains and simple heroes are not May's style.

May develops her complex plots through the eight members of Group Green who interact with and mobilize several groups who converge at the end of each novel and the series in many events. The Nightfall War and the union of the exiles from the revolution and the escapees from a dull society are suggested at the beginning, indicative of May's painstakingly careful planning. Similarly, the basic plot of the Galactic Milieu series is already outlined for readers in the first books. May's admiration for Doc Smith, another user of archetypal figures, draws her toward the blood and guts warfare, adventures set against the vastness of space and time, and frankness in human relations, particularly sex, which can be sadistic, homosexual, obsessive, or downright earthy. Within her well-plotted probing of personality and political intrigue, May manages also to be humorous, with blundering, luckless Tony Wayland and Yiddish-speaking, ex-state supreme court justice Native American Peopeo Moxmox Burke balanced against the dead seriousness of Elizabeth Orme and Marc Remillard for comic relief. The high epic quality of the Tanu intrigue is parodied in less apt Firulag schemes. Similar artistry goes into her style. May has vivid, poetic descriptions of her Tanu and Firulag people and their pageantry, precisely worded in a large English and invented vocabulary.

The scientific elements of May's work are primarily in the areas of genetics and parapsychology, augmented by myth, history, philosophy, geography, geology, theology, and astrophysics. May has succeeded in blending the best aspects of fantasy and SF into an engrossing adventure series.

—Mary S. Weinkauff

**MAYHAR, Ardath (née Hurst).** American. Born in Timpson, Texas, 20 February 1930. Attended high school in Nacogdoches, Texas. Married Joe E. Mayhar in 1958; two sons and two stepsons. ## Ardath Mayhar comments:

I like to think of my work as metaphysical fiction. S-F and

fantasy elements allow me to create contexts that reach past our own limitations and parameters into continua where what *should be* CAN BE. Logic and Humanity are the poles of my philosophy, and I refuse to be hemmed up into narrow genres. Writing science fiction, fantasy, poetry, juveniles, articles of all kinds, I work toward some inner goal, invisible but inexorable, and when I arrive at my destination I expect to be completely astonished.

\* \* \*

Although she had published in other genres previous to that date, Ardath Mayhar got her start in SF and fantasy literature with the Young Adult work, *How the Gods Wove in Kyrannon* in 1979. Of the 11 genre novels she had produced in the intervening years, only four, *Exile on Vlahil*, *Golden Dream*, *Khi to Freedom*, and *The World Ends in Hickory Hollow*, could be classified as SF. Another four, including the first, are clearly high fantasy. The features characteristic of that genre are elevated diction used by both characters and narrator, and a few characters with superior talents in magic and telepathy, as well as an indisputable separation of good and evil. The other three Mayhar novels fall into a category which has recently been termed "science fantasy" and owes much to the early writing of Andre Norton. *Lords of the Triple Moons*, *Runes of the Lyre* and the recent *The Saga of Grittel Sundotha* are basically fantasy works set in surroundings where magic and heroic adventure are predominant, but they each incorporate some technological feature such as "cross-dimensional" travel from a machine-based dimension or a lost technology called upon by the telepathic protagonists in their battle against evil wizards.

Mayhar is in fact preoccupied with telepathy and other superior powers of mind, an interest which surfaces in the SF as well as her other genre works. For example, in *Khi to Freedom* she creates beings at several levels of corporality and telepathic ability, with the protagonist Hale Enbo as the subject of a process of mental refinement by more elevated beings. *Exile on Vlahil*, her most amusing book to date due to the inclusion of a conscious computer called Alice, places a female-human hero in a position to save some humans from her degenerating home planet through telepathic communication with idealized creatures called Ered and Vlammalba. *Golden Dream*, while giving H. Beam Piper's Little Fuzzys a history and describing the encounter with humans from their perspective, also makes much of their telepathic abilities. The only novel which breaks this mold is anomalous in several ways. *The World Ends in Hickory Hollow* is a largely realistic post-nuclear holocaust novel, one of several such novels by a variety of authors which have appeared in recent years. This work is also partially autobiographical, being set in an area of East Texas similar to that in which the author and her family now live. It is somewhat more positive than the general run of such novels, postulating that a few families will survive a nuclear attack through mutual assistance and the resurrection of traditional, down-home wisdom.

Mayhar's plots are inexorable and thus virtually predictable from the initial pages of any story. Good and evil are as clearly identified in the SF as they are in the fantasy, and no less evident in the adult fiction than in the Young Adult books. The stories also tend to be highly moralistic, dependent on a fixed code of ethics which emphasizes the basic goodness of most individuals and the evident uselessness of those not imbued with this goodness. In most of her works, such beings are either to be reformed or discarded.

This author's greatest accomplishment lies in the description of normal physiological and social functions as they might be

practiced by a wide range of organisms such as crystalline, electrical, or fuzzy-green creatures, as well as wizards, shamans, witches, rulers, and adventures. *Khi to Freedom*, for example, is really two loosely connected episodes in the adventures of Hale Enbo, human extraordinaire. But each one is enriched by the many homey descriptions of eating, sleeping, and social interactions between the human and his various cohorts and enemies. *Exile on Vlahil*, her best and most representative work, succeeds as much because of the elaborate symbiosis which constitutes Vlahil's eco-culture as it does through any adventure-plot elements. Yet the substantive and generic breadth of Mayhar's writings makes it difficult to predict what any particular reader will appreciate most or what she herself will produce next.

\* \* \*

Bruce McAllister is a writer's writer, a man whose work is highly regarded by his fellow professionals, but whose name is relatively unknown even among the most rabid of SF fans. The reasons for this are many: he is a slow and meticulous craftsman, often requiring twenty drafts for every story completed and sold; thus, even his best years have seen no more than three or four published fictions, with a lifetime total of about forty. His one novel, highly acclaimed when published, is now long out-of-print, in a field where regular production of novels is essential to

achieving public recognition; only Harlan Ellison has managed to carve out a career based primarily on short stories. He does not write series, sequels, swords-and-sorcery fiction, or Star Trek novels. His stories, novellas, and novel tend to be somewhat cerebral character studies, focusing on individuals rather than mindless action-adventure. For all these reasons, McAllister's unique and compelling visions have yet to achieve the widespread recognition they deserve.

McAllister's first story, "The Faces Outside," published when he was only 16, sets the tone for his later work. The unnamed hero finds himself floating in a tank with his mate and an assortment of aquatic creatures; their only contact with the outside world is a disembodied Voice. The Voice tells them that the faces watching them through the ports are the Enemy, the aliens who have annihilated the rest of the human race, and who have changed these two survivors into underwater humanoids. The two eventually transcend captivity by developing mental powers that completely vanquish the alien beings, thereby assuring the survival of the new race.

Here in microcosm are the basic themes that permeate almost all of McAllister's work. His protagonists are often tortured individuals caught between a Heaven and Hell not of their own choosing. Their suffering and tribulations take them from the Limbos of their own minds to some kind of ultimate realization, epiphany, or metamorphosis. In McAllister's early work, this theme of self-transcendence often translates into rather obvious power fantasies, in which one lonely (alienated) character somehow miraculously manages to conquer his nemesis (i. e., himself), whether that be alien monsters, his fellow human beings, or some life-threatening situation. In his later stories, however, the author's treatment of this theme has become more sophisticated, his view of mankind more cynical, his feeling for man's predicament more poignant, his treatment of man's self-sacrificing inclinations more realistic. Always present, however, are the agony and the ecstasy—nothing is achieved in McAllister's universe without pain. Representative of these newer works is "The Boy," the most downbeat of McAllister's short fiction, "Victor," "What He Wore for Them," and "When the Fathers Go." (Many of these will be collected in his forthcoming book, *The Faces Outside*.)

We also see these themes at work in *Humanity Prime*, McAllister's only novel, which was very loosely adapted from "The Faces Outside." Issued as the last book in the original Ace Science Fiction Special Series, it achieved very limited circulation, since Ace had already decided to terminate both the series and its editor. *Humanity Prime* mixes human mermen, cyborgs, intelligent sea turtles, and telepathy to produce one of the most compelling portraits of undersea man ever published. McAllister's intimate knowledge of human and animal biology, and his childhood experiences as the son of a behavioral psychologist, are reflected in this realistic and plausible extrapolation of man and alien function together in a unique environment. To McAllister, animals are as human in their own ways as man is sometimes alien in his; much of his fiction is specifically concerned with the question of what it means to be human. His forthcoming story "The Ark" also focuses on this problem, and demonstrates a maturity and honesty not found in his earlier fiction. Another recent novella, "Their Immortal Hearts," which combines human psychobiology with a more traditional science-fiction setting, has achieved much notice from mainstream critics.

—R. Reginald

**McCAFFREY, Anne (Inez).** American. Born in Cambridge, Massachusetts, 1 April 1926. Educated at Stuart Hall, Staunton, Virginia; Montclair High School, New Jersey; Radcliffe College, Cambridge, Massachusetts, B. A. (cum laude) in Slavonic languages and literature 1947; studied meteorology at City of Dublin University. Married E. Wright Johnson in 1950 (divorced, 1970); two sons and one daughter. Copywriter and layout designer, Liberty Music Shops, New York, 1948-50; Copywriter, Helena Rubinstein, New York, 1950-52. Currently runs a thoroughbred horse stud farm in Ireland; since 1978, Director, Dragonhold Ltd., and since 1979, Director, Fin Film Productions. Has performed in and directed several operas and musical comedies in Wilmington and Greenville, Delaware. Secretary-Treasurer, Science Fiction Writers of America, 1968-70. Recipient: Hugo Award, 1968, 1979; Nebula Award, 1968; Gandalf Award, 1979; Balrog Award, 1980. Agent: Virginia Kidd, Box 278, Milford, Pennsylvania 18337, U.S.A. Address: Dragonhold, Kilquade, Greystones, County Wicklow, Ireland.

## Anne McCaffrey comments:

I am a story-teller of *science-fiction* and wish that label attached to my work in that field. I make this point as I am often classified, erroneously, as a fantasy writer. Since I am more interested in the interaction of people, the research I do for some of the books is not apparent, thus confusing the uninitiated. I have no pretensions to literary style or excellence, nor are my stories allegorical, mystical, or political. I cannot honestly call myself a feminist, though I do not disagree with the aims of the women's movement, and in *The Kilternan Legacy* I make comparisons between the rights of American women and the deplorable lack of status of Irish women. My personal philosophy was heavily influenced by Austin Tappan Wright's classic, *Islandia*—a book I read at 14 and consistently reread. Of all the stories I have written to date, *The Ship Who Sang* is my favorite.

\* \* \*

Anne McCaffrey is primarily known as creator of Pern, the planet of telepathic dragons and their riders. But she has also written science fiction which has nothing to do with dragons.

*Restoree*, for example, is the story of a terrestrial woman kidnapped by aliens who butcher sentients for food. Though she is dismembered, humanoid aliens restore and beautify her (hence the title). Since the restoration process has hitherto resulted in mindless Frankenstein-like monsters, the heroine is hidden away in a prison camp. Together with a dashing alien

man, she escapes, and the two become lovers. The book has been criticized as melodramatic and full of sexist stereotypes, but McCaffrey herself calls it a deliberate science-fiction parody of the gothic romance. *Decision at Doona* relates problems of alien encounters when a group of earthlings find that they will have to abandon their idyllic new planet because terrestrial authorities will not let them co-colonize with cat-like sentients called Hrrubans. The book contains fine portrayals of family relationships, frontier hardships, and touching children's friendships. Helva, of *The Ship Who Sang*, is born with disfiguring, disabling multiple birth defects. Technology in her enlightened future world makes her into a cyborg controlling a huge interstellar starship. Her unconventional love-affairs and friendships with mobile humans are depicted with imagination and verve.

McCaffrey's Pern books, however, have been her best award-winners. The adult series is *Dragonflight*, *Dragonquest*, *The White Dragon*, and *Moreta, Dragonlady of Pern*. The juvenile, or Harper Hall, trilogy is *Dragonsong*, *Dragonsinger*, and *Dragondrums*. McCaffrey continues to work on the series and has recently finished "Nerilka's Story." There are ancillary Pern stories as well. Pern is a planet colonized in the forgotten past by terrestrials who left bio-engineered dragons as defense against a mycorrhizoid spore called Thread which crosses vacuum from Pern's companion planet, the Red Star. The dragons bond telepathically to a rider and fight Thread by burning it out of the air with their phosphine-loaded breath. Dragons can also cross space—and, it is learned, time—telekinetically. Pernese society has a medieval flavor which tempts the critic to call these books sword-and-sorcery or fantasy. But everything about Pern is based on science, and therefore the books are true science fiction. The most spirited and moving passages in the series depict dragon bonding, mating, and hatching. The Harper Hall trilogy emphasizes the use of dragonflight as metaphor for the artistic process, where the rider of the dragon represents intellect and direction, while the dragon itself (and in her other works various other steeds, such as the spaceship in *The Ship Who Sang*) represents emotion and drive. A further development of this imagery is shown in *To Ride Pegasus*, where the human intellect is seen as riding the "Pegasus" of super-normal mental powers. The title of *Get Off the Unicorn* suggests similar imagery; the book itself is a series of stories which are parts of various McCaffrey worlds.

The Killashandra stories began in Roger Elwood's Continuum books. McCaffrey revised these extensively for *Crystal Singer*. Killashandra Ree's special musical ability enables her to cut special crystal used in interstellar travel and communication. The crystal planet's indigenous life form is a symbiote which fuses with the cutter's nervous system, bestowing long life, special sensitivities, and, unfortunately, madness. The series is the darkest of McCaffrey's work, fascinating for its rich symbolism, its insight into complex, tortured characters, and its use of unreliable narrator.

*Dinosaur Planet* and *Dinosaur Planet Survivors* are about a mysterious garlic-scented planet, Ireta, which contains life forms from several eras of Earth's prehistory, including intelligent pteranodons. The first book sets up several mysteries about the source of these creatures and the fate of the protagonists; the second book solves these mysteries, but a little too facilely. Apparently no sequel is projected, despite the appeal of the intelligent giffs and the interstellar culture of the explorers.

McCaffrey also writes non-science fiction—mysteries and romances with strong female protagonists. Her main theme has been the many forms of bonding—between lovers, between parent and child, between friends, between humans and

animals, between aliens and humans. She also explores reproductive processes and psychic potentialities in a cool, scientific spirit. The metaphor of flight for artistic activity is one of her most beautiful contributions. Her characterization, plotting, and creation of imaginary worlds place her as a significant science-fiction writer.

"The Terrible Sense," in *Best of Science Fiction*, edited by Groff Conklin. New York, Crown, 1946.

\* \* \*

In addition to a few Calvin Perego short stories, Thomas McClary has produced two memorable works, *Rebirth* and *Three Thousand Years*, both Darwinian in attitude. In both a scientific elite theorize that, together with the intelligent and fit from other fields, they can overcome the stratified prejudices and superstitions of their age, wipe the slate clean, and produce a new utopia characterized by some degree of comfort and humanity. To achieve this the scientists intentionally and instantaneously precipitate a catastrophe, by a memory-obliterating ray in *Rebirth* and by the translation of all life forms to a state of suspended animation in *Three Thousand Years*.

Both works partially deflate such idealistic visions of reformation by revealing man at the instinctual level as possessive, violent, competitive, and innately unequal (his weaknesses and his strengths), but suggest that love, music, pride in work, and a basic sense of responsibility toward those who can contribute to the community raise man above both his animal limitations and any computerized substitutes. When human minds are reduced to a *tabula rasa* amid a technologically advanced society (*Rebirth*) or when that technology crumbles (*Three Thousand Years*), chaos, destruction, and death ensue. In *Rebirth* man must relearn such elementary skills as talking, walking, and eating; in *Three Thousand Years* experts must learn to start from scratch; in both man must survive on the basis of instinct and innate capacity. Most die, but the clever and strong survive to rebuild society and to become, ultimately, very much what they had been before rebirth or suspension, with only some achieving higher levels of understanding than before. Yet overall the world is a better place, with the weak weeded out, the government established on a more realistic basis of common need and common interest, and scientists and politicians learning to cooperate to keep man striving and progressing. Once one has accepted rather implausible initial premises and a simplistic style, the working out of the details is interesting and occasionally witty and unexpected.

Critical Study: *The Eureka Years: Boucher and McComas's The Magazine of Fantasy and Science Fiction 1949-1954* edited by Annette P. McComas, New York, Bantam, 1982.

\* \* \*

Although he attracted some critical attention for his writing, J. Francis McComas is best known in partnership activities. His story "Flight Into Darkness" is dated, since it deals with speculative relationships between the US and the remnants of German civilization after World War II. Here the author is concerned with political jingoism in the fanatical devotion to The Leader by the story's villain, who hatches a plot to overthrow the triumphant Americans through the secret construction of a space ship. While the yarn is starkly melodramatic, with a spectacular ending to satisfy the post-World War II reader, McComas's sympathetic sketching of the crippled younger brother earns the account more than passing attention.

It is McComas's sensitivity, in fact, which contributed so greatly to his success in two partnerships that made him a notable figure in science fiction. The first of these was with Anthony Boucher in the creation in 1949 of *The Magazine of Fantasy and Science Fiction*. This periodical was unusual in attracting stories of high literary quality at a time when many pulps subsisted on much cheaper fare. While the magazine's content leaned heavily toward fantasy the balance shifted to include some of the finest science fiction written for magazines. His keen perceptiveness and high literary standards are evident, too, in *Adventures in Time and Space*, which McComas edited with Raymond J. Healy. This anthology gave science fiction an impetus toward respectability and literary value which it may not have previously enjoyed by presenting a stimulating cross-section of speculative experiences and underlining the contribution of science fiction to American literature.

J. Francis McComas deserves great critical attention, then, for his keen perception and high literary standards. Without such individuals it is very speculative whether the fine writers of science fiction we can enjoy today would have developed to such respectable levels. While he was himself a writer, he was more: a connoisseur of writing standards.

J. T. McIntosh comments:

I became a science fiction writer not by choice but by force of circumstance. At the time when I was ready to publish (1945-50), paper was in short supply and publishers tended to use it for books by established authors. America was the obvious market, but I had no accurate knowledge of the U. S. scene. So I wrote SF, in which accurate knowledge of the U. S. scene is not necessary.

Later, when I tried non-SF, the international nature of SF became clear to me. There was little interest in my mainstream fiction outside Britain, while the SF books often had editions in many other countries.

\* \* \*

Under the pen name J. T. McIntosh, the Scots writer and journalist James Murdoch Macgregor first won recognition as an author of science fiction with *World Out of Mind*, his first novel. This work presents a future society organized around the ultimate merit system: IQ. All members of this society are rigorously tested for intelligence; test results place each individual in a group marked by a colored badge indicating rank. The governing class, wearing the white star indicating the highest 1% of intelligence, is infiltrated by a Martian who has been reprocessed as a human being and whose mission is to prepare for a Martian invasion. However, since the Martian spy has become *completely* human, he cannot help falling in love with the youngest (and most beautiful) living white star. He betrays the loveless Martians and thwarts the invasion. Humanity (and love) conquer.

Also greeted with critical enthusiasm, *Born Leader* develops two human conflicts: daring youth pitted against conservative age, and a cooperative libertarian society pitted against military totalitarian state. Mundis, a planet colonised by space settlers from an Earth destroyed by nuclear war, is inhabited by two generations: the original settlers, determined not to use nuclear power, and their children, born only after the 22-year space voyage, eager to explore its possibilities. Mundis's egalitarian society is threatened by invaders from a second Earth ship, a Spartan, loveless military group whose women are considered subhuman breeders. Under the threat of domination, the Mundans unite, develop nuclear defences, defeat the invaders, and integrate them into their own egalitarian system.

*One in Three Hundred* begins on an Earth doomed by a shift in its solar orbit. It shows the selection of a small and random minority for space colonisation, their hazardous voyage, and their sufferings in making Mars habitable from the point of view of one of the leaders responsible for the selection and supervision of a small group. Faced by the threat of a sadist and would-be dictator on Mars, the colonists rebel, kill the tyrants, and cooperate successfully in order to survive. *The Fittest* similarly shows humans forced to work together for survival against great physical odds. Earth is overpopulated by paggets, super-intelligent mice, cats, rats, and dogs, developed by

accident in an experiment and determined to overwhelm human life by cutting lines of communication, devouring supplies, sabotage, and murder. Mankind can survive biologically only by using the uniquely human qualities of communication and cooperation to remain the fittest species in simple democratic communities free from social convention.

McIntoch's later full-length fiction fails to live up to the promise of his early novels. Although his later work still deals with his major themes—overpopulation in *The Million Cities*, space travel and evolution in *200 Years to Christmas*, the aftermath of holocaust in *Out of Chaos*, and morality in *Six Gates from Limbo*, *Transmigration*, and *Flight from Rebirth*—he tends to repeat and overwrite early plots, often expanding ideas originally published as short stories. His ability to write fast and convincing action remains, but he fails to present themes and ideas as convincingly as his novels from the early 1950's.

McIntoch's four early novels interestingly depict libertarian utopias whose members' mutual concern and willingness to cooperate in order to survive demonstrate a hopeful view of human nature in a threatening universe. The terrible odds his characters must face are plausible threats for our future: overpopulation, misdirected technology, war, physical changes on Earth itself. In the Darwinian struggle to survive, women become essential. McIntoch's heroes are typically attracted to independence, competence, and strength in their mates, rather than to dependence, passivity, and physical frailty they might have preferred in easier times. McIntoch's ability to depict realistically the violence and dangers of the unknown future and his hopefulness about mankind's ability to endure make his early novels both moving and memorable.

\* \* \*

Explicitly feminist, Vonda N. McIntyre's science fiction—part of a wave of feminist science fiction and fantasy written in the 1970's and 1980's—is multifaceted. It is characterized not only by careful attention to sexism in society but by thoughtful depictions of the social and personal problems which may still exist when sexual stereotyping and discrimination are vanquished. The need for personal commitment—to oneself and others—despite human imperfection is a theme throughout McIntyre's works, many of which also reflect her scientific background.

The award-winning "Of Mist, and Grass, and Sand" exemplifies these themes. This short story depicts a post-holocaust society whose healers aid the sick with serums cultivated from snake venom. Its protagonist, herself named Snake, is an independent, responsible, and strong person. Snake successfully copes not only with the strenuous demands of her chosen profession but also with her own failure to assess the fears of the nomads who have desperately sought her help. Even though they kill one of her invaluable snakes, she continues to treat and ultimately cure their sick child. This story is exceptional in its understated presentation of realistically flawed characters in a non-sexist society.

In 1978, McIntyre expanded "Of Mist, and Grass, and Sand" into a full-length novel, *Dreamsnake*. This episodic work follows the healer on a series of adventures as she tries to replace the snake she has lost. Each episode highlights different aspects of contemporary, restrictive society and depicts social and personal alternatives. For example, Snake encounters "partnerships" which consists of three people. By omitting gender pronouns in this episode, McIntyre conveys the superfluousness of sex roles in unconventionally functional relationships. In later episodes, Snake encounters and helps remove the pain that lack of contraceptive knowledge or emphasis on physical appearance can cause.

*The Exile Waiting*, McIntyre's first novel, also explores the lives of strong women in possible futures. Its young protagonist, Mischa, is a telepath in another post-holocaust society. Mischa frees herself from a series of mental and physical tyrannies through her own ingenuity and courage. Two of McIntyre's best-known stories continue to examine this theme. In "Screwtop," set in a future penal institution, Kylis is a resourceful female spaceport "rat" who has survived since

childhood as an interplanetary stowaway. Imprisoned, Kylis learns to accept responsibility for others as well as for herself when she is offered, but refuses, freedom for betraying two fellow prisoners. McIntyre's creation in this story of a "tetraparental"—a genetically superior character endowed with the traits of four parents—is another reflection of her scientific training.

"Aztecs" again demonstrates McIntyre's concern with psychologically strong, mature women and her scientific background. Beginning with the sentence, "She gave up her heart quite willingly," this story follows its central character, Laena, through several rites of passage. Having had her heart surgically removed in order to survive "transit" as a spaceship pilot, Laena must adjust not only to her new, rarefied social status but to the unexpected side effects of this surgery. It is only when she falls in love (again, giving up her heart), that Laena learns that her biological rhythms are no longer compatible with those of ordinary people. Remaining with her lover will kill her, but Laena rejects the conventional alternatives. Instead of a romantic liebestod or a renunciation of her career, McIntyre's character sadly chooses to adjust to the limitations of her new way of life.

In 1983, McIntyre expanded "Aztecs" into a full-length novel, *Superluminal*. Shifting among the perspectives of Lanea; her lover, Racul; and a genetically-transformed human, Orca, this work extends McIntyre's examination of alien "otherness" vs. human and ecological interdependence. Orca's family has been altered to live underwater; it is their association with the sentient great whales, once nearly exterminated by humanity, which may provide the key to safe faster-than-light space travel. Orca herself is another strong, committed female protagonist, willing to go against her family's traditions to honor personal loyalties and meet social needs.

McIntyre has continued her political interests in a series of focusing on characters from the popular television series, *Star Trek*. In the 1981 novel, *The Entropy Effect*, she concentrates on Sulu, a relatively minor character in the original series, and on a female starship captain of her own creation, Mandala Flynn. Her depiction of these characters against the mythologized backdrop of the U. S. S. Enterprise enables McIntyre to examine once more the effects of and alternatives to cultural and sexual difference. Sulu's Asian heritage, as well as Mandala's gender, are significant plot elements.

McIntyre has also written the "novelizations" of *Star Trek* motion pictures, bringing to each work her own feminist concerns and ability to create vivid characters. In *Star Trek: The Wrath of Khan*, she concentrates on the minor, alien characters seen only briefly on-screen. By detailing their personalities, cultures, and unique physiology, she provokes the reader (and viewers of the film) to rethink the meanings of "alien." Similarly, her characterization of Saavik, the half-Vulcan, half-Romulan cadet, causes the reader to reexamine the "outsider" yet again. Saavik's gradual acceptance of friendship and other human emotions is a further variation upon the theme of interdependence seen throughout McIntyre's work.

The novelization of *Star Trek 3: The Search for Spock*, with its emphasis on the primacy of friendship over social directives, provides McIntyre with another vehicle for the exploration of personal loyalties among strong characters in a (comparatively) non-sexist society. Kirk disobeys Starfleet to rescue Spock. McIntyre's ability to rework the *Star Trek* mythos to reflect her own concerns is an interesting, at times exciting example of the ways in which forms of popular culture interact, and of the growing impact of feminism on popular culture in general.

\* \* \*

Richard M. McKenna, although best known for his fine novel *The Sand Pebbles*, was also a skilled writer of science fiction whose short stories and novelettes are usually concerned with the troubling and often painful aspects of both fantasy and reality. In a small number of science-fiction and fantasy stories that are vividly written, fast paced, and well characterized, McKenna continually exhibits his superb gifts as a storyteller.

Most of McKenna's science-fiction works are rich in anthropological content. They frequently portray individuals in relation to their groups, and both individual and group in relation to alien cultures or fantasy phenomena. "Casey Agonistes" meticulously explores the interrelationships of patients in a tuberculosis ward, depicting their symbolic rebellion against hospital authority through an ape that is either a genuine apparition or their shared fantasy. The ape, Casey, reflects in his antics the patients' underlying attitudes about the hospital and their poignant efforts to cope with the fact of death. Also, the sharing of the fantasy becomes a catalyst for the raising of the emotional levels of the ward and the improvement of the general conditions there. In "Mine Own Ways," "Hunter, Come Home," and "The Bramble Bush" characters who are members of a scientific team are faced with conflicts that in different ways are caused by the uniqueness of an alien culture on the planet that is the focus of their professional activities. In these stories the psychological state of the protagonists influences and affects the relationship of the group to the aliens and leads to the protagonists being put through a symbolic or actual ritual. This experience alters not only their beliefs, but

also the outcome of the group's mission. McKenna depicts such anthropological themes and motifs with an equal concern for the humans and the aliens.

The world of fantasy, its virtues as well as defects, is the subject on which McKenna focuses most often. In some stories he studies the interplay between the fantasy and an outer reality, casting certain features of the reality into doubt, and in others he constructs fantasy worlds whose landscapes are the basis for a questioning of the nature of fantasy and reality. Often the fantasy world is more appealing, and even ameliorative, as in the cheerful ape's transformation of the despairing hospital ward into an active and even hopeful place. In "The Secret Place" a barren featureless Oregon countryside hides a wondrous fairyland that, in a way, defies the efforts of science to penetrate it and utilize its resources. Dying sailors, in "Fiddler's Green," escape into an imperfect but, through their own imaginative efforts, developing otherworld that simultaneously represents salvation and sterility. Stories like these fantasies that are perceived by the characters as just as real as the obsession-ridden world of reality. However the stories are resolved, whether with acceptance or rejection of the fantasy, the worlds function as alternatives to reality or some facet of reality. In "Hunter, Come Home" and "The Bramble Bush" McKenna treats his planetary settings in a fantasy-like way. The exotic world of the former affects the hold on reality of individuals from two differing human cultures, and the bizarre time-changing world of the latter traps a group of meddling scientists in a field that changes the very shape of their universe.

McKenna integrates linguistic considerations into many of his stories, which is not surprising in an author so intensely interested in anthropological subjects and with the structure of reality versus illusion. The overly macho hunting culture of "Hunter, Come Home" reveals itself as much through its language as its cultural statements of belief. In their society bullets is a curse word, and the ideal is to be as sharp as a gunflint. Words are said to come alive in the native rituals of "Mine Own Ways"; time-binding symbology is integral to the plot of "The Bramble Bush."

No matter how exotic his planetary settings are, and no matter how deeply his characters penetrate a fantasy world, McKenna's fiction is always credible. He makes the fantasy worlds real and, for that matter, presents what is essentially fantastic and unreal about the so-called reality. Such attention to detail, along with McKenna's meticulous approach to the writing of language, adds to the verisimilitude of tales that are among the best examples of storytelling in science fiction.

\* \* \*

Dean McLaughlin's novels display a fascination with the concept of one man capable of altering the entire course of history. McLaughlin does not have in mind brilliant military strategists or mighty-thewed barbarians, but common men, those who may even doubt their own actions but carry through with them nonetheless. Danial Mason, leader of the undersea city of Wilmington in *Dome World*, is a perfect example. Mason is chief administrator of the domed city, one of many that have sprung up on the ocean floor, built by various nations intent on mining or fishing or trading with other nations. But the undersea cities are also the focus of some conflict because of the haphazard fashion in which matters of sovereignty have been resolved. So it is that the American Union and South Africa are on the verge of war over control of a rich vanadium deposit that lies between two such domes. Because of the utter vulnerability of the domes, Mason organizes a widespread secession from the mainland nations to prevent fatal involvement in their war. The second half of the novel deals with the situation some years later when the creation of smaller, individualized domes is the cause of tension between the newly formed league of domed cities and the mainland authorities. Once again a small businessman ignores his own government to take steps that eventually reduces the chance of war. Both of McLaughlin's characters are far from physically fit; one is recently returned from the moon and has difficulties with Earth's greater gravity, and the other has a weak heart that might cease to function at any time.

Similarly, the protagonist of *The Fury from Earth* is a pacifist who refuses to help the government of Venus to develop weapons for their war with Earth. On the other hand, he is willing to help design purely defensive weapons, and is quick to see that a new development on Earth could be used for interstellar travel rather than as an offensive weapon that will shake entire planets. This is thematically somewhat similar to McLaughlin's remaining novel, *The Man Who Wanted Stars*, in which a single man keeps the space program alive, primarily through his own stubbornness. The latter novel suffers somewhat from the didactic material, which often interferes with the plot, and with the megalomania of the central character, which often causes the reader to dislike him even while agreeing with his position.

McLaughlin has also produced a string of competent short stories, at least two of which are exceptional. "Hawk among the Sparrows" is somewhat unusual for McLaughlin in that the hero tries to alter history and fails utterly. He has been projected back through time with a modern supersonic aircraft, and assumes that he can affect the course of the air war in Europe. Such is not the case. He cannot locate appropriate fuel, and his aircraft travels so rapidly that it is impossible for him to engage in combat with his slower, more primitive antagonists. McLaughlin also produced one of the more fascinating alien societies in "The Brotherhood of Keepers."

Although not a stylistic virtuoso, McLaughlin employs clean prose throughout his writing, with a crisp delivery that falters only in *The Man Who Wanted Stars*. He avoids larger-than-life character very consciously, taking pains to make his characters vulnerable and human. His plots and situations ring true, and he takes care that issues are for the most part presented in many facets rather than clear cut. Most of his better fiction leaves the reader with something to consider even after the story has ended, although McLaughlin is careful to tie up necessary loose ends.

\*

Mike McQuay comments:

My writing tends toward the sociological/humanistic end of the spectrum. Though considered a cynic by many of my detractors, I consider myself a social realist (an optimist in wolf's clothing). My work as a whole deals with the survival of the human spirit despite the out-of-control technologies we've set in motion, which puts me in direct opposition (gladly) with the science-as-God writers who seem to fill the shelves. Don't look for sugar coating in a McQuay book—

My main sub-theme seems to be discussions on the nature of reality, and the human's ability to construct reality to his own specifications.

\*   \*   \*

Mike McQuay has established himself in a short time as an energetic and prolific writer whose science fiction projects an emphatically masculine vision. McQuay's Mathew Swain series makes an interesting effort to combine the science-fiction and private eye genres, and his other novels display a penchant for vivid melodramatic action. Strongly individualist and non-conformist heroes are a distinguishing feature of McQuay's work, as well as an obvious skepticism and distrust of the ethics and purposes of corporations and governments. Another intriguing trait of McQuay's fiction is the influence of his southwest background, which appears both in his style and in the non-conformist stance of his tough-minded heroes.

McQuay's first important novel was *Lifekeeper*, which employed the bold stroke of a black hero. In a dismal future divided between wilderness tribes and communal states, ruled by computers which outlaw individuality, Doral Dulan is a rebellious and archaic individualist who realizes his destiny by overthrowing the dominance of the machines and fulfilling the desert tribes' yearning for a messiah. Some sharp parallels with Frank Herbert's *Dune* novels are obvious, including an ending which attempts to suggest Herbert's sophisticated sense of irony.

This ambitious but uneven first novel was followed by *Escape from New York*, a novelization of a cynically conceived film melodrama about a near future in which New York City has collapsed into a forbidden zone or anarchic sanctuary for criminals and outcasts. Plissken, the heroic antihero, is characterized effectively, and his hard-headed and intractable individualism anticipates Matt Swain, the hero of McQuay's 21st-century private-eye series.

The Swain series is dedicated to the memory of Raymond Chandler, "who understood." Presumably McQuay is paying homage to Chandler's vision of a corrupt and materialistic society where ethical norms are in constant flux, and also to Chandler's Philip Marlowe, the incorruptible and disenchanted knight who uncovers forgotten crimes and repressed memories of venality and compromise, as Chandler described his hero's role in his famous essay and apologia, "The Simple Art of Murder."

In the first Swain adventure, *Hot Time in Old Town*, McQuay's private eye is depicted as a younger and slightly more idealistic Marlowe, and as a former law officer now playing a lone hand in a decaying Southwestern city suggestive of Dallas or Tulsa. However, Swain has a more active sex life than

Marlowe, since McQuay bestows on him a wealthy and voluptuous young woman, Ginny Teal, in the first novel; while in later books in the series other attractive women become Swain's lovers. Swain is also a more impulsive and physical hero than Marlowe, displaying a good deal of prowess with his fists and with weapons, somewhat in the mode of Robert B. Parker's Spenser. Yet like his model, Marlowe, Swain also remains true to the tradition of the private eye as a man of honor, showing himself to be relentless and incorruptible as he searches for the murderer of a dissolute heir in *Hot Time on Old Town*.

In the second Swain novel, *When Trouble Beckons*, McQuay takes his hero to a city on the moon where a large multinational corporation rules. Although Swain's mission is ostensibly to rescue Ginny, in reality the novel examines the corrupting influence of a decadent and dehumanizing social environment, evoking memories of Dashiell Hammett's *Personville* (or "Poisonville") in *Red Harvest*, and Ross MacDonald's scandal-ridden midwestern town in *Blue City*. *When Trouble Beckons* is notable for its unrelenting action, its virtuoso reversals of plot, especially in the closing pages, and its sympathetic characterization of an earthy woman cab driver.

*The Deadliest Show in Town* continues Swain's crusade against corporate dishonesty and greed, and government indifference and corruption, this time pitting the private eye against the 21st-century communications industry. The final entry to date in the series, *The Odds Are Murder*, continues the emphasis on violent physical action featured in the first three novels, as Swain investigates greed and scandal in the manufacture of pharmaceutical drugs. But the themes and attitudes of the Swain books are now beginning to seem repetitious and obsessive; as yet, none of the Swain novels has established itself as worthy of comparison with the mature Raymond Chandler.

To his credit, however, McQuay has refused to become the prisoner of a series with its limitations. In 1984, he published *Jitterbug*, a work which returns to the epic scale of *Lifekeeper*, depicting a dystopian world of the 22nd century. In this novel, a fanatical Arab dictatorship rules a decaying America; but this "corporation" is challenged successfully by the rebellion of Olson, another of McQuay's tough-minded heroes, who emerges from obscurity and a harsh upbringing in the southwest. *Jitterbug* shows marked growth in McQuay as a novelist, for its extrapolated future world is envisaged with both imaginative power and an increased thoroughness and plausibility.

Continuing to write with impressive energy, McQuay followed *Jitterbug* with *Pure Blood*, another vigorous adventure saga set in a much-changed New York State a thousand years hence. In the predominantly primitive post-disaster world of this novel, McQuay portrays an environment of barbaric humans and new creatures created by genetic experiment, where another of his outcast heroes, Morgan, tempered by the crucible of hardship and struggle, rises to leadership.

Inevitably, McQuay's virile fiction depicting traditionally masculine heroes who grimly and courageously battle against worlds of decadence resulting from 20th-century follies will suggest comparisons with such famous names as Heinlein and Philip José Farmer. Whatever future development McQuay's work takes, it seems clear that he has the energy and talent to become both commercially popular and a major novelist in the science-fiction genre.

Shepherd Mead comments:

I have a warm spot in my heart for science fiction. Sometimes things can be said by means of it that cannot be said any other way. That is surely true of *The Carefully Considered Rape of the World*, which is about genetics, really—that the first beings to control their own evolution will become the first gods of the universe.

My favorite book of all is *The Big Ball of Wax*. At the time I considered it the other side of the coin to Orwell's excellent *Nineteen Eighty-Four*—that the future would belong not to the totalitarian Big Brothers but to the persuaders. The book showed what would happen to a society that gave everyone only what the lowest common denominator wanted. Now that the returns are in, we can see which of us was right—and it wasn't Orwell! (a great man, nonetheless).

I have one more SF work in manuscript form called *The Purple Peoplegrams*; this is about the whole business of electronic communication with the rest of the universe.

\* \* \*

Shepherd Mead, who is best known for *How to Succeed in Business Without Really Trying*, has written three novels which may be classed as science fiction. *The Magnificent MacInnes* and *The Big Ball of Wax* are similar in thrust—both focus on the manipulation of mass society by the media and by Madison Avenue. In the first the advertising industry and its marketing pollsters by catering to ordinary taste are making "sure everybody gets tomorrow what the lowest common denominator wanted yesterday." When it is accidentally discovered that Victor V. MacInnes has the facility (unexplained) to intuit public opinion on any question, an absurd utopia is envisioned. Simply register the will of the people and then feed it in the name of "true Democracy." The result, of course, is a sterile, drab mediocrity—the TV program that achieves top ratings but has its audience soundly sleeping. The similarity between Kornbluth and Pohl (especially in *The Space Merchants*) and Mead extends to *The Big Ball of Wax*, an account of the crucial sequence of events in 1993 that have led to "the best of all possible worlds." The gimmick here is XP, an ersatz electronic experience for the real thing from eating to travel to sex (compare Compton's *Synthajoy*). XP provides the perfect vehicle for the merchandisers to guide society "step by step down the path of mediocrity." The warning is similar to Kornbluth's "The Marching Morons": "Notch by notch the mental level was dropping, thinking was decreasing, self-expression dying out." Both novels have as protagonists male, mid-level Madison Avenue executives who serve the system with naive enthusiasm: "We have made Progress, and we look to all of you to carry the torch when we drop it and to go ahead, always ahead, to the Goal line."

*The Carefully Considered Rape of the World*, structurally like *The Big Ball of Wax*, is a chronicle of the brief period when distant kin from Phycyx (48 light years away) arrive like UFO's to lead us to a higher evolutionary stage by artificially impregnating a relatively small number of women the world

over. The novel traces the effects on three Long Island couples. The eventual offspring are super-intelligent and baboon-like. Inherent again is a message, a stronger one than the earlier warnings about mass merchandising. The Phycians have a Formula for Evolutionary Termination, popularly called the Doomsday Variable: given a carnivorous heredity (the gentle yielding to the savage), if "nuclear ability comes before genetic control, extinction follows within approximately four generations." Like Vonnegut, Mead is an adroit comic writer who uses SF material to achieve his satire.

—Anthony Wolk

**MEEK, S(terner St. ) P(aul).** Also wrote as Sterner St. Paul. American. Born in Chicago, Illinois, 8 April 1894. Educated at the University of Chicago, Sc. A. 1914; University of Alabama, University, S. B. 1915 (Phi Beta Kappa); University of Wisconsin, Madison, 1916; Massachusetts Institute of Technology, Cambridge, 1921-23. Married Edna Burndage Noble in 1927; one son. Football coach, Kirkley Junior College, Greenville, Texas, 1915; chemist, Western Electric Company, Hawthorne, Illinois, 1916, and Deuvitt Laboratories, Chicago, 1917. Served in the United States Army from 1917; directed small arms ammunition research, 1923-26; chief publications officer, Ordnance Department, 1941-44; retired due to disability, 1947: Colonel. Held patents on tracer ammunition. *Died 10 June 1972.*

\* \* \*

S. P. Meek was one of the most prominent contributors of the science-fiction magazines which struggled to survive the years of the depression between 1929 and 1933. He first appeared with "The Murgatroyd Experiment," a still-memorable tale concerning the appalling results of an effort to sustain the world's swollen population in the year 2060, and wrote regularly for the next few years. It was to be expected that he would write about future warfare, and in "The Red Peril" he drew a grim picture of the world's great cities being sprayed with disease germs in 1957—the enemy, inevitably, being the Soviet Union. Propaganda leaflets were also in the armoury of the attackers, whose gravity-defying aircraft were repelled by atomic shells. Even after the Soviet leaders had been confined on St. Helena, the struggle was continued in a sequel, "The Last War," in which synthetic men were produced to turn the tide of battle.

The Red Menace often lurked in the background when Meek's popular character, Dr. Bird of the Bureau of Standards, accompanied by Operative Carnes of the Secret Service, set out to expose some piece of villainy in the series of intriguing tales. In "The Gland Murders" the plot was designed to decimate the educated rich by lacing their bootleg liquor with an extract from the pineal gland of a murderer, stimulating them to violent acts for which they would pay the penalty. Economic disaster was narrowly averted when, in "Vanishing Gold," bullion in the vaults of the Federal Reserve Bank became radioactive and lost weight. In "When Caverns Yawned" whole cities were imperilled by artificial earthquakes; and in "The Solar Magnet" the subversive genius Ivan Saranoff even tried to straighten the Earth's axis so that Russia might win her true place in the sun. Most of the Dr. Bird stories appeared in the early issues of *Astounding Stories*, where the emphasis on foreign villains brought protests from some readers, and an assurance from the editor that "our authors mean no offence." Among other tales was "Giants on the Earth," a gaudy interplanetary adventure in a style he seldom affected but which clearly showed the extent of his versatility. His tale of an electronic world, "Submicroscopic," was continued in "Awlo of Ulm," an action-romance in the Burroughs tradition. Two serials, *The Drums of Tapajos* and its sequel, *Troyana*, concerned a lost civilisation buried in the Brazilian jungle, and appeared in book form after an interval of 30 years. A collection of his humorous short stories was published as *The Monkeys Have No Tails in Zamboanga*.

David Meltzer comments:

My involvement with science fiction began when I was a teenager with my reading of H. G. Wells. This led to the early Conklin anthologies and to pulps like *Famous Fantastic Mysteries*, *Amazing*, and *Thrilling Wonder Stories*. *Weird Tales* directed me to Arkham House and to Bradbury's first book. Though I enjoyed all aspects of the genre—from David H. Keller to A. E. van Vogt—the writers who interested me most, for their style and innovative stories, were Sturgeon, Kuttner, and finally Alfred Bester, whose *Demolished Man* (serialized in *Galaxy*) was a significant opening in the development of my own work. Its typographical free-play, reminiscent of 1920's Dada and Surrealist typewriter art, felt comfortable to a young poet enthralled with Kenneth Patchen and E. E. Cummings.

Though I wrote and sold a few stories in the 1950's, it was writing the erotic tracts for Essex House that gave me the format I needed to extend my involvement with science fiction. These novels allowed me to use the speculative freedom of SF in a free-for-all attempt to make moral, political, and it is hoped, satirical appraisal of the USA in the late 1960's without sacrificing any "respectability" poets are supposed to wear as top hats or laurel crowns.

\* \* \*

Of the ten novels by the California poet and novelist David Meltzer, seven were—in the author's words—"SF or fantasy, future projections." The fact that the Essex House series, edited by Brian Kirby, was devoted to serious American erotic writing did not hinder Meltzer when he wrote his prophetic, Blakean novels of the future. As he has said, "The pornographic erotic format seemed most fitting a zone to engage in didactic moral outcries."

In *The Agency*, The first volume of a trilogy, Meltzer conveys a poetic vision in spare, allusive prose. He uses techniques special to speculative fiction and satire. As the novelist Norman Spinrad writes in his afterword to *The Agent*: the Agency "is clearly Meltzer's paradigm of society; a mindless machine of which we are all 'agents,' including those whom the machine supposedly serves. . . . The Agency is "a well-organised, self-sufficient, sexual underground." In *The Agency* a young man is picked up by sexual agents and—like the woman in *Story of O*—spends the rest of the novel being forcibly indoctrinated with The Agency's tyrannical precepts. Brainwashed, he becomes an agent himself, ready to propagate the evil fantasies of his masters. In *The Agent* the satirical possibilities implied in *The Agency* are applied more broadly to various aspects of American society. Here Meltzer's deliberately ambiguous portrayal of two agents who may or may not be working for the same agency is often reminiscent of scenes from the movie *Dr. Strangelove*. The third volume in the trilogy, *How Many Blocks in the Pile?*, is constructed differently from the first two. In it, Meltzer creates an exaggerated portrait of the Agency's customers—a married couple who respond to sexual advertisements.

Meltzer's most ambitious erotic SF project is the Brain Plant Tetralogy. In classical Greek drama, a tetralogy is a group of four dramatic pieces, either four tragedies or three tragedies and a satire. Meltzer's Brain-Plant novels are not tragedies in the classical sense, and satire is a prominent feature of each of them; but his extrapolation of tendencies in American society of the late 1960's and their application in his prophetic fictions renders a tragic, scarifying vision. Meltzer's achievement in these four novels does not lie in the creation of characters, because they are either deliberate caricatures or disembodied voices, nor in the creation of a central fantasy. His projection of a future

American government ruled by "Military Industry" in which "Rads" (radicals) and "Rebs" (lower middle-class whites), "Snarks" (sexual anarchists) and black militants, are pacified by "Fun Zones" (ingenious Disneylands for the satisfaction of sexual fantasies) is simplistic—like R. Crumb cartoons, as Frank M. Robinson points out in his afterword to *Lovely*. Meltzer's achievement lies instead in the utterly convincing manner in which he argues his theme of exploitation through sex, power, and dreams. The Series, because of the extravagant, entertaining, violent, prophetic vision it conveys, is one of the high points of erotic SF literature.

—Michael Perkins

#### SCIENCE-FICTION PUBLICATIONS

##### Novels (series: Wind)

*Sovereign*. New York, New American Library, 1979; London, Arrow, 1980.

*Wind Dancers*. New York, New American Library, 1981.

*Wind Child*. New York, New American Library, 1982.

*Jerusalem Fire*. New York, New American Library, 1985.

\* \* \*

R. M. Meluch is a relatively young writer (23 when her first novel was published) who paints her intergalactic adventure stories with a broad brush.

*Sovereign*, her first novel, is a self-contained saga of heroism thrust upon the person of a tormented young man. *Wind Child* and *Wind Dancer* combine to chronicle the return from virtual extermination of a race of shape-changers through the assistance of half-breed human/alien. In all of the novels, however, the characters rather than the plot grasp the reader's attention.

*Sovereign* is in fact a sort of character study predicated on a father-son conflict. The novel is divided into four parts, starting on the alien Arana, moving with the character, Teal, to earth, then to his own spacecraft, *Sovereign*, and then back to Arana. It follows Teal's heroic struggle for survival through a variety of interpersonal situations cast against an intergalactic war. As the 33rd and crucial generation of a long line of single, male children, Teal is dependent upon his father's tutoring for protection from side-effects of this breeding program. His birth causes the death of his mother and his father's rejection, starting a chain of events within which he must oppose ever larger aggregates of hostile beings. His father is his first enemy, while his second is the competing Brekk family, his third the invading "northern" tribes of the home planet, Arana, his fourth the alien Uelson race which threatens Arana as well as earth (Arana's social structure owes something to a Scottish model). Teal's long struggle to replace his father's missing affection takes him

first north to join a spacefaring race and then off-planet to battle the nefarious Uelsons in earth's behalf. These adventures, seemingly motivated by internal need rather than external compulsion, form the arena within which his heroic scope can be displayed. The focus of *Sovereign* is this character and all that flows from him, making the plot at times confusing but not without precedent in SF adventure tales.

*Wind Dancer* and *Wind Child*, while also based upon the existence of a race of genetically altered beings, is more reminiscent of H. Beam Piper than Doc Smith. A dying race of beings with Isets of chromosomes is able to take three forms—human-like, animal, and wind. The wealthy terrans who have taken over their planet wish to deny and then to conceal their existence in order to hold their claim to a planet with no apparent indigenous population, a plot element borrowed from Piper's *Little Fuzzy*. *Wind Dancer* introduces the alien-human conflict and the characters, alien Niki, half-alien Laure, and human East, who will restore the race. *Wind Child* provides the human-alien savior, Daniel, who is similar in stature to Teal in *Sovereign*, to search out lost members of the race among the stars.

Alternations between the viewpoints of the wind-aliens and the humans provide this two-novel story with more controlled depth than found in her first novel, although all but a few central characters are embodiments of a single principle, mystery and aesthetic beauty in the alien dancer, Niki, evil in the rich Duchess Estelita and the military leader Admiral Czals, and unselfish but mischievous goodness in Daniel's close companion, Tavi.

All of Meluch's novels show a knowledge of SF as a genre and a genuine sensitivity to psychological development in the person of major characters. She has also obviously given a lot of thought to the cultures of her many worlds, although this comes through more strongly in *Wind Dancer* and *Wind Child*. If she devotes some serious attention to plot development, her evident stylistic strengths should bear out this early promise.

—Janice M. Bogstad

**MEREDITH, Richard C(arlton).** American. Born in Alderson, West Virginia, 21 October 1937. \* \* \*

The protagonists of Richard C. Meredith's fiction generally are reluctant and/or disabled heroes who are forced by circumstances to attempt to solve the mysteries of the strange worlds in which they have previously been mere functionaries. As in traditional quest tales, they uncover even more mystery until a resolution, not always the solution they seek, is reached. They face frequent crises and perform heroically, if not always wisely, in response to external threats. They usually endure deep pain and are quite often physically injured—in fact, it seems that Meredith needs to put his protagonists through as much physical hell as possible before they are allowed the answers they seek or the revelations that there are some areas of human existence they will never fully understand. However, they are not the usual action-adventure sort of heroes. During their moments of flight or hiding, they reflect often upon their actions, regretting the emotional or physical pain they have caused and the violence, with its often questionable killings, that their need for self-preservation has precipitated. As pain is the recurring problem of the characters, violence is perhaps the aspect of Meredith's work that best sums up the science-fiction worlds he creates. Whether the story is about a contingent of handicapped warriors in outer space; a mercenary crossing alternate worlds, time, and space; or a time-traveller exploring facets of American history, the characters are frequently in a state of paranoiac apprehension, not knowing from where or when the next violent attack will come.

While Meredith's science fiction is thoroughly researched for its scientific and sociological aspects, he derives much of his inspiration from a finely honed sense of history. Science fiction is a field which attracts, in addition to hard-science promoters, social commentators, and literary aspirants, the history-influenced writer whose main impulse is to tamper with known history (time travel, alternate worlds) or to create complex future histories. Both of these impulses are found in Meredith's fiction and, in fact, he combines them skilfully in his timeliner trilogy and his time travel tour de force ( *Run, Come See Jerusalem* ). Many factors no doubt enter into an author's choice to write science fiction that has a strong historical bent, not the least of which is that it is definitely fun to play with history. Except for some dry leftover subjects, most of the exciting events and adventures of history have been adequately covered academically. On the other hand, the science-fiction writer can deal with history extensively in time travel and

alternate world stories. Additionally, such stories often necessitate speculation on historical subjects, an opportunity that Meredith takes full advantage of.

*Run, Come See Jerusalem* not only presents well-researched historical material but also gives full treatment to the what-if theme of the traveller effecting historical change by his actions in the past. Further, it juxtaposes two possible 21st-century futures against each other to make not only cautionary statements about contemporary trends but also detailed future histories rich in political and social implications. Meredith seems to have realized, along with a few other writers like Fritz Leiber, Jack Finney, and Robert Silverberg, that history can be very much a subject of science fiction, integrated comfortably with its fantastic plots and themes to create worlds just as imaginative as deep space colonies. Historically based science fiction helps to enlarge or at least vitalize our perception of historical matters. Perhaps as a result of this interest in history, Meredith's plots are extremely complicated and skillful. For example, events introduced early in his trilogy fit neatly into later portions of the story, and figure in a nearly apocalyptic finale that brings back into action most of the novels' surviving characters.

Meredith's best novel, *We All Died at Breakaway Station*, is an elegiac space opera which incorporates many elements similar to those in his time and alternate world sagas. It also features his most fully realized protagonist, the slightly embittered but resilient Absalom Bracer, a starship captain who has died in battle and been resurrected and put back together as more machine than man. Before he makes his valiant last stand as defender of Breakaway Station, he reviews his life as a warrior and ponders the more metaphysical questions regarding his place in a cold and alien universe. Like all Meredith heroes, he wonders if the effort and the pain are worth the result, that is, being the leader for a crew of the functioning wounded. He decides he does not regret his warrior life, especially since he has reached his life goal, being a starship captain. He is able to die courageously, also without regret. He may not have found satisfying answers, but he has asked the most important questions. In spite of Absalom's death, Meredith achieves in this novel a glorification of courage that is—oddly, in our times—quite inspiring. *We All Died at Breakaway Station* is a kind of Horatio-at-the-bridge epic that is given extra dimension by its main character's questing intelligence, by the way its heroism transcends the adventure story requirements of the genre, and because of the dramatic and poignant sacrifices of its disabled, tortured, but brave men and women. It is intriguing that similar bravery by the protagonist of a later novel, *Run, Come See Jerusalem*, results in a nearly opposite type of solution, the character's failure to create a better world where an already abominable one had existed.

Meredith's fiction is fast-paced, mysterious, and complex. He admirably blends philosophical reflection with high adventure to delineate the essential loneliness of his protagonists in an uncertain universe. A sympathetic observer of what is sometimes called the human condition, he infuses his novels and stories with intelligent compassion and a sense of what drives us to our sometimes disputable goals.

\* \* \*

Judith Merrill has been so prominent as a reviewer and an

editor that her fiction has been somewhat eclipsed. Her most widely known story is her first, "That Only a Mother." On one level this tale shows the power of love to blind the lover to the flaws of the beloved and to see only his or her best parts. On another, it is a horror story about the effects of atomic radiation. The two levels combine thematically: atomic energy is a beloved creation with great power to do good for mankind, but we delude ourselves if we refuse to see its potential dangers. Not only does this theme remain relevant to present-day problems; the story bears rereading for the pleasure of the word play, one of Merrill's strengths throughout her work. Her finest novel, *Shadow on the Hearth*, also deals with the danger of atomic energy. It focuses on a Westchester woman with two daughters battling to survive the aftermath of a nuclear attack while her husband is trapped in Manhattan. Quietly rather than militantly feminist and ameliorative rather than separatist, Merrill portrays the domestic reality of coping not only with the dangers of radiation but also with the unwelcome advances of a neighbor who has somehow managed to set himself up as an official of the emergency authorities who wishes to become her "protector."

Working as one of the very few women in the SF field during an era when women were usually dumped with robots and aliens and treated as plot features rather than characters, Merrill introduced a "woman's angle"—fiction unlikely to have been written by a man, usually with a female central character, yet still (against the so-called wisdom of the publishing trade) exciting to readers of both sexes. While "Project Nursemaid" (*Daughters of Earth*) does have a male viewpoint character, its main concern is the selection of candidates for foster-mothering babies born in space. "Daughters of Earth" is also quite unusual for its time, chronicling six generations of female space explorers. Merrill vividly portrays the interactions and reactions between mother and daughter, who then becomes the mother against whom the next generation must react, and so on. Perhaps her most imaginative story is the novella "Homecalling" (*Daughters of Earth*). Again concerned with beauty in the eye of the beholder and the power of love, it is the story of a girl and her baby brother, shipwrecked on a planet with no other human life, who are adopted by a benevolent but repulsively alien mother.

Although it is always difficult to assess the contributions of each individual in collaborations, the two novels Merrill wrote with C. M. Kornbluth as Cyril Judd (*Gunner Cade* and *Outpost Mars*) seem to have benefitted from the strengths of both writers, exhibiting Kornbluth's crisp prose, Merrill's full-range view of human experience, and their mutual respect for irony.

Bibliography: *A. Merritt: A Bibliography of Fantastic Writings* by Walter James Wentz, Los Angeles, Bibby, 1965.

\* \* \*

A. Merritt was probably the most influential American science-fiction writer, after Edgar Rice Burroughs, though he is not nearly so well known to the general public. A major reason for this is the paucity of his output (particularly as compared to Burroughs), though his relatively few novels have been almost continuously in print since World War II. He is generally regarded as a fantasist, but this is mainly a matter of changing standards in definition. A half century ago, many matters were regarded as open to "scientific" speculation that are not currently, particularly in the area of the occult. Three of Merritt's eight completed novels concern themselves with the occult ( *Burn, Witch, Burn!*, *Creep, Shadow!*, and *Seven Footprints to Satan*, the last being a variation on the arch-criminal theme with occult and science-fiction overtones), and one ( *The Ship of Ishtar* ) is very definitely a fantasy set in an alternate world of Babylonian mythology.

The remaining four, however, are given enough of a pseudo-scientific rationale to qualify as science fiction in the romantic vein. There is a strong debt to H. Rider Haggard for the theme of "lost races" in what were then unknown corners of the world, as well as for the ever-popular idea of super-scientific knowledge from forgotten eras (certainly an idea back in vogue today). All this might be called anthropological speculation. *The Moon*

*Pool* deals with a scientific party that penetrates the great caverns left beneath the Pacific when the Moon was ripped from the Earth. There they find the remnants of the ancient Lemurians, using the sophisticated technological instruments of their past. The conflict is with The Shining One, an entity created by the rulers of this land, three (implied) extra-terrestrials, and now turned against them. *The Face in the Abyss* takes place in an unknown part of the Andes. Again there are the remnants of a lost civilization, here ruled by the snake Mother, the last of a race of intelligent beings descended from reptilian antecedents. The lost culture of *Dwellers in the Mirage* is a curious mix of Amerindian, Mongol, and Norse. Its people inhabit a valley in Alaska, which due to volcanic activity and thermal layers gives the illusion of a wasteland; underneath the mirage is a "lost world" of unique life forms. *The Metal Monster* takes a slightly different theme; the title creature is an alien life form, sentient metallic beings with a sort of hive mentality reproducing themselves with astonishing vitality in the Himalayas.

Merritt wrote very much to pulp formula, that of rapidly paced adventure. There is inevitably conflict in these exotic locales, in which the protagonists from the outside world become involved, always on the "good" side. There are usually two women, one pure and beautiful to provide romantic interest for the hero, the other just the opposite; both are allied with the obvious sides of the conflict.

What Merritt brought to this formula that made his work so continuously popular was a remarkable writing style, called purple by his detractors, poetic by his followers. The super-scientific artifacts of the stories are given the barest minimum of scientific justification; their functions and activities are described in extremely visual, highly sensuous ways, as are the exotic flora, fauna, and natural phenomena. The result is far from the usual pulp writing of the time in its evocative imagery.

Because of their magazine origins and other factors, Merritt's works have often appeared in several variations and combinations. *The Moon Pool* is the combination of two shorter works ("The Moon Pool" and "The Conquest of the Moon Pool"), as is *The Face in the Abyss* ("The Face in the Abyss" and "The Snake Mother"). *Dwellers in the Mirage* has alternate endings. There is also a handful of short stories and fragments, two of which were completed by the artist Hannes Bok.

There can be no doubt that Merritt was of direct and considerable influence on what might be called the second generation of pulp science-fiction writers such as Kuttner, Moore, and Brackett, and through them on today's writers of the romantic school of SF.

\*

Sam Merwin, Jr. comments:

Although I have done more work in other fields, SF has been my favorite field since the mid-1950's. I have never sought to re-form the world via such fiction, but have sought to entertain and, perhaps, to increase understanding through the introduction of speculative thought. I consider SF to be the other side of the IF.

\* \* \*

Sam Merwin, Jr., is important because he is representative of a larger group of science-fiction writers. During his long career, he has written a number of intricately plotted formula novels. The principal characters and the bare bones of the story lines are remarkably similar; however, the locales and situational details are imaginatively conceived and extremely well executed.

Merwin's basic plot calls for an able but somewhat unlikely and relatively untried hero to be pitted against a group of one sex or the other who are scheming to overthrow the existing world order. The hero is usually assisted by a young and extraordinarily beautiful woman whose feats of strength and sexual prowess are matched only by his own. This remarkable couple is usually opposed by a fiendish mastermind who has somehow thwarted the aging process and lives undercover as a benign professor or in some similar disguise. Amazon-like women, superior mentally or physically or both, always figure prominently in Merwin's novels. They are not always on the side of evil; in *Chauvinisto* the Amazons control the world and have made it better, if somewhat homogenized, place to live. The denouement of each story occurs when the young hero almost single-handedly exposes the kingpin of the conspiracy and saves the world.

Merwin's short novels are composed of three major elements: the detective story, the conspiracy, and the spy novel. The first element, the detective story, is represented by at least one grisly murder which usually takes place in the opening chapter and the amateur sleuthing that the hero and his female friend do to solve the mystery of who runs the conspiracy. This conspiracy appears as a main thread of the plot in all of Merwin's novels. It is usually a pervasive and secret group that is plotting to control the world through ingenious schemes of disarming disguises and infiltration of the highest reaches of government. The spy element is represented by the exotic locales and the use of bugging devices and other sophisticated electronic espionage paraphernalia.

Some might be tempted to dismiss Merwin as a hack writer of formula science fiction. Such a quick dismissal would be entirely unjustified. While his novels do have many elements in common, they are set in vastly different locations, from the rarified atmosphere of a university think-tank to the female-dominated world of the 22nd century, and use a wide variety of secondary characters and subplots. In addition to being extremely readable these stories have dealt with some controversial issues such as the relationships between men and women; in the 1950's, for instance, Merwin was writing novels that portrayed women as the equal or dominant sex, as worthy adversaries and competent partners. All in all, Sam Merwin, Jr., has written a series of interesting and entertaining novels that have been enjoyed by readers of science fiction for 35 years.

\* \* \*

Long before it became fashionable, Roy Meyers was concerned about the quality of life in the sea and especially about the fate of humanity's underwater relatives, the dolphins and whales. Although Meyers may be considered a minor science fiction author, the questions and speculations he raised in the dolphin novels are important enough to transcend both the pedestrian writing style and the melodramatic plot. Luckily Meyers' education and interest enabled him to found the novels on a factual basis; otherwise they would have been rather ordinary romantic fantasies.

And the *Dolphin Boy*, born Sir John Averill, is quite a romantic figure. Exposed to radiation in an early fetal stage, John was born with slight physical abnormalities that would enable him to live for extended periods of time in the water. When his wealthy parents' Crab Island home and laboratory exploded, infant John, the sole survivor, was thrown into the ocean, where he was adopted by a school of dolphins. John was taught to swim and eat and live like a dolphin, but he was also taught that he was a human being, and that he would one day have to take his proper place among the "upper air creatures." Curiosity led John to teach himself to walk, and he began to follow ships around the Caribbean, in order to learn more about his own kind. When lovely Della Lord was swept overboard, John rescued her; this was his first encounter with another human. She taught him to speak English (his native tongue was Dolphine) and instructed him in the rudiments of polite human behavior. Through several lucky coincidences, John, now a young man, made other human friends who helped him discover his identity and, incidentally, that he was very rich.

John's parents had been trying to develop a method of transmitting power through the air; with the resources at his command, John hired a staff to continue the experiments. One staff member, newly pregnant, was exposed to the same type of radiation that had affected John's mother. The woman died in childbirth, but her twin daughters were born with the same bodily abnormalities that John had, so he adopted them. He gave the infants to the dolphins to raise as he had been raised; as they grew older, he taught them to speak and walk and live on the land as humans. When Vinca and Synclaire were grown, John introduced them to society, and they were immediate successes. Some time later, John's Crab Island home was struck by a tidal wave, which opened a deep crack in the earth, from which escaping air promised to provide a perpetual power source. This was fortunate for them, because war broke out around the world; although nuclear weapons were not used, some nations resorted to biological warfare. Plagues and disease quickly wiped out all human life except for John, Syn, and Vinca. The rather vague conclusion (perhaps Meyers had

envisioned a fourth novel) leaves the reader to assume that the three protagonists may be entering a new underwater Garden of Eden with their friends the dolphins.

In these novels, Meyers presents strong contrasts between the serenity and simplicity of underwater life and our hectic, strident modern world. When the dolphin-raised humans are introduced to their own kind, they are truly alien, and they shock and surprise other people with their direct and honest dolphin-learned manners and morals. Meyers takes many opportunities for not-so-subtle commentary on the irrationality of some human customs, and, in fact, he cannot be accused of subtlety in any of his messages. As a writer, in fact, Meyers can most charitably be characterized as adequate. The flow of the narrative is uneven: long descriptive passages are interspersed with dramatic action, and occasional Serious Messages. He is most successful when he describes life under the sea; his feeling for the world of nature invests the writing with a touch of beauty. In handling the human characters, Meyers is often repetitious in description: every part of Syn and Vinca's bodies, for example, is called "pretty" at one time or another. The people are one-dimensional; the good characters have no vices, and the villains are all leering brutes, to be dispatched as expeditiously as possible.

Somehow, in spite of the awkward style and the episodic plotline the novels do impress upon the reader the beauty and the uniqueness of the ocean world. Meyers's dolphins are better friends to John, unacquainted as they are with avarice and cruelty, than many a human. And Meyers's arguments against whaling, illustrated with dignified and intelligent cetaceans, could scarcely be bettered by Greenpeace. Although his limitations as a writer are only too apparent, Meyers clearly showed himself to be a caring person with a creative imagination.

Critical Study: *A Canticle for P. Schuyler Miller* by Sam Moskowitz, privately printed, 1975.

\* \* \*

P. Schuyler Miller is best known for his reviews, covering most books worth mention over 23 years, a service of enormous value and influence. His approach was balanced optimism, looking for whatever values books had on any level. He kept history and context in mind, often interpolating short essays on ideas and trends. His criticism was neither bland nor shallow, but his more penetrating observations were briefly stated for the student to probe further. His own stories had made him a familiar name in the magazines from 1930, and his writing had developed somewhat as the general ambiance did.

In early years he was often compared to A. Merritt, though he is not very similar to modern eyes. Early Miller stories tend to be written in a florid style, though story and character are closer to real life than to heroic myth, and there is a down-to-earth

awareness of the natural world that gives a strongly visualised location. The impressions of landscape, forest and mountain, and living environment, contrast with many contemporaries' romantically vague and perfunctory settings. His early story "The Red Plague" is "More of a well-written plot synopsis for a novel than a short story" as Sam Moskowitz remarks—true of innumerable early SF stories. There is a menace—a chain-reaction mineral blight of dust absorbing all surface water—and Martians, who have beaten the problem, provide the answer. But the voyage to Mars is vividly written and shows an original thinker's own vision of the remote prospect of space flight. "Through the Vibrations" and its sequel, "Cleon of Yzdral," has a world of abandoned automated cities, located on a different wavelength from Earth. "The Arrhenius Horror" is an exotic crystalline life form falling as particles from space. "If life is energy, why should it not rest where it will?" SF was opening new vistas of what other worlds might produce that was not Earth over again. Later Miller came back to the thought in "Spawn," a grim, powerful story of particles from beyond carrying elemental vitality that started new life in inanimate matter: a colloidal mass in the sea, a monster of gold, and a dead man revived as something else. "Tetrahedra of Space" deals with an invasion force of crystal beings from Mercury, not simply fought off but frightened off and diverted to more suitable Mars. "The Atom Smasher" predicts release of nuclear energy as an uncontrollable mountain-blasting discharge. "The Pool of Life" is an amorphous entity mentally controlling subhumans in a cave environment, treated as soberly as such a concept can be.

Many stories exploit the pre-war vision of the interplanetary future. "The Forgotten Man of Space" is about a man, marooned and adopted by primitive Martians, who dies protecting them from genocide by human exploiters. Several collaborations with Dennis and McDermott treat space piracy with amoral realism, the thoroughly evil pirate evading justice. "The Flame of Life" is an early Space Patrol episode, set on the rain-forest Venus of yore, as are others like "Old Man Mulligan," "Bird Walk," "Cuckoo," and "In the Good Old Summertime," introducing novel fauna. Others later move to the fanciful interstellar sphere. "Gleeps" lightly handles the intelligent alien mimicking people. "Trouble on Tantalus" goes back to the jungle adventure tradition on a world full of curiosities.

Miller's most distinctive work is the short novel "The Titan." Unfortunately it was revised into the idiom of the 1950's for its only complete publication (the original serialisation is incomplete). The change from first to third person lessens the impact of this story of crisis in an age-old, decadent Martian civilisation, told from a native leader's viewpoint, and the tighter style lacks the color and charm of the early version.

—Graham Stone

\* \* \*

An engineer by profession, a Catholic by conversion, Walter M. Miller, Jr. brought both points of view to bear on the utilization of science and technology in some 41 stories and novellas of the 1950's, honing his writing skills to the peak achieved by his much-lauded novel, *A Canticle for Leibowitz*.

Amid his 1951 apprentice work, the novella "Dark Benediction" shows control of local color and romance psychology in a study of faith and prejudice. Gray and scaly "dermies," unable to control their urge to touch and transform others, are being exiled or killed. Sympathetic to one such mob victim in the early stages of her infection, Paul Oberlin takes her to priestly controlled Galveston Island, where he learns the truth. A meteor shower brought alien spores to Earth in an ironic invasion story that inverts the story of Pandora's Box. The benefits outweigh the disadvantages for those who are able to accept this gift of heaven's grace.

The next year, Miller published 15 pieces, eight of them good, three outstanding. A classic statement of wanderlust, "The Big Hunger" is a prose poem about waves of space travellers and homebodies over millennia of human change, if not development. An ironic commentary on conformity is "Command Performance." Resenting her suburban wifely role, Lisa resists her telepathic talent until it saves her from another telepath, intent on breeding supermen with her. With him eliminated, her loneliness sets in again, and she tries out her new communication channel, tentatively, as he too must once have done. "Conditionally Human" concerns playing God with life and death, as man elevates "lower" animals to substitute for babies in an overcrowded, overregulated world. Terry Norris, a veterinarian, must choose between killing a "neutroid" (a chimp-baby too smart and pretty and humanly viable, i. e., a deviant) or keeping his wife who wants children herself. Terry can't avoid playing God, but he plays it his way, killing his supervisor and taking a new job, helping to create more deviants. In making this choice, he opts for a race which "hasn't picked an apple yet," i. e., has no original sin.

Miller's best short story is "Crucifixus Etiam" (1953). Manue Nanti, a Peruvian laborer, works to help terraform Mars, and suffers acclimatization to the technology needed to keep him alive. Though he comes to realize he can never go home again to spend his earnings, he finds his sacrifice worthwhile, an act of faith in future generations.

In "The Ties that Bind" (1954), a novella pitting a far-future pacifist Earth society against the militarism of a fleet refueling at the old home world, the "innocent" pastoralists are the more

dangerous, their ancestry including the inner hell with which Earth once infected a whole galaxy. Ambitious formally, this tale of original sin interweaves viewpoints and themes with stanzas from the old ballad "Edward." "Death of a Spaceman" (1954; often reprinted as "Memento Homo") is a sentimental elegy to a man whose decrepit body lies in bed while his heart remains in space. A more ambitious variation on the theme of clipped wings is "The Hooper" (1955), in which an itinerant entertainer comes home to Earth for the last time, his story combining slapstick with tragedy. "The Darfsteller" (1955) is a tale of technological displacement which also comments ironically on the paradox of free will and determinism. In telling the story of an aging matinee idol's near-tragic comeback, replacing a mannequin in an automated stage play, Miller adheres strictly to the actor's egotistical and stage-infatuated point of view. No mere entertainer, he is a genuine artist, for whom the "Maestro," the performance's mechanical producer-director, really has no tolerance. But though he is doomed to lose, the actor becomes more fully human by making this last stand. Miller's last published story, "The Lineman" (1957), portrays a day in the life of a lunar worker, when a travelling whorehouse put the crew off schedule. Mixing humor and pathos, Miller shows his main character learning to see that God created man and the universe on pretty equal footing.

These stories would be memorable enough, without his novel. But they pale by comparison with what may be the one universally acknowledged literary masterpiece to emerge from magazine SF. First published as three novellas, *A Canticle for Leibowitz* in book form is still a triptych. Each of its three "books" reaches six hundred years further into the future, viewing history from the vantage point of the Abbey of Leibowitz, somewhere in the American southwest. Each era is sharply etched, its characters clearly limned as plausible citizens of the City of God, simultaneously resisting and accommodating the City of Dys (Earthly life), as mankind struggles back from nuclear war to recycled Medieval, Renaissance, and Modern eras. Named for a Jewish engineer, a "booklegger" who memorized forbidden texts in the "Age of Simplicity" following the war, the Order of Leibowitz is committed to the preservation of knowledge, interpretation and use of which lie in secular hands.

In "Fiat Homo" (Let There Be Man), sheer survival is at issue, with marauding tribes threatening each other more than the Abbey. The story centers on Brother Francis's attempts to serve his order and mankind by finding, illuminating, and ultimately giving his life for a blueprint initiated by the Blessed Leibowitz and revealed to Francis by a wandering Jew. Church and State are in equilibrium in "Fiat Lux" (Let There Be Light). A secular scholar visits the Abbey to find his theories of electricity put into practice by Brother Kornhoer, providing artificial illumination over the objections of Brother Armbruster, the librarian, thus enabling the scholar to read—and misread—the Memorabilia. Between the Abbot and the scholar, a parasitic one-eyed Poet and the Wandering Jew, cross-dialogues reveal the misunderstandings that result from differing premises. The balance of power is secular again in "Fiat Voluntas Tua" (Thy Will Be Done), an allegory of contemporary history. As nuclear war erupts ("Lucifer is fallen"), the Abbot resists euthanasia clinics while Brother Joshua prepares to lead a remnant of clergy and children to Alpha Centauri, where another attempt will be made to temper technology with wisdom.

Moving enough in bare outline, the story is enriched in the telling. Olympian irony conveys "what fools these mortals be" even as warm humor makes us care about them. The comedy ranges from puns to slapstick to central symbols of misunder-

standing. Elaborate jokes escape the confines of one book to echo in another (the blueprint of I, the dynamo and a fragment of *R. U. R.* in II, the Poet's satiric verse in III). Continuity is maintained by location and tradition; each era remembers its predecessors, sometimes mistakenly. Light imagery, the Wandering Jew and his eternal skepticism, an enigmatic statue of him and/or of Leibowitz carved in Book I all mock at pretenses to human wisdom. Names and events resound with symbolism, from the simple Francis to the equally simple old woman, Mrs. Grales, whose quest to have her second head, Rachel, blessed by the Abbot, is reversed at the end when Rachel awakes to bless the Abbot, pinned beneath rubble as the bombs fall, because she alone is untainted by original sin. A weighty but entertaining novel, science fiction's best exposure of the "human comedy," *A Canticle for Leibowitz* is a fitting capstone to Miller's writing career.

—David N. Samuelson

Naomi Mitchison comments:

I like to present my characters—whether they are in the past or in the future—with interesting moral choices, and it seems to me that science-fiction writers are, or should be, the prophets and moralists of today. I am fairly well up in the biological sciences, but I am deeply uninterested in gadgets. A writer's job is to write about people with sympathy and insight.

\* \* \*

In his 1946 introduction to *Brave New World*, Naomi Mitchison's friend and contemporary Aldous Huxley outlined a four-point plan for his own personal nightmare, a world in which foolproof techniques of conditioning had been perfected, social dissension obviated by keeping round pegs out of square holes, a harmless substitute for alcohol and narcotics introduced, and the human product standardised by eugenic techniques. What seemed to horrify Huxley most (coming as he did from a family of privileged, well-educated over-achievers) was the idea that the scientific state, instead of complicated random factors like inheritance, ambition, and opportunity, could determine a person's physical condition and social status. *Brave New World* is a piece of bitter and pessimistic polemic against science reducing noble, wild, and self-determining humanity to the status of laboratory mice.

The science fiction written by those scions of another family of privileged, well educated over-achievers, Naomi Mitchison and her brother J. B. S. Haldane, is mild and optimistic polemic promoting sundry brave new worlds in which all the elements that so unnerved Huxley have totally lost their power to disturb. In *Solution Three*, for instance, there are sleep-teaching, conditioning with hormones, a superior caste of cloned future leaders, blind obedience to a social code, cannabis, promiscuity, a constant struggle to improve the DNA, and as in Huxley's novel, a few round pegs chafing at the edges of their square holes. However, Mitchison's characters, controlled though they are, are by no means laboratory mice. After a certain amount of smoothing of curves and filling in of corners, the dissidents fit in, more or less; and while the author obviously views her future society as imperfect, its imperfections are no more sinister than those of the 20th century.

Naomi Mitchison's three science fiction novels are very different from each other, although *Memoirs of a Spacewoman* and *Solution Three* are to some extent bridged by her brother's unfinished *The Man with Two Memories*, in which the protagonist inherits the recollections of a subnormal citizen of a hugely advanced extra-terrestrial utopia of the remote past, complete with genetic and social engineering, drugs, free love, space travel, and talking animals. Free love, space travel, and talking animals are three of the four major preoccupations of the heroine of *Memoirs of a Spacewoman*, whose profession is to speed around the galaxy communicating with alien races; and her aliens are not the bug-eyed men of lesser writers' imaginations but genuinely strange beings such as the starfish-like individuals who, being radially rather than bilaterally symmetrical, cannot polarise choices into a right/left, right/wrong duality, and the caterpillars mercilessly tormented by their butterfly inheritors, who try to prevent them damaging their future bodies with too much infantile sex and creativity, all depicted with extraordinary sympathy and sensitivity. The spacewoman's other preoccupation is with motherhood, an emotion which she extends even to the leech-like parasitic embryos from another world which she experimentally nurtures on her thighs, as well as to various children that she bears to sexually attractive and genetically compatible fathers and the haploid clone that she accidentally conceives while communicating with an over-excited Martian. There is no population problem in the spacewoman's world: even though almost every adventure is concluded by a conception, she spends so much time in relativistic time blackout in outer space that her family is well spaced-out.

Population is much more of a consideration in *Solution Three*. It is an obsession with the society which has conquered aggression and is ever struggling to keep the "popu-curve" dropping while cloning a master race from the two individuals who converted the world to homosexuality, thus stopping the

explosion at a stroke (just as well, because the 20th-century palliative, the Green Revolution, is running into serious trouble). In her dedication, Mitchison refers to it as a "horrid idea", but as ever the book itself is sympathetic and optimistic, and one pauses to wonder whether a society where power is acquired by random heredity or aggression and where heterosexuality is enforced by social sanctions is really much more marvellous or much more free.

Mitchison returns to chronicle the doom of the Green Revolution in *Not by Bread Alone*, darkest and most realistic of her science fiction works, set in a near-future society dominated by the humanitarian face of a puppeteering multinational conglomerate, PAX. Advances in genetic engineering have made plentiful food for all a possibility, and PAX rushes ahead with implementing a global free-food programme (to liberate cash for more profitable forms of consumerism) without much regard for the possible pitfalls. The parallels with nuclear power are clear and frequently alluded to. Freefood fails tragically, but on a less disastrous scale than the average famine, and the book ends optimistically with some of PAX's former pocket scientists starting life and human cultural development on a fresh tack in a self-sufficient, nature-worshipping Australian Aboriginal homeland.

Naomi Mitchison views her Utopian creation with tolerant eye. Her societies are those in which emotion has its place, but in which reason is always the deciding factor. Greed, jealousy, nationalism, racism: all the possessive urges, and all the aggressive ones too, have been conquered. The scientific method is triumphant. The world has been inherited by progressive, liberal, thoroughly rational, scientifically inclined animal lovers, committed to natural childbirth, breastfeeding, pre-school education, free love, and vegetarianism. They are people not at all unlike the Haldane family (or the Huxley family for that matter). The rest of us round pegs will just have to fit in somehow.

—Lee Montgomerie

**MONTELEONE, Thomas F.** American. Born in Baltimore, Maryland, 14 April 1946. Educated at the University of Maryland, College Park, B. S. in psychology 1968, M. A. in English 1973. Married 1) Natalie Monteleone in 1969 (divorced, 1979), one son; 2) Linda Smith in 1981, one son. Psychotherapist, C. T. Perkins Hospital, Jessup, Maryland, 1969-78. Secretary, Science Fiction Writers of America, 1976-78. Recipient (for television play): Gabriel Award, 1984; International Television and Film Award, 1984. Agent: Howard Morhaim Literary Agency, 501 Fifth Avenue, New York, New York 10017. Address: 1366 Sudvale Road, Baltimore, Maryland 21208, U.S.A.

Thomas F. Monteleone comments:

(1981) Although my early novels were little more than adventure fiction, I feel that the majority of my work intends to be more thought-provoking and imaginative. I think my short fiction reflects my desire to employ imagery, symbol, and ironic statement to create stories which make my readers think. I do not write "hard" SF; rather I find myself most comfortable in dealing with the softer sciences such as psychology, anthropology, and sociology. The main emphasis in my fiction seems to be *people*, and the way our technology and society influence them. Themes which are important to me are love, conscience, responsibility, creativity, and man's dual nature.

(1985) Since 1980, my writing has shifted away from SF *per se*, and explored the areas of horror, dark fantasy, and more speculative, "weird tales" kinds of fiction. I enjoy the greater freedom to explore character in the novel of suspense or horror. Although I am primarily a novelist now, I still write an occasional short story, and I believe the well-crafted short story is the most difficult form to master. Also, in recent years, I have become interested in writing for film and television, having had several pieces produced for both media. My intentions for the future are simple enough: keep writing.

\* \* \*

One of the most promising new writers of science fiction adventure stories of the past several years has been Thomas F. Monteleone. His debut was a promotional novel for Laser Books, *Seeds of Change*, which used a well-worn theme to mediocre advantage. Denver Citiplex is a dehumanized, computer-governed city in which humans are mere cogs until a secret group causes a revolution. Fortunately, the novel was untypical of the kind of work Monteleone would shortly begin to produce.

*The Time Connection* is a time-spanning adventure story in the tradition of the best of Edmond Hamilton. A young man encounters a woman in the desert who tells him that she hears things silent to everyone else. Eventually they are transported to a barren future where alien war machines patrol the ruins of the planet, along with a few survivors of the alien invasion force that has caused the destruction, but no humans. They experience a number of adventures before encountering the hidden human civilization, adventures related in a clear, gripping style.

*The Secret Sea* was even better, this time emulating the tradition of Jules Verne. An adventurer travels to a parallel world and is taken aboard the Nautilus, subsequently discovering that it is this world that was the source of inspiration for many of Verne's adventure stories. The protagonist himself is caught up in the battle between Nemo and Robert Burton, Robur the Conqueror, in that alternate world.

A number of Monteleone's short stories were cobbled together into a future history of sorts in *The Time-Swept City*. In this case, the immortal city is Chicago, shown in a number of

brief glimpses as time passes. We see what happens when a cyborg falls in love, when a priest has to deal with the passing of the immunity of religion, and when people are bred in vats by genetically altered mothers, and what happens when that alteration gets out of control. In the latter portions of the book, Chicago has become an entity itself, the computers that govern it having progressed to the point where they constitute an Artificial Intelligence. People are reduced to implements, and interlopers are forbidden entry. There is a fascinating sequence where all humans are in coldsleep, and robots run the city, sometimes feuding among themselves. When a star traveller returns, he is unable to make the city recognize him as possessing any authority to act. It really isn't a novel, but many of the installments are fascinating, and the panoramic view of the future of the city works quite well.

Monteleone wrote two further novels about computers that have come to be more than they were intended. In *Guardian* and its sequel, *Ozymandias*, the sentient computer exists in a post-collapse world, existing in secret until discovered by a group of adventurers. Seeking to learn more about the world, it incarnates its intelligence in a human body and wanders around the world. Monteleone has also collaborated with David Bischoff on the novel *Day of the Dragonstar*, which relates the adventures of a group of explorers sent to investigate a gigantic zoo in space, and those of the rescue team that must find them when they are routed by dinosaurs. A sequel, *Night of the Dragonstar*, has been announced for publication.

Monteleone's latest two novels have been in the horror genre. *Night Train* is set in the subways beneath Manhattan, and deals with a train that disappeared decades before and a series of psychopathic killings. More recently, *Night Things* is a more traditional monster story. An Indian burial mound is inadvertently disturbed, releasing a horde of small biting beasts that promptly begin dismembering and consuming all and sundry. They are both fairly good horror fiction, but not nearly as outstanding in their field as the earlier science-fiction novels are in that genre, and it is to be hoped that Monteleone has not completely left science fiction.

Most of his shorter fiction has been above average as well. Of particular note is "The Mechanical Boy," which deals with a young child who is diagnosed to have a mental disease because of his insistence that he is a machine and cannot function without electricity. The doctor handling his case believes that the problem is more complex than others realize, and soon learns that the boy can actually communicate with machines in some fashion and may indicate the next step in human evolution. The supernatural appears here as well, particularly in "When Dark Descends," written in collaboration with Charles L. Grant, and in "Spare the Child," a chilling story about what happens when you adopt a child by mail and then abandon her, if she happens to be related to a tribal priest.

—Don D'Amassa

**MOORCOCK, Michael.** Has also written as Bill Barclay; Edward P. Bradbury; James Colvin; Desmond Reid. British. Born in Mitcham, Surrey, 18 December 1939. Served in the Air Training Corps. Married 1) Hilary Bailey in 1962, two daughters and one son; 2) Jill Riches in 1978; 3) Linda Steel in 1983. Editor, *Tarzan Adventures*, London, 1956-57, and Sexton Blake Library, Fleetway Publications, London, 1958-61; editor and writer for Liberal Party, 1962-63. Editor since 1964 and Publisher since 1967, *New Worlds*, London. Since 1955, songwriter and member of various rock bands including

Hawkwind and Deep Fix. Recipient: British Science Fiction Association Award, 1966; Nebula Award 1967; Derleth Award, 1972, 1974, 1975, 1976; *Guardian* Fiction Prize, 1977; Campbell Memorial Award, 1979; World Fantasy Award, 1979. Guest of Honor, World Fantasy Convention, New York, 1976. Agent: Anthony Sheil Associates Ltd., 43 Doughty Street, London WC1N 2LF, England; or, Wallace and Sheil Inc., 177 East 70th Street, New York, New York 10021, U.S.A.

Critical Study: *The Entropy Exhibition: Michael Moorcock and the British "New Wave" in Science Fiction* by Colin Greenland, London, Routledge, 1983.

Michael Moorcock comments:

My work varies so widely that it attracts quite different readers. Most of it is not, in fact, generic SF—it's "fantasy," if anything—and much of it uses "genre borrowings" for specific ironic uses. Obsessions include imperialism, "trans-sexuality" (I don't believe in gender-roles as a survival trait—they're anti-survival now), racialism, how to live and grow in modern cities, etc. Modern pieties are another frequent target. I like change. I believe that people and things should be infinitely flexible. I am an anarchist in that I believe every individual should be self-governing and conscious of communal self-interest.

\* \* \*

Michael Moorcock doesn't like SF: doubtless for that reason he has been one of the great impulses behind the New Wave, a notable editor of the genre, and its Proteus. Since his stories are "packed with personal symbols" one key to this paradoxical versatility lies in Moorcock's growing up during a crucial phase of British history. The only child of divorced parents, Moorcock was "brought up on an off-beat brand of Christian Mysticism." A professional writer and editor from an early age, and a Liberal party propagandist (now he supports the anarchist movement), he took over *New Worlds* and by publishing a range of the best authors, conservative as well as experimental, made it into one of the most challenging if misunderstood of SF magazines. Moorcock's dissatisfaction with SF was occasioned less by the inadequacies of the American pulps than by the complacency of an older generation of English writers. At a time when much SF was messianic and naive, he was influenced by the European mainstream, especially its *avant-garde*, believing the extension

of the genre by such experimental techniques would produce work more ethically and psychologically relevant to the modern age. The exigencies as well as the opportunities of editing also shaped his own work. Because Moorcock was forced to finance *New Worlds* himself from hastily written stories, he wrote a copious amount of "swords and sorcery" fiction; so intertwined is his work in the two genres that the nature of his SF is moulded by the parodic experiments he began in the Elric stories and which culminate in *Gloriana*, that apotheosis of heroic burlesque—even if it does have a tinture of SF.

Remarkably little of his early SF lacks any merit, literary or intellectual. If the Michael Kane trilogy (a pastiche of Edgar Rice Burroughs) is a pot-boiler, the example of William Burroughs proved more encouraging; admittedly the ending of *The Rituals of Infinity* indicates the author is concerned less with the scientific than with the metaphysical validity of these stories.

The theme common to both Moorcock's fantasy and science fiction, the apocalypse, is first introduced in one of the Elric stories. Repeatedly his characters and their societies are faced with the question of how to react when confronted with racial extinction: thus in *The Twilight Man* the geodynamics memorably evoke the threat to human fertility posed by the possible unleashing of such cosmic forces by nuclear developments; in *The Black Corridor* Enoch Powell's anti-immigration policies, Celtic Nationalism, and sexism are powerfully satirized. *The Sundered Worlds* is notable for first presenting Moorcock's basic cosmology: one of the two "enlightened" protagonists sacrifices his life for the rest of mankind; the other preaches the gospel of the "multiverse" (the term probably derives from John Cowper Powys out of defiance of Chesterton), i. e., the occult existence of myriad universes in other dimensions which occasionally interact. The variant title (*The Blood Red Game*) underlines the message: there is a pattern to history, an existential gamble in which through self-knowledge humanity may survive. The appropriate eschatology, most fully stated in the ever more spell-binding fantasies, originates in Zoroastrianism which Moorcock admires (even if finally he demythologizes these beliefs): in the continual struggle between Chaos and Order, the balance is kept by the Cosmic Hand; the Zoroastrian historical perspective of time-cycles and millenary saviours inspired the mythos of the Eternal Champion who assumes different identities depending on which universe demands his reincarnation. The doubts often felt by and about the hero smack also of Brecht's epical theories.

Moorcock describes himself as "a faltering atheist with a deep irradicable religious sense"; in this ambivalence is rooted his fear of the dangers presented by the would-be saviour to his already threatened community; in *The Fireclown* one such target is amusingly L. Ron Hubbard. The risk run by the candidate himself is also the concern of the sensational *Behold the Man*. Moorcock now finds its iconoclasm hatefully deficient in humour, yet Glogauer's character is ambiguous enough for some to interpret his actions as true *Imitatio Christi*, whereas in *The Black Corridor*, that sinister version of Harry Martinson's *Aniara*, the self-seeking head of the bourgeois family lost among Pascal's "infinite spaces" degenerates from appeasement to paranoia. More literary allusions are deployed in *The Ice Schooner* where Melville and Coleridge give symbolic as well as vivid circumstantial detail to a study of a new Ice Age hero who finally resists further social manipulation.

Moorcock has argued that while one of the major themes of 19th-century fiction concerned "the attempt of the individual to find personal freedom in a repressive society," today in the Western democracies (as heirs to the great radical and libertarian movements of the early years of this century) our problem is "how we should use this freedom." These themes are

extensively explored in the markedly superior work Moorcock has done since the 1971 winding up of the original *New Worlds*. In the engagingly witty Oswald Bastable cycle, with its burlesque of the Edwardian utopias and wars-to-come of Verne, Kipling, E. Nesbit (and, hidden in the pseudonymic conundrums, Conrad and Lenin), Moorcock attacks the current nostalgia for Britain's imperial past; in *The War Lord of the Air*, *The Land Leviathan* and *The Steel Tsar* the lost time-traveller Bastable is educated into the realities of colonialism. Rather similar lessons are to be taken more to heart in the multiple "transincarnations" of Glogauer, whose "Second Coming" is the subject of that sardonic Brechtian experiment in alienation *Breakfast in the Ruins*. Armageddon is easier to depict than "a new heaven and a new earth"; and whereas in the exuberant Dancers at the End of Time series Moorcock can make hilarious use of Dickens, Shaw, Firbank, and of course Wells to ridicule both the wastefulness of the advanced countries and the "doomsters", ecological as well as religious, in *The Transformation of Miss Mavis Ming* he is over-indulgently whimsical.

The quintessence of Moorcock's achievement is the Jerry Cornelius series. At one time placed at the disposal of contributors to *New Worlds*, Cornelius has been progressively developed by Moorcock into a brilliant satirical device, a prism by means of which he does a spectrum analysis of 20th-century Western culture on the point of collapse. *The Final Programme* is a rewrite of some Elric stories in terms of *The Threepenny Novel*; starting with *A Cure for Cancer* the conventional narrative is decomposed into a series of apparently discrete images reflecting the non-linear mode in which, at least at a conscious level, modern life is increasingly conducted—a dazzling ironic synthesis of popular fictional formulae: detective, thriller, gothic horror, adventure, western, and not least science fiction. These are satirically related to 20th-century actualities in a manner often cinematic (though at other times the language is that of the computer or medicine or the theatre in and off the streets)—a montage of sensational headlines, authentic press stories, pop lyrics, fashion news, military and other advertisements, scientific reports, and subtly tampered-with extracts from scholarly authorities—yet the over-all effect of modernity is disturbed by a persistent sense of *déjà vu* that calls attention to a Jungian awareness of the spiritual heritage of archaic man surviving still in the depths of our unconscious, reinforced by the reappearance of situations or characters from Moorcock's other books. Through the burlesques of the different futures or pasts imagined by both society and the SF writer, Moorcock exposes the various illusions around which modern man has tried to build up a stable identity "against the tyranny of time and the human condition." Still, if Cornelius proves to be not "the Messiah of the age of science" but the *zeitgeist* itself, there is a punning kind of Messiah in the series: breaking through the muzak come the authentic voices of Bob Dylan, Jimi Hendrix, Schoenberg, Ives, and Messiaen whose collective presence helps to give structure and meaning to what might seem incoherence (particularly significant are the overarching allusions to Messiaen's *Turangalila Symphony*). Like the associated references to Vishnu and Shiva which open respectively the first and last books of the series, or the scientific evidence concerning "a hiss located in outer space [that] may be an echo of this explosive creation," these Messiaen references stress the importance of penetrating the illusion of *maya* to perceive the reality of the divine drama of *lila* enacted within the phenomena of the world. The two-part structure of the traditional harlequinade in which Cornelius finally appears obliquely suggests the unmasking desirable for his society. Paradoxically by departing from the strict conventions of the

genre, Moorcock as perhaps no other post-war British SF writer is able to tell home truths.

Eastern story-telling apparently suggested the principles by which he has continued to experiment with ways of distancing himself from SF: retrospectively Moorcock's homage to resourceful Scheherazade in *The Laughter of Carthage* illuminates his own art. With audiences the world over that range from the popular to the learned, arabesque narratives in the West have also stimulated just the sorts of literature, illustration, pantomime, movie, and opera as those which Moorcock delights to reshape; oriental collections of multitudinous tales within tales authenticated by chains of witnesses, their evidence tantalizingly discontinuous and imbricated, encyclopedias of genres combining the everyday and exotic, history and romance, facing tragicomically problems public, private, worldly, and spiritual, framed wisdom stories deploying space-time shifts, "the instrumental marvellous" (Todorov), inversions or replications of plot no less than protagonist, and all this in a manner—as Moorcock evidently has noted—that anticipates modernism's critique of the 19th-century aesthetic. Significantly, too, these Eastern structures admit of contraction as much as accretion, since compilations with the flexibility of *The Arabian Nights* help explain Moorcock's recent alternation between, on the one hand, multi-media *bricolage* as found elegantly minaturized in *The Entropy Tango* (where a snapshot of Major Nye shows him the double of Orwell), and, on the other hand, the vast, teeming canvases of the Pyat memoirs with their deceptive look of an old-style three-decker. Teasingly the alternative histories promised in titles like *Byzantium Endures* are but partially realized. The New Rome whose decline is chronicled here proves less Greek than Slav, Levantine, Cockney, and American, its citizens migrating from Kiev to Istanbul, Paris, London, Los Angeles: the industrial and commercial centres of the disintegrating 19th-century empires eclipsed by a west coast, where a like fall is on the cards. Ironically this geopolitical viewpoint imparts to seemingly traditional novels something of the estranged vision of SF as 20th-century history records events the equal of any bizarreerie imagined in *The Nomad of Time* cycle. Aspects of "The Russian Experiment" and the consequent East European exodus are metamorphosed into a perspective glass focused on the disparity between material and ethical progress in modern times. The powerful story "Crossing into Cambodia" (My Experiences in the Third World War) confronts Babel's cossacks with nuclear holocaust; a threat to Thatcher's England more light-heartedly treated in that coda to Corneliana, "The Alchemist's Question" (*The Opium General*). The novelist, though, requires conventions subtler and more panoramic. Wedding the extravagancies of a Münchhausen with the alibis of the picaresque, conscripting the *dramatis personae* of Buchan to act *Greenmantle* -fashion alongside his existing troupes of maskers, Moorcock spins yarns about his anti-hero that are as enthralling as they are mordant. The parodies of Paustovsky, Piliak and Eisenstein in the first volume of the Pyat sequence, of D. W. Griffith, Nathanael West, Nabokov in the second, challenge oppression by Soviet and Fascist alike. With psychological acuteness Moorcock explores in practice as well as theory the paradox whereby, if the technological age is to be surveyed, even the mainstream novelist needs the expressiveness of SF, yet proportionately must he beware the crypto-authoritarian tendencies in such dangerous visions of the future or the past.

—Peter Caracciolo

**MOORE, C(atherine) L(ucille).** Also writes as Lewis Padgett. American. Born in Indianapolis, Indiana, 24 January 1911. Educated at the University of Southern California, Los Angeles, B. S. 1956 (Phi Beta Kappa), M. A. 1964. Married 1) Henry Kuttner, *q. v.*, in 1940 (died, 1958); 2) Thomas Reggie in 1963. Staff member, later President, Fletcher Trust Company, Indianapolis, 1930-40; Instructor in Writing and Literature, University of Southern California, 1958-61. Most of her work after 1940 was written in collaboration with Henry Kuttner, though not always acknowledged. Agent: Don Congdon Associates, 177 East 70th Street, New York, New York 10021. Address: c/o Boyd Correll, 1948 Hanscom Drive, South Pasadena, California 91030, U.S.A.

One of a handful of American women whose science-fiction and fantasy works were published during the 1930's, C. L. Moore has recently been rediscovered by enthusiastic readers and scholars. Her fiction is of significance not only for its own intrinsic merits but also for its influence on the evolution of this literary field. Alone and later in conjunction with Henry Kuttner, Moore introduced psychological analysis and sensuously evocative setting to a form which had been dominated by stereotyped characterization and technological gimmickry. Moore's works are also of interest in light of the 1970's explicitly feminist science fiction; some of her writing antedates this trend while other aspects of it reflect the beliefs and divided sensibility of a woman writer working without such published, politicized support.

"Shamleau" (1933), Moore's first story, innovatively, emphasized characterization, vivid imagery, and human sexuality in its depiction of an Earth adventurer, Northwest Smith, and his encounter with a Medusa-like alien. Through skillfully ambiguous imagery, Moore conveys the female attributes of this alien which, in themselves, simultaneously arouse and dismay her male protagonist. Smith, a conventionally hard-bitten but honorable hero whose illegal exploits are never immoral, figures in a series of stories which include "Black Thirst," "Scarlet Dream," and "Dust of God." Moore began a chronologically parallel series of fantasy stories featuring Jirel of Joiry, an independent, resolute Warrior queen of the 15th century, in 1934. In "Black God's Kiss" Jirel braves the horrors of a supernatural, evil-ridden dimension in order to find a weapon she can use to overthrow her castle's conqueror. Avenging her warrior's honor and slain soldiers, Jirel discovers too late that she had really loved the briefly victorious Guillaume. In subsequent stories Jirel continues to triumph over the supernatural. "Quest of the Star Stone" (1937) (with Kuttner) is of special interest for both series: in it, Northwest Smith is magically transported back to the 15th century to confront Jirel.

After Moore's marriage in 1940, it is difficult to determine which stories are exclusively or predominantly hers and which Kuttner's because both writers—singly and in collaboration—used a total of 17 different pseudonyms. One story, however, written under her own name, stands clearly as Moore's work. "No Woman Born" (1944), the tale of a beautiful dancer caught in a theater fire whose severe burns force her rescuers to transfer her brain into a metal body, shines with Moore's glowing imagery and subtle questions about the nature of humanity. After the accident, Deidre's resilient physical grace stems from the ingenuity of futuristic engineering as much as from her own guiding memories of motion, but it is her will power, and her own values, that ultimately enable the sensation-deprived dancer to regard friendship and compassion more highly than

her new, inhuman strength. "No Woman Born" is one of the first science-fiction treatments of cyborgs—creatures part human and part machine—to emphasize characterization rather than technological detail or innovation.

"Judgment Night" (1943), a novella also credited solely to Moore, illustrates not only her characteristic synaesthetic imagery but also her ambivalent stance towards independent womanhood. The psychological and ethical strengths Deidre manifests in "No Woman Born" are, in Moore's other works, either adulterated when the female protagonist is of woman born—mere flesh and blood—or else have disastrous consequences. Like Jirel of Joiry, Juille in "Judgment Night" is a warrior princess who must choose between adherence to an ethical code and the man she loves. Although circumstances conspire to remove this final decision from her grasp, Juille's cumulative hesitations and missteps seal both her lover's and her civilization's ultimate doom. While Moore presents Juille as a person who can admire her Amazon mentor's betrayal of her because this treachery stems from the woman's own sworn loyalties, the author undercuts this characterization by also presenting Juille as an incomplete woman seeking to capture "the despised femininity she had repudiated all her life." Within the galaxy-view Moore presents, it is impossible for a woman to be both psychologically strong and sexually or emotionally satisfied, to maintain her principles and still enjoy "a concert in color and motion." Juille is initially as unfamiliar with her body's needs and desires as she is with the extensive religiously taboo surfaces of her native planet. And the knowledge this character ultimately gains of both forbidden territories does little to forestall the "Judgment Night" that overtakes her. Moore leaves her protagonists together, "content" to "live each measured moment that remained to them with. . . vividness," but the reader knows that these moments are numbered.

Two of Moore and Kuttner's collaborations have been included in *The Science Fiction Hall of Fame*. "Mimsy Were the Borogroves" (1943) (as Lewis Padgett) plays with conventional notions of childhood and maturity: in it, two Earth children transport themselves into a different future dimension by deciphering the puzzles and games, scoffed at by their elders, that a time-travelling future scientist has lost. One of these puzzles is the *Through the Looking-Glass* quatrain beginning "Twas brillig. . . ." "Vintage Season" (1946) (as Lawrence O'Donnell) is a novella about time-travellers from the future whose vacations are spent witnessing crucial events in Earth's history. Its action centers upon the characters and personalities of these voyeurs and the reactions of their landlord, a contemporary young man who gradually comes to realize their origin and motivations. Although these dilettantes might avert disaster in his time, they selfishly choose not to. In addition to their numerous short stories, Moore and Kuttner also collaborated on one notable science-fiction novel, *Fury*, set on Venus and describing the aftermath of a failed utopia. Their later collaborative works are of less interest.

Moore's lasting contributions to science fiction and fantasy include not only her own classic works but also the models that she—and Kuttner—set for contemporary and future writers. Depth of characterization and setting, attention to the nuances of human motivation and interaction, recognition of the myths—and mythic quests—that shape human experience, and incorporation of sophisticated mainstream literary techniques—such as the use of a central intelligence in "No Woman Born": these are the innovations one may credit to Moore. Although feminist critics have recently begun to praise Moore for her strong heroine, Jirel of Joiry, at the same time they "excuse" or ignore her other works, such criticism does not recognize the full significance of her oeuvre. Technically

innovative, Moore's writing is also emblematic of women's authorial ambivalence in an explicitly patriarchal culture.

\*

Patrick Moore comments:

My novels are written with the aim of entertaining; they are set in space and are for boys aged roughly 10 to 15. I try to keep a reasonably authentic background, though I am not above taking liberties (after all, Wells did!). I do, however, make a rule that any juvenile novels of mine avoid the sordid and unwholesome.

\* \* \*

Patrick Moore's novels possess some special quality which is not shared by many of their contemporaries. Like the Biggles series, Moore's tales of interplanetary travel continue to be republished and find a steady readership. Unfortunately the quality which enables these novels to maintain their readership does not transmit itself to the adult reader. The children's books of a writer such as Ursula K. Le Guin can be identified as books of some merit even by adult standards. However, Moore's books tend to present a view of life and character that is narrow and unrealistic. The characters themselves are largely stock creations and are emotionally very limited. The story lines are repetitive and rely on a limited number of situations to maintain the excitement of the tale. (The main variations consist of altering the names of the chief characters, the settings, and the order of the incidents). Finally the stories themselves lack a human realism. Scientifically the stories are slightly behind the times but this is of little significance compared to the ease with which his juvenile heroes become incorporated into the adventure: this strains adult credulity, and probably that of many children as well. Despite this the books continue to attract readers at a time when many superior examples of the storyteller's craft fail to do so. Moore's books offer something beyond an adventure in space, something beyond the lack of literary polish. This something lies within the story.

A typical story line would go something like this: an honest courageous youth with a steady head on his shoulders by some means becomes associated with a research establishment engaged in the exploration of outer space. This establishment is staffed by a group of scientific internationalists who react strongly against national or political interests. A crisis occurs and the staff of the establishment are forced through circumstances to utilise the youth in a task of responsibility on a dangerous mission. The youth, despite the fact that he is not of outstanding intelligence or possessed of great knowledge, manages to win the respect of the scientists through a display of his basic qualities during the many dangers encountered throughout the mission, and, now accepted as an equal, has his future career as a respected member of an exploration team assured. In the series the youthful hero gradually occupies a more and more respected place among the ranks of the scientist/explorers. The appeal of this storyline is fairly obvious. It displays successful adolescent involvement in an adult world, though a greatly simplified and idealised one. A display of truth, integrity, and courage is sufficient to achieve one's desire, and there are no authority conflicts to establish problems between the adolescent and his elders, since the authority displayed by the scientists stems only from their great knowledge of a given situation, and the motivation for accepting their authority is made obvious: death in space if the mission fails. In this respect Moore's novels reflect an updating of traditional tales of this type, and in that context a fairly successful updating.

—Gary Coughlan

**MOORE, Ward.** American. Born in Madison, New Jersey, 10 August 1903. Self-educated. Married 1) Lorna Lenzi in 1942 (divorced); 2) Raylyn Crabbe in 1967; four daughters and three sons. Chicken farmer, bookshop clerk and manager, shipyard worker during World War II, house builder, gardener, ghost writer, copy editor, and book review editor; lived in California after 1929. *Died 29 January 1978.*

## OTHER PUBLICATIONS

## Novel

*Breathe the Air Again*. New York, Harper, 1942.

\* \* \*

Ward Moore's science fiction began in 1947 with the publication of *Greener Than You Think*, a disaster novel in which a mysterious mutated "devilgrass" threatens the world. Moore also wrote a number of short stories, but no collected edition exists. This is a shame, since many of the stories are interesting and worthy of a larger audience. "Lot," for example, is a powerful story of a man obsessed with survival, who, with his family, is escaping the fallout of a nuclear attack. "Adjustment" shows Moore's humor in a tale of a man who can make his wishes come true. "The Mysterious Milkman of Bishop Street" shows still another dimension of Moore's ability, in a whimsical fantasy about a milkman too good to be endured.

Moore's reputation in science fiction, however, rests chiefly on a superlative work of alternate history, *Bring the Jubilee*. This fine novel, which ironically takes its title from the Civil War song "Marching Through Georgia," supposes that Lee's forces had taken the high ground before the Battle of Gettysburg, leading to victory there and eventually to victory in the "War of Southern Independence." Most of the novel shows the results of this turn of events on subsequent history: the Confederacy has become wealthy and powerful, expanding westward to California and southward into Central America, but the Northern States lead an impoverished, backward existence. The central character of the novel, Hodge Backmaker, is born into a poor farm family, and in 1938 goes to New York to expand his opportunities. The world of *Bring the Jubilee* is much more technologically backward than our historical one, and Hodge has trouble gaining the education he seeks. Events bring him to a center for study in Pennsylvania, established years before by Herbert Haggerwells, a major in the Confederate army who remained in the area. There Hodge finds his vocation, and begins to build himself a reputation in Civil War history, but his conclusions are challenged by an authority in the field. A descendant of the Major, Barbara Haggerwells, is a physicist; she has perfected a time machine, and she offers its use to Hodge to visit the Battle of Gettysburg and test his theories. Hodge is to learn painfully that even the fact of observation affects that which is studied. Arriving before dawn on the morning of the 1st of July, 1863, Hodge is spotted by advancing Confederate troops, and they halt to question him. A panic ensues in which the officer is killed, and when light breaks, Hodge recognizes the dead man as Herbert Haggerwells. With the advance interrupted, the Confederates never take the Round Tops, and the battle proceeds as our history knows it.

Born in 1921, Hodge dies in 1877, a broken man. He realizes his responsibility for the destruction of the world he knew. In addition to the adventure story and the imaginative construc-

tion of an alternative world, Moore has written a probing discussion of the controversy between free will and determinism, and the result is a work that is one of science fiction's best.

## Dan Morgan comments:

A large number of my novels have been concerned with ESP—particularly the Mind series, of course. People have always interested me more than machines and continue to do so more than ever. The Venturer 12 series, written in collaboration with the late John Hynam (John Kippax), was likewise more concerned with character than hardware, and was labelled by one reviewer as "sophisticated Space Opera."

It may be of interest to note that the one book of mine which continues to stimulate the most comment and interest is *The Richest Corpse in Show Business*. Perhaps there is a clue in that this is the only avowedly humorous novel I have written—maybe I should have mined this vein further. At the moment my business commitments are so heavy that there just isn't time to write, but the bug is still there and I'll be back to it one of these days.

\* \* \*

Although Dan Morgan is not the kind of author who attracts a devoted following, he is certainly underrated and generally overlooked. Most of his novels and short stories display sound storytelling ability, and all rely heavily on a fast-moving plot.

In collaboration with John Kippax, Morgan produced a space opera trilogy that enjoyed a brief popularity and was promptly forgotten. *A Thunder of Stars* introduced the Space

Corps, a professional military and exploratory organization. Against a muted background of alien encroachment, the protagonist must race against time to prevent disaster from a runaway reactor on a colony ship. In the sequel, *Seed of the Stars*, the governor of an established colony world is determined to wrest independence from the home world, even if it results in disaster for his charge. The Space Corps was pitted against another powerful but unscrupulous antagonist in *The Neutral Stars*, this time a private citizen investing his substantial wealth in highly secret research.

The idea of a single highly talented villain opposed by a well organized group is carried into Morgan's most effective series, the Mind series, which concentrates on a group of people with psi powers who band together for mutual support and enhancement of their powers. In each of these novels a different psionic menace appears, confronts the group in some fashion, and is ultimately vanquished. In one case, the problem is complicated by a schism within the organization itself, but the overall idea of the many banded together against the uncooperative opponent recurs throughout the series.

With one exception, the rest of Morgan's novels are fairly routine adventure stories. There is a struggle for power in reasonably familiar fashion on a far world in *The High Destiny*, interplanetary war and more telepathy in *The Uninhibited*, and contra-terrene matter in *Cee Tee Man*. An interesting novel that doesn't totally succeed is *Inside*, wherein an unconscionable experiment with human beings is conducted in a domed city on airless Mars. Totally untypical of Morgan is the satirical *The Richest Corpse in Show Business*. Although the barbed humor is generally directed at the television industry, there are good-natured swipes at nearly everything else along the way, including some satire of the genre itself.

Morgan's relative lack of popularity probably stems from his mining of conceptual veins already fairly well worked over. Competent but unoriginal stories of telepathy make little impression on readers after the surfeit of them provided during the Campbell years at *Analog*. Morgan is not really innovative, but does consistently maintain a degree of competence well above the average. His adventure novels are of the type that form the bulwark of the science-fiction genre.

John Morressy comments:

I write science fiction because I find it to be the most interesting, enjoyable, and creative field open to a writer today and the one that may, in time, prove to be the most significant.

My books are founded on the assumption that the human race, in future ages, will behave much as it always has in the past. We are not yet civilized, and I find it hard to believe that we ever will be. After six or seven thousand years of recorded history and, according to some, progress, we still settle our ideological and economic conflicts by killing one another and laying waste to our planet. Piracy, slavery, and brigandage still thrive. In more countries than we can enumerate, torture is routinely inflicted on prisoners, trial and sentencing is a mockery of justice, and execution is quick and brutal. Under the circumstances, such cherished terms as "freedom" and "human dignity" are meaningless, almost silly. And all this is in the age of *Apollo*, *Voyager*, and *Explorer*, of organ transplants and laser surgery and micro-computers and an arm-long list of scientific and technological wonders.

My novels are set in a future spawned by this present. I envision the human race as surviving (though not without great suffering), eventually reaching the stars, encountering other worlds and other races, and making all the old mistakes over again, on a larger scale. I have tried to create a single future continuum and keep my novels within it. The novels are linked, not sequentially, but laterally. There is no one that must be read first, or last, in order to understand some grand design. A few characters, and places, and institutions, and events, appear in several of my novels; others are in one only. My novels are not attempts to predict the future, but glimpses of what might happen in one particular future. To me, that is the thing science fiction can do and no other genre can: it can give a reader a taste of the future without charging the full and non-refundable price of experiencing it in person.

\* \* \*

Isaac Asimov has remarked that year in and year out his "juveniles" are his steadiest sellers; and certainly Robert Heinlein's books for young readers have reached a wide audience. Similarly, several of John Morressy's works of science fiction, intended for children, will not be familiar even to avid readers of the genre. Yet they have received favorable reviews from library journals: *The Windows of Forever*, a time-travel story, was praised for the lesson of tolerance it conveys; likewise, the Ziax II novels, are noted for their ecological concerns.

Several of Morressy's science-fiction novels for adults are interesting for a plot technique reminiscent in some ways of Lawrence Durrell's *Alexandria Quartet*. The first of these, *Starbrat*, tells the story of Del Whitby, who, kidnapped as a child, later searches for information about his parentage. In the course of his adventures, he meets a man named Gariv, who has led a slaves' revolt on the planet Xhanchos and is returning to his homeworld, Skorat, to be reunited with his queen, Nikkolope. Del gives the man a lift and says goodbye after putting him on Skorat. Some adventures ensue, and he later encounters a minstrel named Alladale. As the owner of a spaceship, Del accommodates Alladale in his need for transportation, parts with the minstrel, and heads for a planet named Mazat. There, in the company of six others, he saves the world from marauding pirates and is chosen king. In synopsis, the novel sounds like an episodic, run-of-the-mill space opera. But the story expands as we read more of Morressy's interwoven works.

In *Nail Down the Stars*, we meet Jolon Gallamor, the minstrel who had called himself Alladale when he met Del Whitby. Unknown to either of them at their meeting, Gallamor had also been on Xhanchos as one of the slaves when the revolt took place. He had ridden at the side of Gariv, the leader, and had later sung at the court of Queen Nikkolope; he left there suddenly when a murderous fight broke out at a banquet. Yet neither Del nor Jolon Gallamor, despite their travels, ever learns the whole story of the events they have been part of: *Under a Calculating Star* gives the reader a fuller picture. In that work we meet a confidence man named Kian Jorry. Jorry organizes an expedition for a raid on a long-abandoned but dangerous treasure trove, but the attempt is a failure. He winds up, disgruntled and weary, on Xhanchos shortly after the slave rebellion has succeeded. While there, he sees a picture of the beautiful Queen Nikkolope, and notices the close resemblance between himself and Gariv. He resolves to try one more audacious con-game: after killing Gariv in a fight the king has provoked, he decides to pose as Gariv, return to Skorat, and usurp the throne. It is in this assumed identity that he meets Del Whitby and is taken to the planet. Gallamor (Alladale) is playing at the banquet at which Jorry announces that King Gariv has returned; although Alladale is the only man there able to expose Jorry, the minstrel flees when the fight breaks out at Jorry's announcement. Each of the characters has only part of the truth; only the readers have the whole story of the sequence.

While *Frostworld and Dreamfire* introduces different characters, Morressy sets the work in the same milieu of the far future as the others. It is a time of lost knowledge and heroic action, a time that Morressy makes more familiar with each work.

Janet E. Morris comments:

(1981) The thrust of my work, over the long term and through a projected group of books, historical, contemporary, and speculative, is the evolution of consciousness, with an eye toward the genetic, societal, and philosophical influences thereon. Sophocles states that one law ever hold true: nothing vast enters into the world of mortals without a curse. I look for in

past history or create in my future histories moments of cataclysm in theaters both physical and mental. My intention is always to explore the thought that must precede any outward action, its struggle to reach a new, more tenable position from which to regard self and universe.

My work in history shall eventually include: Sargon of Agade's conquest of Ebla; Rammesseide Egypt in its position as the seat of Yawwhist tradition; the Seven Sages, those wonderful progenitors of pre-Socratic thought; as well as Suppiluliumas I of Hatti and his dealings with the short-lived Atenist rise in Egypt ( *I, The Sun* ). Another work samples alchemical thought at the time of the death of Paracelsus, father of chemotherapy.

My science-fictional excursions into the possible evolution of consciousness have all centered on man's apprehension of the physical world, and his sense of place in it. My areas of study are necessarily genetics, biology, sociobiology, philosophy, and physics, but the aim at all times is to *show* rather than *tell*. The more crystallized the tenets of my position in a particular book, the more I strive to present them in an experiential manner without technical discourse which might erect a barrier between myself and the reader.

My Silistra series openly treats sexual themes as well as the possible effect of mind on probability. My Dream Dancer books (in progress) treat the marriage of man and mechanical intelligence through the utilization of our mastery of the intelligence code, the decipherment of which is even now in progress, as well as man's attempt to emancipate himself from the prison of relativistic space. Both the above groups of books focus to some extent on women, but are in no sense "women's" books; rather, I feel that technology is the leveler of sexism and the liberator of those sexual types not included in the sub-set "heterosexual male."

Reading back over what I have written, I must add that I write primarily the book which I myself would like to read, the book I can imagine that you might like to read. My hope above all is to tender you, the reader, an excursion, a journey into another realm which, upon returning, you might find to some small degree has enriched your "present."

\* \* \*

Rigorously intellectual, and ruthlessly demanding both of herself and of her readers, Janet E. Morris's first publication, *High Couch of Silistra*, established her as a writer to watch and a likely contender as the most controversial writer to emerge in the 1970's. Though the book did not contain graphic depictions of violence and sex, it immediately transcended the "barbarians and bondage" genre into which detractors tried to dump it. Morris's evocation of an old, elaborate culture literally bound by the metaphor of *chaldra*, chains symbolizing achievements and obligations, her complex literary style, and her concerns with cosmology and sociobiology (at a time when this issue was being hotly debated) demonstrated what have become hallmarks of Morris's work.

Her second series, the three Dream Dancer novels, shows the metamorphosis of Shebat from fey urchin to aristocrat when she is taken from a squalid future Earth and adopted into the noblest family in a culture that is actually a form of high-tech Hellenism. In these three books Morris deals with Hellenistic concerns: politics and citizenship (to keep citizenship, voters must pass tests), study (by mental access to computer datapools), and even mythology and magic—all in an aureate style reminiscent of later Greek epic. The myth that she focuses on primarily is the story of Alexander the Great, the Persian Wars, and Alexander's bequeathing his Empire "to the

strongest." But the most fascinating aspect of the series is Morris's creation of sentient cruisers, starships capable of traversing "sponge space" and bonding emotionally with their pilots. The cruisers are a metaphoric expression of Morris's interests in quantum mechanics and geochronometry, and are part of her ambition to "make the higher intellectual level more accessible" to readers.

Morris's fascination with ancient history dominates her one historical novel *I, The Sun*, a story of a Hittite God-King. Hellenism and the Persian Wars appear in the stories Morris has written for the Thieves' World anthologies about Tempus, prince, philosopher, and immortal avatar to a war-god. These stories have now grown into a trilogy dealing with Tempus's wars: *Beyond Sanctuary*, *Beyond Wizardwall*, and *Beyond the Veil* (forthcoming). Both the enjoyment and intellectual challenge Morris has found in working with the other Thieves World writers are reflected in a series of collaborations: chiefly with Chris Morris, but works with C. J. Cherryh and David Drake are also planned, as is a collaborative anthology series, *Heroes in Hell*.

Some of her most recent work, *The Forty-Minute War* (written with Chris Morris) and *Active Measures* (written with David A. Drake), demonstrates remarkable expertise in a different kind of data-gathering—modern intelligence. These fast-paced novels are tales both of espionage and of ideas. *The Forty-Minute War* once again deals with geochronology and the effect of an observer upon the events observed; *Active Measures* involves the reader in the process of decoding. Additional books relating to modern intelligence techniques will no doubt be forthcoming.

Her most recent books show a trend away from her earlier lyricism to a kind of spare, tough prose. In addition, her collaborations show that this most intellectually independent of writers is a superb team player. And her development of the *Heroes in Hell* concept which she will edit indicates a willingness to share her stage with other writers capable of the originality and intensity she demands.

##### Uncollected Short Story

"Land Deal," in *Dreamworks*, edited by David King. Carlton, Victoria, Norstrilia Press, 1983.

\* \* \*

Gerald Murnane may be dubbed a science-fiction writer by affinity with such speculative authors as J. G. Ballard, Brian Aldiss, and Christopher Priest. His first novel, *Tamarisk Row*, is a remarkable metafantasy, an obsessional study of the fantasies of a small boy in a country town in Victoria (and the pathetic attempts by his father to realize fantasies by gambling on horses), written in short mosaic chapters and, sometimes, extraordinarily long aspiring sentences. It is notable for its truthfulness, its sometimes embarrassing fidelity to the furtive or inexpressible dreams and crude realities of pre-pubescent life. *A Lifetime on Clouds* is about an adolescent boy's struggles with masturbation, and so, again, is a novel about the weaving of fantasies from the meagre facts and misleading suggestions offered by life, in this case, mainly those of Catholic secondary education in a Melbourne suburb. The ribald humour of the book fails to mask Murnane's fierce satirical indictment of what was then (1953-54) a stultifying religious ethos.

The difference between fantasy and reality becomes blurred for 15-year-old Adrian Sherd; at one point he notes that his lustful fantasies about American film stars are not sanctioned by the behaviour of the few heroes he has seen on screen: "instead of courting them patiently . . . he had undressed them and defiled them only hours after their first meeting. It was all so absurd compared with what really happened in films." In *The Plains* the threshold has been crossed and we are presented with a mature man's fantasy of an Australia which is related to the real one only by inversion. All the wealth and values belong to the plainsmen of Inner Australia, who despise the busy city-dwellers of the coast. The narrator is an outsider, willing to spend his life making notes towards a film which will put on record the ever-elusive culture of the inner land, a land which is within Australia, because only Australia could have demanded its existence, yet a land which is beyond Australia, because it is too large and grand a vision to be comprehended by it. Murnane had adumbrated this vision in describing the yearnings of young Clement Killeaton in *Tamarisk Row* for what lies farther in,

farther north, beyond the farthest imaginable horizons of his wretchedly confined experience. Fantasies lie within fantasies in *The Plains*, a short memorable novel of considerable philosophical interest.

*The Plains* itself, slightly curtailed and adapted, might fit within the structure of Murnane's latest metafantasy, *Landscape with Landscape*, a kind of möbius box of six stories, each of which is written by the narrator of its predecessor (and the first story by the last narrator). The stories concern Melbourne men who are obsessed with the wish to see the landscape that is hidden by the landscape, or that is seen only by the figure in the landscape, and so on; people themselves are landscapes or owners of hidden landscapes, perhaps. In what may be the most interesting of these stories, "The Battle of Acosta Nu," Melbourne is located in Paraguay and the narrator, a descendant of Australian colonists, defines himself in relation to the Australian city which he has never seen.

Bruce Gillespie has remarked that both *The Plains* and *Tamarisk Row* "are guided by the proposition that, however one might perceive any object or idea in the universe, it is quite possible to perceive it in the *other* way as well." This insight seems particularly apt for the short story, "Land Deal," which presents a philosophically valid Aboriginal view of European colonists as having a possible existence only in dreams: their land deal is therefore a dream within a dream.

\* \* \*

Ed Naha is one of those rarities who have been able successfully to merge the science fiction and mystery genres. His first science-fiction novel, *The Paradise Plot*, introduced the character of Harry Porter, a newspaper reporter who always seems to be at the right spot at the right time, to get himself involved with world-shaking plots. In this first adventure, he is aboard Island One, an orbiting city established as part of mankind's movement toward the colonization of space. But not everything is peaceful in the colony, which has not cast off as many of the problems of the mother world as they might have thought.

Shortly after his arrival, Porter is thoroughly enmeshed in a complicated plot that involves a string of murders and a desperate political struggle both within the habitat and back on Earth. Although Porter is ultimately instrumental in solving the mystery, the revelations result in the closing down of Island One, although it is quite clear that this is probably a temporary measure. Naha's scientific background for the novel is convincing, and while Porter is essentially a stereotypical detective hero, he's a well-done stereotype involved in an engrossing mystery, livened up with excellent dialogue.

The sequel, *The Suicide Plague*, is even better. Porter, the last investigative reporter still working, is bewildered by a sudden rash of young suicides, uncovers a secret plot to assassinate the President of the United States, runs afoul of the Church of the Ancient Astronauts, a sinister and increasingly powerful new cult, searches for missing research scientists, solves the mystery of a murdered man who had telepathic powers, and helps to avert what might have resulted in a nuclear war. This obviously complex group of plots and subplots is woven skillfully together in a thoroughly satisfying fashion.

Naha also created "The Traveller," hero of an ongoing series of post-nuclear-holocaust novels published by Dell Books, although he may have written only the first in the series, *First, You Fight*. The series features a tough, well armed protagonist who is a professional soldier wandering through ruined America in his armored van, helping the weak, avoiding the mutants and power seekers among the survivors. It is a thoroughly violent action series, but displays none of the finesse of Naha's other work. He has also written extensively in the fields of science fiction, fantasy, and horror films, and in the history of popular music.

## Ray Nelson comments:

(1981) For me, Jack London, not Hugo Gernsback, is the father of American Science Fiction, and my aim is to continue the tradition established at the beginning of this century by London and his friends. My three obsessive themes are radical utopianism, experimental occultism, and a love-fear romance with nature. In California these ideas are understood, particularly in the Bay Area (all but two of the living writers I admire live in California), but in New York, where there are no trees, my obsessions seem like nonsense. Most of my work has been published outside New York—places where there are trees and intuition and hope for a better life, and someday New York too will grudgingly lend me an ear, perhaps when I am safely dead.

(1985) In *Timequest* I have at last written the novel I always wanted to write, the book I hope posterity will remember me by, if it remembers me at all. Editors have helped me, from Roger Elwood who let me do the first version of a book no other editor would touch, through Hank Stein who encouraged me to put in everything previous length restrictions had forced me to leave out, to Terry Carr who suggested restoring even the parts I had left out for Hank Stein, but really *Timequest* represents my own basic attitudes and philosophy so well I am content to stand or fall on this one work, so well I may never write another book in this genre. Now I want to do something else: comedy, cartoons, songs. Maybe I'll steal a spraycan of paint and start drawing propellor beanies on subway walls.

Although Ray Nelson has never been one of the more prolific writers in the field, he has firmly established a reputation for himself on the basis of the generally high quality of his work. His first novel, *The Ganymede Takeover*, was written in collaboration with Philip K. Dick, and dealt with the domination of Earth by wormlike invaders from Ganymede, but it was written as a witty and satiric examination of individuals and societies, not the low grade movie plot it so resembles.

It would be almost a decade later that Nelson first appeared as sole author of a novel, in this case *Blake's Progress*, a serious contender for best novel of its year. Ostensibly, the central character was the poet, William Blake, a man capable of mentally travelling through time in company with his wife. It

soon becomes apparent, however, that it is she who dominates their relationship, has the more powerful intellect, and is in fact a far more interesting character than is her weak-willed husband.

*Then Beggars Could Ride* and *The Ecolog* appeared soon after. Each was entertaining in its own way, but both suffered in comparison to their predecessor. The former was a similar kaleidoscopic odyssey through time. The latter is a more conventional novel, pitting a determined, expert military man against a planet ruled by a ruthless matriarch. *Dimension of Horror*, an adventure in the "Richard Blade" series, was similarly competent but even less memorable.

*The Prometheus Man*, on the other hand, is one of the best dystopian novels of all time. Overpopulation, automation, and lethargy have weakened the fabric of society as the vast majority of the population is unemployable. In order to maintain order, most of these people are confined to camps where they are theoretically looked after, but the impersonal treatment leads predictably to unrest. The plot is complex and thoroughly worked out.

Nelson's short fiction is extremely good and equally infrequent. "Nightfall on the Dead Sea," for example, is a fine historical horror story putting a Roman soldier against a man cursed with immortality. "Time Travel for Pedestrians" aroused a degree of controversy because of its subject matter—time travel via masturbation—but its clear superiority of style and the maturity of its vision established it as a major accomplishment.

Nelson displays a fondness for the grotesque. A human is turned into an organic asteroid in "Flesh Pearl," and another becomes a rather unpleasant form of nourishment in "Food." Grotesquerie and the absurd are to be found in "The Great Cosmic Donut of Life" and "Turn Off the Sky" as well.

"Eight O'Clock in the Morning" takes a routine gimmick (aliens who can only be seen by a single human) but condenses what other writers would have extended to novel length into a few thousand words. Ancient history and the supernatural mix again in "The City of the Crocodile," and a man takes a spiritual journey to the land of the suicides in "Valse Triste." "A Song on the Rising Wind" examines the nature of violence and courage on a level rare in any field of writing, as a revolution brews among a society of sequestered unemployables in the obvious precursor to *The Prometheus Man*.

Although not a prolific writer, Nelson is a careful craftsman whose every story appears to reflect great concentration and commitment. He is not afraid to tackle controversial themes or ambitious goals, and maintains tight control of his work at all times. While his work is frequently idiosyncratic, this uniqueness of viewpoint is often what makes them stand out from the scores of similar works from lesser writers.

## Kris Neville commented:

(1980) I wrote the majority of my stories in the early 1950's. Having just graduated from UCLA with a degree in English literature, I was interested in introducing mainstream elements into science fiction (which I had been reading avidly since 1937)—shifting the emphasis to the impact of future technology on ordinary individuals. I also tried to seek out new perspectives—using female protagonists; playing with various viewpoints; seeing the future through the eyes of the old or young; portraying Earthmen in less than favorable lights; breaking taboos; making satirical comments (I was a socialist/humanist). In many of my shorts, I aimed for emotional effect. I was a trail blazer in my time.

By the mid-1950's, I'd run out of things to say. During the next decade, I kept my hand in with *The Unearth People* and an occasional short, and also revised earlier material into novels. I moved leftward philosophically to my present position: left wing anarchist. The shorts contained sharper social commentary ("Survival Problems"). I was particularly unhappy with the war in Vietnam ("The Price of Simeryl") and, later, Richard Nixon ("The Reality Machine"). During that decade, Lil and I wrote *Run, The Spearmaker*, a novel dealing with the evolution

of civilization at the beginning of human history. The translator called it a minor literary masterpiece. Pity it isn't available in English.

During the 1970's, in addition to half a dozen shorts that Lil and I collaborated on, we also did another novel, *Thorstein Macaulay*. It contains our best writing and most carefully considered political statements. It was about 10 years in the making. As of this writing (June 1979) we had not yet found a publisher for it.

\* \* \*

Kris Neville's large output of stories seems to be equally divided among adventure SF, social SF, fantasy SF and fantasy. While he was known as a *Galaxy* school writer, his most characteristic work appears to be more melodramatic than ironic. Nevertheless, Neville will often subordinate adventure narrative to character interaction or to the character's response to those environmental or cultural forces that are by-products of future science and technology. Neville was a popular and critically respected author in the genre during the 1950's and 1960's, but his reputation as a craftsman seems to have been lost, perhaps as the result of the rather conventional plotting and characterization in his later work.

Neville's great theme is alienation, one which takes its most obvious form in stories that treat alien-human contact. He eschews the more sensational aspects of this theme in favor of the psychological dimensions implied in its use in the future world of SF. Novels like *Special Delivery*, *Earth Alert* (If, February 1953), and *The Mutants* deal with variations of the alien invasion theme or its analogues. *The Mutants*, a potentially timely treatment of the social implications of artificial insemination in a state utopia, fails to rise above the level of the melodramatic struggle of a few idealistic youths fighting to save the race from a progressively more repressive state control of human biology.

In the main, Neville was a writer typical of his time. He knew how to make good use of psychologically enriched characters and possessed more sensitivity toward character motivation and interaction than most of his colleagues. In many ways, he belongs in the Theodore Sturgeon camp of SF writers, although he does lapse into the action/adventure idiom more frequently than Sturgeon and his successors. Neville's style is also more direct, simple, and clear than Sturgeon's, better suited, perhaps, for the pot boilers he produced for Belmont. Neville was, it appears, in nearly every way a writer several cuts above the average who never quite made the success expected of him. Although he wrote SF, Neville gave little evidence of being deeply committed for or against science. It, like the future, is simply one of the unexamined, given elements of his stories. Whatever the cause, Neville produced a body of SF that refuses to move us deeply in any of the many ways in which less accomplished stylists have done by writing with more conviction, except in one notable case.

Neville may not deserve the obscurity into which his career has fallen if only for the sake of one superb story, "Bettyann" (1951; expanded into a novel, 1970; a sequel is "Bettyann's Children"). This story of a crippled orphan girl raised in a foster home whose sense of difference is confirmed when she discovers she is actually a member of an extra-terrestrial race is handled with the same kind of sensitivity and poignance as Daniel Keyes's "Flowers for Algernon," another story that grew successfully into a novel. In place of the overwriting of most SF melodrama, Neville has his subject and his characters fully under control. In "Bettyann" Neville manages understated effects brilliantly in a way that he approached in only a few other

stories besides the sequel: "Old Man Henderson" and "Closing Time" are examples. "Bettyann" is one of those rare SF stories that could not be written in another genre but which deals profoundly with universal, human values. Bettyann's affirmation of a basic humanity which has become stronger in her nature than her lately discovered alien origins is an inspiring moment in literature. The two stories and the novel must be considered neglected masterpieces, which are only beginning to receive their due critical recognition.

\* \* \*

Larry Niven learned his craft through his long familiarity with SF literature as a fan and through study of writers such as John W. Campbell, Jr., Heinlein, Asimov, and, later, Anderson, Clarke, and Clement. Niven sees himself rightly as carrying on and developing SF traditions and those of the related genre, popular fantasy. Everything Niven has written thus far has a strong genre identification, and his appeal as well as his fame has been until recently within the expanding universe of the SF and fantasy reader. Niven has tried his hand at nearly every major type of SF, including fantasy SF stories of time travel, parallel worlds, and sword and sorcery.

Niven's best and most characteristic work in SF has been done in series works. Among the lesser series are the delightful Hanville Svetz comic SF fantasies (*The Flight of the Horse*); the Leshy series, the best of which is "The Fourth Profession," culminating in *A World Out of Time*; the Draco's Tavern stories (*Convergent Series*); and the Jayberry Jensen teleportation stories, the best of which are "Flash Crowd" and "All the Bridges Rusting."

The pre-eminent series, and possibly the best in SF history, has occupied Niven since the publication of his first story, "The Coldest Place" (1964). Known Space is the saga of the next 1200 years of human history, beginning in 1975 with the development of organbank technology on earth, chronicling the exploration of our galaxy and encounters with alien species, and culminating in the spread throughout the race of a mutant gene which incorporates the code for a psychic power that operates to

protect the individual from harm and to promote and even guarantee maximum opportunities for happiness. The end result is a universe safe for future human development and for the generation of a species preferred by evolution through the cooperative union of genetics and psionics. In short, Niven's cosmology moves ultimately toward the realization of that universal hope of intelligent species expressed in the story "Convergent Series" (1967) that "There is a way to thwart entropy, to live forever." Many of Niven's critics have found in his ultimate triumphalism a weakness of vision, but it proceeds logically from Niven's traditionalism and from the philosophical assumptions underlying his fiction.

Between the present and dawn of the golden age in the Third Millennium, Niven chronicles the struggles of each generation to meet the challenges presented by the future development of modern technological advances that seem most revolutionary to Niven in biological and transportation engineering. The immediate impact of organ-transplant technology and the development of personal teleportation transfer stations is to polarize society into revolutionary and reactionary factions. Such new technologies "create new customs, new laws, new ethics, new crimes," as Niven observes. The potentiality for repressive and even ghoulish practices by both criminals and by society and its agents is dramatized powerfully in those stories set in the near future which strike the reader with the impact of social realism. Two of the Gil Hamilton stories, "Death by Ecstasy" and "The Defenseless Dead," present the official, police view of "organlegging," while stories like "Cloak of Anarchy," "The Jigsaw Man," and "Rammer" and the novel *A Gift from Earth* focus effectively on the kinds of abuse likely to grow from using criminals to supply body parts for organ banks. The teleportation stories like "Flash Crowd" extrapolate the technology and sociology of the displacement transfer booths. Typically, Niven's solution to the social and ethical problems of this chaotic world is technological. Unlike Huxley, Heinlein, and others who leave the technological base of their narrative in favor of moral speculations on human nature or social history, Niven follows through on his belief that moral values and ethical practice change with the alteration of basic social processes produced by technology.

The challenges of space exploration are even more dramatic because they allow Niven's imagination freer rein for invention. The smaller gravity of asteroids and planetary satellites affects all phases of the lives of the Belt inhabitants. Inevitably, the differences between Belters and Flatlanders (terrans) lead to separate and competing political and economic structures. The colonization of new worlds leads to the further specialization of the race and to the development of new characteristics peculiar to those from colony worlds of other star systems like Jinx and Wunderland. In his Known Space stories, Niven develops consequences implied in ecology-psychology interactions even more successfully than his mentors Asimov, Heinlein, and Herbert.

One of the great challenges of Known Space exploration comes from attempting to subdue alien environments of interstellar space and other worlds. Perhaps the most exotic of Niven's worlds is the Smoke Ring, a gaseous doughnut around a neutron star, a SF Noah's ark, carrying around in free fall all manner of flying life, especially the elegant flora of the title, *The Integral Trees*, so named because they are shaped as integral signs. Scattered among these trees are the descendants of the mutinous crew of the space craft *Discipline*, a future *Bounty*. After more than five centuries, while *Discipline* waits patiently outside the torus ring, the Quinn clan finds itself living on a dying tree. An expedition sets out to look for food, and encounters members of a rival clan from the other end of their

tree. Together, they explore their own Dalton-Quinn tree and subsequently the rarefied geography of the gas torus. Social life on the trees has devolved from the advanced scientific to a semi-feudal or in places tribal structure. Their quest leads the expedition into captivity and eventually to escape aboard one of *Discipline's* CARM (a module) where they encounter, electronically, Sharls Davis Kennedy, the legendary computer/cyborg policeman of the mother ship. The confrontation involving the conflicting loyalties of those aboard the CARM with the distant but electronically immanent Kendy is one of Niven's best pieces of writing. Despite Kendy's neofascist reflexes, he permits the survivors to live because, finally, his curiosity gets the better of his passion for order. Niven promises at least one sequel, provisionally called *The Smoke Ring*, in which we can expect to hear more from Kendy.

Critics who disparage Niven's writing do so on two counts. One is the critic's dislike of Niven's rather conventional optimism, even though there is a historical basis for Niven's positivism, and he is anything but naive about the abuse of technology. Niven's vision may be meliorative in the end, but humanity has to pay for its golden age with hard times to come. Critics have also objected to Niven's plotting difficulties in his novels, and there is no doubt that this is a weakness of his writing. At the same time, it must be said that Niven's use of cinematographic techniques of storytelling work well in his two most successful novels, *World of Ptavvs* and *Ringworld*. Few would deny Niven's extraordinary powers of invention and his ability to blend hard science extrapolation with soft science speculations and space opera adventure. To some degree the pleasure of reading Niven depends on the reader's growing awareness of the grand design of the series so that even the weaker novels and stories take on added dimensions.

At least brief mention should be made here of the appeal of Niven's plausible use of hard science speculations, especially in such glamor fields as biomedical engineering, space exploration, and exobiology. These are complemented brilliantly by Niven's extraordinary powers of naming. Niven's off-world inventions include an orismology of the colonized worlds of Known Space: Plateau, Home, Jinx, Wunderland, Down, and We Made It, with their inspired mixture of naive anthropocentrism, popular folk culture, and humor in a rather typically American combination. Niven is also especially good at suggesting ways in which the impact of these strange new worlds shapes the character and thinking of their inhabitants in the space of even a few generations.

Perhaps the two creations that give Niven's Known Space its distinctive richness and appeal are the alien creatures encountered by humanity in its exploration and expansion and the related discovery of universal history in the records, traditions, and artifacts of alien races, both living and dead. Niven's mythical history discloses three major eras in galactic history. The First is the ancient empire of the Thrint, known as Slavers, whose artifacts are occasionally to be found in stasis boxes, preserved from change, and prized by their finders for their technological importance. We actually meet a Thrint in *World of Ptavvs*, an encounter in which humanity barely escapes with life and freedom. The Thrint empire and its creatures were destroyed eventually during the suicidal revolution of the master technician slaves known as Tnuctipun. The second epoch was that of the Pak, remote ancestors in Niven's mythology of humans and other intelligent life forms, whose breeders had seeded the universe of Known Space and perhaps beyond. Although very ancient, Pak Protectors have survived to challenge the existence of their own unrecognized, mutated human descendants and to produce, accidentally, in what Niven intends to be an analogue of natural selection, a hybrid human

protector, the Brennan monster, who ushers in a golden age of peace that lasts three centuries. The Third epoch begins with the Kzin-human wars and the acquisition of hyperdrive from the Outsiders, continues with Beowulf Shaeffer's discovery that the galactic core has exploded, and concludes with the discovery of the Great Pak artifact, Ringworld, and with the emergence of the Teela Brown gene. Niven's universal history is an ingenious and beautifully modulated bit of cosmic mythmaking.

A second distinctive creation is Niven's aliens. No SF writer has lavished as much energy in populating his fiction with such a variety of sentient beings: the ancient Thrint slavers; the enslaved master technician Tnuctipun; Pak Protectors; the bellicose, cat-like Kzinti; the cowardly, manipulative Puppeteers; the enigmatic space merchant Outsiders; and an oddity of other creatures including Grogs, Kdatlyno, and Bandersnatchi. Niven gives his readers far more than an alien bestiary, for he creates new species of intelligent beings who are both representative members of a type as well as distinctive individuals. Niven establishes the psychology, attitudes, and cultural identity of his aliens with rare economy and style. And yet we never feel that Niven has told us all he knows about his alien beings, their worlds, or their place in the cosmic history of Known Space.

Niven's collaborative work deserves brief mention here. His best collaborations have been with Jerry Pournelle, especially the cult favorite *Inferno* and the ponderous *Mote in God's Eye*. Niven has done a number of short stories and novels with Steven Barnes. Their best effort to date is *Dream Park* (1981), a science fantasy that entertains but fails to realize the potentials of its premise. So far, Niven's collaborations have been financial and social successes—writing is a solitary business—but indifferently rewarding to Niven admirers.

Niven also writes fantasy, and the chief modern influences on his writing in that genre have been Cabell, Dunsany, Howard, de Camp, and Fletcher Pratt. References, allusions, and analogues to the work of these writers are often deliberately worked into Niven's fantasy as echoes recalling the traditions he follows. So far, Niven has not attempted high or literary fantasy of the kind we associate with the tradition of Morris and Tolkien; rather, he writes in the fashion of popular adventure fantasies of Howard, Burroughs, and Brackett. Niven's best work in the Warlock series has been *The Magic Goes Away*, another novel that fails to live up to its original inspiration. The series also includes *The Magic May Return*, a collection of stories by other hands (Pournelle, Barnes, Ing, Saberhagen), edited by Niven who contributed one story to his own mythology, and *More Magic*, which is more of the same again.

Larry Niven deserves recognition as a major SF writer who has achieved excellence in individual stories and novels, but whose reputation will securely rest upon the foundation of his Known Space mythology. For readers unfamiliar with Niven's work, it is best to begin with the Gil Hamilton stories and *World of Ptavvs*. *Ringworld* should be saved for last since it comes virtually at the end of the Known Space saga. *Tales of Known Space* is invaluable for Niven's charts and editorial notes; and, although not up to the standard of the best novels, *Protector* forms an important link in the mythology no interested reader will want to overlook.

#### William F. Nolan comments:

As a writer I'm hard to pin down. Science fiction is just one of my many fields, and I take equal pride in my crime-suspense writing, auto-racing books, biographies, fantasy-terror fiction, thriller novels, and essays and book reviews. I keep fresh and excited as a writer by switching constantly from one genre to another. I enjoy doing SF, particularly the Logan novels, but I also enjoy all other types of writing. After 30 years as a professional, my work totals 895 items—and I figure my career has another 30 years to go.

\* \* \*

William F. Nolan is best known for the creation of Logan who appeared in the novels *Logan's Run*, *Logan's World*, and *Logan's Search*. He has also written the mystery science-fiction novel *Space for Hire* and numerous short stories. His early influences included William Faulkner and Dashiell Hammett, but one of the greatest literary influences on his writing style and pacing technique is Ernest Hemingway, and in some respects it would be an accurate analysis to say Nolan is the contemporary, high-tech Hemingway of science fiction. Hints of this can be seen in *Space for Hire*, especially in the novel's central character, Samuel Space. During his early career, Nolan was influenced by Charles Beaumont (1929-67), and collaborated with Beaumont on some work; his literary friendship with such notable authors as Ray Bradbury, Robert Bloch, Ray Russell, and Richard Matheson is well known.

Nolan's ability to create and sustain a mood, construct characters with several levels of depth, and devise a tightly constructed plot is the hallmark of his fiction. With the Logan novels, Nolan created a fictional character whose interest and respect among science-fiction readers made him into a cult hero. Logan's appeal lies in his deterministic, moral approach to existence, and his strength to persevere against overwhelming odds and adversity.

Nolan is the author of over 700 works. Among his short fiction are the memorable stories "Jenny among the Zeebs," "Papa's Planet," "Lawbreaker," "The Underdweller," "The Day the Gorf Took Over," "Starblood," "Solution," and "The Joy of Living." Each story concerns some aspect of survival, and the idea that struggle gives meaning to existence. Although the mood and plot are important in any Nolan story, the thrust is on character development—how the individual reacts to the situation and conflict; the character must make a logical decision as to what personal, moral, and social role is demanded and act accordingly. This is illustrated in three of Nolan's finest stories: "Starblood," "Jenny among the Zeebs," and "The Underdweller." The existential side of Nolan, with its dark

emphasis on the themes of conflict and struggle, is revealed in "The Underweller," a morose and hauntingly strange story.

Noted as a writer gifted with the ability to create believable dialogue, Nolan has turned to screen and television writing in recent years, and the themes prevalent in his fiction are reflected there as well.

Nolan's contribution to science fiction is his keen insight into the sociological and psychological role of a character in any given situation, whether that situation involves confrontation with an alien entity, an alien environment, or with personal self. Nolan can translate a contemporary moral or social problem into any setting with ease, and his fiction can be compared favorably with other writers who show a similar concern: Ray Bradbury, Richard Matheson, and William Tenn. His character creations intrigue the reader with their sensitivity and empathic natures. The continued importance of William F. Nolan to scholars, sociologists, and readers of science fiction rests on his enduring creation of a universal culture hero: Logan. From a philosophical perspective, Nolan is Logan and Logan is Nolan.

—Harold Lee Prosser

**NORMAN, John.** Pseudonym for John (Frederick) Lange (Jr.). American. Born in Chicago, Illinois, 3 June 1931. Educated at the University of Nebraska, Lincoln, B. A. 1953; University of Southern California, Los Angeles, M. A. 1957; Princeton University, New Jersey, Ph. D. 1963. Served in the United States Army: Sergeant. Married Bernice L. Green in 1956; two sons and one daughter. Radio writer; story analyst, Warner Brothers; film writer, University of Nebraska; technical writer, Rocketdyne (North American Aviation); Instructor in Philosophy, Hamilton College, Clinton, New York, 1962-64. Since 1964, Member of the Department, and since 1967, Professor of Philosophy, Queens College, City University of New York. Address: Department of Philosophy, Queens College, Flushing, New York 11367, U.S.A.

\* \* \*

John Norman has written almost two dozen novels in the Gor series (the Chronicles of Counter-Earth), novels in the tradition of Edgar Rice Burroughs's Mars books or Andre Norton's Witch World stories. In these works, a character from contemporary Earth finds himself transported, often by inexplicable means, to an unfamiliar world where he is caught up in the events which are shaping the future of that world. And in such worlds, heroic action is almost always the means by which destiny is decided.

Norman's hero, Tarl Cabot, is transported to Gor, a planet on the opposite side of the sun from Earth and somehow shielded from any detection by Terran scientists. On Gor, Cabot is initiated into a way of life which the reader recognizes as medieval. All technological development, especially in weaponry, has been held in check by the Priest-Kings, and the men must fight with sword, spear, bow and arrow, and the like. For most of the known planet, the largest political unit is the city, and politics in and among cities is generally feudal. Gorean society is highly structured, and each person usually remains in the caste—warriors, bakers, scribes, etc.—into which he is born. But Gor and the Priest-Kings are in trouble and in need of heroics which only Tarl Cabot can provide.

As with any extended work of fantasy, the author's ability to detail convincingly a complex culture—or group of cultures—is important. Norman is quite good at this. In the first book, *Tarnsman of Gor*, such detail is necessary, and Norman provides a wealth of information on everything from the training of a warrior to the importance of a Home Stone. In what is possibly his best book to date, *Nomads of Gor*, he brings Cabot to the four tribes of the Wagon People, and the reader is treated to a fascinating descriptions of customs, habits, rituals, and all the other aspects of a complex cultural group. On Gor, the reader realizes, heroic action is not only possible, it is necessary; in other words, the culture is not just a backdrop for the action in Norman's books, it is an integral part of the action.

Heroic fantasies have always been considered male-escapist. The hero is muscular and skillful with weapons; he rescues the heroine who then succumbs to his over-powering maleness. Carries this aspect of heroic fantasy one step further than his predecessors. On Gor, most of the women are slaves, and those who are not are vaguely unhappy because a woman can be free only in total submission to a man. Some of the later books, *Slave Girl of Gor*, for example, focus less on Tarl Cabot than on the Earth woman brought to Gor. Such women are at first distressed by the culture in which they find themselves but soon realize the falseness of their previous (Terran) way of life. On Gor, Cabot says, women are free to be women; whereas, on Earth, they are forced to try to be men. This concept has lost Norman two groups of readers, the first violently opposed to his analysis of women, the second tired of hearing Cabot—or one of the women—explain and defend it book after book.

In literary terms it is the prolonged defense, not the attitude itself, which mars the novels, some of which mars the novels, some of which seem to have written solely to present examples of these ideas and attitudes of women. And Cabot's primary quest has suffered as well; to be sure, he still fights skirmishes against the enemies of the Priest-Kings, but what seemed to be the main plot-line of the series is barely progressing. This situation is unfortunate, for the Gor books are, in most other respects, good heroic fantasy.

\* \* \*

Andre Norton's early intention was to write fiction for boys, and she changed her name to enter this male-dominated market. Fortunately for the millions of readers who have made her one of the best selling of contemporary fantasy and science-fiction authors, she turned to these two forms in 1947 with her first published short story "People of the Crater" (later title: "Garin of Tav"). It is odd that Norton turned to science fiction at all. In fact, books like the *Beast Master* and its sequel, *Lord of Thunder*, weren't really science fiction at all. They were simply an experiment applying the form of a western to outer space and alien worlds. Actually, Norton has contempt for science and technology; they appear in her fiction only as vehicles and foils. In Ric Brooks's essay (in *The Many Worlds of Andre Norton*, 1974), she makes her stance quite clear: "Yes, I am anti-machine. The more research I do, the more I am convinced that when western civilizations turned to machines . . . , they threw away parts of life . . . [the lack of which] leads to much of our present frustration."

Even in Norton's science fiction, technology and science are incidental to plot and character. These major concerns reflect the influences of Edgar Rice Burroughs, H. Rider Haggard, A. Merritt, and Talbot Mundy, and Norton's respect for their fast-moving plots and memorable characters. For plot content, Norton's extensive research and affection for the mysterious and intriguing have led her to a number of specific motifs that occur throughout her fiction. Jewels frequently appear as powerful talismans, particularly in her fantasy novels. For example, as early as *At Swords' Point*, part of the Sword series that focuses on post-World-War-II espionage and the Netherlands during World War II, a set of jeweled miniature knights are central to a young man's search for his brother's murderer. Jewels are also important in *The Zero Stone*, the much heralded Witch World series, *Wraiths of Time*, and the gothic novels, particularly *The White Jade Fox* and *The Opal-Eyed Fan*. Frequently, these talismans are connected to an even more pervasive motif: the pseudo-science psychometry. This is formally defined as the detection of the residue of "memory" retained in an artifact by a sensitive. This plays a major role in the fantasy (with strong science-fiction elements) *Forerunner Foray*, in which Ziatha is drawn into a prehuman age through her reaction to a jewel; in *Wraiths of Time*, a crystal ankh and a staff contain the accumulated psychic power of a race.

Jewels and psychometry are two of the elements that give Norton's fiction its brooding depth, and together they provide a bridge between two other major Norton fascinations: history and speculative archaeology. Whether it be through references to prehistoric alien visits to Earth, as in *Merlin's Mirror*, or allusions to the prehistoric past, as in the Moon Magic series, Norton's fiction always has a resonance that goes beyond the immediate present to a more pervasive and often mysterious past. It is the characters' responsibility to discover the relevance of the past to themselves and their futures.

Yet none of these motifs or devices is the center of Andre Norton's fiction. Rather, the most important aspects are simply humanity and self-realization. Norton explains this in "On Writing Fantasy" (in *The Many Worlds of Andre Norton*): "But

the first requirement for writing heroic . . . fantasy must be a deep interest in and a love for history itself. Not the history of dates, of sweeps and empires—but the kind of history which deals with daily life, the beliefs, and the aspirations of people long since dust." Within the obvious cosmic scope, alien climes, antagonistic technology, vast quests, and fantastic forces of Norton's fiction, the characters are involved in crucial patterns of being, both for themselves and their fellows. While they are arrayed in mythic quests that grow from deep tradition, exist in a momentous present, and face a vital future, the characters remain pointedly human and humane. Most frequently, they move through what Northrop Frye calls "triumphant comedy." They struggle against an unlawful or unnatural order, undergo rites of passage to find realization, and establish new orders and freedoms. Kaththea (*Sorceress of the Witch World*) reflects this pattern as well as Norton's pioneering commitment to female characters. Shattered and disillusioned, Kaththea must find the faith to accept Hilarion, one of the enormously powerful "Old Ones" of the Witch World, if she is to save her family and regenerate her environment. Furtig, the mutated cat protagonist of *Breed to Come*, must overcome the mythology surrounding his long-departed human masters to unleash his own potentiality. Through the characters' agonizing trials, bondages and wastelands are destroyed, shape prejudice is eliminated, generative orders are established, and the protagonists and their fellows are ennobled. As Ric Brooks writes, "the chief value of Andre Norton's fiction may not lie in entertainment or social commentary, but in her 'reenchanting' us with her creations that renew our linkages to life."

Andre Norton's characters are always alone, alienated, fearful, and searching. They are admirable for their positive, if sometimes confused, values, and they are attractive in their frailty and their doubt. In spite of their varied shapes and alien abilities, they achieve the nobility and status of the healer as they cure themselves and others. Frequently, their solutions are androgynous—as for Simon Tregarth and Jaelithe in *Witch World*—and they do find the best of male and female. More significantly, their solutions to pain and loneliness are mythic and elemental and are a celebration of the bonds among man, animal, nature and cosmic order.

NORWOOD, Warren. American. Born in Philadelphia, Pennsylvania, 21 August 1945. Educated at North Texas State University, Denton, B. A. 1972. Served in the United States Army, 1966-69; Bronze Star. Married 1) Mary Walker in 1965 (divorced, 1972); 2) Margot Biery in 1973; one daughter. Assistant Manager, University Bookstore, University of Texas, Arlington, 1973-76; Manager, Century Bookstore, Fort Worth, 1976-77; publisher's representative in Fort Worth, for Ballantine Books, 1978-79, and for Bantam Books, 1980-83; taught creative writing, Tarrant County Junior College, 1981-83. Agent: Richard Curtis Associates, 164 East 64th Street, New York, New York 10021. Address: 2428 Las Brisas, Fort Worth, Texas 76116, U.S.A.

## SCIENCE-FICTION PUBLICATIONS

Novels (series: Double Spiral War; Windhover Tapes)

## The Windhover Tapes:

1. *An Image of Voices*. New York, Bantam, 1982.
2. *Flexing the Warp*. New York, Bantam, 1983.
3. *Fize of the Gabriel Ratchets*. New York, Bantam, 1983.
4. *Planet of Flowers*. New York, Bantam, 1984.

*The Seren Cenacles*, with Ralph Mylius. New York, Bantam, 1983.

## Double Spiral War:

1. *Midway Between*. New York, Bantam, 1984.
2. *Polar Fleet*. New York, Bantam, 1985.

\* \* \*

Warren Norwood's unusual first novel, *The Windhover Tapes: An Image of Voices*, received excellent reviews when it appeared in 1982, but earned its author the dubious honor of finishing last in the balloting for the John W. Campbell Award for best new writer of the year, behind "No Award." The book is a complex amalgam of 1930's-style space opera, obscure literary references to 17th-century poets like Michael Drayton and folklore characters like the Gabriel Ratchets, and a style which seems to fluctuate between Barry Malzberg-like monologue and the 18th-century epistolary novels of Samuel Richardson. The story takes place in the far future, when faster-than-light travel to other galaxies is routine and humanity has contacted and interbred with any number of alien races. Gerard Hopkins Manley is a contract diplomat and anthropological researcher, and the four "Windhover" novels relate his adventures with sentient flowers, pulp-style outer space empires, outspoken feminist ghosts, intelligent, wheeled avians, and other strange beings and situations. The first two books are made up entirely of Manley's first-person conversations with himself and his sentient space ship, Windhover. The later volumes are more conventional, third-person narratives. All four books contain numerous references to Manley's 19th-century English namesake, though Manley and those around him have apparently never heard of the poet.

The Windhover Tapes series is an enjoyable piece of work, but it has several flaws: the seeming irrelevance of most of the Hopkins material, Norwood's frequent inclusion of his own not very good poetry (including a travesty of Hopkins's "Windhover"), and the author's apparent fixation on human and humanoid mammary glands (Manley's beautiful alien wife has three). On the positive side, Norwood is doing some interesting stylistic experimentation, and his main character is a very unusual hero for science fiction—an emotional man who is not afraid to cry or dote upon his infant son and daughter, a man who is capable of space opera-style action, but who would really much rather talk things out sensibly.

That Norwood has considerable ability is clear; however, one cannot help but wish that he would take more time with his books. The Windhover series fluctuates markedly between startling originality and pulp cliché but maintains on the whole a fairly high level of excellence. The author's more recent novels, however, are generally less successful. *The Seren Cenacles*, co-authored with Ralph Mylius, is a well-written but poorly plotted tale of "alien terror" on a mining colony. The several political and industrial groups, military forces, and alien species contending for control of the situation are thrown at us willy nilly, without sufficient cultural context or satisfactory explanation. The book's basic premise, mining organic matter buried on distant worlds to ship to the galaxy's starving trillions, is not very believable, nor is the story's abrupt and

rather unlikely denouement. Likewise, *Midway Between*, the first volume of the Double Spiral War series, throws so many similar characters at the reader that it is virtually impossible to keep them straight. This space war novel, like all Norwood's books, is well written, but it is also talky, obscurely plotted, and considering its sub-genre, short on action.

In summary, Warren Norwood is a talented young writer with a knack for character development, fine prose, and experimentation, but he has considerable problems with plotting and background development. One can only hope that his prolific rate of publication will give him the financial stability he needs to ease his pace and refine his art.

Alan E. Nourse has several specialized interests which form a unifying theme in many of his short stories and novels. Most of them have a number of common stylistic characteristics linking him to the science-fiction writers of the 1950's. In his recent book, *The Bladerunner*, Nourse makes several frightening but logical extrapolations from current social problems.

A number of Nourse's novels, among them *Scavengers in Space*, *Trouble on Titan*, *Rocket to Limbo*, and *Raiders from the Rings*, are straightforward science fiction/adventure stories. Not surprisingly, however, since Nourse is a former practicing physician, his best stories deal with medicine. His most readable adventure story is *Star Surgeon* in which he develops an interesting concept, "Hospital Earth," where Earth utilizes its medical research and technology to serve as medical liaison for the galaxy. A number of stories revolve around Hoffman

Center, a futuristic medical complex in Philadelphia, and Nourse develops a tantalizing concept, the "mercy men"—men who are recruited and paid for being guinea pigs. An additional theme Nourse frequently treats is the development, realization, and analysis of mental superpowers in individuals whom Nourse call "PSI high." In a number of his stories Nourse works with the concept of possible alternate universes that exist in other dimensions. Nourse frequently combines the medical and PSI themes, and in *The Universe Between* he adds to these the alternate dimension concept as well.

Like his contemporary Robert Heinlein, Nourse wrote "Juveniles" during the 1950's, and unlike Heinlein, continued to write them. These novels contain prototype characters, like the young male hero, and there are no overtly romantic scenes, but the prototype males may have female complements who are, for the 1950's and 1960's, surprisingly forceful. Because so many of Nourse's stories concern mental rather than scientific advancement, he seldom uses the "hard" science-fiction technique of describing in detail futuristic methods and machines; even in his medical-theme novels, where Nourse's familiarity with his subject clearly shows, he does not give his fiction much explicit scientific detail. In the Hoffman Center fiction Nourse does place some emphasis on the world-covering computer hook-up, but he generally expects his reader to take for granted the medical, scientific, and technological accomplishments of his future world. Nourse does not use the familiar 1950's social theme of nuclear disaster, although in his Hoffman Center fiction he postulates a social background which includes a devastating third world war. Like much of the science fiction of the 1950's, most of Nourse's relies for its primary interest on plot development and problem-solving rather than on character development, social philosophy, and other "new wave" techniques.

*The Bladerunner* is clearly aimed at a more mature audience. While it retains most stylistic characteristics of earlier Nourse novels, its theme is dystopian. Nourse based his novel on two premises: medical advancement would lead to increased longevity, survival of people with hereditary defects, and conquest of viral and bacterial diseases. In addition, the country would turn within 20 years entirely to socialized medicine. The consequences would be over-population and more virulent diseases requiring constant development of new medicines. Socialized medical care would have a price—sterilization—and to fulfill the needs of people unwilling to submit to sterilization, an army of underground doctors would work illegally, supplied and aided by "bladerunners." The plot of *The Bladerunner* centers on one doctor's fight to defeat the policies of socialized medicine and simultaneously to publicize a dangerous plague. While the plot and solution to the problem are entertaining, Nourse clearly wishes for *The Bladerunner* to serve as a warning against socialized medicine, and the diatribes against this evil are occasionally intrusive. Despite this flaw, *The Bladerunner* is the best of Nourse's science-fiction novels.

\* \* \*

Although not as well known as Edgar Rice Burroughs or E. E. Smith, Philip Francis Nowlan was probably their equal both as a writer and as an influence on modern science fiction. In his first story, "Armageddon 2419 A. D." (*Amazing*, August 1928), he introduced perhaps the most popular character in the history of the genre, Anthony, or as he was later known, Buck Rogers. Over the decades that followed Nowlan and others scripted innumerable Buck Rogers comic strips. There were several films, and a current successful television series is proof of Buck Rogers's continuing appeal.

In "Armageddon 2419 A. D." Anthony Rogers, an engineer exploring a Pennsylvania mine in 1929, is caught in a cave-in and placed in suspended animation. Awakening in the 25th century, he discovers that the United States is now ruled by Mongolians and that Americans live in scattered communities, hiding from the conquerors who consider them vermin. The Mongolians, or Hans, a decadent, heartless race, rarely leave their cities and rely on huge airships equipped with disintegrator rays to maintain their dominance. Rogers has appeared at an opportune moment, for the Americans, armed with newly developed anti-gravity devices and rocket guns, are preparing to revolt. Contributing a knowledge of 20th-century military tactics and a certain primitive blood-thirstiness, Rogers soon becomes a leader in the struggle. The American conquest is completed in Nowlan's sequel, "The Airlords of Han." (The two stories were combined in the 1962 book *Armageddon 2419 A. D.*) Although

flawed by occasionally awkward language and handicapped by the poorly considered choice of a first-person narrator, the Anthony Rogers stories stand up quite well even today. The action moves smoothly and the various military inventions and tactics are intriguing. The stories are touched by the racism so common in 1920's pulp fiction but, interestingly, are extremely progressive in their treatment of women. Wilma Deering, although occasionally given to the fainting spells and fits of weeping which were *de rigueur* for women in popular fiction, is in general more competent and active than any female character in science fiction prior to Joanna Russ's Alyx.

"The Onslaught from Venus" is a first-person account by a member of the Airguard (the military arm of the Supernational Commission of the Cascasioan League) who, captured by the invading Venusians, first studies their civilization and then, escaping, helps destroy it. Again the story is largely taken up with inventive weaponry and tactics. The Venusians, who seem quite human except for their skin color, are, like the Hans, totally evil, totally decadent. They are incapable of even considering coexistence and their complete extermination is thus a necessity.

Nowlan published little science fiction in the years that followed. His final story, and, after "Armageddon 2419 A. D.," probably his best, was "Space Guards." In this tale the narrator and his commanding officer, another of Nowlan's capable women, are searching the jungles of Venus for the headquarters of the criminal mastermind Tiger Madden. They're captured by tribesmen who, again, are totally human except for their skin color. Converting the natives to their side, the two Earth people defeat Madden's troops in battle and then infiltrate his city. Eventually they kidnap the villain and escape under fire. The narrator saves his commander's life, disobeying her direct order to abandon her. She at first considers court-martialing him but then, as the story closes, decides to marry him instead. Despite its silly ending and its somewhat old-fashioned plotting, "Space Guards" is an interesting and exciting story.

Philip Nowlan was a talented writer, and, despite his small output, he is one of the most influential science-fiction writers of the Gernsback era.

Editor, *Great Stories of Human Courage*. London, Lane, 1933.  
 Editor, *Quest and Conquest: An Anthology of Personal Adventures*. London, Macmillan, 1936.

\* \* \*

There is little mystery about the title character of E. V. Odle's *The Clockwork Man*, for his origins become obvious right from the start. Through a malfunction of his clockwork mechanism he appears at a local village cricket match, having slipped back 8000 years from a future world established after a series of catastrophic wars. His bizarre behaviour and strange appearance throw the cricketers of 1920's England into confusion. Though at first glance human, he is internally a mass of cogs and wheels that are controlled by a "clock" set into the back of his head.

Most of the novel is concerned with the intellectual and moral challenges the Clockwork Man poses to his cricket-playing ancestors. His apparent ability to overcome the laws of time and space presents a prospect too bleak to contemplate to the middle-aged bachelor Dr. Allingham, primarily because he threatens, like the Doctor's free-thinking fiancée Lilian, a comfortable and complacent way of life. Gregg, a university graduate in his 20's, finds the existence of the Clockwork Man both believable and encouraging, the ideal outcome of man's quest for progress. Arthur Withers, a simple and contented bank clerk, sees only an unhappy soul, transported from a world devoid of emotion and trapped into one that can offer no acceptance.

Odle provides no clear answers to the questions he raises in this book. Is the Clockwork Man a manifestation of man's triumph over his physiological limitations, or merely a glorified puppet, a grim look into a future where, through his pursuit of happiness, man has become a slave to his own technology? The Clockwork Man forces the people he meets to re-examine their own lives. Are they superior to him, being free to act as they will? Or are they not as firmly fixed into their own mechanical patterns of behaviour and thought as he is into his loveless world of perpetual time and space change?

*The Clockwork Man* is undeniably a slow-moving and uneventful work of science fiction, and can hardly be considered an incisive allegory, but it is a thoughtful and well-constructed novel that shouldn't be quite so forgotten as it has apparently become.

Kevin O'Donnell, Jr., comments:

When I write, I want the eventual readers to enjoy themselves; to think about themselves, others, and the future; and to feel at the end that they have experienced something worthwhile.

In one sense, science fiction is the opportunity to sample, vicariously and in advance, the consequences of choices human beings are making right now. I do not pretend to be a prophet, but I do attempt to depict potential futures, and those futures should ring as true to life as possible. Thus I stress verisimilitude in my writing, which poses a special challenge, since, by definition, what I write about has not happened yet, and probably never will. Before the words go on the paper, I have already spent a great deal of time trying to answer to my own satisfaction the question "What would it *really* be like if—?"

I give equal weight to characterization. Stereotypes are easy to work with—cardboard characters shuffle as easily as a deck of cards—but real people tangled in the webwork of their families, their friends, their pasts, and their present predicaments interest me much more than do mighty-thewed heroes or black-hearted villains. Don't get me wrong. I *like* heroes and villains. I also like shades of grey.

\* \* \*

Possessed of one of the more entertaining new voices of science fiction, Kevin O'Donnell, Jr., infuses familiar SF themes and concepts with his own eager tone, the voice of the born story-teller. Among his shorter pieces, 6 have been recommended for Nebula Awards: "A Matter of Pride," a serious tale of epidemiology and prisoners of war, "Low Grade Ore" and "Temple Guardian," two stories of alien invaders, a time-travel short called "The Gift of Prometheus," a humorous story of censorship-via-computer, "Judo and the Art of Self-Government," and "Marchianna," of robots and asteroid mining. Emotional constants in O'Donnell's work are reliance

upon individual strengths and the saving love of friends whether human or alien, and a suspicion of the corporate and bureaucratic. Humor is often achieved through a Chaplinesque stumbling over a plethora of detail.

His best-known work, *Mayflies*, utilizes two familiar themes: the hero interfaced with a computer and the generation starship. O'Donnell fuses these with energy and enthusiasm to create the memorable image of the immortal captain and controlling entity of a starship taking his human cargo across a thousand-year voyage, observing them with mingled compassion and disdain for their "mayfly" existence. Like a gardener, he cultivates, prunes, limits, and stimulates, and all the while we get an eerie sense of a human slowly developing into something other over the centuries. A similar tension between the hermetic and the oceanic pervades *ORA:CLE*, where the hero, Mr. Ale Elatey (AL L80) is liked by brain implant to a network of thousands of computer experts but never leaves the high-rise apartment where he and his wife live through their contacts on the network, and through other communication systems. As *Mayflies* may be said to reevaluate the experience of Heinlein's *Universe* and McCaffrey's *The Ship Who Sang*, *ORA:CLE* may be viewed as finding new possibilities in the closed environment of Silverberg's *The World Inside*.

O'Donnell's most ambitious project is the light-hearted Adventures of McGill Feighan, an open-ended series of picaresque travels among alien worlds by means of "flinging," a teleportation technique of which McGill is a rare possessor. The first four volumes in the series—*Caverns*, *Reefs*, *Lava*, and *Cliffs*—explore the intricacies of McGill's talent, human-alien encounter, the menace of a mob-like crime syndicate so powerfully parasitic it takes steps not to kill its host culture, and McGill's search for the Far Being, source of his flinging talent. Here O'Donnell's ability to compel sympathetic interest in his anomalous young hero helps him skirt the many improbabilities of the story line. Billed as "techno-fantasy," the inventive series shows a talent for humorous dialogue increasingly matched by pacing of incident and character development. A young writer still, O'Donnell shows great creative promise.

\* \* \*

Many science fiction and fantasy writers can be categorized according to the particular sub-genre in which they write. However, Andrew J. Offutt must be discussed in several sub-genres, from heroic fantasy to sociological science fiction.

Much of Offutt's early science fiction was obviously social criticism. *The Castle Keeps*, for example, is set in the same not-too-distant dystopian future as quite a bit of other science fiction; John Brunner's *Stand on Zanzibar* and *The Sheep Look Up* come immediately to mind. The world of *The Castle Keeps* is over-populated and poisonously polluted, and the society has devolved toward barbarism. The Andrews' home in the country is heavily fortified, and there is constant danger of being overrun by roving bands of looters and killers. In the city, the Caudills live inside a sealed-up apartment building from which they seldom emerge; outside, in spite of the official agencies, gangs are a threat by day and all-powerful by night. Throughout the novel, there are signs of how we, mid-20th-century Americans, got there.

Offutt can also write humorous science fiction and fantasy, often with a satiric bite. Short stories like "For Value Received" and "Population Implosion" satirize, among other things, one of Offutt's favorite targets, the medical profession. In "For Value Received," for example, he refers to the AMA as the American Magicians Association. In this story, Bob Barber is told that he cannot take his new baby daughter home before he pays the difference between what his insurance covers and the total bill. He refuses to do so, and Mary Ann Barber grows up in Saint Meinrad Medical Center. And *Ardor on Aros* is a humorous look at the heroic fantasy that Offutt himself seriously writes.

Offutt's heroic fantasy comes in two groups. The first group includes those stories which are essentially his own constructions, like *Messenger of Zhuvastou*. Scion Mark Keniston follows a beautiful woman, Elaine Dixon, supposedly his fiancée, to Helene, a planet which is the approximate cultural equivalent of early Imperial Rome. Because the planet is insulated from contact with more technologically advanced civilizations, Keniston must "go native" to follow Elaine onto the planet's surface. Disguised as an official messenger of the most powerful domain on the planet, Keniston sets out on his quest. The description of the planet and the portrayal of the heroic adventure are well-integrated so that the reader is able to envision quite clearly the world through which Keniston makes his way.

The second group of heroic fantasies, which seems to be occupying an increasing amount of Offutt's time, is based on characters created by Robert E. Howard. In fact, Offutt has selected one, Cormac mac Art, for extended consideration, and he admits, in the introduction to *Sword of the Gael*, that he is a Robert E. Howard fan and also "hopelessly in love with the Emerald Isle." This happy combination unites the heroic-age hero with a perfect historical setting, the Celtic/Viking period. Offutt skillfully mixes historical material from his own research with the literary history created by Howard to provide a cogent background for the adventures of Cormac mac Art and his Viking comrade, Wulphere Skull-Splitter.

Heroic fantasy, socially critical science fiction, humor, and satire—Offutt writes them all and writes them well. His word output is tremendous, and not all of it is science fiction; many feel that not enough of it is science fiction.

## Chad Oliver comments:

I wrote my first story when I was 14, and sold my first story (to Anthony Boucher of *The Magazine of Fantasy and Science Fiction*) when I was 22. I was a professional writer before I was an anthropologist, and I suspect that I still am. I grew up with science fiction and it has been an important part of my life.

I have written many kinds of stories and about all they have in common is that I always tried to write as well as I could. I am not interested in essays disguised as fiction; my stories are about people and my opinion is that if they don't work on an emotional level they don't work at all. I was strongly influenced by writers outside the science-fiction field, notably Hemingway and Steinbeck.

\* \* \*

For a genre that deals freely in alien beings and cultures, science fiction has often shown a marked tendency toward simplistic anthropomorphism in handling such themes. Readers and editors who would demand the utmost verisimilitude in fiction dealing with the natural sciences often allowed the most naive applications of social science theory to pass unnoticed in science-fiction stories, and it was not until well into the 1950's that the social sciences began to take their place as serious thematic material in popular science fiction. While economics and sociology began to be treated with relative sophistication by Frederik Pohl and other satirists of the *Galaxy*-magazine school, the credit for introducing well-thought-out anthropological themes into popular American science fiction of the 1950's rests almost solely with Chad Oliver. Himself a professional anthropologist, Oliver dealt with alien cultures, and the problems inherent in communicating with those cultures, in a series of sympathetic and plausible stories and novels that paved the way for later anthropological themes in such writers as Ursula K. Le Guin.

Oliver's fiction tends heavily toward exposition and didacticism, but his pleasant, relaxed style and understated, non-heroic characters work to make the lessons in cultural differentiation and values easily palatable. When he treats a traditional theme, such as the secret colonization of Earth by aliens in *Shadows in the Sun*, he is apt to undercut the reader's expectations by revealing early in the narrative the secret of the alien presence (in this novel, they have completely taken over a small town in Texas, without violence or murder), and focusing instead on the more complex and interesting problem of what their motivations and values are. The equally familiar theme of the generations-long space voyage, initially popularized by Robert Heinlein in "Universe," is given a new twist in Oliver's "Stardust" by the introduction of the problem of the culture shock that the spaceship inhabitants might face if the circumscribed environment that they have come to regard as the

universe is suddenly revealed to be only a machine. A "first contact" story is also given a new twist, in "Scientific Method," by its simultaneous presentation from two opposing viewpoints. One of Oliver's favorite themes is the depiction of a "primitive" alien culture that is really advanced, but in radically different cultural terms from our own. This is the theme of "Rite of Passage" and *Unearthly Neighbors*; the latter may be the most carefully reasoned account of the problems of making contact with an alien culture in all of science fiction.

Much of Oliver's fiction clearly draws on his own experiences—his familiarity with small-town Texas culture in *Shadows in the Sun*, his hobby of trout fishing in *The Winds of Time*, his experiences in Kenya in *The Shores of Another Sea*. In the last novel particularly the science-fiction theme seems to be decidedly secondary to the portrayal of life on a baboonery in the bush country of Kenya. Relatively few of his stories deal with future societies, and his portrayals of technologically advanced earth societies (as in *Unearthly Neighbors*) seem somewhat stilted and uncomfortable. His real strengths lie in the construction of hypothetical anthropological problems and his graceful, understated style. Although he has produced relatively little science fiction, what there is is valuable both for the specific insights it offers and for the importance it holds in the developing sophistication of the genre.

- "Wanted: A Definition for SF," in *Future* (New York), Summer 1957.

\* \* \*

Bob Olsen was among the earliest protégés of the editor Hugo Gernsback, who introduced him to *Amazing Stories* readers in 1927 and was soon pronouncing him "the possessor of a fertile mind with a turn for good writing." He begins with a series of ingenious treatments of the fourth dimension theme, to which he returned more than once in the course of earning a reputation over the next decade as a "distinguished" contributor, if only on account of his consistent popularity.

Some of his early offerings were more like popular lectures than stories, most of the dialogue emanating from his scientist hero, Professor Archimedes Banning, in "Four Dimension Transit" and "The Man Who Annexed the Moon"—a tale of the first lunar voyage, fairly typical of the period, which today seems uncannily predictive. Another stock character, Justin Pryor, a merchandising counsellor with a yen for criminal investigation, was featured in "The Master of Mystery" and "Seven Sunstrokes." An outstanding story was "The Ant with a Human Soul" in which the subject of a bizarre experiment in brain transference relates his experiences while "going native" among the ants. Two years later the author treated much the same idea to greater effect, with more human interest and less text-book detail, in "Peril Among the Drivers." And in "Six-Legged Gangsters" he told a simple story of formicary antics from the viewpoint of the insects themselves. He was also fascinated by the amoeba, a voracious specimen of which lurked in "The Pool of Death," another Justin Pryor mystery. It was to be found in its natural surroundings in "Noekken of Norway," which clearly betrayed the author's Scandinavian antecedents. And the amoeba-men of Titan were the villains "Captain Brink of the Space Marines" had to contend with.

In a mood close to satire, in "The Purple Monsters" he made light of an invasion of New York by nightmarish giants from Ganymede. "The Crime Crusher" brought criminals to book with a device which photographed their misdeeds in retrospect; and "The Four Dimensional Auto-Parker" offered a solution to a problem which, even in 1934, vexed Los Angeles motorists. By that time Olsen had also added jailbreaking to the list of possibilities—including surgery and bank robbery—presented by the exploitation of hyperspace.

- The Kingdom-Maker* (as Seosamh O'Neill), lyrics by Mary Devenport O'Neill. Dublin, Talbot Press, and London, Unwin, 1918.

\* \* \*

Joseph O'Neill wrote five novels, a play, some criticism, some poetry and a few scholarly papers. Of his novels, three may be regarded as science fiction, though the connection is sometimes tenuous. *Wind from the North* is a well-written time-travel story of Norsemen in Dublin in the 11th century; the emphasis is on the conflict between the hero's 11th-century and 20th-century selves. *Day of Wrath* is a prophetic potboiler about an airwar involving "the Yellow Alliance" and Nazi aggressors against Russia, "the Latin Alliance," and, eventually, Great Britain and the United States; the aftermath of its poison gas and thermite bombs is a vivid picture of the breakdown of civilized behavior

but it is not especially exciting either as science fiction or as novel.

*Land under England* is a work of power that was justly well received when first published and then almost forgotten until recently. It is doubtless worth noting that of all O'Neill's works only this one—despite the fact that *Wind from the North* received the Harmsworth Prize—was widely reviewed, and that only this one has been reprinted. Even so, except for passing references critical evaluation of the work is largely confined to reviews that appeared in 1935.

Part of the attraction of the novel is the development from an almost innocent beginning through an adventurous though fantastic journey into a world of horror that gradually becomes prophetic of doom not only for the protagonist but for the world at large. The story begins with devices like those of second-rate fantasy: the Julians are an old family tracing their origins back to Roman Britain; they live along the Roman Wall on property believed to possess the entrance to an underground world. There are half-believed stories of ancestors who have disappeared and returned with stories of a strange land beyond the mysterious entrance. Anthony Julian, the narrator, is the only child of two dramatically opposite types both of whom believe in the old legends, his father in the years following World War I, to the point of obsession; when he disappears, both wife and son are convinced that he has found the entrance. Tony, whose hero-worship of his father is the driving force of the book, is equally convinced that he will some day be found.

Tony's accidental discovery of the entrance in a dried-up pond and unhesitating plunge down the slope into the underworld are the obvious and expected result of what has gone before. What is not obvious or expected is what happens thereafter, and it is in this respect that the novel departs from the ordinary to become something of a minor masterpiece.

In this underground world are many curious, strange, and frequently alarming creatures, both plant and animal. But nothing is more curious, stranger, or more alarming than its human inhabitants. At first encounter they appear to be civilized and enough like the ancient Romans who had inhabited the land above that Tony speaks to them in Latin, but there is no reply and he realizes that all communication is through some kind of mind talk. When his early failure to understand this causes the master of the ship on which he first takes refuge to regard him as ill, and curable only by the Masters of Will and of Knowledge to whom he is sent, he soon learns that in this different and horrifying society control is through the minds of a few leaders who work their will on the rest of the populace. The remainder of the story deals with Tony's unceasing efforts to locate his father, to understand the ways of this fearful society, and eventually, his father obviously lost to him forever, to undertake the grueling flight back to the upper world.

If one pays attention only to the monstrous plants and animals and the even more monstrous leaders of the underworld society, *Land under England* remains only a good fantastic adventure. But if one remembers the time when it was written, it becomes a warning of the future that the totalitarian societies of the 1930's, especially that of Nazi Germany, might bring to England. When taken together with the search for self in *Wind from the North* and the polemical picture of brute mankind when the veneer of civilization is removed in *Day of Wrath*, it provides evidence of O'Neill's continuing effort to understand the hidden drives and motivations that still plague humanity. There are political and psychological aspects to this almost allegorical tale that move it to a higher level than most such works of the time, and O'Neill can justly be regarded as a minor but significant figure whose work prefigures the kind of social science fiction

and fantasy that became prominent in the immediate postwar years.

—Arthur O. Lewis

---

**ORWELL, George.** Pseudonym for Eric Arthur Blair. British. Born of English parents in Motihari, Bengal, India, 25 June 1903; brought to England, 1904. Educated at a convent school, Henley-on-Thames, Oxfordshire; St. Cyprian's, Eastbourne, Sussex, 1911-16; Wellington School, 1917; Eton College (King's Scholar), 1917-21. Served in the United Marxist Workers' Party militia in Catalonia, 1937: wounded in action; served in the Home Guard, 1940-43: Sergeant. Married 1) Eileen O'Shaughnessy in 1936 (died, 1945), one adopted son; 2) Sonia Mary Brownell in 1949. Served in the Imperial Indian Police in Burma: at Police Training School, Rangoon, 1922-23, Assistant Superintendent of Police at Myaungmya, 1923, Twante, 1924, Syriam, 1925, Insein, 1925-26, Moulmein, 1926, and Katha, 1927 (resigned 1927); lived in London, 1927, and Paris, 1928-29 (worked briefly as dishwasher, 1929); tutor, Southwold, Suffolk, 1930; lived in London, 1930-31; headmaster, The Hawthorns, Hayes, Middlesex, 1932-33, and teacher at Frays College, Uxbridge, 1933; worked at Booklovers' Corner bookshop, London, 1934-36; shopkeeper, Wallingford, Hertfordshire, 1936-40; talks producer in the Empire Department, BBC, London, 1941-43. Free-lance writer from 1935: reviewer, *New English Weekly*, 1935-36, *Time and Tide*, 1940-41, *Tribune*, 1940-47 (Literary Editor, 1943-45), and *Horizon*, 1940-49, all London; columnist ("London Letter"), *Partisan Review*, New York, 1941-46; Editor, with T. R. Fyvel, Searchlight Books series, Secker and Warburg, publishers, London, 1941-42; regular contributor, *Observer*, London, 1942-49 (war correspondent, 1945); columnist, *Manchester Evening News*, 1943-46. Lived on Jura, Hebrides Islands, Scotland, 1946-47. Died 21 January 1950.

\* \* \*

George Orwell's world-wide reputation as a writer of science fiction rests upon a single novel, *Nineteen Eighty-Four*. Such is the dynamic force of this work that the title of the book has become a universal symbol for the totalitarian nightmare. Although indisputably an SF novel, it differs from most other works in the genre by having an overt political purpose. In the author's own words he desired "to push the world in a certain direction, to alter other people's idea of the kind of society they should strive after." His experiences while fighting alongside the Anarchists in the Spanish Civil War had opened his eyes to the "expedient inhumanities" which lay behind both international Communism and European Fascism. From now on in any conflict between the individual human being and the State Orwell was always to be found on the side of the underdog. Orwell's international stature was first established with *Animal Farm*, a classic Swiftian satire on the Soviet experiment. The runaway success of this work ensured that his next book would be given wide critical attention. When *Nineteen Eighty-Four* first appeared it was initially hailed in many quarters as a further trenchant indictment of Soviet Communism though, in fact, it is an indictment of absolutism of whatsoever political hue. Its

conception owes a great deal to Eugene Zamyatin's *We* which Orwell had first read in a French translation some 20 years previously

The plot of *Nineteen Eighty-Four* is straightforward. The story follows the tragic fortunes of Winston Smith, a minor civil servant, who lives and works in the London which has survived an atomic Third World War. This London is now the capital of Airstrip One, an off-shore province of Oceania, one of three constantly warring world-power blocs, Oceania, Eurasia, Eastasia. Under the absolute control of the Party and its Leader, Big Brother, the society of Oceania is stratified into the Inner Party (the rulers), the Party (the bureaucracy), and the rest (known collectively as the Proles). The complete ascendancy of the Party is symbolized by the four Ministries which dominate Winston Smith's decaying urban metropolis. These are, in order of significance, the Ministry of Love, the Ministry of Truth, the Ministry of Peace, and the Ministry of Plenty:

The Ministry of Love was the really frightening one. There were no windows in it at all. Winston had never been inside the Ministry of Love, nor within half a kilometre of it. The place was impossible to enter except on official business, and then only by penetrating through a maze of barbed-wire entanglements, steel doors and hidden machine-gun nests. Even the streets leading up to its outer barriers were roamed by gorilla-faced guards in black uniforms, armed with jointed truncheons.

Winston works in the Ministry of Truth whose slogans are "War is Peace. Freedom is Slavery. Ignorance is Strength." His job is to re-write items of recent history in Newspeak (the official Party language) in such a way that it accords with the official Party line. Watched over at all hours of the day and night by the ubiquitous telescreens of the dreaded Thought Police, Winston rebels against the system and commits the crime of falling in love with a fellow Party worker. For a brief spell he enjoys a precarious happiness only to learn, in what is surely one of the most horrendous passages in the whole of SF, that the Party has simply been toying with him all along. He is dragged into the Ministry of Love, and his total physical and spiritual degradation begins as the Party, in the person of the Torquemadian Senior Official O'Brien, sets about the task of extinguishing Winston's one precious spark of individual humanity—his moral conscience. The end is inevitable and horrifying. By a series of physical and psychological tortures Winston Smith as a person is totally erased and is then re-created in the Party's image until, in the end, "he loves Big Brother." Orwell's vision of a future in which the acquisition and tenure of absolute power is the only aspiration left to man is truly terrifying. "Power is not a means, it is an end," O'Brien tells Winston Smith. "If you want a picture of the future, imagine a boot stamping on a human face—forever."

*Nineteen Eighty-Four* is a cautionary tale on a heroic scale; its initial impact on an immediately post-war world still groggy from the revelations of the Nazi extermination camps and the tales of Russian defectors to the West is not difficult to imagine. What still gives the story its tremendous emotional force is the intensity with which Orwell has expressed in fictional terms his passionately held belief in individual human freedom. All in all *Nineteen Eighty-Four* seems likely to retain its position as the most powerful as well as the most widely read science-fiction novel of the century.

\* \* \*

Raymond A. Palmer was one of the earliest science-fiction fans, his activities dating from the late 1920's, and his major influence was as an editor. His first important assignment was the editorship of *Amazing Stories*, taken over from the moribund Teck Publications in 1938 by Ziff-Davis. Palmer discarded the on-hand inventory, quickly filled the magazine with new, adventure-oriented stories, and (perhaps most important) refurbished its drab appearance to create a lively, colorful package. Simultaneously he worked to bring the contents of the magazine in line with its new appearance.

He was immediately successful, and the following year was able to add a companion magazine, *Fantastic Adventures*. In a number of ways, Palmer's career remarkably paralleled that of the legendary John W. Campbell, Jr. Each editor brought on a stable of new writers, in addition to retaining (or re-recruiting) the best writers of a previous administration. Each editor also ran afoul of reader resistance when he attempted to introduce a variety of pseudoscientific cult material in the 1940's and 1950's. For Campbell it was Dianetics, and other oddities; for Palmer, it was first the Shaver Mystery, and later an infatuation with Flying Saucers. Much given to hucksterism and juvenile promotional appeals, Palmer met strong resistance in science fiction and withdrew to concentrate on occult publishing after 1957. However, his real achievements as an editor have been sorely underrated, and an examination of files of the magazines he edited reveals an absolute treasure-trove of overlooked material, by many leading writers. He lured Edgar Rice Burroughs back to the science-fiction magazines after an absence of 12 years. Palmer was the first editor to publish stories

by Isaac Asimov, for all that the latter prefers to emphasize his later association with Campbell in his reminiscences. It is to be hoped that as the lingering bad taste of "Shaverism," "Saucerism," and Palmer's other regrettable antics fades away, his very significant editorial contribution to modern science fiction will be more appreciated.

Palmer's own fiction, upon review, indicates a considerable talent but one which was not applied sufficiently consistently to produce a coherent body of works. In Palmer's earliest work, for Gernsback's *Wonder Stories*, he shows strongly the influence of early writers in the field. "The Time Ray of Jandra" reads like a throwback to the early 19th century, with a first-person narrator explaining the circumstances of his birth and naming, and continuing through over-long paragraphs to detail a discovery tale in which he is purely an observer rather than a participant. Before long, Palmer had fallen into the pulp style. His stories of the 1930's and 1940's show a fully developed set of pulp characteristics: simplistic but highly colored characterization, heavy doses of violent action, a reliance on coincidence and a strongly romantic bent. An excellent example, further embellished with occasional pseudo-scientific asides, is "The Test Tube Girl" (as Frank Patton). In his few stories published in the 1950's, Palmer appears to have overcome the worse excesses of his pulp period, and to have moved toward a less heavy-handed and melodramatic approach.

Edgar Pangborn's work, according to Damon Knight, reflects "the regretful, ironic, sorrowful, deeply joyous—and purblind—love of the world and all in it." Pangborn sees wonder in the ordinary, removing the reader from mundane perceptions. Some readers resent this heightening of the conventional. Knight sees Pangborn's magic as a veil obscuring the story. "The author will not get out of the way, but forces you to look through his own misty substance at what he wants you to see." A moment of reflection reveals that this sort of reaction indicates a matter of taste. Pangborn is an individual writer who directs the reader's perceptions; he does not write to the reader's order. Pangborn's view of life is tragic, comic, serious, and speculatively imaginative; his range is wider than many critics suspect. He is one of the few writers of SF and fantasy who was also a major fiction writer. His ideas were not always original, but he always managed to transform them.

"Angel's Egg," Pangborn's first story, is a powerful and very moving alien-contact story which pleads for tolerance and patience in regard to humankind's fate. Often reprinted, this story would have been enough to make a name for any writer. Pangborn's first SF novel, *West of the Sun*, is a deeply felt story of interstellar castaways, notable for its vividly realized settings, complex characters, and a painful knowledge of human failing. The sense of being there with the characters is overwhelming. *A Mirror for Observers*, a story of alien observers on earth who struggle between being watchers and meddlers, reaches Stapledonian heights of thought and feeling about the fate of humanity, but without the Stapledonian vistas. Pangborn's focus is more personal and intimate. Pangborn regarded *Wilderness of Spring* as a historical novel. Set in colonial New England, there is much in the story's pioneer spirit to interest the SF reader (one of the characters becomes a scientist). *The Trial of Callista Blake* is a novel on the theme of capital punishment.

*Davy* is Pangborn's most famous novel. Set 300 years after a nuclear holocaust, the book is a memoir written by the title character who grows from a bondsman to an ambitious leader concerned with the fate of humanity. Funny and tragic, bawdy and adventurous in the manner of *Tom Jones*, *Davy* is one of the lasting works of SF. A similar work, but one involving a female counterpart to Davy, *The Judgment of Eve* is not as well known, but, filled with the agony of choices, the book will please anyone who has enjoyed Pangborn's work. It has been suggested that the ambiguous ending might have been the result of editorial pressure to avoid depicting a *ménage-à-quatre*. *The Company of Glory* is set in the same world as *Davy* and *The Judgment of Eve* (though the Pyramid edition was censored as being "too faggoty") *Still I Persist in Wondering* contains most of the shorter works set in the world of *Davy*.

Pangborn's body of work is of a consistent high quality. A reader who responds to his work will want to read it all; but Pangborn is clearly not for everyone who reads science fiction. The narrow genre addict cannot enjoy Pangborn without widening his reading horizons. His work addressed itself to the great problems of life and death, the mystery of existence, personal worth. Paradoxically, science fiction, though it claims

to be a literature of ideas and wide vision, rarely rises above the entertainment formulas. Pangborn helped keep alive the tradition of "high science fiction," even while the pejorative genre association with SF dragged down serious receptions of his work. Above everything else, Pangborn brought an overpowering sense of beauty to science fiction. *West of the Sun* glows with an unwearying light: "I give you birth and death and the journey of our days and nights between them, the shining of green fields, and patience of the forest, the little stars, the great stars, the love and the thought, the labor and the laughter, the good morning sky." *A Mirror for Observers* breathes with an unwaning love: "Never, beautiful Earth, never even at the height of the human storms have I forgotten you, my planet Earth, your forests and your fields, your oceans, the serenity of your mountains; the meadows, the continuing rivers, the incorruptible promise of returning spring." In trying to make us see, hear, and feel the important things that we so often forget, Pangborn aspired to the utterance of music, his first love.

Alexei Panshin comments:

My first aim as an Sf writer is to tell good stories. To me, that means the solidest, most complete, truest stories I can imagine. My second aim is to make every story new in some way: new characters, new settings, new style, new to myself. For me, each story has its own unique voice, its own autonomy, and I've got to find it and respect it and love it into being.

Most of the time I write stories slowly, and I get published even more slowly. 20 years after I first began to write, I've published five novels and one book of stories. An editor wrote to my first agent: "I used to think Panshin wrote this way because he was stubborn. Now I think he just doesn't have a very interesting imagination." I don't know which it is. All that I know is that the SF that I want to write is still beyond me, but I haven't giving up trying.

\* \* \*

Alexei Panshin began publishing science-fiction stories as an undergraduate. He had already conceived and begun writing the Nebula Award novel *Rite of Passage* while serving in the army. The novel, an acknowledged science-fiction classic, is an anthropological novel of the maturation of Mia Havero, the 19-year-old narrator recalling her one month "trial." The time is 150 years after the earth has been destroyed. The trial is a survival test that all 14-year-olds living on the asteroid star "ships" must undergo on a colony planet in order to be adult citizens. The point of view of an adolescent girl and her maturation are well done, though she and her friend, Jimmy Dentremon, seem rather precocious, particularly at the conclusion of the novel. In its psychological realism and the careful delineation of the "ship" society and the colony planet culture, *Rite of Passage* is Panshin's major fiction achievement.

The three Villiers novels, *Star Well*, *The Thurb Revolution*, and *Masque World*, follow the adventures of the titled Anthony Villiers and his inscrutable, unpredictable alien companion, Torve, the frog-like Torg. Each novel takes place on a different planet near or in the weak Nashua Empire. Panshin incorporates many comic elements, parodying space operas, spy thrillers, novels of intrigue, and regency and picaresque novels. The narrator is a cynical observer of the human comedy who interrupts the narrative with epigrammatic comments and short essays on human folly and absurdity. While amusing, the literary parody is occasionally labored and the relativistic, amoral narrator can become wearing. However, the emphasis on style and manner is appropriate to the genres being parodied and to the character of a rebellious, wandering aristocrat whose adventures are precipitated by the failure of his father's remittance to arrive. Sometimes Panshin's learning is brought in rather obviously. The novels become increasingly pessimistic. *Masque World* has the weakest plot and ends the most grimly.

*Farewell to Yesterday's Tomorrow* includes stories written between 1966 and 1975 and shows how deeply affected Panshin was by the revolutionary 1960's and early 1970's in America. "The Sons of Prometheus," "A Sense of Direction," and "Arpad" employ the basis situation of the asteroid star "ships" from *Rite of Passage*. "Sky Blue" reflects a concern with the rapacious development of planets and, by extension, the exploitation of earth's ecology. "When the Vertical World Becomes Horizontal" preaches the need for freedom and spontaneity to replace rigid social assumptions and behaviour. Panshin's disillusionment with the failure of the counter culture

of the early 1970's is apparent in "How Can We Sink When We Can Fly?" "Lady Sunshine and the Beatus" (written with his wife Cory) is a quest story and a phantasmagoric version of the Beauty and the Beast fairy tale. It ends the collection optimistically and romantically.

*Earth Magic*, also in collaboration with his wife, is an intriguing heroic fantasy which follows the adventures of Haldane, the son of Black Morca, a barbaric warrior tyrant. It is an exploration of the themes of change, identity, and reality versus vision or magic.

Kit Pedler commented:

(1981) My science fiction has always had to do with small logical extensions of current reality. I am currently engaged on "Document from the Year 3," for example, which deals (post hoc) with the evolution of homo sapiens, and "The Logon" which are the result of mating between a mould and a microchip!

\* \* \*

Kit Pedler and Gerry Davis wrote three popular disaster novels following their collaboration on BBC-TV's *Doomwatch* series and their creation of the Cybermen for *Doctor Who*. Strong on the science background, these novels are sometimes markedly weak as fictions because of poor characterization and, particularly in *The Dynostar Menace*, a reliance on stylistic and suspense clichés. Nevertheless, the narratives are at times remarkably exciting and well-sustained, as in the well-executed main sequence in *Mutant 59*, *The Plastic Eater*, when a small group is trapped in the London Underground by fire and explosion. Further, the authors sometimes achieve nice ironic and satirical effects, for instance, by well-timed narrative switches of focus from one character to another in *Mutant 59*.

As prophets of doom, Pedler and Davis seem to be telling us that we are unwise to rely on over-complicated mechanisms that are vulnerable to simple accidents, caused by unforeseen weaknesses or dangers in materials, human error, or simply the over-complication itself. If we heeded their warnings, we would take immediate steps drastically to simplify our lives. At the end of their second and strongest novel, *Brainrack*, this solution is rendered highly appealing by an idyllic evocation of a London without motor vehicles. The solution, perhaps unfortunately, is more convincing than the threats, which are needlessly fantastic. It is not strictly necessary to postulate the existence of a mutant virus that feeds on plastic (and finds abundant food when a new sun-degradable plastic is marketed), in order to explain severe disasters to airliners, submarines, and London. That men brought up in cities are suffering irretrievable brain damage because of an unsuspected ingredient of petrol is a highly unconvincing explanation of the destruction of a new nuclear power plant. It does not seem very likely that a satellite reactor will disrupt the ozone layer of earth's atmosphere and burn large areas of the surface of our planet. (Human greed and negligence are sufficient explanations, as in a disaster novel that is not regarded as SF, John D. MacDonald's *Condominium*). However, these startling threats are piquant and intriguing, and, to be fair to the writers, they take ample account of familiar human nature as a contributory cause of the disasters. What they like to do, in fact, is to make their point by showing how easy it is for various weaknesses inherent in a system to compound each other: the "plastic eater" is simply the icing on the cake. Pedler and Davis are particularly convincing when, in the early part of *Brainrack*, they expose the "EMMY" (man-machine interface) dangers: most of us know how easy it is to hit the wrong keys on typewriters, or misread simple instructions, or confuse colour codes. There is a grand tour de force in *Brainrack*, a long sustained narrative account of the effects of meltdown on the workers in a nuclear reactor. This is vivid and horrific and, except that some people survive, for the sake of the story, highly convincing.

*The Dynostar Menace* stands apart from the other two novels in being set in a closed environment, a space lab, and having the

form of a kind of hard SF version of Christie's *Ten Little Niggers*. In this sort of plot, versions of which can often be found in TV series (*Blake's Seven*) or films (*Alien*), the actual nature of the threat is almost bound to be subordinated to the excitement of detection (here, of a saboteur) in a race against time. Exceptional imaginative power and skill, particularly in characterization, are needed to lift such a hackneyed plot from cliché and perhaps it is here that we can see how a background in TV script-writing may have been a disadvantage, particularly to Davis. However, their three works together constitute a notable contribution to disaster fiction and they were perhaps a shade unlucky to have slightly anticipated the greatest market for this branch of the genre.

\* \* \*

In *Love in the Ruins*, his only work of science fiction, Walker Percy uses a chaotic future to dramatize our present chaotic and amoral state. Dr. Thomas More observes the end of life-as-we-know-it, watching from his Louisiana vantage-point as America polarizes into abstraction and lust, the polarization cause by heavy sodium and chloride escaping into the atmosphere from underground. More has a machine which can measure and treat the disorders these heavy chemicals cause. The novel takes place in the future, and a new mechanical invention is crucial to the plot: it is science fiction. However, the science would pass no laboratory test—it is symbolically, not scientifically, logical. More is a great deal like his famous namesake; holding out against sin (he never stops believing in God and love) with humorous self-effacement, he beats the devil, here named Art Immelmann. Abstraction and lust are referred to by “technical” and rather medieval terms, angelism and bestialism. The heavy chemicals are sulfur and brimstone, welling up from hell, and More’s invention is a lapsometer, which measures and treats nothing less than the disorders of the soul. America is going to hell because of its tendency to polarize into pure abstraction and pure lust, and because it has failed a simple moral test, by violating every right of the black people it transported from Africa.

In “Notes for a Novel about the End of the World” (in *The Message in the Bottle*), Percy makes it clear that we are not to take the strange signs and portents of *Love in the Ruins* as the ephemera of a disordered mind, though More is clearly disturbed. It is the world which is in disorder: “It may be useful to write a novel about the end of the world. Perhaps it is only through the conjuring up of catastrophe, the destruction of all Exxon signs, and the sprouting of vines in the church pews, that the novelist can make vicarious use of catastrophe in order that he and his reader may come to themselves.” By making vividly concrete America’s spiritual ills, and by warning us through his description of a possible future, Percy hopes to make his readers aware of their present condition. The result of his concretion is a witty and humane novel written in the philosophical tradition of the American romantics and William Faulkner which makes meaningful and entertaining use of science-fiction devices.

Percy makes only passing reference to science fiction in later works. The eponymous anti-hero of *Lancelot* talks of a chivalric “Third Revolution” and Will Barrett of *Second Coming* expect’s Jesus’s reappearance, but neither future ever materializes and

life-as-we-know-it continues. The curious *Lost in the Cosmos: The Last Self-Help Book*, a statement of philosophy and a satire of pop psychology, uses hypothetical aliens and space odysseys in hypothetical situations to illustrate hypothetical questions. While it does not use science fiction, it uses the tools of the genre to discuss ideas.

Emil Petaja comments:

My writing endeavors have mainly been to entertain, except for the factual material concerning Hannes Bok and fantasy art in general, which serves to indicate my enthusiasm for these subjects. My novels about the Finnish legendry epic *Kalevala: The Land of Heroes* spring from a lifelong interest in this fine poetic work. I own six translations of the *Kalevala*, as well as the work in the original. Both my parents were Finnish.

\* \* \*

Though Emil Petaja published short fiction sporadically during the 1940's and 1950's, his important works were written in the 1960's. Most of these novels were published by Ace Books, and even those that were not followed the Ace formula: heavy on action, with some superficial romance. Though Petaja never sought to go beyond this formula, his innovations within its structure are impressive. Petaja's choice of story-material is the source of his appeal, for into the traditional settings of science fiction he transferred mythic heroes and situations, devoting particular attention to his own Finnish myth-heritage, the *Kalevala* story-cycle. Petaja deftly contrasts the sterile safety of centralized civilization (into which the hero is born) with the barbaric but vital hardship of primitive culture (into which the hero is initiated), and though the author concedes the necessity for both milieus, he emphasizes the greater need for preserving humanity's potential. Unlike most Ace "common man" heroes, Petaja's protagonists are strong, romantic-minded men, slightly alienated in progressive society, but greatly attuned to the poetry of myths. Ultimately the hero's ability to empathize with mythic situations is the factor which saves all of humanity—whether directly by battling destructive forces or indirectly by mastering the situation with poetic insight (*Alpha Yes, Terra No!*)

In the *Kalevala*-based novels the hero's empathy is deep enough to propel his psyche upon astral journeys, becoming merged with a Finnish hero endowed with magic (psychic?) powers. These are probably the best of Petaja's works because of their belief in an actual existence of the Finnish mythos, even by means of rationalizations like psychic powers and alien entities. Thus the mythos provides the structural basis for evoking the poetry of Finnish culture. Earlier authors' works had also rationalized myths into science fiction (Henry Kuttner's *Mask of Circe*), but Petaja is virtually the first to maintain limited fidelity to the cultural content of the myths, rather than manipulating it to fit melodramatic purposes.

Less successful, but equally colorful, are the two books of a plantary culture modeled on Irish story-cycles, though no particular myths are emphasized by the plots of *Lord of the Green Planet* and *Doom of the Green Planet*. The supernatural creatures of Irish myth are robots and alien entities, while the "Irish" are merely transplanted humans from other planets, all brought together by a mad Fenian poet with super-scientific resources. Though entertaining these books do not have the poetry of the *Kalevala* books, for the Irish culture is merely a

giant mock-up rather than a shamanistic culture like the Finns', seen as surviving into the future. Furthermore, though the mythos-structure is less articulated, Petaja displays more dislike for the "progressive" civilization beyond the Green Planet than in earlier novels, and greater cognizance of the conflict between the appeal of heroism and the necessities of humanism.

Of the non-related books, the best is *The Path Beyond the Stars* in which a man and woman traverse several time-periods attempting to acquire knowledge of the universe's destruction—which they ultimately cannot prevent, though they can become the Adam and Eve of another cosmos. The other novels have less imaginative scope, but, in a melodramatic way, they all work toward the same goal: regeneration of the heroes' mythopoetic faculties, and thus the redemption of the profane world.

Petaja's importance to science fiction is that of a precursor of the increased use of myth in late 1960's SF. At their best his works suggest an archaic heritage of man not unlike the findings of anthropologist Mircea Eliade—a heritage which most contemporary writers, SF and mainstream alike, have chosen to neglect.

\* \* \*

Rog Phillips (the name by which Roger P. Graham was generally known to science-fiction readers) became a professional writer in his mid-thirties, after several years as a power plant engineer and shipyard welder, and quickly established himself as a prolific and reliable producer of pulp fiction. Phillips used many pseudonyms, including several house names.

Until 1950 Phillips wrote exclusively for the Ziff-Davis magazines; his SF and fantasy fiction appeared in *Amazing Stories* and *Fantastic Adventures*. Phillips wrote everything from featured novels to short stories and fillers. A large part of this output was routine work done to editorial order, but it was often a notch or two above the general level of quality in the magazines, and was very popular with the readers. The first work to attract wide attention was the novel, "So Shall Ye Reap." Starting with the premise that the five atomic bombs already exploded by 1947 had released enough radioactivity into the atmosphere to affect the genes of future generations, the novel offered a scenario of the next hundred and fifty years, in which mankind established an elaborate underground civilization and retreated from the Earth's surface. Although marred by polemical stretches and badly dated now, the story nevertheless has some effective scenes and an overall crude energy. A sequel, "Starship from Sirius," added human colonies on Mars and Venus and an insect-dominated Earth in the far future, and was quite different in tone from its predecessor.

Four memorable Phillips stories appeared in 1949. "M'Bong-Ah" was a novelette telling of the colonization of Venus and of the Earthman who became the natives' pawn in their resistance to the invasion. "Matrix" and "Beyond the Matrix of Time" together form a complex story of time paradox and alternate realities. *The Involuntary Immortals* is the story of a group of "accidental" immortals who band together to discover the source of their immortality and to protect themselves against the

vengefulness of their own jealous relatives.

Starting in 1950 Rog Phillips's stories had begun to appear in a wider variety of magazines. "Rat in the Skull" is a memorable story of an experiment in rodent intelligence; "Ground Leave Incident" is a hard-boiled episode on a frontier planet; "Services, Inc." is an offbeat deal-with-the-Devil story. By far the most successful story Phillips ever wrote is "The Yellow Pill," a brief tale of multiple subjective realities.

Marge Piercy is a fairly prolific author, with several books of poetry and fiction to her credit, but of these only two can be claimed for science fiction. *Dance the Eagle to Sleep* is only peripherally within the genre, a vivid though unsatisfying picture of an attempt by young people to break away from society and set up a tribal-based, loving, and supportive community. It does point forward, as do many of Piercy's other writings to her most successful work, *Woman on the Edge of Time*, a vision of future utopia.

In one sense *Woman on the Edge of Time* has had more attention than it deserves: science fiction, utopian, and, above all, feminist scholars have written about the book extensively. On the other hand, this is the best written of the many feminist utopias that have appeared in recent years, and, unlike most utopian works, it is a novel with believable characters, an interesting plot, and potential for implementation. That it is also a careful, complete portrayal of the kind of society a reformer of the early 1970's would envisage as an ideal future only adds to its importance, in the field of utopian literature at least. There are, of course, many elements that are common to science fiction: travel through time, alternative futures, advanced technology—both physical and mental, new social and sexual groupings, and most important of all, extrapolation of current knowledge to plausible and far-reaching conclusions.

The heroine is Connie Ramos, Chicana, welfare-mother wrongly charged with abusing her daughter, patient against her will in a mental hospital, and victim of various experimental medical "treatments," including implantations of electrodes in her brain. Beginning as scattered dream impression, then in a real presence at first frightening to Connie, Luciente—"from a village in Massachusetts—Mattapoiset. Only I live there in 2137"—gets through to her as the first contact from a future into which she is soon able to journey more and more easily. The story of her horrible and inhuman experiences in the mental hospital is alternated with these visits to the pleasant new society of the 22nd century where many new friends teach her about their world. But always she is pulled back to the ugly world of

doctors, ever-present nurses and attendants, and the ill-treated patients on whom they practice their cures and make their experiments, Connie's true 20th-century friends.

In Mattapoiset—utopian despite Piercy's claim that it is not but rather "the result of a full feminist revolution"—an ecologically responsible, loving, non-sexist (male and female pronouns have been replaced by "per") community has learned that its own existence is threatened by the possible outcome of the experiments being conducted at Rockover State Hospital. The contact with Connie is part of their attempt—there are four others, all also in mental hospitals or prisons—to prevent these undesirable consequences. Connie, it is apparent to Mattapoiset, can be a major factor in the conflict between technology wrongly used and the opposition and rebellion of those who want the kind of society that Mattapoiset represents. Bringing her to the right action, to fighting back against the system that has mistreated her, is a matter of showing her the beautiful future they represent as opposed to the dystopian society of her own day or the alternative future described in chapter 15 that would come as a result of her failure to act. Although the people of Mattapoiset are peaceful, they fight when necessary to defend their community—as Connie discovers on one of her visits, and they remind Connie that sometimes, especially in her time, the violence-prone must be resisted. Connie does take drastic action, but she is clearly doomed to end her days at Rockover.

Perhaps, as has been suggested by several critics, Connie's visits to the future are all hallucinations—certainly she has been sufficiently drugged to make such a suggestion reasonable. But hallucination or not, the story deals with a tormented victim of the evil in society, an almost-innocent, betrayed by those closest to her, who cannot understand why things work out for her as they do. The contrast with the beautiful world that might be is clearly the work of a reformer who feels deeply the injustices of this world and believes just as deeply in the things of which she writes. But, no matter what the motivating force behind its productions, this is an excellent novel, deserving of its warm critical reception. Piercy may never write another work that fits the science-fiction mold, but this work has earned her a permanent place in the utopian branch of the genre.

\* \* \*

H. Beam Piper's science fiction is largely the stories of heroes (or heroines), with ideas apparently subordinate to the needs of plot and action. This is most evident in novels such as *A Planet for Texans*, *Four-Day Planet*, *Space Viking*, and *Lord Kalvan of Otherwhen*. The last two of these, especially, are fast-paced adventure yarns, with a well-developed central figure, but quite two-dimensional supporting characters. In each case, the hero (Calvin Morrison in *Lord Kalvan of Otherwhen* Lucas Trask in *Space Viking*) is forced by circumstances totally beyond his control to enter a life radically different from the one that he had anticipated. A major difficulty each man must resolve is the ethical dilemma of the life which he perceives as central to his functioning. Thus, Morrison is caught in the field of an interdimension/time travel machine, while Trask on his wedding day has his bride-to-be killed by her rejected suitor. Morrison must agonize about the appropriateness of introducing more sophisticated weaponry into an essentially static culture, Trask the ethics of killing and looting even though the attached planets are decadent remnants of the "Old Federation." The ultimate results of the activities of each man are intrinsically the same as well: Morrison defeats Styphon's House (which opposed progress and sought to divide countries against one another) while Trask defeats the destructive forces both on Marduk and among the space vikings, establishing Tanith as a progressive planet which is destined to lead a new League of Civilized Worlds.

Perhaps his most famous works are *Little Fuzzy* and *The Other Human Race*. *Little Fuzzy* builds towards a dramatic courtroom scene in which good and evil clearly clash over the question of the sapience of the Fuzzies. Again there is a central heroic figure, Jack Holloway, discoverer of the Fuzzies. The ethical dilemma to be resolved is whether to recognize the Fuzzies as sentient, giving them *prima facie* right to their own planet and thereby displacing the human interests on the planet Zarathustra, or to allow them to be treated as charming and quick-to-learn animals, subjecting them to what is—for a

sentient being—slavery. Holloway's determination and courage in the face of the bureaucratic opposition to the recognition of the Fuzzies as sentient has elements of the heroic physical challenges confronting Morrison and Trask, but it is primarily a moral courage in the face of social opposition. In *The Other Human Race* the same basic problem is repeated except that the ethical dilemma is whether or not to honor the governmental commitment to the Fuzzy Reservation in the face of economic pressures to open the Reservation for mining. There is the added problem of the radical increase in defective births among the Fuzzies. The apparently neutral position of doing nothing about Fuzzy rights is extensionally the same as the decision to exterminate the Fuzzy race, for the humans have it within their power to halt the flood of defective Fuzzy births. Again, in both books, the resolution of the ethical dilemma leaves the world rather significantly altered in the direction of progress-as-we-know-it.

A side light which may be of significant interest has to do with the name of the Fuzzies' planet—Zarathustra, the name of the central figure in the pre-Christian middle-Eastern religion Zoroastrianism (Zoroaster was also known as Zarathustra), similar to the Christian Manichean heresy, which argues the existence of two co-equal forces in the universe, Ahura Mazda (good) and Angra Mainyu (evil). An interesting speculation is that Piper was consciously trying to depict such a struggle in the Fuzzies novels. The planet's name might also have been an allusion to Friedrich Nietzsche's *Also Sprach Zarathustra*. This interpretation offers a potentially convoluted approach to the text because Nietzsche argued for the recognition of man *and* *superman*. Since the superman is exempt from the constraints of normal ethics, one might have expected a different conclusion.

Piper's other writings more or less follow the same pattern: the hero/heroine is struck by a major ethical problem—paternalism over proud people in *A Planet for Texans*; revolution or economic slavery in *Four-Day Planet*; human dependency upon its own machines in *Junkyard Planet*; the dominance of scholarship by economics in 'Omnilingual.' In each case the protagonist chooses honor and decency, but also, more significantly, the choice is made for progress. Those forces which support the status quo are doomed from the outset. In a Piper story one "knows" that the hero/heroine will prevail, but only after terrible difficulties. More impressive, however, is Piper's recognition that such successes must result in a significant alteration of the world on which they occur. Although Piper's works will never get him classed as a great writer, they certainly would get him listed as one whom the reader enjoys.

\* \* \*

Doris Piserchia's strongest asset in her novels has been the exotic and colorful settings she has created. *Star Rider*, for example, features a young girl who has a telepathic bond with a horse. The two of them can teleport themselves around the universe, encased by small pockets of environment. They are looking for a fabled world which turns out to be a ruined, deserted Earth tucked into another dimension. Her quest is complicated by a number of other parties involved not only in her quest, but interested as well in her mutant ability to transport herself across intergalactic as well as interstellar distances.

In *A Billion Days of Earth*, men have assumed godlike powers and many of the lower species of animal have acquired intelligence. A vigilante metes out his own brand of justice in *Mister Justice*. But the novels that followed these spent less time on characterization and more on setting and plot, with mixed results. *Earth Child* for instance is almost one constant chase-

adventure-battle scene. Earth is being contested by Indigo, a plant that is becoming an ocean, and Emeroo, another plant that is much smaller in size but possibly more powerful in the long run. The last living human is a young girl named Ree, who spends much of her time flying giant insects and fighting the blueboys, plant growths that can move independently and who became increasingly human as the story progresses.

The plot of this novel shows up again in *Doomtime*, this time with gigantic trees battling for control of Earth, with the human race as pawns in their games. It shows up again in *Earth in Twilight*, except in this case the protagonist is a lone space explorer who returns to abandoned Earth to find it overgrown by a gigantic forest inhabited by newly sentient races and giant insects. The astronaut is a classic antihero, unable and perhaps unwilling to make any serious attempt to improve his situation, and the forest of Earth is itself really the strongest character in the novel.

Alien monsters figure even more centrally in two other novels, *The Fluger* and *The Spinner*. The first is rather minor: a gigantic alien wreaks havoc in a closed Earth city until eventually brought to its death by booby-trapped food. The second novel is considerably more interesting. An alien from another dimension spins a mysterious web over an entire city and begins to reproduce his kind in preparation for conquering the entire world.

Inter-dimensional adventures are another staple in Piserchia's novels. In *The Spaceling*, mutants can perceive different dimensions because of drifting rings that allow movement from one plane of existence to another. A young man is drafted into the effort to prevent an interdimensional invasion in *The Deadly Sky*. An extra-dimensional chase is the main plot of *The Dimensioneers*, which transports us from one weird environment to another so quickly that it is almost a comic book adventure without pictures.

Piserchia made more serious efforts at characterization in two recent novels published under the name "Curt Selby." *Blood County* is a supernatural adventure story involving a vampire who has set himself up as a virtual feudal lord. *I, Zombie*, despite the title, is straight science fiction. The recent dead are fitted with implants that allow them to be used as slave laborers with no will of their own, until one such body begins to reawaken its former personality and sets out to free others from their bondage.

Although an infrequent writer of short stories, Piserchia has had over a dozen published over the years, perhaps the most interesting of which are "Empty Eden," a variation of the "Dorian Gray" tale, "Deathrights Deferred," another story of reanimated corpses, and "Rocket to Gehenna," in which an asteroid cemetery is emptied by new tenants, a story marred by silly pseudoscience, but also featuring some of her best writing.

\* \* \*

The science fiction written by the old *New Worlds* writers, of whom Charles Platt is a prolific and representative specimen, tends towards the antithesis of the scenario in which a macho hero saves (and preserves in an unchanged or improved state) the world from an alien threat before setting blasters for home, a beautiful but useless girl at his side. Theirs is the science fiction of despair looking to a future where things are inevitably worse. Their pet threats are those implicit in human or cosmic nature, and their totem motif is the inexorable unwinding of the universal mainspring. The entropy in Platt's fiction is the disorder created by the breakdown of the social mechanism rather than the heat death of the universe. His two major novels, *The Garbage World* and *The City Dwellers* (rewritten, with added love interest, as *Twilight of the City*), both concentrate on people coming to terms with the collapse, or loss of meaning, of the system which produced them.

In *The Garbage World* a two-man team arrive, ostensibly to repair a defective gravity generator but actually to blow up Kopra, the rubbish tip of the Asteroid Belt; its inhabitants, as befits the planet's name, pursue the anal pleasures of establishing pecking orders and hoarding trash in a landscape of shanty towns, stinking swamps, and gigantic mutated slugs, with a miserable climate exacerbated by a constant rain of space-going garbage packs. One of the new arrivals is converted to their insalubrious but unrepressed lifestyle, having fallen for the head man's dirty daughter; and after sundry erotic and other adventures in the sewerlike backwaters of the planet, both Kopra and the other official (clean-handed but dirty-dealing) are messily blown up, smothering the pleasures of the pleasure worlds of the Asteroid belt in a shower of excrement.

*The City Dwellers* has undergone several mutations between appearing as a series of disconnected short stories in *New Worlds* and being completely unified into *Twilight of the City*. This increase in order defies the second law of thermodynamics, but the story in all its forms goes along with it, forsaking the metaphor of *The Garbage World* in an attempt to depict with prophetic realism the degeneration of organised society. Trendy, hip characters from the pulsating, neon-lit heart of the city are forced, as the beat runs down, to abandon the twitching carcass and scrape an existence in the hostile countryside, finally returning to the rotting corpse to exterminate the last few worms which prey upon it.

There are no hairy-chested heroes in shiny suits and boots in Platt's novels. Even in *Planet of the Voles*, most space-operatic of his books, the protagonist struggles in hunger, rags, and filth through a hostile environment to confront a feared enemy and find it (although still an implacable enemy) jewelled, perfumed, and closer to him than he at first supposed. Platt's real heroes are small-time misfits: the coprotropic official of *The Garbage World*, the "socially inept" songwriter of *Twilight of the City*, the artist and the runt of the artificially reared crew of military men in *Planet of the Voles*. They survive where the perfect

specimens bite the dust, and in adjusting to the filth and pollution of the rubbish tip or the hardship of scraping a living on the land rapidly come to find, if not happiness, at least substance in the unsynthesised pleasures of life away from the glitter of the civilised artifice. The immaculate white gloves and the rhinestone-studded suit are well lost for such a reward. It is not optimism, but when the cake has been snatched away it is a crumb of consolation.

#### Frederik Pohl comments:

I write what interests me, in the hope that it will interest others. The things that particularly interest me are: The mismatch between what people say and what they do (U. S. presidents being only the most conspicuous example); The turbulence and elegance of science, particularly at its frontiers (science is my favorite spectator sport); The vulnerability and confusion inside the most plastic of human faces; The sound of language, and the amusing tricks that can be played with it; and Morality.

How thoroughly I communicate these concerns I can't easily tell, but when I stop trying I will stop writing.

\* \* \*

A major figure in science fiction for more than four decades, Frederik Pohl in his best work combines technical extrapolation and penetrating social commentary with narrative complexity and a distinctive sardonic style. His 1950's short stories attracted attention with their satire of American consumer society, upending conventional expectations about economic planning ("Rafferty's Reasons"), social stratification ("My Lady Greensleeves"), and population stabilization ("The Census Takers"). The first of these "comic infernos" to gain major attention was "The Midas Plague," in which increasing status in an overproducing economy accrues to people entitled to consume less. This tall tale multiplies complications for comic effect, satirizing the assumption that affluence is infinite. Best of the "consumer cycle," however, is "The Tunnel under the World," horror story based on penetrating insight into social manipulation by commercial interests. In it, Guy Burckhardt finds his mind imprisoned in a tiny automaton, at the mercy of a

market research firm's controlled experiments. Derived partly from his advertising and sales experience, this motif of mind manipulation echoes throughout Pohl's work.

Collaborating since 1940, Pohl and C. M. Kornbluth gained fame with *The Space Merchants*. Its future dystopia run by advertising agencies is the setting for another tall tale, relating the fall from grace of ad executive Mitch Courtenay. Surviving addictive rations and a labor camp, he converts to the "Consies" (Conservationists) and subverts the admen's scheme to dump excess production and population on Venus. With sometimes manic humor, the novel moves swiftly to its climax, side-swiping venerable social institutions and incorporating a routine love-story plot. Other Pohl-Kornbluth collaborations were less impressive, especially where aliens are invoked to explain human failings (a Pohl weakness). *Gladiator-at-Law* took on the legal profession, *Search the Sky* attacked planetary isolationism, and *Wolfbane* was an occasionally chilling variation on the theme of aliens ruling human zombies. Another dystopian collaboration (with Lester del Rey), *Preferred Risk* is a lackluster exposé of dictatorship by worldwide insurance companies.

Another partnership, with Jack Williamson, began in the 1950's with formula-perfect adventure stories for children, *Undersea Quest*, *Undersea Fleet*, and *Undersea City*, overly reliant on coincidence, derring-do, and black-and-white characterizations. They also wrote *The Starchild Trilogy*, a straightforward if tedious entertainment lacking Pohl's verbal economy and social immediacy. Pohl's influence is more visible in Cuckoo's Saga (*Farthest Star* and *Wall Around a Star*) in which people are replicated on a multi-race starship bound for a distant artificial planet, but the plot wanders with multiple crises and undistinguished characterizations.

Pohl's own novels have generally grown from alien-fighting melodrama to fables of human folly. Exploring communication with animals in *Slave Ship*, he satirizes higher education in the dystopian *Drunkard's Walk*, and stresses the horrors of alien mind control in *A Plague of Pythons*. Just short of a comic masterpiece, *The Age of the Pussyfoot* tells how a man revived from cryogenic freezing finds a continually progressing world is not his oyster.

His chief advance in the 1960's he called "velocity exercises," minimal stories with little plot or dialogue. "The Martian Stargazers," for example, derives Martians' race suicide from their astrological lore. "Speed Trap" shows how the honors and trappings of a scientist's success thwart future creativity. Pohl perfected the form in "Day Million," a "love story" of the far future when "boy" and "girl" and "marriage" have been redefined.

His consistently best work emerged in the 1970's, however, and in longer forms. "The Merchants of Venus" is a tale of adventure with a happy ending, but its real interest lies in the setting, the hellish Venus of modern astronomy, and a socio-economic situation little short of desperate. In "The Gold at the Starbow's End," a misfired experiment sends ten bright young people to explore a nonexistent planet orbiting Alpha Centaurus. Ten years of concentrated thinking turns them into supermen, creating their own world and returning to select colonists from a devastated Earth. A rare utopian story, "In the Problem Pit" shows ordinary people in a "think-tank" helping society surmount intractable obstacles. His finest treatment of mind control, "We Purchased People" is based on the "sale" of human criminals to alien remote control in a deal bringing trade to "backward" Earth from extraterrestrial civilizations.

*Man Plus* focuses on the transformation of Roger Torraway to help him survive on Mars; his self-control, his identity, even his sex are stripped away, making him more minus than plus.

The real "plus," man's computer network, narrates how it manipulated events to arrange its own survival on more worlds than one. Set in the future of "The Merchants of Venus," *Gateway* intertwines a literally mechanical Freudian analysis with a story of chance-ridden space exploration via alien ships abandoned (by the "Heechee") on an asteroid. The thoroughly dislikeable protagonist, Robinet Broadhead, stands in for human society depending for survival on a cosmic game of chance. Potentially heroic on the small scale, Broadhead's self-confrontation makes the book's emotional content as honest as its presentation is complex. In *Jem*, a tripartite division of Earth society (productive of food, energy, and people) is projected allegorically upon an alien planet, in conflict with three coexisting intelligent races of natives. The final amalgamation (ironically utopian) of all four races and all six life-styles is threatened by contact with a human colony near Alpha Centaurus. Though lumbering and mechanical, the book has scenes and passages of undeniable power, and a dire message for mankind to cooperate or die.

After this spate of works confronting real problems and hard solutions in challenging narrative structures, most of Pohl's 1980s novels are disappointing sequels. *Beyond the Blue Event Horizon* and *Heechee Rendezvous* progressively increase the scope and the threat to human survival, losing the personal and temporal immediacy of *Gateway*. *Starburst* does something similar to its original, "The Gold at the Starbow's End." *The Merchants' War* largely repeats *The Space Merchants*, and *Midas World* adds little to the "consumer cycle" of stories from which it is lamely constructed.

Of the non-sequels, *Syzygy* introduces a detached narrative voice, for a work of minimal science fiction concerning the difficulty of proving a negative. Though the "Jupiter Effect" precipitates no cataclysm, anxiety over it takes its toll on Los Angeles, less damaging than its own "routine" natural catastrophes. *The Cool War* suffers from a witless hero, all-powerful gangsters, and boring melodrama built on the conceit that East-West espionage is ruining Earth's "quality of life." Only *The Years of the City* offers a ray of hope, in both outlook and technique. A set of linked stories, each a jump forward in the future of New York, it blends the technical and social inventiveness of *The Age of the Pussyfoot* with the optimism of "In the Problem Pit," the chronicle form mitigating its weak characterizations. A welcome reminder of Pohl's potential, it highlights by contrast the facile ideas and lame writing for which he is too often willing to settle.

—David N. Samuelson

**PORGES, Arthur.** Also writes as Peter Arthur; Pat Rogers. American. Born in Chicago, Illinois, 20 August 1915. Educated at Illinois Institute of Technology, Chicago, B. S. 1940.  "Pressure" (De Ruyter), in *Amazing* (New York), February 1966.  
 "Priceless Possession," in *Galaxy* (New York), June 1966.  
 "The Mirror," in *Fantasy and Science Fiction* (New York), October 1966.  
 "Solomon's Demon," in *Legends for the Dark*, edited by Peter Haining. London, New English Library, 1968.  
 "The Dragons of Tesla," in *Fantastic* (New York), October 1968.

\* \* \*

Arthur Porges's fiction consists of some 70 short stories, often of 3,000 or fewer words. The corpus itself and many of the individual stories within it blend fantasy with science fiction. "Mop-Up," for instance, takes place in the realistic wreckage following a world war fought with atomic and biological weapons. Sharing what is left with the sole human survivor are a witch, a vampire, and a ghoul. Similarly, there appears to be no difference in feel or treatment between stories which are purely SF and other which are purely fantasy. Thus the djinn of "Solomon's Demon" and the robot speciman-gatherer of "The Ruum" are precisely equivalent in so far as the humans who come in contact with them are concerned: they are alien, enormously powerful, inexorable—and they must be stopped if the viewpoint characters are to survive.

The viewpoint character *doesn't* always survive a Porges story, a fact which contributes to the considerable tension of the best of them. The character does always struggle, however. The horror is not that caused by watching a man helpless in the face of the unknown; rather, it is aroused by seeing a strong and resourceful man overborne by a power or cunning still greater

than his own. An excellent example of this is "The Rats," in which a lone man fights more-than-bestial rats against a backdrop of impending nuclear war. In his ultimate failure, the man turns over the world to antagonists who have proven themselves worthy at least to attempt to better Mankind's record.

Porges works against sharp, tersely drawn backgrounds; he has an enviable talent for choosing the right word or two which convinces a reader that the scene or character was written from life rather than merely studied. His work typically begins with a narrative hook which draws the reader into the body of the story. And even pedestrian stories are frequently enlivened by flashes of character which demonstrate a considerable depth of feeling. Regrettably, many of the stories *are* pedestrian. This is a result of their being based on gimmicks, often bits of scientific fact: parabolic reflectors concentrate light ("A Touch of Sun," "The Dragons of Tesla"); crickets chirp at a rate dependant on temperature ("The Formula"); a human body reduced to raw elements is a slight value ("\$.98"). While the development may be at least professional, only the gimmick itself is likely to stick in the reader's mind for any length of time. When the gimmick is integral to the story, however, the result can be extremely effective. "The Ruum" (humans can lose significant body weight by sweating) and "Solomon's Demon" (high voltage is harmless unless coupled with a path to ground) are striking examples of this synthesis; and "The Mirror," which turns on an analysis of multiple reflections, is a stunning horror story. If these are the exceptions, then in themselves they constitute a body which many writers must envy.

Despite his frequent use of factual gimmicks, Porges never neglects his characters. It is fitting that one of his last-published stories, "Priceless Possession," involves no gimmicks at all; only the question of what part of their souls three spacemen will pay to avoid losing a treasure which in money terms is priceless. This is not a sardonic story; and perhaps it is a story that is not without hope for humanity; but it is an indictment more damning than any shrill diatribe could have been. As if in summary of much of Porges's best work, men struggle but we cannot assume their victory; and our worst enemies may not be external to our hearts.

\*

Jerry Pournelle comments:

My work is intended to entertain. I may well have a serious message, but in my judgment fiction is best served if the characters in a story do not know they have a message to deliver. Science-fiction writers are bards of the sciences; we are not fundamentally different from the bards of Homeric times, who would travel about and, spying an encamped group, say, "If you'll fill my cup with wine and dish me a bowl of stew, I will tell you a story about a virgin and a bull that you just wouldn't believe. . . ."

\* \* \*

Jerry Pournelle's science fiction has consistently portrayed technological advance as the most significant visible indication of mankind's progress. The most obvious form of benevolent innovation is the development of space travel, a theme which infuses much of his work. This theme is particularly evident in *A Spaceship for the King*, in which the salvation of an entire world rests upon its ability to develop rapidly a spacefaring technology. In *Exiles to Glory* humanity is jolted out of its introverted and short-sighted doldrums by a space effort financed by commercial organizations. The Martian colony in *Birth of Fire* is entirely dependent on advanced equipment from Earth for its very existence.

There is a well expressed admiration for the professional military man. Colonel Nathan MacKinnie, the protagonist of *A Spaceship for the King*, is a cashiered veteran unable to function

properly within the organized military of his world. *Janissaries*, and its sequel *Clan and Clown*, co-authored with Roland Green, concerns a small group of professional soldiers kidnapped from Earth by aliens unwilling to fight their own battles. John Falkenberg, a recurring character in Pournelle's early fiction, is a highly skilled strategic and tactical planner who leads a successful career with a unit of mercenaries. Falkenberg and his companions are featured in the novel *West of Honor* and several shorter pieces, three of which were collected to form the book, *The Mercenary*. (one of the best stories in this series, "Silent Leges," was not included.)

The Falkenberg stories are set within the context of the CoDominium, a pragmatic alliance of the United States and the Soviet Union that eventually evolves in the world government and an interseller empire. Pournelle subscribes here to the concept of civilization as going through cycles of collapse and renewal, as decadence destroys the old order to make way for the vigorous new. One of the several novels Pournelle has written in collaboration with Larry Niven takes place several centuries after the fall of the CoDominium. This novel, *The Mote in God's Eye*, is possibly the best single work to have appeared under the Pournelle byline.

*Mote* was met with widely varied reader response. It is a much longer than average novel, and it concerns the first contact with an alien species that is biologically diversified in order to cope with the exigencies of survival within the confines of their own system. There is a well-paced and logically developed plot, a strong and sustained element of suspense, gradual revelation of the mystery of the alien culture, and several extremely effective scenes, particularly one in which a handful of aliens animate an empty human spacesuit. There was some adverse reaction to what some readers saw as stereotyped characterizations, particularly that of the single female character, a passive individual who demonstrates little initiative. There is little evidence of any sustained effort to fully develop characters, but *Mote* is nevertheless an enthralling novel of adventure and discovery, and the focus of the story is the unfolding mystery of the alien culture, not the reactions of the characters. To a degree, the traditional values of literature are subordinated in this type of novel.

The next collaborative novel, *Lucifer's Hammer*, features several strong female characters, possibly to counter the earlier criticism. *Lucifer's Hammer* is an end-of-the-world story on a panoramic scale. Following the collision of Earth with a comet, civilization collapses into barbarism and most of the physical features of the world are altered. Marketed as a mainstream disaster novel, it features an extremely large cast of characters, numerous plots and subplots and covers a span of decades. There is careful, plausible extrapolation of the slow decay of the few islands of comparatively advanced society that survive as the apparatus of civilization disappears. It is indicative of Pournelle's view of technology that the climactic battle is fought for control of a functional nuclear power plant.

*Oath of Fealty*, also written with Larry Niven, is set in an enormous self-contained city-building that is theoretically a part of Los Angeles. Automatic defensive systems kill intruders, and interests unfriendly to the building administration use the incident in a political struggle that may determine the shape of future urban life throughout the world. Although less grandiose than the earlier collaborations, the novel is complexly plotted and the implications of each turn of events are explored in detail.

Pournelle makes use of traditional plots for the most part, such as interplanetary war and conquest, world disaster, war in space, first contact with aliens, commercial rivalries for political advantage, penal colonies on other worlds, etc. His themes are familiar as well, the importance of space travel as an outlet for

human endeavor, technological answers to problems confronting the human race, the value of individualism as opposed to collectivism, and the primacy of man over aliens because of our stronger competitive drive for survival.

But the familiarity of plot and theme should not be construed to mean a lack of ability. The de-emphasis of characterization does not imply a lack of depth in other areas. Pournelle develops his plots in a logical fashion, with a good sense of timing and judicious use of suspense and other devices. Most of his fiction is essentially adventure, with clear-out action and sympathetic, if not entirely realistic characters. Social issues, when they arise in Pournelle's fiction, are dealt with consistently, as he makes no secret of his views. Shortsighted ecological protection and population control movements nearly destroy the space effort in *Exiles to Glory*. Government officials are almost invariably portrayed as corrupt or inept or both. Even at his most polemic, Pournelle carefully avoids disturbing the momentum of his stories with his discourses. But even while the implications of his work might infuriate, the inventiveness and smooth flow of his plotting will entertain.

##### Uncollected Short Story

"The Way Down the Hill," in *Fantasy and Science Fiction* (New York), December 1982.

\* \* \*

Tim Powers, along with James P. Blaylock and K. W. Jeter, is one of a group of science-fiction writers around San Francisco who are now gaining recognition; companions of the late Philip K. Dick, they are perhaps most known for the originality of their own voices. Powers's career, after an undistinguished beginning with science fiction for Laser books, produced two innovative and entertaining books unique in recent fantasy. One, *The Anubis Gates*, won the Philip K. Dick award for 1983. Now, with *Dinner at Deviant's Palace* and a forthcoming rewrite of his *The Skies Discrowned*, Powers is returning to science fiction with a voice in some ways more skillful than that he brought to fantasy.

*The Drawing of the Dark*—the title is a pun on the threatened decline of the West and the potent, magical Herzwesen beer that may be a key to saving it—concerns a 16th-century mercenary who is contacted by Merlin and finds he is the latest incarnation of King Arthur. Though pure fantasy, it shows a number of scientific skills, including good presentation of Renaissance Europe, in some ways as foreign as an alien culture. Also, both *The Drawing of the Dark* and *The Anubis Gates* use a system of magic which, while not exactly a scientific technology, still clearly functions by stated rules: since a magician forsakes the natural earth, in the books, someone is safe if in touch with the earth, by direct contact or a grounding wire.

*The Anubis Gates*, however, is arguably science fiction, particularly in its major concern, time travel. In fact, magic and the science of Darrow Interdisciplinary Research Enterprises serve as equal, and equally plausible, vehicles for and explanations of travel into the past. Through various paradoxes and explanations, all of the mysteries of the novel—including the fate of the hero, Brendon Doyle; the mysterious life of the early 19th-century poet, William Ashbless; the Dancing Ape Madness; Lord Byron in two places at once—are shown to be perfectly logical effects of time travel or the actions of the magicians and others involved. (The theme of immortality through changing bodies, which is part of the explanation of events in the *The Anubis Gates*, also is treated in “The Way Down the Hill.”) The handling of the historical settings is even stronger than in the earlier novel.

If *The Anubis Gates* is a fantasy novel with some of the strengths of science fiction, *Dinner at Deviant's Palace* is a science-fiction novel which at first seems to be fantasy. While the post-World War III setting—a Los Angeles where carefully preserved cars are towed on wagonbeds for their prestige value, and almost any vice can be purchased—is clearly science fiction, the setting holds a number of mysteries which seem inexplicable in scientific terms, including a cult that partakes of mass psychic communion, from whom the hero, Greg Rivas, is paid to liberate and de-program a woman he once loved. As the plot unfolds and connections appear, the reader discovers all the mysteries to be ingeniously linked, and explicable within the limits of science fiction.

Besides the facility with involved plots in which all is explained and shown to be related, and good description of societies in the past or future, careful depiction of his adventurer-hero in each book also marks Powers's works. These heroes, and other characters, seem constantly in pain due to their travails, in a way that is quite realistic but perhaps unpleasant. Powers also has a fascination for the criminal underworld, which he presents with affection and energy but not sentimentality. Above all, Powers is an entertaining writer, humorous as well as able to present action. All of these qualities show, despite the less mature writing style, in *The Skies Discrowned*; probably, the rewrite will continue the trend of his increasingly able books.

*The Terror from Timorkal*. London, Bear, 1946.

\* \* \*

Festus Pragnell was among the small contingent of British writers who, lacking a suitable market at home, found a billet for their work in the American science-fiction magazines. Though he was far from being the most successful, he enjoyed the distinction of having his work approved by H. G. Wells.

Wells found that *The Green Man of Kilsona* contained a reference to “H. Geewells,” a noted author on the electron world of Kilsona where Pragnell's hero finds himself in the body of an ape-man. Having read it, Wells wrote to Pragnell pronouncing it “a very good story indeed,” but the resulting publicity was too late to help the sales of the novel. Pragnell's first story, “The Essence of Life,” in which super-intelligent beings from Jupiter made a peaceful visit to Earth, appeared in *Amazing* 18 months after acceptance. “Men of the Dark Comet” is the tale of a wandering satellite inhabited by strange plant-creatures, and “The Isotope Men” deals with the destruction of a planet—now the Asteroid Belt—from which man's forebears came to Earth. The ideas were typical of the period, the writing no better or worse than editor Hugo

Gernsback was ready to accept at the rates which applied in those days of economic depression. And Pragnell, a spare-time scribbler, knew the pangs of unemployment.

In "A Visit to Venus" he painted a morbid picture of human bodies distorted by poisonous spores distributed by intending invaders. He was a man obsessed by the study of vitamins and other aspects of medicine which furnished him with plot-material while a daily pinch of baker's yeast supplied him with energy. He was fond of inventing bizarre forms of animal and vegetable life, and the effects of a strict religious upbringing against which he rebelled could be detected in his work. He protested, too, the rigid policies of editors who denied him the freedom of expression he craved. He had little success in his own country, but by the 1940's had found his metier in Ray Palmer's *Amazing Stories* where his lively tales of Don Hargreaves on Mars and its moons, replete with twisted giants and devil birds, suited its juvenile appeal.

##### Uncollected Short Stories

"The Hades Business," in *The Unfriendly Future*, edited by Tom Boardman, Jr. London, FSB, 1965.

"Night Dweller," in *New Worlds* (London), November 1965.

\* \* \*

Terry Pratchett's novel *Strata* was widely regarded as an amusing commentary on Larry Niven's award-winning novel *Ringworld*, which it resembles in many superficial ways. The protagonist is a human woman whose job is to oversee the construction of planets, the future homes of human and other races. She takes great pains to see that her subordinates do not plant anachronistic items in the strata of these planets, a diversion which appears to have an almost universal appeal. But from a mysterious visitor, she learns of the existence of a flat world lost in space, unknown to the rest of the universe, built in a fashion totally impossible to humanity, and inhabited by people totally indistinguishable from human beings.

Her curiosity is piqued, along with her sense of adventure, and she sets off with a number of companions, human and otherwise, in a quest to find the flat world. Unfortunately, a series of mishaps results in the loss of their guide, and the incapacitation of their spaceship in the atmosphere of their destination. After landing, they set off on an often hilarious romp among dragons, robots, aliens, and other creatures, as they explore this strange new environment. Pratchett is one of

the few genuinely funny writers practicing in the genre, and while it is hard to take much of what goes on in this novel (or his others) very seriously, it is consistently amusing and entertaining.

*The Dark Side of the Sun* sounds like a much more serious novel. The protagonist is the rich heir to a powerful title who sets off on a quest to find the Jokers' World, home of a legendary alien species. The background of this novel is tied up with the manipulation of the laws of chance, another concept possibly borrowed from Niven's *Ringworld*. A series of assassination attempts are thwarted, generally through a strange combination of circumstances that seem to defy the laws of probability. As indeed they do. Once again, the delight of the book is in the richly creative backgrounds of alien species, religious and other philosophies, and bizarre settings. Pratchett's light-hearted approach succeeds in what would otherwise be just another adventure novel because of his wittiness and the density of material in a rather short novel.

Pratchett's most recent novel is *The Colour of Magic*, which is an iconoclastic view of fantasy adventures. The four related adventures are set in a flat world which really is held upon the backs of four gigantic elephants astride the shell of a gigantic tortoise swimming in space. The inhabitants of the world know this to be true because they have lowered observers over the edge to see for themselves.

Rincewind is certainly one of the least likely magicians ever to grace the pages of fiction. He agrees to provide his services as a guide to a visitor from another planet interested in exploring this strange world. Their travels bring them into encounters with malevolent animals, wizards, monsters, and other villains in an extremely funny spoof, which can only be compared to Jack Vance's "Dying Earth" stories at their very best. Pratchett seems particularly enamoured of anachronisms, which abound in this novel as well.

Pratchett seems to be neither a follower or a leader, more interested in exploring his own niche in the science fiction firmament. Humorous science fiction does not in general sell well and, as of this writing, only *Strata* has seen a mass market paperback edition in the United States. His style is certainly unique enough to attract a following, but it is unclear just how influential his work might ultimately be.

Fletcher Pratt had an extremely varied writing career. While he is considered to be one of the pioneer science-fiction writers, he also wrote fantasy and produced an impressive list of historical nonfiction. In terms of science fiction, Pratt wrote mainly short fiction during his early years, with the exception of *Alien Planet*. The publisher's foreword to the Ace edition of this novel accurately describes it as using "the traditional technique of the 'marvelous voyage' and the 'manuscript found in a bottle' . . . combined with a penetrating and satiric representation of human society through the method of exploring an alien culture." It is a classic representation of the genre. Of course, much of the material is outdated but there remains some interesting philosophy, including the alien dissident's description of intelligent life as a disease infesting the planets which the divine spirit strives to destroy.

In 1939, Pratt met L. Sprague de Camp and his writing turned toward fantasy. Together they wrote a series of stories about a psychologist who finds himself projected into a number of parallel worlds which are based on our myths. Harold Shea, as he is called, makes his rounds of Norse mythology ("The Roaring Trumpet"), Spenser's *Faerie Queene* ("The Mathematics of

Logic”), Ariosto’s *Orlando Furioso* (*The Castle of Iron*), the Finnish *Kalevala* (*Wall of Serpents*) and the world of Irish myth (“The Green Magician”). The stories were unique in that they combined the then new field of sword-and-sorcery fantasy with a refreshing humor. The two writers wrote two additional fantasy novels, *Land of Unreason* and *The Carnelian Cube*, as well as a collection of short fantasy spoofs, *Tales from Gavagan’s Bar*. The last, similar to Clarke’s *Tales of the White Hart*, also showed the magical humor of Pratt and de Camp evident in the Harold Shea pieces. Pratt’s solo novel *The Well of the Unicorn* is a fascinating creation by a master storyteller, one of the very best of fantasies.

Pratt’s SF work *Double Jeopardy* details the adventures of George Helmfleet Jones, an agent with the Secret Service some time in the future. In his first adventure, Jones solves a case dealing with a matter transmitter; in the second, he is confronted by the theft of a large sum of money from a sealed, remote-controlled cargo rocket. *Double in Space* consists of two unrelated works. The first is born of the early Cold War with Russian and US space stations vying for superiority in space. The second is a take-off on the voyage of Ulysses set in the far distant future. In a similar vein, *The Undying Fire* follows the plot of Jason and the Golden Fleece. None of these works matches the caliber of Pratt’s fantasy.

—Paul Swank

**PREUSS, Paul.** American. Born in Albany, Georgia, 7 March 1942. Educated at Yale University, New Haven, Connecticut, B. A. 1966. Served in the United States Air Force Reserve, 1960-66. Married 1) Marsha Pettit in 1963 (divorced, 1968), one daughter; 2) Karen Reiser in 1973. Marketing Planning Projects Director, Batten Barton Durstine & Osborn, New York, 1966-67; Floor Director, King-TV, 1967-68, and Unit Manager, 1968-69, Production Manager, 1969-70, and Creative Director, 1970-72, King Screen Productions, all in Seattle; Staff Consultant, Biological Science Curriculum Study, Boulder, Colorado, 1972-73; independent film producer, 1974-81, and associate producer, editor, and post-production supervisor, Lee Mendelson Film Productions and other companies, 1975-81. Since 1978, free-lance writer. Agent (literary): Diana Price, Frommer Price Literary Agency, 185 East 85th Street, New York, New York 10028, U.S.A.

##### Uncollected Short Story

“Small Bodies,” in *The Planets*, edited by Byron Preiss. New York, Bantam, 1985.

Paul Preuss comments:

I am more interested in the social implications of the scientific endeavor than in gadgets, and I am even more interested in scientists than in science itself.

\* \* \*

The novels that Paul Preuss has published since 1980, along with his competent popular science writing, demonstrate the continuing appropriateness of fiction and exposition for capturing the sense of both wonder and open-ended possibility that permeate modern science. The super science awe from the pulps and the precision of science itself combine in his work to suggest that hard science fiction is still a major mode of the genre. His first two fictions are the more fantastic as well as the less skillfully told; and it is not until *Broken Symmetries* that he achieves controlled storytelling, long passages of history of science exposition, and more plausible but nevertheless awesome recent science to create his best hard science fiction.

The determining theoretic notion for both *The Gates of Heaven* and *Re-Entry*, which may be the first two of a series of stories, is that paired black holes in orbit around one another provide a gateway to remote times and spaces. Not only does Preuss toy with this particular theoretic solution to the limitation of space/time but he also posits the usual plenitude of near-infinite alternate possibilities. Thus his hero in *Re-Entry* cleverly manages to journey backward in time to meet himself as his own tutor only to discover, both theoretically and fictionally, that there are an appalling number of variations possible to his lifeline. As Preuss speculates and marvels over this wonderful theoretic idea (though he does restore unity of character to his hero finally) he echoes Asimov, in particular, in *The End of Eternity*. But it is an old idea in the genre, and Preuss brings nothing startlingly new to it—except perhaps a rather more fanciful juxtaposition of epochs than some time-travel writers have used. In *Re-Entry* his key planet beyond the time-gate is one terraformed for biological engineering on Earth’s Mesozoic and Cenozoic eras named Darwin.

If Preuss decided to abort this opening series of time-travel fictions in favor of what he has most recently accomplished in *Broken Symmetries*, it was a wise decision. Fanciful time travel and infinite possibilities for alternate universes are wonderful and stock themes in hard science fiction, but the sublime possibilities opened up by much actual scientific research and theory in our time can create similar effects in fiction—and more plausibly. Furthermore, his characterization and plotting in *Broken Symmetries* has matured and, also, paradoxically narrowed toward the more manageable range of mainstream fiction. He writes about real scientists and real scientific work in the manner of Gregory Benford in *Timescape* and infuses that realistic setting with the exciting sense of possibility that does exist at the pioneering edges of modern science. One does not need to travel to Darwin to create the sense of wonder in fiction or, for that matter, the sense of intellectual complexity that alternate universes suggest. The theory about sub-atomic particles and the technology of the gigantic particle accelerators offers “mad science” enough, and in this third novel Preuss combines those topics with fine sections of exposition about the history of particle theory and particle research in the 20th century as well as the impact of such research on potential nuclear holocaust. *Broken Symmetries* represents a movement on Preuss’s part away from more pulpish writing and toward the more mainstream novel of modern science. What holds it closer to hard science fiction is the depth of the science and the pursuit of what is marvelous in the science and what is speculative.

Preuss developed those writing traits in his two earlier novels and, apparently, from a love of science fiction.

*Your Book of Film-Making* (for children). London, Faber, 1974.

Editor, *Anticipations*. London, Faber, and New York, Scribner, 1978.

Editor, with Robert Holdstock, *Stars of Albion* (anthology of British science fiction). London, Pan, 1979.

Christopher Priest was one of the most promising new British science-fiction writers to become active in the 1970's. His first novel *Indoctrinaire* (expanded from "The Interrogator"), reflected the type of story that dominated *New Worlds* at the time. Dr. Wentik is a researcher in investigating an experimental drug at a scientific installation in the Antarctic when he is shanghaied by the mysterious American government agent Astrourde. Shortly thereafter he is incarcerated in an enigmatic prison in the Brazilian highlands, in an area that somehow serves as a bridge between the present and the world two centuries from now. Wentik's attempts to escape his situation, or even to make some kind of sense of it, are reminiscent of Kafka. His efforts are largely ineffectual, although it does become increasingly clear to him that even his captors are without true freedom. Reality and fantasy merge at times, and the result is a kaleidoscopic novel that dilutes its effect by the lack of strong focus.

*Fugue for a Darkening Island* also features a weak and less than entirely admirable protagonist. Following a major war in Africa, the British Isles are rapidly inundated with refugees, an exodus that is met with indecisive hostility on the part of the British authorities. As the influx grows, order begins to disintegrate. Divergent opinions about the obligation to provide succor to the refugees lead to an increasingly violent factionalism. Government control over much of the countryside collapses; individual neighborhoods wall themselves off from the outside world. Alan Whitman and his family are cast adrift in this world, and find that they are unable to control their own future. Frequently it is impossible even to distinguish those who uphold the law from those who break it. Priest makes no effort to plot his novel linearly. The viewpoint jumps back and forth through time, seemingly at random, so that the reader is almost simultaneously exposed to Whitman at all stages of his dissolution. But Priest holds his character at arm's length from us, and we can vaguely perceive his motivations; the nightmarish quality of his world remains that, for it never quite achieves reality.

Paradoxically, while the all too possible world shown in *Fugue for a Darkening Island* never acquires depth, the almost totally incredible setting of *Inverted World* is vividly realistic. It is a much more cohesive novel than anything Priest had written before. It features a strong sympathetic character, and some of the most innovative settings to appear in years. Helward Mann is a citizen of City Earth, an enormous construct that inches across the surface of its world by wincing itself across tracks picked up from beyond and laboriously replaced ahead. The city is in eternal pursuit of the Optimum, the place where environmental conditions are most like that of their home world. For this world, whatever it might be, is treacherous and changing. Behind them, physical features become broad and flat, time passes very rapidly in relation to the city itself, and a mysterious force increasingly attempts to pull laggards back to their destruction. Ahead, the distortions of time and space have exactly opposite attributes. As Mann is initiated into the guild responsible for scouting the future, he gradually matures and adjusts to the changing nature of his world. Idea is central here rather than character; nevertheless, Helward and his personal relationships with others from the city are well portrayed. Although less ambitious stylistically than Priest's earlier novels, *Inverted Worlds* is far more successful both as an adventure story and as a novel of ideas. Priest indulged in pastiche next, and *The Space Machine* is a witty and frequently funny examination of some of the situations first presented by H. G. Wells. This invocation of Martians invaders and time machines is carried a bit too far, unfortunately, and it is difficult to sustain interest through the end.

A Dream of Wessex is a far more successful novel in almost any terms, and is easy the high point of Priest's career. The Ridpath Project is a secret research installation where a group of people pool their subconscious minds to create a mutual dream world. Within this context, they can extrapolate the future possibilities of various aspects of the present. But there is trouble brewing. David Harkman, one of the dreamers, has lost his awareness of the real world and will not come out of trance. Julia Stretton, another participant, tries desperately to release him from the grip of the dream world, particularly when she learns of the imminent participation of a new dreamer, a man who considers the project to be nonsense. The dream world becomes more real to the reader than the project itself, and, despite the existence of Soviet domination over Britain, it is easy to see why Harkman is unconsciously reluctant to leave it for reality. Both of the central figures are fully realized personalities, and their awakening feelings for each other are convincing.

*The Affirmation* develops logically from the themes Priest has used in the past. Peter Sinclair is a young man who lives both in the London of our world and in Jethra of the Dream Archipelago, the setting for a number of Priest's short stories. In London, Sinclair is descending into madness following a series of personal disasters; in Jethra he has won the prize of immortality, but to secure it he must surrender all of his memories. Each man is writing a book set in the other universe, and each man has reached a point in his life where he must make significant decisions about his future. The intellectual nature of this struggle will not endear this novel to adventure-story readers, but Priest's skillful character development is at its best in this work.

Priest seems to be fusing reality and dreams increasingly in his fiction. It should be no surprise, therefore, to note that most of his better short stories also explore this interface. "Real Time World" describes the Observatory, supposedly an extra-dimensional establishment from which a small staff could observe the flora and fauna of other worlds, in actuality an experiment in itself on news deprivation with a staff thoroughly brainwashed about the nature of their situation. In "Palely Loitering" a man spends much of his life travelling back and forth across time bridges, always in pursuit of a young girl he does not have the courage to confront. His ultimate effort draws into question the immutability of the past and the reality of his own present. Two stories set within the context of the "Dream Archipelago" are also worth mentioning. "Whores" is an incident sliced out of time, wherein the protagonist encounters a series of inexplicable events, mutilations of a sort of people living in an area formerly occupied by enemy troops. Much of the story's impact is dissipated by the ambiguous ending, however, a problem that arises also with Priest's best short story, "The Watched." Yvann Ordier is disturbed by his voyeuristic spying on a band of Qataari refugees. The Qataari have an obsessive need for privacy, and will literally starve to death rather than submit to being studied. At the same time, Ordier himself is compulsively wary of scintillas, tiny mechanical spy devices that are almost unavoidable. The result is a complex story of character, obsession, and personal decay.

The involuted, intellectualized nature of the conflict in Priest's recent fiction demonstrates a mature grasp of character and theme, but unfortunately is not as commercially successful as is fiction with more overt plots. The modest amount of fiction Priest has produced has enriched the field and quietly established him as one of the more innovative writers.

—Don D'Amassa

**PRIESTLEY, J(ohn) B(oynton).** Also wrote as Peter Goldsmith. British. Born in Bradford, Yorkshire, 13 September 1894. Educated at Belle Vue School, Bradford; Trinity Hall, Cambridge, 1919-22, M. A. Served in the Duke of Wellington's and Devon regiments, 1914-1919. Married 1) Patricia Tempest (died, 1928), two daughters; 2) Mary Wyndham Lewis (divorced, 1952), two daughters and one son; 3) the writer Jacquetta Hawkes in 1953. Worked in a wool merchant's office after 1910; free-lance writer and publisher's reader in London after 1922; Director, Mask Theatre, London, 1938-39; radio lecturer on BBC programme "Postscripts" during World War II; regular contributor, *New Statesman*, London. President, P. E. N., London, 1936-37; United Kingdom Delegate, and Chairman, Unesco International Theatre Conference, Paris, 1947, and Prague, 1948; Chairman, British Theatre Conference, 1948; President, International Theatre Institute, 1949; Member, National Theatre Board, London, 1966-67. Recipient: Black Memorial Prize, 1930; Ellen Terry Award, 1948. LL. D. : University of St. Andrews; D. Litt. : University of Birmingham; University of Bradford, 1969. Honorary Freeman, City of Bradford, 1973; Honorary Student, Trinity Hall, Cambridge, 1978. Order of Merit, 1977. *Died 14 August 1984.*

\* \* \*

J. B. Priestley was possessed by a vision of life at its rare best—rich, vivid, eminently worth living. What makes him a science-fiction writer and not just another dreaming romantic is that he espouses theories of time that allow his characters (and conceivably his readers) actually to attain the rich life he envisions. Such theories—chronological simultaneity, serialism, multiple dimensions—are not easy to illustrate, but Priestley succeeds surprisingly well, in stories and novels and also in popular stage plays. As literary fashion moves on and Priestley's sedately conventional style falls from favor, it is his time stories, his personal ventures towards altered reality, that remain fresh and intriguing.

Priestley derived his theories from three sources: E. A. Abbott's idea that a fourth dimension would appear as time; J. W. Dunne's mathematical model of time as continuous, simultaneous, and serial; and P. D. Ouspensky's more philosophical view of time as a repeated circle which can be made to spiral morally up or down. What these concepts gave to Priestley was a non-religious hope. If there are other dimensions, then there might be somewhere to go after life's time ends. In the plays *Music at Night* and *Jolson over Jordan* characters withdraw after death into a higher observer-state similar to the Tibetan "Bardo." Also, if all time is simultaneous then each minute is not murdered by the next, and the goodness of the past can be made accessible to those trapped in a bad present. Such comforting access is given to characters in the play *Time and the Conways* and in fiction such as "Night Sequence" and *The*

*Magicians*. And if precognition and time's recurrence are true, then the known future can be, paradoxically, changed, altered in a tiny moment to redirect the flow, as in the plays *Dangerous Corner* and *I Have Been Here Before*.

Priestley desires these comforts and powers because he sees the modern world as darkening fast. In a short grim tale called "The Grey Ones" he incarnates the powers of darkness into grey tentacled devils capable of human shape. Their weapons are boredom, blandness, and despair; they seek to dull the world down to a suburban hell. Priestley's fullest treatment of this theme, and of the time-conscious man's opposition to it, comes in *The Magicians*. The industrialist Ravenstreet leaves his company when it turns from exciting scientific quest to passionless bureaucracy. As he slides into despair he is tempted by a bitter elitist to help drug the masses into final lethargy. Ravenstreet almost agrees, but is saved by the intervention of three "magicians" whose mysterious abilities include precognition and hypnosis, and who seem to be involved in some larger struggle. They show Ravenstreet the difference between the "tick-tock time" he had been dying in, and "time alive" where his hopeful past still lives. They send him to re-experience crucial moments, and they also rearrange the present so that the drug's numbing secret is lost. At the end, Ravenstreet has reason to live, and the world is a little less grey. Priestley's time visions are not always cheering. In one of his most haunting stories, "The Statues," a tired man is granted exhilarating but temporary sight of huge glorious statues towering above a future London, and the contrast with the banal present saddens the rest of his life. In the well-crafted and widely anthologized "Mr. Strenberry's Tale" the title character is visited briefly by a time traveler from an advanced humanity's last black moment. The traveler vanishes, destroyed, but the terror stays.

Some of Priestley's stories have been classified as science fiction because they focus on some unusual bit of technology—the musical invention in *Low Notes on a High Level* or the earth-destroying transmitter in *The Doomsday Men*. But such devices usually turn out to be occasions for plot, not concepts in themselves, and plot for Priestley means romance, marriages, careers, and individual morale more than anything else. Even his children's book, *Snoggle*, which offers extra-terrestrial pets and invisible spaceships, spends most of its rather unsuccessful pages detailing the interactions of three ordinary children. Priestley began writing in 1910; he learned his craft in an earlier time than most science-fiction writers. His many romantic comedies now seem dated, his plots coercive and even clanking. But his parables of hope and despair remain compelling, and there are few science-fiction writers who can match him for the seriousness of his thinking about time.

—Karen G. Way

\* \* \*

In much of "hard science fiction," the technology overshadows characters and often becomes the protagonist. The science-fiction work of George W. Proctor shows a different and more human-oriented approach. Proctor relegates technology to the minor position of a plot device and concentrates on human and alien characters, showing little more than their reaction to technological gadgetry. In *Fire at the Center* the centerpiece isn't the technology of time travel or even what they hope to achieve by journeying into the past, but how the protagonists, Nils Kendler and Caltha Renenet, communicate psionically and the personal challenges and relationship this affords.

The central theme weaving throughout all Proctor's books is that of communication, no doubt a product of his training and work as a newspaper journalist. His first published novel, *The Esper Transfer*, is an uncomplicated, straightforward escape-chase plot, but the protagonist depends heavily on his telepathic talents and "oneness" with others of his race. The conflict comes more from within than from external forces. This is likewise true in *Shadowman*. Outwardly another escape-chase plot, the novel becomes more. Male and female join in telepathic contact and become lovers through this most intimate of contact.

Proctor carries this theme to its logical extension in *Starwings*. The protagonist, Radman Donalt, uses a collapsar as a time machine and becomes separated from his lover, Jenica, not only in space but in time. Fifteen years of time and the barriers of untold light years notwithstanding, Donalt enters Jenica's mind and they make love in the only way possible for them. "His mind merged with hers, Donalt led her to the bed. And there, her hands now hers, he made love to her."

This central theme of male-female, human-alien communication extends beyond Proctor's science fiction and into fantasy novels. While the structure and tone of his fantasy work is strongly influenced by Fritz Leiber's *Fafhrd* and the Gray Mouser stories, the basic themes are easily identifiable as belonging to Proctor.

The Nalcon and Hweir short stories transcend the usual genre offerings of sword-and-sorcery quest through the interplay between the main characters. Both are rogues and thieves, but their fierce friendship is obvious. They have discovered common ground, common affection, and fulfillment in one another in spite of divergent background as blond prince and black-skinned thief. This friendship and the strains placed upon it are more central to the stories than any quest.

In the *Swords of Raemillyn* heroic fantasy series, Proctor has created another way of examining male-female communication. While in *Death's Acolyte* there is Chal, a tongueless character who makes his wishes known to the heroine empathically, a more intriguing method of exploration lies with Goran One-Eye, an interdimensional being capable of massive shape changes. Goran, at first, lacks the control over this ability and is locked in a bulky male human body. By the second book, *A Yoke of Magic*, he shifts into female form and attempts to seduce his friend, Davin Anane. The byplay between the two, when Davin discovers the shape transformation, examines not only the limits of their friendship but also male-female roles and expectations.

Trying to sum up an author's works in a few words presents insurmountable problems, but the theme underlying virtually all of George W. Proctor's science fiction and fantasy works is both simple and beguiling: communication. How do men and women relate to one another, how would this be different if we were able to enter another's mind telepathically, how would our friendships and love alter if they were based on empathic rather than verbal considerations. Science fiction provides a suitable vehicle for Proctor's explorations for this enhanced communication.

\*

Tom Purdom comments:

My main aim as a fiction writer is to create the kind of stories I like to read—engrossing, well-plotted works that hold you from the first page to the end and really get you involved in the characters and the things that are happening to them. Once I jokingly said that the greatest living novelists were Alexander Solzhenitsyn, Ursula K. LeGuin, Richard Adams, and George Macdonald Fraser. I was poking a little fun at literary pomposity, but I would give a great deal to have written the better works of any of them.

The struggle that most interests me—and I think its mostly what I've written about and like to read about in SF—is the problem of adapting technology, especially the attempts to seize the opportunity it gives us without falling into all the traps it puts in front of us (some of which are not too obvious). I'm also fond of one of the things the man Santiago said about his fish: "It will feed many people and it will bring a good price on the market." I think science fiction has given a great many people a lot of things they needed, and it has even—especially recently—brought some of its practitioners a good price on the market.

\* \* \*

Tom Purdom's career spans more than two decades. Though clearly distinguishable from one another, his early novels share the same narrative formula: the hero finds himself on an alien planet which is ruled by a dictator, either benign as in *Five Against Arlane* or malevolent as in *The Tree Lord of Imeten*. In either case, the hero struggles to overthrow tyranny and re-establish social equilibrium through bloodshed. In the aftermath of the battle against the tyrant, the hero emerges victorious from the rubble to announce that democratic liberties have been restored to the people. Great adulation of the Purdom hero follows the revolution, and the novel closes on a note of exhaustion as an infant republic comes uncertainly to life.

This well-worn plot serves as the basis for Purdom's most recent novels too, but in *The Barons of Behavior* he has achieved more interesting results. Here Purdom's subject is the potential threat which Skinnerian behaviorism poses to a free society. The novel opens in a world of the remote future in which the privileges and responsibilities of life in 20th-century America have been lost. Nurtured by democracy, the growth of lawlessness and violence has long ago become intolerable to society, and politicians, seeking a retardant, have turned to the behavioral sciences for help. And indeed they have found there willing social physicians. Thus a terrible triple alliance is formed of science, technology, and politics, whose aim it is to produce law and order, to provide security and comfort to the citizens of Windham County, Pennsylvania, but whose real accomplishment is to rob the human spirit of its civil liberties and to render the human will impotent. In *The Barons of Behavior* the orderly operation of society is insured by an arsenal of devices and techniques which can subvert individual free will. It can be numbed or stupified by insidious drugs; it can be forced to betray itself through the techniques of behaviour modification; or, most horribly, it can be bypassed altogether by devices surgically implanted in the brain. Opposed to the dehumanizing powers in control of society stands the Purdom hero, Ralph Nicholson, "psychotherapist to a psyched-out world," who

manages to defeat the political machine of Martin Boyd despite the overwhelming odds against his doing so.

But this is familiar stuff to science-fiction readers. The science of control has inspired dozens of novels along the same line, the very best of which achieve truly chilling results. The atrocities committed against Alex in Burgess's *A Clockwork Orange*, for instance, evoke the archetypal fear humans have of being obliterated by forces beyond their comprehension, while his struggle to remain human and intact in the face of dehumanizing powers approaches Aristotle's definition of great tragedy, the purgation of fear and pity. Unfortunately, *The Barons of Behavior* never achieves such impact. Though Purdom's technological imagination is impressive, his ability to conceive and delineate character is not. Ralph Nicholson of *The Barons of Behavior* is as two-dimensional as Migel Lassamba of *Five Against Arlane*. Both are conventional super-heroes, men of endless resource and daring, but since they lack depth and delineation, their suffering appears rather more ludicrous than tragic, their lives more gratuitously violent than compelling, and their inevitable victory more contrived than earned.

Nevertheless, Purdom's interest in possibilities is genuine, and his grasp of the implications of behaviorism is very thorough. At his best, he is capable of constructing a shockingly plausible and horrifying vision of the future, a time when individual freedom is a suppressed, half-forgotten memory, abandoned centuries ago in pursuit of law and order. There is little anxiety in this world, even less disorder once chance factors have been all but eliminated. There are no dangers, except to the intellect and imagination. There is no physical suffering in the America of *The Barons of Behavior*, but there is no free thought either, no unapproved writing, no spontaneous creation of any kind. Men and women smile and go about their daily business, but their eyes appear vacant. They reflect no light. Birth and death are quiet, pre-arranged experiences.

—Marvin W. Hunt

\* \* \*

Thomas Pynchon's novels are firmly entrenched in historic and technological realities, but question all orders and unities to suggest that, since man continually imposes patterns on his world, all patterns are suspect and potentially false, so much so that recorded "history" may be simply man imposing private interpretations on chaotic reality, just as man's mastery of bureaucratic and technological systems may well be his enslavement to his own creations. Pynchon's is a vision of a world in decline, one where personal choices are shaped by the necessities of science, language, history, and economics, where the victim in turn victimizes, where vast, shadowy conspiracies flourish, and where huge conglomerates seem to control events. His dominant themes include isolation, alienation, fragmentation, failure to communicate, degradation, entropy, the battle between men and machines and between established society and the preterites (the rebellious disinherited), the absurdities and ironies of modern existence, man's self-destructive potentials, the horrors of war, paranoia, and the question of multiple interpretations. Wastelands and undergrounds dominate his imagery.

His style, in tune with the complexity of his thematic concerns, is baroque, variegated, and multistructural, an intricate amalgam of Whitmanesque catalogs, Dickensian names, cryptic abbreviations, puns, analogical sequences, and historical and literary allusions. It runs the gamut of literary and cinematic modes, rapidly shifting, much like media events,

between comic-book fantasy and learned discourse on complex scientific and technological concerns: the organic chemistry, operant conditioning, rocket dynamics. It partakes of parody, farce, and black humor, jeremiad, apocalypse, and prophesy. Its geography is often allegorical, its conception mythic, its patterns analogical compounds—networks of interlocking images from personal to social to cosmic. Each novel focuses on some central mystery, a cryptogram in *The Crying of Lot 49*, an exclusive secret agent in *V*, a missing supersonic rocket in *Gravity's Rainbow*, which provides the supportive structure for diverse images encompassing a range of perspectives delineated by signs, codes, signals, patterns, and plots. Pynchon's last two works are like densely textured puzzles whose central images are visible only from a distance, while close up all seems chaos.

*The Crying of Lot 49*, the most accessible of Pynchon's novels, focuses on the quest of Oedipa Maas for the meaning of her ex-lover's will. Her synthesis of scattered clues, including a Jacobean tragedy, doodlings, acronyms, postage stamps, and graffiti, postulates the existence of a secret, 16th-century anti-postal service, the Tristero, perpetuated by W. A. S. T. E., an underground of the disenchanting. Ultimately she must question whether her discovery is a genuine conspiracy involving a parallel, secret America, a giant farcical hoax, or a paranoid projection of her own creation. In Pynchon it is a question of interpretation, one eye seeing chaos, another a system. This question of whether order, systems, patterns truly exist or are merely superimposed on chaotic reality is an essential concern of *V* and *Gravity's Rainbow* as well.

The central character of *V*, as his name suggests, "Stencils" his own pattern on an external blankness, but his various versions of himself, the elusive woman he pursues, and his world are all private dreams, products of his early conditioning and of his own paranoid inventiveness. He is played off against Benny Profane, an empiricist who becomes engulfed in incomprehensible details. Drawing on Henry Adams, Jorge Borges, thermodynamics, and WWII film clips, Pynchon traces man's historic progression towards the moribund. The anarchistic V gradually replaces her flesh with cold machinery; an automaton named SHROUD walks the earth, and all the characters move towards annihilation near the rock of Malta. It is a nightmare world of genocide, dehumanization, dead landscapes, and man-machines.

*Gravity's Rainbow* continues the historic focus of *V*, tracing the end product of bureaucratic, technological system—a V-2 supersonic rocket that screams into view in the first lines of the novel (1945) and disintegrates the reader and his "theater," perhaps our civilization, at its close. A satiric fantasy, an historic novel, a parody of various forms—part technological manual, part folk myth, part Kabbala, part pornography—it involves numerous plots and a cast of 400 characters and 1000 objects (including a talking light bulb, Richard Nixon, and King Kong), each with their own story. It begins with the quest of Lt. Slothrop, a New Englander of Puritan stock, whose sexuality is attuned to a mysterious, gravity-defying rocket for whom everybody is searching, but he ultimately dissolves over the Allied Zone, and the plot digresses in a myriad of directions, its only unity analogical. *Gravity's Rainbow*, with its labyrinthine complications, is a massive effort to seek through historic analysis the roots of man's mass death wish, his cultural programming for death, and to project a future/present when that wish might come true.

Pynchon suggests that modern man is paranoid, perhaps with good reason, compulsive, and self-destructive; his lethal technology is perhaps already beyond control, and he cannot be sure whether his perceptions of the world are valid or merely self-imposed. While breaking traditional patterns, he builds on

our scientific and literary heritage. His works are eclectic and controversial, novels which verge on science fiction and partake of its techniques, while remaining difficult to categorize precisely.

\* \* \*

Under his own name and the pseudonym of John Rackham, John T. Phillifent produced a series of short adventure novels that made use of traditional science-fiction plots to present a fast-moving plot set against an exotic background. There is little doubt in the reader's mind that right will ultimately prevail, but the events along the way are the chief attraction.

To a great extent, Rackham repeated the situations he found most appealing. One of these is the Mowgli tale set in the future; one or more humans are returned to civilization after being raised among aliens, and the ensuing culture shock provides much of the basis of the story. This is the major plotline in *The Beasts of Kohl*, for example, where Earth has become considerably more benign but still unsettling to one not used to human ways. The same is true of the far better Phillifent novel, *Life with Lanceot*, in which the alien Shogleet rebuilds a damaged human with mechanical parts, and then tries to reintegrate him into human culture. Another recurring plot is the search for a fabulous treasure, be it gem, secret plans, or immortality drug. The protagonist of *The Treasure of Tau Ceti* is motivated by legends of priceless gems on that jungle world, but along the way he forces humans to recognize that the inhabitants of the planet are indeed intelligent. A secret agent searches for a rumored sentient plant in *The Anything Tree*. Another plant, this time one that will cure all human diseases, is the target of another group of adventurers in *The Flowers of Doradil*. This time the major subplot is a crew of human smugglers determined to prevent the success of the hero's mission. Jewels are the quarry once again in the *Hierarchies* (Phillifent), this time purloined from their rightful owner. Another theme is that of secret alien or human manipulation of society. Secret aliens provoke a war between Earth and Venus in *Alien Sea*; a new drug is revealed to be the tool of insidious would-be alien conquerors in *Ipomoea*; human expansion into space is blocked by apparently invulnerable alien constructs in *Beyond Capella*. Secret human societies appear in *Earthstrings*, in which a human colony is wiped out as part of a plot by commercial magnates, and in *Genius Unlimited* (Phillifent), wherein a scientific colony is actually serving as a mask to conceal a plot for interstellar conquest.

Rackham did interject some commentary into his novels, and the earlier ones in particular seem to demonstrate his faith that mankind would grow out of its petty prejudices. In *We, The Venusians* Anthony Taylor passes as human because a pill changes his skin color and he cannot be identified as a native Greenie. Ultimately, the racial prejudice that forms the basis of the novel is reconciled as the two races eventually recognise each other's equality. In *The Beasts of Kohl* humanity has learned to accept the rights of whales on Earth and aliens in space. There is some evidence that Rackham became disillusioned in his last years. Nefarious plots are invariably human-instigated in the later novels, and the more enlightened humans cast themselves loose from the race, as in *King of Argent* (Phillifent), or even settle down among aliens, as does the hero of *Dark Planet*. Where the human refugees had favorable effects on a primitive alien race in *Danger from Vega*, they are presented as a danger to the interstellar community in *Genius Unlimited* (Phillifent) and, to a lesser extent, *Beyond Capella*. Other Standard plots appear here and there. There is rather dull interstellar war in *The Double Invaders*, and a rather amusing view of one in *Beanstalk*, which presents the familiar fairy tale as a distorted version of Earth's minor involvement in an interstellar war. Mankind's necessity to advance into the universe is central to *Beyond Capella* and *The Proxima Project*.

Rackham never produced what could fairly be termed an outstanding work. He made no attempt to tackle major social problems except in the most superficial way, and he broke no new ground in either style or plot. But he did produce a string of competently written light adventure novels that don't insult the intelligence of the reader. They are invariably unbeaten, there is no confusion between heroes and villains, and any incompetence on the part of the central character is transitory. It is a simple universe in many ways that Rackham wrote about, and generally an entertaining one.

\* \* \*

Considering her unvarying depictions of heroes and heroines as people adhering to unpopular views despite hostility and abuse, Ayn Rand must have been pleased at resembling them through the controversy she arouses by her novels. In spite of

her claim to be an unswerving advocate of reason, her appeal is often violently emotional. She makes her readers long to identify themselves with her dynamic, creative, productive, intelligent, handsome, and ultimately victorious heroes (and thereby with the ideas associated with them). She also compels her readers to despise the cowardly, lazy, incompetent, vicious, ugly, and inevitably defeated spokesman for the ideas she abhors. Her two speculative novels, *Anthem* and *Atlas Shrugged*, stridently warn against shaping our future according to the ideas of Christianity, Marxism, liberalism, or any other viewpoint advocating self-sacrifice which, to her, means self-negation. In opposition to such ideals, they applaud man's ego as the source of all inventiveness, achievement, and happiness and capitalism as the system allowing the fullest expression of the ego. In spite of her stridency, Rand remains one of the most powerful—and thoughtful—defenders of conservative American values, portraying the businessman as the unacknowledged Atlas who carries the burden of civilization on his mighty shoulders.

Although *Anthem* and *Atlas Shrugged* are clearly intended as cautionary tracts expounding Rand's social and philosophical beliefs and fears, both present carefully detailed pictures of future societies. In creating these societies, Rand extrapolates the possible consequences of self-sacrificial goals on art, politics, economics, sex, and family and social relationships. *Anthem* is set in a new dark age which has come about after the collectivists have defeated all the individualists. In this world, technology has nearly ceased to exist since, for Rand, it is the product of individual curiosity, effort, and ability which have also nearly ceased to exist. At birth, all children are taken from their parents and placed in a communal home where they will be taught that they must devote their lives to working for the benefit of their brothers, act as all their brothers act, and think only what all their brothers think. No man is permitted to live as an individual and the word "I" is forbidden. However, one man known as Equality 7-2521 finds such a world uncomfortable, "transgresses," and through his "sinful" behavior rediscovers individualism, creativity, self-respect, and selective love and friendship—or, in short, Rand's own values. *Atlas Shrugged* is set in an America resembling that of the 1950's when the book was written. However, this America soon becomes transformed into a society trying to follow the Christian goal of loving one's brother like oneself and the Marxist principle "From each according to his ability, to each according to his need." The government assumes control over the economy, places all industries under a Unification Board, and attempts to redistribute the benefits earned by the most efficient companies to the least efficient ones on the assumption that the weaker companies have the greater need. The result of this policy of penalizing success and rewarding failure is that moochers rise to the highest levels of government (the head of the economic program is named Wesley Mouch) and the most productive businessmen have difficulty surviving. Having foreseen these developments, the superheroic protagonist, John Galt, leads the greatest producers and creators on strike, thus precipitating the collapse of the moochers' government and preparing the way for a new society founded on the Randian oath: "I swear—by my life and by my love of it—that I will never live for the sake of another man, nor ask another man to live for mine."

Both of Rand's speculative novels are major contributions to the field. Her passionate commitment to ideas about social structure is well suited to the speculative form, especially since it is coupled with an ability to give concrete embodiment to these ideas. Though the slim *Anthem* only sketches her ideas, it offers a good introduction to them. Longer than Samuel Delany's *Dhalgren* and talkier than Robert Heinlein's *I Will Fear No Evil*,

the gigantic *Atlas Shrugged* spells them out fully in repetitious but often exciting, provocative, and even brilliant detail.

##### Marta Randall comments:

I find it difficult to speak about my own fiction—primarily, I think, because of a conviction that stories must stand by themselves, and the hopes, opinion, or beliefs of their authors are ultimately irrelevant. I view science fiction as a tool, as a useful series of conventions with which to deal with a storyteller's basic task, that is, the exploration not of ideas, but of people. By using the devices of the genre the writer can pare away anything not relevant to the characters and their dilemmas, can, in effect, create a crucible in which to toss the characters and view their reactions. Last that sound pompous, I believe it equally important that science fiction remain, far more than general mainstream fiction, a genre in which one can tell stories, present adventures, write for the simple joy of creating wonderful things. My principal goal as a science-fiction writer is to meld these two approaches to the genre. It is a goal which I hope to be chasing for the rest of my professional life.

\* \* \*

Marta Randall is a prolific and versatile writer. Her six novels span a variety of literary forms: science fiction, quasi-fantasy, and conventional novels. She has experimented with different literary modes as well: novels, short stories, novellas, and the editing of anthologies.

Her first two works, *Islands* and *A City in the North*, were published in 1976. *A City in the North* tells the story of an alien species, colonized and exploited by humans, who decide to tear asunder their social order in their revolt against their masters. The finale is ambiguous when the author posits that oppression does not lead to a higher morality on the part of the victim. *Journey* and *Dangerous Games* form a two-part saga of the Kennerin family who own the planet Aerie and attempt to create a society alternative to Earth.

In her last two novels Randall has increasingly moved away from science fiction. In *The Sword of Winter* she depicts a feudal society poised between change and stasis. The novel is neither science fiction nor fantasy; although it takes place on another planet, it is closer to a conventional historical novel. Her latest novel, *Those Who Favour Fire* is not science fiction at all, but rather a dystopian extrapolation of what could happen on the West Coast given urban crime, gang warfare, organized right-wing movements, and earthquakes.

Randall's works are representative of the feminist sub-genre in science fiction. This distinct sub-grouping emerged in the mid 1960's when women joined the ranks of science-fiction writers in substantial numbers for the first time. Almost to a woman, they wrote "soft" science fiction, concentrating on depicting alternative worlds which, when juxtaposed to their own, served to highlight the deleterious effects of sexism.

Many characteristics found in Randall's work are typical of traits found in feminist science fiction. First, her alternative worlds are not sexist. All her novels portray strong female

characters who are decisive, independent, nurturing, and thoughtful. Second, Randall explores sexual taboos and alternative sexual modes openly and uninhibitedly, such as homosexuality, incest, and sensuality. Third, her imaginary worlds, although vivid, do not proffer an alternative view to the author's own social order. This shortcoming, shared with many feminist science-fiction writers, is most evident in *Journey* and *Dangerous Games* where Randall recreates monopoly capitalism and proffers it as a utopic social order to the reader.

Randall's strengths are many. Her novels are fast-paced and contain strong, well-developed characters. Her aliens in *Journey*, *Dangerous Games*, and especially *A City in the North* are believable and engaging. Her best science-fiction novel is her first, *Islands*. Here, she explores a society whose inhabitants have discovered the secret to immortality. Randall is brilliant in her speculations of the sciences, language, morality, psychology, phobias, and pathologies of immortal beings. The emotions of the heroine, who cannot achieve immortality and is an aging freak in a perpetually youthful society, are depicted masterfully. The finale is strongly reminiscent of Olaf Stapledon's *Star Maker*, where the heroine mutates to a higher level of consciousness, transcends the corporal, and merges with the world and cosmos.

John Rankine comments:

Science fiction is either escapist adventure—Hornblower in a star ship—or an allegory for our time—the dystopia, *Brave New World* bit. I tend to write the first as John Rankine and the second as Douglas R. Mason.

I hold the view that the biogrammar that determines the human make-up was laid down over such a long period that events like the technological revolution will not alter anything in the foreseeable future. Therefore my inhabitants of Wirral City in 4000 AD act in the same way as people of the present. Cain is still Cain and unable to change.

\* \* \*

John Rankine, who also writes under his real name, Douglas R. Mason, envisions future battles waged by man against android, robot, computer, or physically recreated bionic man. Usually the machines' rigidity, their propensity toward predictable patterns, their lack of emotion, their machine nature is responsible for or aids in their ultimate defeat, while man's doubt, his emotion, his loyalty, his physical self, spurred by instinct, passion, and a need for action and for self-preservation, help him ultimately to conquer. Rankine continually deplores man's insidious tendency to sacrifice freedom and intellectual activity for the sake of comfort, stability, and pleasure, and asks if there can be true pleasure without conflict and pain. His heroes are constantly struck with the realization that they have never felt truly alive until they have tasted sweat, endured trauma, and shared danger. Rankine also wonders whether prolonging life through chemicals and mechanical replacements might not be ultimately self-destructive, immortality at the price of humanity and selfhood. Frequently his bionic characters are patronizing about real humans, and feel an intellectual sympathy with computers, attitudes that always doom them.

Rankine heroes are tough and manly but have sunk into the mindless apathy of modern regimentation only to be jarred into self-awareness and rebellion by a freak accident, a sudden intuition or insight, an irrepressible instinct. Occasionally they

articulate these attitudes in lines from Shakespeare or Keats. Often these men are attracted to cold, incredibly beautiful women who keep them at a distance and intellectualize their relationship; ultimately, however, they learn that such women are either useless in a crisis or actively act against them, turning them over to robots for "readjustment." Usually the heroes are passionately aroused by a less perfect but more nubile woman who has worked with them unnoticed in the past, who fights in their cause, and who finally accepts a division of labor whereby the male is leader and warrior and the woman submits as helpmate, nurse, cook, and technician.

In *The End Bringers* androids rule, monitoring human emotions and repressing them with drugs, until a natural rebel uncovers a plot to eliminate all humanoids; rescuing hundreds before robots eviscerate them, he leads survivors to an air raid shelter from which revived humanity launches its attack on android tyrants. In *Matrix* city computers plan to eliminate all human life and use the free space to unify storage banks and achieve godhood, but a human administrator discovers the plan and fights back. In doing so he has to deal with conformists who not only disapprove of rebellion, but actively battle against it, blind to their own precarious predicament, or with doubters who understand his logic but question his motives, or with humanists who oppose the violence of his methods, violence that ultimately proves justified. In *From Carthage Then I Came* a computer, originally established to protect man from a cruel ice age, has monitored all life in the domed city for seven thousand years, but life is sterile, impersonal, and public. A few who have learned to evade mind probes unite in an escape plot, and, against difficult odds, outwit computers and robots, and start a new world in the wilderness, agrarian but free. These patterns with their Edenic themes are typical of much of Rankine's canon.

Basically Rankine writes about science's potential abuses, limiting man's potentiality, reducing originality, variety, and natural evolution, controlling his weather and his atmosphere, tampering with his mind. In *Satellite 54-Zero* a secret agent tries to penetrate a private scientific operation studying Jupiter, only to encounter the horror of mechanical failure in space, a scientific mind out of control, and a centaur transported from another dimension. In *Operation Umanaq* the Southern hemisphere plots to destroy the Northern by affecting weather conditions and producing another ice age, while a fast-acting Northern agent evades hitmen and suicide drugs to invade a Polar station and reset weather computers. *The Phaeton Condition* begins in a world so polluted by industrial waste that its oxygen supply is fast being depleted; an industrial giant who helped create this condition plans to exploit it further through a secret high-priced safe zone with its own underground oxygen reserves. Frequently Mason's scientists consider humans expendable and progress worth any danger. In *Moons of Triopus* the industrial advantages of exploiting a new planet are judged more important than slow, safe investigation, but politicians and businessmen learn too late that more rational beings may well view their selfish acts with contempt and act accordingly.

The "Dag Fletcher" series are all set in the same galaxy and involve lots of action, while his novelized episodes from *TV Space 1999*, are episodic, a progression of threats and dangers ranging from space brain anti-bodies to materialized nightmares to alien wars of annihilation. His short stories often focus on mathematics, "Six Cubed Plus 1" on the magical properties of special numbers and "Traveller's Rest" on topological oddities whereby time and language vary with the structure of space.

—Gina Macdonald

**RAPHAEL, Rick.** American. Born in New York City, 20 February 1919. Educated at Boise Junior College, Idaho; University of New Mexico Albuquerque, B. A. 1948; Colorado State University, Fort Collins. Served in the United States Army, 1936-45, and in the reserve service, 1945-65; retired as Captain: Bronze Star, Purple Heart, and service stars. ## Rick Raphael comments:

Science fiction is the extrapolation of today's technology into tomorrow. But while science progresses, human nature and emotions remain unchanged. Tomorrow's man will merely have new tools to manifest his love, hate, fear, greed, and laughter.

\* \* \*

In recent years Rick Raphael has turned to the suspense/thriller mode with such novels as *The President Must Die*, which, even though set for convenience in the 1990's (having been published in 1981) contains no science-fiction elements. Raphael's reputation as a pure science-fiction writer remains based upon the long stories which make up two books of classic SF: *The Thirst Quenchers* and *Code Three*. Most of the stories in question were originally published in *Analog* in the mid-1960's, and they exemplify that magazine's commitment to technological extrapolation and the rigorous if unobtrusive development of "lived-in" futures.

Both the title story of *The Thirst Quenchers* and "Gutter-snipe," collected in the same volume, deal with futures in which overpopulation has led to a scarcity of fresh water. Formidable managerial and technological resources are shown being used to maintain supplies. The different measures adopted in each story are threatened by disasters which generate the interest. Most notable in these stories is the patience and intelligence with which Raphael has worked out the operation of the agencies

concerned with conserving the precious water; his technical descriptions are confidently and convincingly written.

*Code Three* is really three novellas strung together in sequence; two of the three were originally published separately. Like much of Raphael's work, *Code Three* presents a dystopian future, in this case one dominated by five-mile-wide thruways providing routes for cars which travel at 400 miles per hour or more. The main characters of the book are officers who man a patrol car designed to cope with the dangers of driving on such roads—and the irresponsibilities of the civilian motorists, who often use their vehicles in a lunatic manner.

Because of its episodic structure, *Code Three* lacks true cohesion as a novel. In the first two sections, the officers of the patrol car 56 deal efficiently with rampaging criminal vehicle (the cars, rather than the people, are the real characters of this section), then with the reckless son of an important businessman. The son, like his father, thinks he is beyond law. He turns out to be likeable enough, and even shows signs of learning his lesson; however, the corrupt father is made to feel the full weight of the law when he tries to interfere criminally with the legal proceedings. In the last section, heroic romance suddenly changes to tragic irony: the main character, Ben Martin, is killed while testing a new type of patrol car, portentously known as "the bomb." His death is caused by an irresponsible young officer whose recklessness epitomizes what Martin had spent his life controlling. The sinister, ironic tone of this section meshes badly with the rest of the novel; yet the section itself is genuinely moving.

Ultimately, Ben Martin is a futile scapegoat—slain by a guilty and irresponsible society, but without his death contributing a jot to society's redemption. While the society which Raphael has extrapolated no longer appears feasible—the development of more and more powerful motor vehicles having ceased to be the dominant trend that it was at this time of writing—*Code Three* is an effective and impressive technological parable, read in its proper context.

As a science-fiction writer, Raphael is admirable when describing the more technical aspects of his projected societies' workings. He is less certain in handling his characters: his women are particularly stereotyped, while the male characters are seldom treated in psychological depth, and often engage in dialogue which is unbelievably sententious or downright corny (a criticism which applies to his recent mainstream work as well as to his science-fiction). Nonetheless, Raphael's admittedly minor contribution to the science-fiction genre has shown him to be a formidable and underrated talent whose hard-edged extrapolative ability is deserving of particular respect.

Francis G. Rayer commented:

(1981) My aim in writing science fiction was to show some aspects of the world as it could be within one or two generations. "Time Was," *Tomorrow Sometimes Comes*, and *The Star Seekers* were probably the best examples of this.

\* \* \*

Much of the work produced by Francis G. Rayer is the routine potboiler that makes up the vast majority of published science fiction. In novels such as *The Iron and the Anger* he depicts the conflict between a typical unwillingly heroic human and some non-human menace, in this case homicidally inclined robots determined to wipe out the human race. At times, there is a more serious note to his fiction, but still only in a very limited sense. For example, *Cardinal of the Stars* points out what Rayer sees as the importance of humanity's progress into space, in this case in order to be able to defend itself from the encroachment of a hostile alien fleet. But the novel remains essentially a spy story set in the future, with the two-fisted hero determined to stop the series of sabotaged space-ships and bombings from outer space that have begun to plague the world. Similarly, *Star Seekers* makes some tentative efforts toward philosophy, but remains essentially a potboiler about the dangers inherent in violating Einstein's laws and attempting to travel faster than light. Rayer's attempts here to avoid overt melodrama result in slow-paced scenes made even more ineffective by a turgid prose that is void of wit or clarity.

But there are times when Rayer is more than just a hack adventure writer. He was most successful with his series about an intelligent computer of unprecedented capacity that appears first as the administrator of a completely unemotional legal system in a short story, then progresses to taking complete control of humanity during a nuclear war in Rayer's best novel, *Tomorrow Sometimes Comes*. In a short story later in that same series, and possibly the best piece of short fiction Rayer wrote, the computer becomes "The Peacemaker," paradoxically by helping an alien race to invade Earth and conquer humanity for its own good. At the time Rayer wrote this story, this was certainly a far more novel and less acceptable conclusion than it would be now.

—Don D'Amassa

\* \* \*

From 1974, when his first stories appeared, Tom Reamy was considered a promising new writer and his progress watched with interest. His sudden death in 1977 meant that, instead of the long and prolific career and the steady increase in his already formidable powers his admirers expected, we have only one novel and a dozen short stories. But the novel, *Blind Voices*, and the best of the short stories need no special pleading as early experiments— they can stand on their own as successful and remarkable works. Tom Reamy's position is secure. Although he is often called a science-fiction writer, and won science-fiction awards, nearly all of Reamy's work would be better classified as fantasy. His stories skim along the edge of reality, firmly anchored in time and place, whether Depression-era, rural Kansas, or present-day Los Angeles, and the plots range between the subtlest of fantasies and the most visceral, outrageous horrors. His recurring themes are of human relationships, the frightening, dark side of sexuality, the triumph or destruction of the innocent, and monsters—from outer space, from Hollywood, from the id.

"Twill," his first published story, shows the strong influence films—particularly low-budget horror films—had on Reamy, who worked in Hollywood and first tried his hand at script-writing. The plot of "Twill" is straightforward and violent, full of vivid, visual descriptions with little time wasted on explanations. Like the films it emulates, the story seeks to entertain and shock, and it succeeds. There are some problems with plot construction and logic, but the story works as well as it does because of a solid grounding in reality, the accumulation of detail giving it a peculiar depth. In this, as in later stories, Reamy

revealed his talent for selecting the perfect details to bring scenes and characters to life, from the utterly convincing names of even minor characters to precise descriptions of dress and furniture. "San Diego Lighfoot Sue," Reamy's own favorite and an award-winner, is the gentlest and most romantic of all his stories. The horror takes place off-stage and the emphasis is that of the so-called "mainstream," with the fantasy element almost superfluous. It is not the story, nor any sense of the fantastic, which remains to haunt the reader, but the characters—the vividly depicted Pearl and Daisy Mae; the extreme innocence and beauty of John Lee Peacock; the dying Grace Elizabeth; the hinted-at depths of the title character.

To my mind, Reamy's best and most powerful stories are "The Detweiler Boy" and "Under the Hollywood Sign," both set in a grittily real Los Angeles, both told in the first-person and using many of the conventions of the hard-boiled detective story, both probing the dark side of sexual desire and offering a complex vision of the conflict, on many levels, between innocence and evil. They are both disturbing stories which reveal love and need as the inseparable siamese twins of violence and destruction. In these stories people need each other and shy away from their need, knowing that sexual love will inevitable lead to death.

*Blind Voices* takes place in the American midwest during the Depression—a time and a place that Reamy makes convincingly his own. The story sets the fantastic creatures of a travelling wonder-show against the everyday lives of the people of Hawley, Kansas. It obviously owes much to works by Ray Bradbury, Charles Finney, and Theodore Sturgeon, but it shows Reamy's distinctive touch in the reworking of some familiar material, in the characterizations, the vivid style, and the dark undercurrent of sexuality which runs through all his writings. Although the material is that of fantasy, like *The Circus of Doctor Lao* or *Something Wicked This Way Comes*, an explanation near the end tips the book into science fiction.

\* \* \*

J. Michael Reaves is just now finding his own voice as a writer, making a true assessment of his work somewhat difficult and possibly premature. His 12 year career has seen eleven published short stories and six novels, two of them juvenile, three of them collaborative. Three other novels and a short story collection have been sold, and at least one collaborative novel remains unpublished. Reaves has supported himself through his apprenticeship by writing approximately 120 teleplays, treatments, bibles, and developments for the Saturday morning juvenile TV market, including both live-action and animated scripts. Not all of these programs have been produced, but the consistent level of work since 1975 has provided Reaves with the financial security to develop his craft slowly, and to be more selective with his books than he might have been otherwise. Further, many of these scripts were penned for science-fiction or fantasy programs, giving him a thorough grounding in a wide variety of plot elements common to both fields.

Reaves had been writing stories since his teen years, and had taken the usual round of creative writing courses in college. His first real break, however, was attending the Clarion Workshop for science fiction writers in 1972, where he had a chance to meet the professionals for the first time, and to have his stories torn apart by the experts. The result was his first professional sale, "The Breath of Dragons." The choice of theme and setting in this story uncannily presages Reaves's later fiction. Perrin is a hunter on a planet where dragons are killed for their fire-producing bladders. The dragons look and fly like the creatures from children's fairy tales, but they're no match for man's superior future technology. Perrin also believes they're sentient beings, a theory no one else is willing to countenance. Perrin's attempts to prove the dragons' intelligence causes the accidental death of a crewmate; as he struggles to find a way out of his predicament, he is consumed (in an apparent act of kindness) by the very creatures he is striving to protect.

Reaves enjoys combining traditional science fiction and fantasy elements into one seemingly irreconcilable plot line, making the believability of one depend on the other. The images of dragons and similar creatures, of flying in general, of man and beast soaring above the grittiness of the everyday world, permeate his fiction. Even in *Hellstar* (forthcoming), where the world is a man-made, interstellar spaceship travelling slowly between the stars, we find constant pictures of man's attempts literally to rise above his environment. He imbues his key protagonists with a sense of responsibility for the worlds around them. The obvious caring demonstrated by Perrin in "The Breath of Dragons" is evident also in Amsel's dragonquest in *Dragonworld*, in Beorn's courage in *The Shattered World*, and even in the rather sardonic sense of justice evidenced by Kamus of Kadizar (*Darkworld Detective*).

In each of these stories the fantastic settings are counterbalan-

ced by the reality of the people who must live in them. Those who evade their responsibilities must pay the price; correspondingly, those who act must suffer the consequences of their actions, consequences which are not always pleasant. Reaves sees the real drama in both life and literature in forcing recognizable individuals to make choices that will positively or negatively influence their lives—and even the universe—forever.

Thus, in Reaves's best novel to date, *The Shattered World*, the magicians must face the consequences of their ancient and irresponsible war that literally broke the world into fragments, Pandrogas and Amber cannot escape the harm caused by their affair, and Beorn, as attractive a thief as one will find in modern fantasy literature, still must pay a very high price indeed for his chosen profession. Yet they all persist in the face of severe adversity to keep on doing what each of them thinks is right and necessary and proper—for themselves, and even sometimes for others. For Reaves, the universe inevitable is a moral place where immorals fear to tread.

Kit Reed writes within several fiction genres. Her stories have been published in *Fiction* (Paris), *Town* (London), *Seventeen*, and a variety of science-fiction and fantasy magazines. Some of her stories are realistic, some impressionistic, some fantasy, some science fiction. And representatives of each of these types appear in the collection *Mister da V*. Reed does not write hard, or technologically oriented, science fiction; and although some of her stories do make use of traditional science-fiction devices or theories, those stories actually focus on the people in them and the ways in which those people are affected by their surroundings. While this is typical of science fiction in general, Reed seems to deal primarily with the people and to use the science-fiction elements as another writer might use a car or truck—as a detail necessary to the story.

In "Automatic Tiger" the full-sized mechanical tiger is not presented as an object of wonder. Edward Benedict accepts the tiger as no more than a special toy for his nephew. When he tries the tiger out, however, he decides to keep it. Having his own tiger gives Benedict confidence and changes his previously nondescript life. He becomes successful in business and in society—until he no longer has time for the tiger, which deteriorates. When he loses the tiger, his life collapses, and he is left much as he was when the story began. "Mister da V." is a story in which time travel is the traditional science-fiction device, but the story is really about the 20th-century family into which Leonardo da

Vinci is brought. The mother can see only the extra work that this "guest" necessitates. The twins like the strange toys he makes for them, but after he has gone and the toys are broken, they forget him. The father sees Leonardo as the source for a definitive biography. But the teen-aged girl sees a sweet, lonely, brilliant old man who seems to be sad because he will never get to do all the things he can envision.

This focus on people and the ways in which technology effects them is also at the heart of Reed's socially critical stories. One of her strongest pieces of social criticism is "Golden Acres," about a home for the elderly. In this future setting, an old person can use his negotiable assets to purchase a place in Golden Acres. Although these establishments look very attractive from the outside, they are extremely dehumanizing: all of the rooms are the same, the furniture is bolted down, and there is no place for personal effects or mementoes—what the management calls "clutter." And when a person's funds run out—rent, medical care, etc. all add up—he is taken to the Tower of Sleep where his life is terminated.

"At Central," "Ordeal," and the novel *Armed Camps* are similar stories about societies in which technology has all but taken over. In "At Central" people watch television all the time (never going outside), pump their money into the appropriate slots when they see something they want, and have everything delivered. The people in "Ordeal" are all on "life fluid" and spend their time hooked up to the intravenous tubes which pump the purple liquid into their veins. In *Armed Camps* warfare is the one constant thing in the world; and although it seems that only champions fight and die, great numbers of people are killed each year. And instead of trying to end it, the top brass make sure that it will go on—forever, if possible.

In the final analysis, it is Reed's characters that carry her fiction—science fiction, fantasy, or mainstream. To be sure, the other aspects of her writing are not found wanting, but her characters—especially the women struggling to find themselves in an indifferent or hostile society, or struggling against various institutions—remain in the reader's mind.

—C. W. Sullivan III

**REPP, Ed(ward) Earl.** Also wrote as John Cody; Peter Field. American. Born in Pittsburgh, Pennsylvania, 22 May 1900. Married Margaret Louise Smith in 1925; one son. \* \* \*

For decades Ed Earl Repp was regarded in science-fiction circles as the ultimate example of the hack pulp writer, representing both the best and the worst elements of the pulp tradition. Never very interested in mingling, Repp had become a legendary figure, widely believed to have been dead for many years, when he was tracked down and interviewed shortly before

his actual death in 1979. His statements indicated that his personal philosophy fit neatly into the pulp mold. He maintained that a commercial writer should produce 20 pages of manuscript a day. His formula for story construction was simple: place a sympathetic hero in dire peril and bring him through to triumph in the face of insurmountable odds. He has had little formal education (two years of high school), wandered from newspaper reporting into publicity work, and decided to try fiction when Edgar Rice Burroughs and Zane Grey independently recommended that he do so.

Repp produced scores of SF stories. Probably the best known is "The Radium Pool," wherein he uses a practical knowledge of geological exploration as background for an adventure tale typical of his work. The explorers—accompanied by a newspaper reporter who acts also as narrator—discover a mysterious glowing pool. There they discover evidence of alien intelligences with malign intentions toward the earth. In an atmosphere of isolation from the outside world, the explorers struggle against the alien forces, appear to be in hopeless straits, but ultimately triumph.

The characters in the story are typical of pulp science fiction: elderly professor, younger male companion, beautiful young woman who comes within the thrall of the villains and is ultimately rescued by the courageous newsman. The action is crude and physical, the pace a trifle less frenetic than in some pulp stories, the characterization vivid but simplistic.

*Stellar Missiles* (originally published as separate novelettes) is thematically similar to "The Radium Pool." Ancient aliens existing in a state of suspended animation are discovered in two sites, one in Arizona and the other in Siberia. As a result of tampering with the aliens, the young son of the elderly scientist faces permanent suspended animation and in fact the entire earth is menaced. Other aspects aside, the story remarkably anticipates John W. Campbell's celebrated "Who Goes There?" (1938).

Repp's most successful shorter story is "The Red Dimension" (in *The Radium Pool*), a tale in which a scientist develops a technique for first observing, then physically entering, other vibrational planes of existence. In plot the story is unremarkable, concerning the usual pulp paraphernalia of hostile monstrosities, but in "The Red Dimension" Repp's prose, usually of a pedestrian flavor, achieves a number of descriptive moments little short of epiphanous.

Repp's science fiction is illuminated by an examination of samples of his western fiction. The latter appeared under such titles as *Suicide Ranch*, *Cyclone Jim*, and *Hell on the Pecos*. It is possible through the direct substitution of blasters for six-shooters, space-liners for stage-coaches, remote asteroids for isolated ranchos, and so on, to transform Repp's westerns into science fiction (or vice versa).

#### Mike Resnick comments:

I'm not at all sure that I write honest-to-God true-blue science fiction. What I write are morality plays, and if turning them into myths and fables of the future and setting them on alien worlds makes them more saleable, I have no objection to so doing. I have a hard time with fearless heroes and beautiful princesses, so I tend to write about overmatched detectives and obsessed

ministers and frustrated stripteasers. I have a hard time with heroes who are all good and villains who are all bad, so my characters tend to be neither heroes nor villains, but fall into that in-between gray area that most of us inhabit. The future in which I set my stories is lived-in and a little bit shopworn around the edges; planets tend to look more like the outskirts of Indianapolis or Sioux City than those beautiful mechanized utopias that Frank Paul used to paint 40 and 50 years ago. I don't like puzzle or gimmick stories that leave the reader unmoved and untouched, and so I don't write them. I believe that every man and woman is ultimately responsible for his actions, and this is a theme that seems to recur through my novels.

I suppose if I had to sum up my work in a single sentence, it would be as follows: I am writing about adult characters who face adult problems in an adult universe, and I am writing these stories for an adult audience. This is, alas, rarer than you might think.

\* \* \*

Mike Resnick wrote 250 pseudonymous novels before publishing under his own name, and he knows how to structure fiction to maintain the reader's interest. The characterization, however, is sometimes sacrificed in that major figures have vague backgrounds and hazy motivations: little is learned about Jericho in *Walpurgis III* except that he has assassinated a number of people; the Leather Madonna in *Eros Ascending* promises to explain how she became a madam but gives only fragments of information; and no real explanation is offered for Billybuck Dancer's compulsion to flirt with death. An original but sometimes disconcerting characteristic is Resnick's tendency near the end to kill off one or more major characters with whom the reader has thoroughly identified and then to conclude the work from the viewpoint of a minor character.

Resnick cites Olaf Stapledon as a writer who influenced him, and *Birthright: The Book of Man* presents his interpretation of a Stapledon subject, the rise and fall of the human race. Essentially a collection of short stories organized along a time line, the work presents a cynical view of man as he conquers and slaughters his way across the universe until other species unite to destroy him. This same cynicism and concern with slaughter are the focus of his novel *Walpurgis III*, in which the death-obsessed Conrad Bland systematically destroys cities while he sits in his church, like a contemporary Vlad Dracul, surrounded by tortured and dying victims on meat hooks. This "moral parable set in the future" (Resnick's term for his writings) contrasts the evil of Bland to that of his assassin. Like a gunfighter after the danger is over, Jericho must face a grateful but unsympathetic police force.

Although Resnick dislikes series novels, he has written one and is proceeding with a second; each, however, was planned as a limited series. *Tales of the Galactic Midway*, a four-volume work, follows the adventures of Thaddeus Flint and his sideshow acts through the carnival's five-year history. The characters, mostly carnival types, continue through the books; the aliens tend to have human emotions; and Flint's position at the end of the last novel exemplifies the cynical but fighting stance of many of Resnick's main characters. Although references are made in later volumes to events in the earlier ones, reading the books in order is not necessary. *Tales of the Velvet Comet* is another four-part work, but the volumes occur at fifty-year intervals, so only the setting—an elaborate house of prostitution—and its inherent problems remain the same. As in most of Resnick's works, the major characters have sublimated their humanity to their professions, whether it is murder,

espionage, prostitution, or corporate politics, and the positive characters tend to be minor or ineffectual, as is Rasputin in *Eros Ascending* or Sable in *Walpurgis III*, except for one action at the end.

A theme throughout his works is that people become obsessed with money, excitement, and evil if they have not found love; for example, Sable and Rasputin both resist temptation and both are family men whose pictures of wives and children are mentioned several times. When Bonhomme tries to bribe Rasputin by asking, "What are *you* looking for?" he glances at the pictures of his family and replies, "I found it a long time ago." Because of their themes, suspense, wide range of characters, and accessibility, most of his novels have been popular and have reached the Nebula preliminaries.

—Leonard G. Heldreth

**REYNOLDS, Mack** (Dallas McCord Reynolds). Also wrote as Todd Harding; Maxine Reynolds. American. Born in Corcoran, California, 12 November 1917. Attended public schools in Kingston, New York. Served in the United States Army Transportation Corps, during World War II; trained in the Marine Officers School, New Orleans; Navigator. Married Jeanette Wooley in 1947; two sons and one daughter. Editor, *Catskill Mountain Star*, Saugerties, New York, 1937-38, and *Oneonta News*, New York, 1939-40; IBM supervisor, San Pedro shipyards, California, 1940-43; National Organizer, Socialist Labor Party, 1946-52; foreign correspondent and travel editor, *Rogue*, 1953-63. Died 29 January 1983.

Mack Reynolds commented:

(1981) Thirty years ago, when I first began writing science fiction, I soon arrived at the conclusion that a serious free-lancer in the field must be acquainted with the sciences he dealt with. The day of the space opera was rapidly disappearing, and the writer had best know what he was talking about. My background in the hard sciences was sketchy and I realized that I was out of my depth in them. However, I have had a lifelong interest in the social sciences and particularly in political economy. And, somewhat to my surprise, I discovered that few writers in our genre were so equipped. I decided to concentrate on stories with socio-economic backgrounds.

Many of us in our extrapolations do very well in portraying a future in which the sciences and technology have blossomed fantastically. We rejoice in faster-than-light travel, we colonize the galaxy, we have become immortal, we have matter transformers and transmitters. And what is our socio-economic system? Often it's feudalism, complete with galactic emperors, dukes, counts, and barons, sometimes swinging laser swords, whatever they are. We don't even have capitalism, not to speak of something in advance. What is the means of exchange? Often currency, silver and gold coins. What is the relationship between the sexes? What type of family prevails? The writers have returned to Victorian times. Not one story in 25 in depicting the future ever considers that the private ownership of the means of production, the profit system, and class divided society, might one day end. American science fiction is myopic when it comes to foreseeing an evolved social system. So is Soviet Science fiction. In the Soviets' case, they seem to have a fond belief that the millennium has been reached, that nothing lies beyond the state capitalism they have achieved, so there is no point in speculating on future socio-economics. The big difference is that even if a Soviet SF writer did attempt to look beyond their version of Utopia, it is unlikely that his story would ever see print. In the west we are still free to extrapolate in the field of political economy—we just don't. And, in my belief, science fiction is the poorer for it.

The world is going through an unprecedented period of revolutionary change, in science, in medicine, in technology, in the family relationship, in social systems, in the relationship between nations, between generations, between sexes. And if the future is to be a valid one we must buckle down to deciding just what we want. An end of war, an end of poverty, an end of the rape of our planet, a viable world government, are only a few of the goals we should keep ever in mind.

In my stories, I do not have any particular axe to grind. I have written stories (some humorous ones) both for and against every socio-economic system that I know of including socialism, in all its myriad forms, communism, syndicalism, anarchism, fascism, theocracy, technocracy, meritocracy, and industrial feudalism. It simply seems not to occur to the average person, even science fiction readers, that there is an alternative, or alternatives, to our present social system. I am attempting to bring home to them that there is, and possibly desirable alternatives at that.

\* \* \*

A maverick socialist, Mack Reynolds is of that rare breed of American science-fiction writers specializing in socioeconomic speculation. Early in his writing career Reynolds switched from detective fiction to science fiction; but as the title of his first science-fiction novel ( *The Case of the Little Green Men* ) suggests, he never left the plots and characters of detective fiction entirely behind. Producing a strange amalgam of economics, politics, intrigue, action, and mystery, Reynolds became quite popular, and the readers of *Galaxy* and *If* once chose him as their favorite author.

Reynolds's popularity comes largely from his interplanetary fiction, such as his Section G: United Planets series. The premise is that a future confederation of diverse worlds pledges non-interference in each other's socioeconomic systems, but that anomalous worlds threaten this pledge. Crack agent Ronnie Bronston of the intelligence bureau Section G is, typically, the troubleshooter. A representative assignment, in *Dawnman Planet*, takes Ronnie to the super-capitalist world Phrygia, where the villainous Baron Wylie hides information about invading aliens who threaten the confederation. In *Code Duello* the troublesome world is Firenze, ruled by Florentine gentlemen preoccupied with dueling. The best in this series may be *The Rival Rigellians*, in which rival teams develop capitalism and socialism on their respective worlds until the natives rebel against both systems.

On the whole, though, Reynolds's short stories are both better written and better introductions to Reynolds ideas, for the irony of Reynolds's political thinking blends with the irony and reversal of the story form. In "Revolution" the U. S. tries to stop a democratic revolution within the U. S. S. R., since such a revolution would make a stronger Russia; in "Pacifist" a pacifist group uses terrorism to achieve its goals. "Compounded Interests," a time-loop story, suggests that anonymous financial interests control history. "Utopian" sets the premises for much of Reynolds's utopian fiction. Although one might expect a socialist's utopias to be pleasant places, Reynold's utopias are ambiguous; in this story the utopian leaders import a revolutionist from the past to keep them from going stale. The assumption behind these ironic stories is that change so dominates the late 20th century that what is revolutionary one day is reactionary the next.

The year 2000 series of near-future utopian novels is likewise ambiguous. Some worlds are rather pleasant places; others struggle with desperate boredom. Typically these worlds have put an end to the extremes of wealth and poverty (in fact, to social class). But the welfare state produces stagnation and decay. In *Computer World* Reynolds predicts, before computers were in vogue (1967), a world totally dependent on the computer. In *Commune 2000 A. D.* he gives us a world in which one can choose between many modes of dropping out. Reynolds's most ambitious works are his two updates of Bellamy, *Looking Backward*, *From the Year 2000 and Equality: In the Year 2000*. Reynolds's 2000 resembles but also diverges

from Bellamy's. Reynolds's Julian West is out of place in a world he cannot understand, a world which has transcended traditional ideologies and could be called socialism, collectivism, technocracy, archism, meritocracy, or, more accurately, none of these. Reynolds 2000—which he calls evolutionary rather than utopian—is more inevitable than it is attractive.

The Africa series ( *Blackman's Burden*; *Border, Breed nor Birth*; *The Best Ye Breed* ) likewise presents fixed ideologies in a changing world. Both the capitalist west and the socialist east struggle, often with strange results, to control African nationalism. In the Joe Mauser series ( *Time Gladiator*, *The Earth War*, and others ) Reynolds develops a world that has moved in a direction different from that of his utopias. The Earth contains a decadent class society in which one can advance only in the "fracases," a TV-age version of the Roman bread and circuses. Even protagonist Joe Mauser departs from the good-guy stereotypes in his disillusionment.

At his death Reynolds left several unfinished manuscripts which have been edited by Dean Ing. Some of these represent Reynolds at his best, particularly *The Other Time*, a time-paradox story containing a remarkably complete ethnology of 16th century Mexico. The Lagrangia series presents another ambiguous utopia, an orbiting colony which, because of its revolutionary production of power, is the source of fierce contention among rival forces on Earth.

Reynolds wrote too much, and his fiction contains grave flaws: sexism, macho-chauvinist heroes, super-slick dialogue, and melodramatic plots resolved often by pointless violence. Yet he takes seriously, as few writers do, the idea that the socioeconomic future will be stranger than we can imagine.

## Leigh Richmond comments:

All of our books have been "hard core" or "hard science" science fiction, based on the results of research at the Centric Foundation. The next one, which should be published by the fall of 1986, is *How to Psi; or, Field Effect—The Pi-Phase of Physics*. This is not science fiction, but should be of interest to readers of the genre. It is a how-to book for using the psionic abilities consciously, as well as a detailed analysis of the electromagnetic structure which permeates and surrounds the body (seen as the aura) of which the psionic abilities are the sensory apparatus.

\* \* \*

Walt and Leigh Richmond both grew up before the atomic bomb fell, when science seemed both simpler and more accessible. Understanding was not yet locked in moated research foundations—in those days (it seemed) a boy could invent anti-gravity with the right cardboard tubes and wires, and a few people thinking hard could uncover the secrets of the universe and Explain Everything. The Richmonds wanted to be among those few people, and in their eager stories the maverick amateurs always win. But because the Richmonds did not actually start writing until after the atomic bomb fell, their stories are also marked by a scorn for the current secrecy-bound scientific bureaucracy, and an appetite for apocalypse.

When the Richmonds' stories work, they successfully convey the excitement of individual discovery—the mind's reaction to its own new thinking, to its own awakening power. As a result, the Richmonds' most convincing characters tend to be children. An early story, "Poppa Needs Shorts," neatly details the way a four-year-old can combine pieces of information that an adult would keep rigidly separate. The same child, Oley, grows up in the novel *The Probability Corner* to learn how to read the mind of a computer and invent a matter transmitter in his cellar—all through his willingness to keep combining divergent types of knowledge. Such willingness, the Richmonds imply, is usually destroyed by modern education, and education is the most interesting topic in their novel *Phase Two*. The hero, S. T. A. R. Dustin, is injected with molecules of trained men's brains, whose knowledge is then activated in him through four years of computer testing. But the boy's real mental power develops from his efforts to recombine the facts on his own, preguessing the computer and eventually walking easily out of his political prison into new realms of science. The idea that the computer is

an appropriate tool for the expanding mind is also pursued in *Challenge the Hellmaker*, where a group of friends on an orbital station accidentally invent a spacedrive while singlehandedly fighting off a world-wide military takeover. Though the heroes in the Richmonds' books are almost anachronistically individualistic, they are rarely isolated. Even little Oley feels secure in the center of his family, and the collaboration of friends (another means of combining divergent knowledge) is one of the more pleasant constants in the Richmonds' own collaboration.

When their stories do not work—or do not work consistently—they are flawed by unconvincing politics, hyperactive melodrama, and scientific explanations that are not only impossible but are also praised for their clarity by the other characters. The worst offender on all counts is *The Lost Millennium*, a novel that tries to explain all human and geologic history by proposing a prehistorical race of supermen who, through solar taps located in pyramids, possessed broadcast electrical power. The story covers so much so quickly—including all myths, many lectures on electricity, and an incomprehensible soap opera sub-plot—that the result is a fragmented scenario whose several apocalypses are the only relief.

Yet perhaps even *The Lost Millennium* is just part of the Richmonds' effort to scramble our brains into new connections. They were serious enough about the content of their work to form their own research group, the Centric Foundation, and before Walt Richmond's death in 1977 they planned to apply "relatively simple high school mathematics" to physics, and improve on the quantum theory. Few young science-fiction readers would fault their attack on education, and it is hard to resist the Richmonds' faith in the potentially supernatural power of individual thinking. Their eagerness and their determined amateur science ("It's really quite easy," he explained briskly) are part of an innocence science fiction has lost, and could never easily regain.

#### Keith Roberts comments:

I think if we survive our do-it-yourself Armageddon, the 20th century will be remembered as the Age of the pigeonhole. Everything has to have its tag; Stonehenge is a computer, etc. The particular label attached to me is science-fiction writer. I've nothing against it; but I really know very little science. I suppose I did write some technological fiction in the very early days. But I've simply tried to talk about characters who interested me, and events that moved or disturbed me. If that's science fiction, then so be it.

\* \* \*

Keith Roberts is the Thomas Hardy of science fiction, a writer whose vision is deeply embedded in a particular place—the area of southwest England from Salisbury plain south to the Dorset downs and the Isle of Purbeck where Corfe Castle stands. That landscape is the spiritual centre of his work, from the alternate world of *Pavane*, the historical crumbling Roman Empire of *The Boat of Fate*, to the hallucinatory primitive 'future' of *The Chalk Giants*. This sense of place even affects the landscapes of the stories set on other worlds. Roberts's people live in a profoundly felt world, a phenomenal and perceived *lebenswelt* which actively influences their behaviour and beliefs. Roberts also shares with Hardy a desire to articulate the human struggle with passion, need, violence, and corruption of power; to explore humankind's tremendous will to survive in even the worst circumstances (ranging from the living death of survivors of atomic attack to the machine-like behaviour demanded by the ruling class in the new Britain of *Molly Zero*); to incarnate the possibilities of love, and the kinds of penances people committed to others serve for the rest of guilty humanity. If his stories often seem extremely dark, they are shot through with

lightning strokes of passionate love and spiritual striving. They are full of powerful emotional currents, and the best of them are truly visionary.

Roberts began his career with a somewhat typically British disaster novel, *The Furies*. In it Britain is ravaged by giant wasps controlled by an alien intelligence. It's a good example of the sub-genre, and the descriptions, especially those of the wasps' underground nests, are strong; yet ironic self-destruction of the wasps and humanity's somewhat humble new beginning are quite conventional, as a quick look at *The Day of the Triffids* shows. *The Inner Wheel* is also an apprentice work, though a very good one. In this work Robert explores the theme of *homo gestalt* in a story that obviously owes a great deal to Theodore Sturgeon's *More Than Human*, yet especially in his handling of sexual love and the interactions of power and violence, he engages us with his singular emerging 'voice'. Although his characterizations deepen in later works, in *The Inner Wheel* he is already using tone of voice and the small revealing gesture to present complex and humanly opaque individuals. Most important, his people *feel*, and because he renders their feelings with care and precision, we feel with and for them, as well.

In the stories in *Machines and Men* Roberts shows a wide-ranging imagination in his handling of SF themes, from ESP to flying saucers (revealing a capacity for comedy often ignored by his critics). Yet he sets them all in England, as if to say there's no need to go careening across the galaxy in order to explore either workings of the human heart or the awesome and awful possibilities of technological changes in society. "The Deeps" is especially interesting for its complex and subtle presentation of a new, underwater, society.

In the mosaic novel *Pavane*, which many critics agree is the finest of all alternate universe novels, Roberts comes into his own as a unique and major SF writer. Set in 20th-century England in an alternate universe where Elizabeth I was assassinated, the Spanish Armada won, and the Catholic Church has held power over most of the world until the present day, it is a superb complex chain of interlocked stories showing how, finally, the Church's attempt to hold civilization in stasis fail in the face of political and technological "progress." We learn of the many social changes mostly by implications, however, for Roberts seeks to show us how particular people seek and find their destinies in such a world, a world after all not that different from our own in the sacrifices it demands of each person trying to live a "good" life. Roberts is a moral writer in that he insists that all persons face choices in life which will affect not only themselves but their families, friends, perhaps their whole societies. His people engage us because they face those moments of choice and bear the often terrible responsibilities they find there. Thus Brother John the artist, after he has seen and painted the Inquisition, finds he must turn heretic and preach against the Church, and the Lady Eleanor of Corfe Castle (which broods over so much of Roberts's fiction) is moved by compassion and political wit to do battle with the Pope, even at the cost of finally losing all. These people, and others, are troubling and passionate reflections of ourselves, and in their struggles we perforce recognize the possibilities our own lives offer. Yeats's line "In dreams begin responsibilities" could be taken as an epigraph to all Roberts's fiction, for his people break or make themselves in their struggles with precisely that recognition.

It certainly applies to the figures in that even darker novel of a future return to barbarism, *The Chalk Giants*. After an atomic war has literally torn Britain apart, Stan Potts, a lost little fatman, lies dreaming (or foreseeing) passages in the story of humanity's return to an almost medieval culture in the centuries to come. Almost all the stories feature a character resembling

Martine, the woman he never dared to tell he adored. This fantasy lady is never in full control, though she is sometimes priestess, sometimes almost goddess, sometimes princess. The stories themselves are brooding meditations on the human capacity for love and violent hatred of others. Roberts's vision of humanity is not kindly; people will survive but they will often do so at any cost in pain and suffering, for themselves, yes, but especially for others. Yet sometimes suffering is a kind of necessary penance, a recognition of human guilt. *The Chalk Giants* is a richly figured, awe-full book, yet like any good tragedy it is cathartic rather than simply depressing. The latter term could much better be applied to his later, and perhaps last, novel, *Molly Zero*, in which the vision of a blandly terroristic government controlling British youth in a dull bureaucratic future is barely transcended by a tour de force narration in the second person. But even here, as in *The Chalk Giants*, there are flashes of light in the darkness. These flashes, often the discovery of courage in love, even in love lost, occur in the best stories in *The Grain Kings* as well, such as the powerful 'Weihnachtsabend' and the two stories set on the planet Xerxes, where humanity's technology has destroyed the natives' traditional way of life. 'Weihnachtsabend' is another example of Roberts's talent for alternative universes: this time it's a Britain conquered by the Third Reich, in which the most terrifying of the German gods hold power. But his vision has always had an apocalyptic edge, like Blake's, as his brilliant collation of vampire legend and SF scenario of atomic war in "Kaeti's Nights" demonstrates. Yet even this dark fable's power partly comes from Robert's expert invocation of village life in the British countryside. To know the land of Britain as Robert does is to know all its gods, the mythic inheritance which inheres in the very stuff of the language he uses with such visionary power. Balder, Tir-nan-Og, the spirits of place, the Old Ones, all live in Roberts's beloved landscape, as much a part of it as the trees and grass, the ruins of Corfe Castle, or the stones of the henge. Their special presence adds another element to the tapestries in which all the major threads of art and life—passion, compassion, love, courage, vision, humanity, and the human awareness of how easily these can be lost to their opposites, which are therefore also present in the warp and woof of his stories—are woven into rich and exciting patterns.

\* \* \*

Stylist, theorist, storyteller, Stephen Robinett has written some of the funniest science fiction ever published. Whatever the "what if" situation, he is concerned with telling a story with grace and wit and style. True also of his non-SF and pseudonymous SF potboilers, this facet of his writing stands out in two novels and a clutch of short stories from "Mini-talent" to "The President's Image." Once typed as an *Analog* writer, Robinett was first published by John W. Campbell, who liked his care with details, engaging style, and neutral attitude toward science and technology. Close extrapolation, narrow focus and a eye for the self-mocking detail mark even his early stories bylined Tak Hallus (Arabic for pen-name).

After two stories about matter transmitters, Robinett wrote a novel about big corporations and people on the make, in which two huge shipping concerns fight for their share, or more, of the 180-kilometer-wide tantalum ring through which drone freighters are transmitted to and from the stars. Set in near-future Orange County, California, and somewhere beyond the orbit of Mars, *Stargate* is also a detective story with a difference. The detective, who enters the story late, is a 75-year-old, cigar-smoking physical fitness buff, whose reconstruction of the crime is only part of the story. The narrator, an ambitious young project engineer, lives through consequent events and his success or failure hangs on their outcome. Revolutionary politics, utopian urban planning and a dead man's quest for immortality are involved in *The Man Responsible*, which cannibalizes earlier stories about a computer projection as corporation head and an almost-perfected method of transferring personality via synthesized RNA. A lawyer like Robinett, the hero has an essential interest only in recovering a client's \$200 investment. Like a futuristic Philip Marlowe, he jousts with the forces of evil, ambition, and just plain flakiness in Southern California.

Collected in *Projections*, Robinett's best short fiction reveals in miniature his control of style, construction, local color, and humor. He plays it straight in "Tomus" and "Cynthia," ably exploiting the pathos of lost opportunities, but his zanier side dominates most of the others. In "Helbent 4" a self-conscious warship, having conquered the monstrous "Space Things," returns earlier in time to a parallel universe, where shocking us into taking the threat seriously costs it its "life." "The Linguist" exploits his talent by selling engrams that strip away each language as soon as he has learned it. "The Satyr" is produced in real life by molecular engineering, but his "natural" proclivities cause distress to his maker and eventually to himself.

Excessive taxation is the enemy in "The Tax Man" where a trucker manages to beat the system. Birdlike aliens' threat to Earth is turned back by an Indian in full-feathered regalia in

"Powwow." A "teleshia projector" for subliminal commercials gets an ad agency involved with politics and the law in the title story. A more recent story, "Hell Creatures of the Third Planet," finds a movie buff witnessing an insane attack by aliens on a movie studio parking lot and defending police and military forces. In each case, an appropriate narrator makes believable not only the everyday, but also the ridiculous and the sublime. How they're told makes all the difference.

Frank M. Robinson comments:

I have no particular statement to make about my own variety of science fiction except that I like to read and write science fiction based upon extrapolations of current trends in the physical sciences, psychology, cultural anthropology, politics, etc. Conversely, I have little interest in the type of fantasy that has come to dominate the field in recent years.

\* \* \*

Despite his background in physical science, Frank M. Robinson's stories are most often based on psychology or cultural anthropology. One such story, "The Fire and the Sword," is concerned with the reactions of Earthmen to a "perfect" alien society. Robinson chose this story to represent his work in the anthology *SF: Author's Choice 4* (edited by Harry Harrison, 1974). He worked entertaining variations on time travel in "Untitled Story," and produced a short novel of headlong action in "The Hunting Season." "The Night Shift" is a clever short fantasy, and "The Oceans Are Wide" a short novel telling of a young boy's harsh passage to maturity in the warped society on board a generation-ship carrying colonists to a distant planetary system. Behind the editor's inappropriate title of "Dead End Kids of Space" was an entertaining story of the adventures of a survey team on a planet with a very confusing and unpredictable culture. Another light-hearted story with an anthropological basis was "The Santa Claus Planet" concerning a society in which the giving of gifts had been elevated into a ritual with decidedly sinister overtones. In another vein entirely, "Dream Street" was a deceptively simple story of a boy on the run from an orphanage, and of his longing to become a spaceman.

His first novel *The Power*, was published by Lippincott as part of a short-lived series of "novels of menace." It lived up to its billing admirably. The story concerns a Navy-subsidized research team studying human endurance and survival characteristics. Results of an anonymous questionnaire suggest that one of the team members is a superman with an assortment of psychic powers, and the one team member who takes these results seriously promptly dies under mysterious circumstances. He leaves an uncompleted letter for team chairman William Tanner: "I want to tell you about Adam Hart. . . ." In his review of the book, Damon Knight characterized Robinson as "a gifted and sensitive writer" but found fault with his logic and with an anti-scientific tone to the book. Most readers and critics, on the other hand, found Tanner's nightmare battle against Adam Hart hair-raising and compulsively readable.

After the publication of *The Power*, Robinson temporarily gave up fiction writing and took a succession of editorial jobs. Occasionally another story would appear. "East Wind, West Wind" is a grim story of an inspector for Air Central, monitoring air quality in a smog-bound future Los Angeles in which all forms of air pollution, from cigarette smoking to internal combustion engines, are outlawed.

The collection, *A Life in the Day of . . . and Other Short Stories*, includes five of Robinson's stories from the 1950's and four later stories. The book is a reminder of just how good (and how underrated) Robinson's short fiction is, and is equally valuable for the extensive autobiographical commentary, which gives a vivid picture of the science fiction field in the 1950's and 1960's.

In 1973 Robinson began a very successful collaboration with Thomas N. Scortia. The team has produced a series of best-selling "disaster" novels, some of which are borderline science fiction. The first of these was *The Glass Inferno*, a story of a fire in a modern high-rise building. (Together with a similar book, *The Tower* by Richard Martin Stern, this was the basis for the popular film *The Towering Inferno*.) *The Prometheus Crisis* is about a reactor failure in a nuclear power plant, *The Nightmare Factor*, covert biological warfare. Even when not concerned with science-fiction ideas, these books exhibit the science-fiction writer's careful analysis of processes, both physical and mental. This attention to expository detail is not allowed to interfere with the pace of the story, and serves to enhance the realistic tone.

*The Great Divide*, a collaboration with John Levin, is a political thriller set in the late 1980's. The Second Constitutional Convention and a renewed oil crisis provide an unscrupulous California governor with the tools for a coup that would split the country into two warring camps. The efforts of a vice-presidential aide and a small group of friends to uncover and stop this scheme make a tense and uncomfortably convincing narrative.

*The Novels of Philip K. Dick*. Ann Arbor, Michigan, UMI Research Press, 1984.

\* \* \*

Kim Stanley Robinson is one of the most promising new writers to burst onto the science fiction scene in the 1980's. Robinson gained instant respect with his short fiction, first published in *Orbit*. He gained a Nebula Award nomination for the haunting "Venice Drowned" in 1981; "To Leave a Mark" was nominated for a Hugo Award in 1982; "Black Air" won the World Fantasy Award and was also a Nebula and Hugo Award finalist.

But it was Robinson's first novel, *The Wild Shore*, that gained him fame and a larger audience. It is a post-nuclear holocaust novel in which the U. N. has quarantined America. Henry, a 17-year-old version of Huck Finn, decides to explore his world and himself. Robinson displays his skills as a writer as he takes Henry through a series of adventures that culminate in an unforgettable rite of passage.

Robinson's next novel, *Icehenge*, is more difficult, and reveals a strong Philip K. Dick influence (this shouldn't be surprising because Robinson wrote his doctoral dissertation on Dick's work; a revised version was published as *The Novels of Philip K. Dick*). In *Icehenge* three narrators describe the same event in wildly different ways. This is a future in which individuals can live hundreds of years, but the government purges the data banks and controls information so that memories can last only 50 years. In an Orwellian sense, memory and history become fluid, relative. Yet a crisis occurs when the first expedition to Pluto finds a series of monoliths: the fact that *Icehenge* was constructed by humans is inescapable, but a total contradiction of established, official history. Robinson's brilliant realization of the characters of engineer Emma Weil and historian Hjalmar Nederland shows his growth as a writer.

\* \* \*

In little more than a decade, Spider Robinson has established himself as an important writer and critic of contemporary SF. With three novels, two story collections, an anthology and two series of book reviews to his credit, Robinson has won a number of major awards; more important, he has shown himself able to combine successfully two themes that often seem incompatible in other SF writers: technological optimism and a critique of technological society.

Robinson's themes and style show a clear continuity from early stories and novellas such as those collected in *Callahan's Crosstime Saloon* through the apocalyptic novels *Telepath* and *Stardance* to the more recent SF mystery *Mindkiller*. The first, a collection of stories about the unusual clientele of a Long Island tavern, is a metaphorical *symposium* as well as a literal one: the gruff but kindly barkeep Callahan presides over a series of dialogues and encounters moving from a vision of social disintegration to one of restored community in the final story, which takes place on New Year's Eve. This comedic pattern appears in *Telepath* as well: here the remnant population of a post-catastrophe United States is threatened by powerful aliens as well as by conflict between technophiles and a naturalist cult, but the story ends in a love-feast marked by multiple marriages, restored filial relations, and administrative merger. In *Mindkiller* a professor whose life has disintegrated is restored by joining a conspiracy to change the world through a technique

known as mindwiping. And in *Stardance* the final vision is of a Dantesque redemption of humanity, flesh become incorruptible, and polymorphous sexual-spiritual communion among humanity's elect and plasmoid aliens who rather resemble angels.

The first-person narrator plays a similar role in the four fictions. Jake, frame-narrator of *Callahan's*, is nursing a spiritual wound—he was responsible for his wife's and daughter's deaths in an auto accident—but it is he who articulates the redemptive (cross-time) nature of Callahan's place. In *Telepath* Isham Stone has been nurtured on hatred, violence, and revenge, and early in the novel loses an arm and attempts to murder his father; yet it is Isham who evolves the ability to communicate with the aliens and who makes peace between the two factions of humanity. Charlie Armstead of *Stardance* is similarly wounded. An embittered dancer whose career was destroyed when his hip was damaged by a gunman's bullet, he works as a video specialist with the dancer Shara Drummond. This leads to communication with the alien entity that threatens Earth, and later to his dance company's transcendence of a corrupt and polluted planet, union with the aliens, and reunion with Shara. The importance of the disabled narrator redeemed through the shared experience of pain is underlined by the *Callahan* story "The Law of Conservation of Pain," in which a time traveler interferes with the early life of a blues singer. Rather than destroying her talent by obliterating the universe in which she suffered and was scarred, his interference creates a universe in which her songs of joy are as wrenching as her songs of pain ever were. The metaphor of the conservation laws makes joy and pain, like matter and energy, metonyms of the same reality. Curiously, the dual narrator of *Mindkiller* (English professor Norman/cat burglar Joe) comes to accept violence and a strong leader, beyond good and evil, as necessary to social progress, even though that individual has been directly responsible for much of Norman/Joe's personal misery.

It might seem paradoxical that Robinson, whose themes include the fragmentary and incomplete, as well as destructive, qualities of discursive thought and verbalized experience, should be so word-conscious a stylist. A hallmark of his writing is the pun, from the "Punday night" contests in *Callahan's* to the "abominable multi-level puns" swapped by Raoul and Charlie at the conclusion of *Stardance*. Especially in *Telepath*, the function of the pun is to deconstruct the reality asserted by the utterance in which it appears, suggesting that the universe of propositional language is created and provisional rather than given. Another feature making for dense verbal texture is a complex of allusions, especially to SF writers, situations, and language, but also to jazz and popular songs, and in *Stardance* to the traditions of modern dance and to the space colonization literature. Also notable is the high proportion of text devoted to dialogue and internal monologue (and in *Telepath* to documents), often reducing narration to mere stage directions. Such an "associative rhythm" (as Northrop Frye has termed it) is characteristic more of lyric poetry than of traditional prose fiction. Robinson's SF, which embodies a vision of *telepathy* (a secular version of the "communion of saints"), appropriately tends to be more lyric than narrative in style and structure.

The lyric quality of Robinson's SF suggests how he manages to fuse sharp critique with technological optimism. Such a collocation sits uneasily in the customary universe of hard SF, a universe governed by either/or, cause-and-effect logic. In *Telepath* and *Stardance* we view a world literally poisoned by the effects of modern technical society: pollution, overpopulation, war, crime, and madness. In *Callahan's*, redemption from this world is allotted only to those whose steps direct them to

Callahan's refuge and who are able to share in the bar's feast of love and empathy. In the two apocalyptic novels, redemption is communal: a remnant of humanity overcomes disintegration to move onto a new evolutionary plane of physical, intellectual and spiritual fusion. The fusion comes about partly through apparently fortuitous encounters with angels rationalized as plasmoids (alien entities embodied in the fourth phase of matter). But it occurs only when man makes benign use of his most advanced technologies to facilitate full communication. And it obliterates the oppositions which seem to structure the possibilities of human experience, including the one between technology and nature.

The lyric quality is nearly absent from *Mindkiller*, a more conventional SF mystery novel that seems to yield to the totalitarian temptations inherent in the "fusion" or "communion" motif of the earlier fictions. Like the others it portrays a society corrupt in all respects, but through a series of appearance/reality reversals, it tries to make us accept that its villain, a sinister practitioner of mind control, is really a benevolent scientist who wishes only to save the world. It is a novel promoting the theme that great ends justify any means, that urges the amorality of technology and of the visionary leader, and that naively reverses 1984's cynicism about the ends of power. The "associative rhythm" is muted, and even Robinson's wordplay seems strained and aimless. When Norman's identity is restored at the end, he speaks of the technology as "mindfill" as opposed to "mindkill," but we have the feeling that he and the other enthusiasts of mental surgery are little more than puppets mouthing a new party line.

Like all good SF writers, Robinson has created a myth of the future, one in which human initiative and technological advancement play an active part. In most versions of his myth, Robinson portrays humankind moving toward a quasi-mystical fusion in which individual consciousness retains its identity while merging into something greater than the self. Perhaps uncomfortable with the theological implications of those versions, Robinson has lately given us a version in which the individual consciousness remains atomistic and alone, to achieve union with others only through their common controller. It will be interesting to watch as the myth's two main variants contend for superiority in Robinson's future SF.

—John P. Brennan

\* \* \*

Ross Rocklynne was one of the important authors of magazine science fiction's middle-years. He published his first story in *Astounding* in 1935, and for some 15 years was a regular contributor to a variety of science-fiction magazines. His works was of sufficiently high quality that L. Sprague de Camp wanted to include him as one of the 20 or so leading writers in the field for his *Science-Fiction Handbook* (1953). Both the key early anthologies of science fiction featured Ross Rocklynne stories: "Quietus" was in the Healy and McComas *Adventures in Time and Space* (1946) and "Jackdaw" was in the Groff Conklin *The Best of Science Fiction* (1946). Since 1950, Rocklynne's appearances have been sporadic.

Although he wrote some short novels, Rocklynne concentrated on shorter works. It is possible that his avoidance of the longer lengths has made his name less well known than it should be. Usually a careful craftsman, he wrote many types of science fiction: competent space operas, time-travel stories, effective mood pieces, scientific puzzle stories, detective stories, and yarns spun around the Big Idea. Typical of the latter was "The Moth" (*Astounding*, 1939). Here—in 14 pages—he presented what John Campbell called "a wholly new idea for a spaceship drive" and for good measure threw in a fairly sophisticated picture of competing corporations.

Rocklynne also wrote a series of stories about a character named Hallmeyer. They are unfortunately largely forgotten today. Dealing with a "Bureau of Transmitted Egos," they are early examples of reshaping human beings to live on alien worlds. More than that, Hallmeyer was a person who *cared*. The stories have an atmosphere of compassion, of questioning basic values, of sadness. (For example, see "Task to Lahri," *Planet*, Summer 1942.) Indeed, there is an elegiac quality that pervades many of Rocklynne's better stories. The experimental side of Rocklynne appears most notably in his *Darkness* stories (1940 to 1951). They are concerned with the fates of sentient stars, and the writing is far removed from the usual styles of pulp fiction. The series was reworked as *The Sun Destroyers*.

Ross Rocklynne was never less than a capable storyteller. However, he tried to be more than that: he pushed himself instead of always taking the easy way. He was a major creator of the science fiction of the past, but he was also one of those who pointed the way ahead.

Richard Rohmer's novels only qualify for the epithet "science fiction" by virtue of their settings, which are projections of the contemporary international political, economic, and military arena. As tales of the near future, they are ephemeral works, their fictional prognostications soon invalidated by historical reality (*Exodus/UK*, published in 1975, is set in the late 1970's, but the events narrated therein bear little resemblance to the actual political developments of the latter part of that decade). They perhaps fit more permanently, within the science-fiction framework, as alternative histories; nevertheless, their plots, characters, and narrative style have closer affinities with political thrillers than science fiction.

All the novels deal with various political and economic intrigues and are made convincing by Rohmer's personal knowledge of the worlds of the law, politics, and the military. His stories are particularly persuasive when they describe major global events, such as the bankruptcy of Britain, due to the withdrawal of Arab monies, in *Exodus/UK*; the events leading up to the annexation of Canada, in *Ultimatum*; the Canadian take-over of the two American banks, in *Retaliation*; the natural gas crisis, in *Balls!* But while the construction of such realistic scenarios is Rohmer's major strength, the presentation of his *dramatis personae*, within these settings, is his major weakness. His characters are wooden and heavily stereotyped, given unrealistic dialogue (often for the sake of explication), and are frequently limited by a somewhat sexist representation. The male-female relationships are handled without subtlety—hard-drinking men seducing attractive and ambitious women—and conform to clichéd soap opera conventions (e. g., in *Retaliation* Samantha Scott, described as a handsome woman, unlikely to turn heads, is transformed when she removes her glasses).

All of the novels follow a consistent pattern of narrative technique, characterisation, and plot development. The chief part of each story is the description of an event (e. g., an energy crisis, take-over bid, military exercise) in which the characters are largely embodiments of certain prevailing elements within our society—what E. M. Forster would call "flat characters," built around a single idea or quality (the military man, the captain of industry, the superpower leader, etc). Inserted into general stream of the plot are some gratuitous digressions in a sensational vein (such as the Prime Minister's plane crash in *Exodus/UK* and the kidnapping of Dr. Huber's daughter in *Retaliation*), which do nothing to develop the characters or the plot and, I suspect, exist in order to make the rather impersonal central themes more immediately exciting. Another technique Rohmer uses, to this end, is the alternation of different streams, in an attempt to create an episodic cliff-hanger effect. A number of the stories have sequels: *Ultimatum* is followed by *Exxoneration*; *Exodus/UK* is followed by *Separation* and *Separation Two*; *Periscope Red* is followed by *Triad*.

Rohmer's novels reflect some of the most powerful examples of social-Darwinism which occur in our society, particularly among the upper levels of international politics and multinational business, in which the balance of power shifts in vast, impersonal games of profit and loss. However, rather than questioning and analysing these games, Rohmer constructs his narratives in simple affirmation of his acute right-wing philosophies. At times his work reflects particularly Canadian concerns—such as the divisionalism in Canadian provinces and the threat of succession.

Rohmer is, on the one hand, a writer with an impressive imagination, has considerable experience in the areas about which he writes and presents imminently plausible projections of modern-day events, yet, on the other hand, he is very much limited by artificial and clumsy technique, awkward plots and bluntly stereotyped characterisations. Nevertheless, his books

are popular with his audience, all of them best-sellers in his native Canada.

Mordecai Roshwald comments:

I became involved in fiction writing through concern about the menace to humanity from nuclear armament, as well as out of a sense of disenchantment with some aspects of modern life. However, an involvement in this kind of writing creates a momentum of its own, as it releases half-hidden emotions and sentiments in the writer's mind. Thus, in a way, I have become a

fiction writer, intent on not neglecting this kind of self-expression and public address, despite my regular academic commitments to teaching and scholarly research, as well as occasional journalistic writing. The diversity of my activity does not prevent me from looking for a common denominator, a philosophy common to these varied efforts. Indeed, I believe I have maintained a fairly consistent approach throughout the different modes of expression.

The science fiction I have written is very much coloured by social, political and cultural concern. Indeed, science fiction is for me a *form* of expression rather than an objective in its own right. In this sense I would classify it with such books as Swift's *Gulliver's Travels* or Huxley's *Brave New World*, rather than with some modern stories dealing with inter-stellar warfare, monsters from distant planets, and the like (unless such stories are used as parables). Though my main success as a fiction writer was due to the success of *Level Seven*, classified as science fiction, I do not feel restricted to this literary form.

\* \* \*

Mordecai Roshwald's first book, *Level Seven*, is perhaps the most chilling of all warnings about the new and unlimited dangers of thermonuclear war—such as Nevil Shute's *On the Beach*, Eugene Burdick and Harvey Wheeler's *Fail Safe*, Peter George's *Red Alert*, and others. The story begins as the Push-button Officer X-127 is taken down the one-way escalator 4000 feet to Level 7, the deepest in his country's shelter system and the control centre for its offensive weapons. The personnel on this level have numbers and opinions, but not names and faces; they have an atomic reactor for power, synthetic food for 500 years, and taped music for amusement. Marriage is permitted and plans are made for raising children to carry on life as troglodytes after the inevitable war. Finally the order comes (set off, we learn, by an accidental rocket firing), X-127 and his colleagues push all their buttons and the surface of the planet is destroyed. Gradually, as the radiation penetrates deeper, the other Levels and those of the enemy and the neutrals falls silent. Level 7 itself is flooded with radiation from its faulty reactor, and X-127 dies with the others, huddled in his bunk and dreaming of the sun. The terrifying effect of *Level Seven* depends on the absolute inevitability of its outcome. The feeble protests of X-117, a button-pusher who refuses to do his duty, only underscore the iron determinism of the system. If the story were recast in more mundane and conventional form, using real characters instead of numbered abstractions, much of its unique capacity to convince and frighten would probably be lost.

We see the other side of the coin in Roshwald's second novel, *A Small Armageddon*. In this peculiar tale, a group of officers of the American nuclear submarine *Polar Lion* hold a clandestine drinking party while the ship is on patrol. When the captain finds them, a scuffle takes place in which the captain is killed. The submarine proceeds to cruise the world, exacting tribute under threat of its missiles. It is finally destroyed in an exchange of fire with a Minuteman base which has been taken over by religious fanatics. Meanwhile neo-Nazis have captured missile bases in Germany, and the African state of Qunta-Qunta announces its own demands, backed by three hydrogen bombs that it has managed to buy or steal.

*Level Seven* depends on the notion that heads of state are irresponsible maniacs. Its abstract nature enables the reader to believe this, at least enough to give the story a profound impact. *A Small Armageddon* requires us to believe that malcontents and fanatics can easily gain control of nuclear weapons. It fails because of Roshwald's failure to make either people or situations even remotely credible. Submarine officers are not

sophomores who wait till the captain's asleep to hold booze parties. Armed Civilians cannot take over a functional missile base as bandits might a supermarket. *Level Seven* is an effective work produced by an author who cannot handle the demands of mainstream fiction; as such, the book is interesting as an SF boundary marker as well as for its own real and unique terror.

\* \* \*

William Rotsler is one of the few SF writers who has also achieved fame as a cartoonist. His distinctive style of cartooning has proven popular for over 30 years, and he writes frequently on the arts for such monthlies as *Adam*. It is little wonder, then, that Rotsler's first novel *Patron of the Arts*, is about the nature of the artistic process. Rotsler attempts in this novel to determine the social effects of a *Gesamstwerk*, an attempt at the total union of the arts through a synthesis of holography and electronic music. This novel succeeds to the extent that the ideas it contains are reflections of authentic experience, but Rotsler's extrapolative sense is not keen, and the novel can best be characterised as an interesting failure.

From his promising first novel, Rotsler's work quickly declined. Rotsler has tried a career as a commercial entertainer, but fails to provide that depth of characterisation and intellection that the best popular writers, such as Paul Anderson and Gordon Dickson, provide. His later novels are mere repetition of formulas without any distinctive presence. His favourite formula is that of the Ship of Fools, a cast of various racial and sexual types gathered together to face a perilous situation. Thus in *Zandra* the varied cast is drawn together after their cruiseship passes through the Bermuda Triangle into another dimension. In *Shiva Descending* (with Gregory Benford) the cast faces the familiar peril of a meteor about to destroy Earth. Rotsler and Benford mine this tired lode of apocalyptic fiction to little effect. Rotsler's worst novel, however, is *The Far Frontier*. In this work, Rotsler fulfills the worst fantasies of those mundane critics who insist that science fiction is nothing more than Western formulas transported to a wider setting. Rotsler has replied with a novel complete with interstellar Indians, space cows, and planet rustlers. Rarely does one read a novel where the writer rejoices in its trashy content; such, unfortunately, is the case with *The Far Frontier*.

Rotsler, then, after achieving promise as a first novelist, has reneged upon that promise with his later novels. He is less important for his writings than for his cartoons, which have the distinction and wit that his novels lack.

—Martin Morse Wooster

**ROUSSEAU, Victor** (Victor Rousseau Emanuel). Also wrote as H. M. Egbert. American. Born in London, in 1879. Lived in South Africa at the turn of the century; emigrated to the United States, and wrote for pulp magazines until 1941. *Died 5 April 1960*.

\* \* \*

Victor Rousseau's stories spring out immediately and absorb the reader with global plots and bold valiance. Rousseau's rare talent is to combine medieval values and Louis L'Amour's style in the science-fiction context. The result provides sentimental satisfaction. The amusement in reading Rousseau is similar to the *Star Wars* experience in cinema. Both *The Messiah of the Cylinder* and *The Sea Demons* present strong heroes and execrable villains.

Even if the "daring sexual implications" that the promotion page of *The Sea Demons* promise are hard to find, there are enough imagination and activity in the macrocosmic plots to satisfy thrill-seeking readers. In *The Messiah of the Cylinder*, our hero (Arnold) and his foul antagonist are prep school mates. One of their school-mates, Herman Lagaroff, invents the 100-year time-lock cylinder that transports the two men (and the pristine maiden whom they both love) into the year 2017. The time forwarding is believably described, involving Arnold's tortuous arrival in the strange London of 2017: "I flung myself upon my face and prayed, with all my will, to die." The story of these books is similar to Wells's *A Modern Utopia* and *When the Sleeper Wakes*. The time travelers in Rousseau's work are propelled into a barbarous authoritarian nightmare, however, where "the dull and the base" are categorized by size of cranium. "The Prophet Wells," as he is referred to by Rousseau, would be aghast at the cold brutality of the rational society as it is portrayed in *The Messiah*. The triumphant ending in *The Messiah* includes the destruction and overthrow of the (fascist) government, the outlawing of divorce, and a return to a "ruling class bound to its traditions of public service." Where Wells asserts the final victory of reason, Rousseau longs for a futuristic theocracy. The priests would be happier than the scientists in Rousseau's future. Nonetheless, Rousseau exhibits a vivid technological imagination. He writes about solar power, plausible flying machines, and a communication network similar to the current and projected reality. The sinister government's effective propagandistic use of the media is a startling reminder of the current world situation.

The plot of *The Sea Demon* is of the canned-on-the-shelf variety, and the story is similar to *The Messiah*. The strange sea creatures who are struggling to take over the world are discovered by noble Captain Donald Paget. Gallantry overcoming the hideous threat is the main course: Donald "Raised the girl in his arms, and felt one of the blubbery flippers on his hand . . . the stinging flippers sucked the blood from his face and hands . . . But Donald could not lose with Ida's life at stake." The battle to save the world intensifies to involve all governments and world resources. The story culminates in suicidal frenzy as the Queen Sea Beast dies of a broken heart and leaves the hordes without leadership, which we all know leads immediately to destruction.

The enduring impressions one gets of Rousseau are staunch traditionalism and faith in a well-ordered universe. Rousseau is good for a cheerful escape from heady ambiguity, and the pleasures of a frantic plot with the sugar-coated conclusion never in doubt.

—Peter Lynch

**RUCKER, Rudy.** American. Born in Louisville, Kentucky, 22 March 1946. Educated at Swarthmore College, Pennsylvania, B. A. in Mathematics 1967; Rutgers University, New Brunswick, New Jersey, M. A. 1969, Ph. D. 1973. Married Sylvia Bogesch in 1967; two daughters and one son. Assistant Professor, State University of New York, Geneseo, 1972-78; Alexander von Humboldt Foundation Research Grantee, University of Heidelberg, 1978-80; Associate Professor, Randolph-Macon Woman's College, Lynchburg, Virginia, 1980-82. Since 1982, free-lance writer. Recipient: Philip K. Dick Memorial Award, 1983. Agent: Susan Protter, 110 West 40th Street, New York, New York 10018. Address: 1324 Church Street, Lynchburg, Virginia 24504 U.S.A.

## Rudy Rucker comments:

An unusual thing about my work is that I write popular speculative mathematics books as well as fiction. To some degree the fiction serves as a laboratory for thought-experiments related to my scientific and philosophical investigations.

Another aspect of my fiction is that much of it is, on a higher level, autobiographical. I call the device of writing about one's life in SF terms *transrealism*. Taken in sequence, *Secret of Life*, *White Light*, and *Sex Sphere* make up a transrealist trilogy.

My non-fiction has largely been devoted to expanding the range of things that people are able to think and talk about. Infinity and higher dimensions are of particular interest to me.

\* \* \*

In his works of science fiction and science fact, Rudy Rucker extrapolates new physical and psychological modes of existence from current possibilities. He pursues these extrapolations by exploring how the mind can manipulate the physical universe and hence distort our commonsense perceptions of the world. The results of these distortions are a renewed sense of wonder about the external world and an enhancement of the internal world through increased self awareness.

Rucker frequently takes his hero or heroes—and vicariously, of course, the reader—on a mental journey toward some higher plane of reality. Sometimes this journey involves altering our world by imagining a concept from theoretical physics into an everyday reality. In *Master of Space and Time*, Fletcher and Harry physically occupy Hilbert space and, in the process, allow an alternate version of Harry to escape into our world. This inversion of Harry's affable, disordered personality—Gerry Herber, a figment of Harry's imagination run wild—unleashes a reign of terror that preys upon the weakest elements of society. Herber threatens to eradicate the independent thought and action that made him a physical reality in the first place. Furthermore, Fletcher and Harry are themselves the product of Alwin Bitter's imagination. Bitter's preoccupation with Hilbert space willed them into existence and manipulated their experiment, and, like Gerry Herber, they threaten the balance of the physical world. Similarly, through the imagination, a young Alwin Bitter in *The Sex Sphere* achieves first the transformation of the city of Heidelberg into a degraded carnival of sexual activity and then a return to normalcy. A hypersphere trapped in three-dimensional space and the others it spawns have voracious sexual appetites and an intense aversion to human females. The emotional ties that bind Bitter to a normal life become increasingly precarious. When they reach a breaking

point, he wills into existence a world in which sexual gratification becomes completely divorced from human involvement. There are no females, only sex spheres. Bitter's wife re-establishes ties with him, and he wills the sex spheres and his experiences in Germany away. In both of these novels, Rucker imagines for us a world transformed by an idea and infinite possibilities for the recursion of this transformation.

In addition to theoretical concepts, machines are also the catalysts for the journeys Rucker's heroes take. The possibilities opened up by computers form the basis for several of Rucker's novels, and like concepts, physical objects can alter everyday reality in unexpected ways. In *Infinity and the Mind*, Rucker suggests that computers may one day become self-replicating and through natural selection mimic the intuition and subtlety of human thought. Further, he speculates that because of more favorable environmental conditions on the moon, computers may eventually form their own separate society there. This speculation forms the basis of the novel *Software* in which an old man strives for immortality and a young man for his connection to the rest of the human race. In *Software* computers have achieved a rough parity with humans, and Rucker explores that delicate balance as humans fend off the computer's efforts to "eat their brains" and thus deprive them of their humanity. In *Spacetime Donuts*, the balance has shifted in favor of computers. They control most aspects of human activity, from dispensing food—a tasteless concoction called "dream food"—to plugging into the human consciousness every night and supplying mankind with dreams. Computers provide immediate gratification of all human needs, and men are little more than useless appendages of one large computer that rules the state. The novel explores one man's journey back to his own humanity with the help of theoretical physics and the revolution caused by that journey.

While the journeys prompted by ideas and technology threaten Rucker's heroes and their worlds, each journey ends in an affirmation of humanity. People become more aware and more open to their husbands, wives, lovers, children; people realize the best in themselves; people die because they are old and because death is the way the human race replenishes itself. This human affirmation brings a restoration of normalcy and with it an enhanced sense of wonder about the everyday world. This sense of wonder is what science fiction is all about.

\* \* \*

During the 1960's, Joanna Russ emerged as one of the most talented and provocative writers of science fiction's New Wave. While Russ identifies herself primarily as a feminist, she is equally well known for her experimental way of handling the conventional materials and narrative strategies of science fiction. Since Russ is opposed to all social fixities and intellectual givens, her major effort as a science-fiction writer has been to explore alternate realities and create new myths, especially ones which depict women as complex human subjects.

Russ's apprentice work is feminist only obliquely. Ostensibly she aims at an interesting mix of historic fantasy and the supernatural, a combination she continues to use in her later work. The initial run of stories exploits the theme of the after-life to fresh effect. "Nor Custom Stale," her first story, is untypically set in the future. It describes a bourgeois couple who live stubbornly immured in a future-tech "House" while catastrophic ages pass unnoticed outside; domestic monotony preserves them in a living death. Several of the stories are set in the 19th century, an era Russ understands but dislikes. "Mr. Wilde's Second Chance" is a wry account of the dead poet's renunciation of an opportunity to live a conventionally tasteful second life. In "There Is Another Shore . . .," a revenant young woman, a kind of female Keats, returns to her deathplace in Rome to taste "the fullness of life" in romantic adventure. The ironic promise of this story—that if life for the 19th century woman was death, death was liberation—is also the germ for "My Dear Emily," whose sober young heroine is passionately emancipated when she becomes a vampire. Part of the wit of such stories is their literary allusiveness; "My Dear Emily" condenses the romantic plot of *Wuthering Heights*.

With her first Alyx stories, Russ introduces a character new to science fiction, an adventuress whose daring and cunning issue from her womanly strength. Set in ancient Phoenicia, these stories launch her on a career as a soldier of fortune. In her natural setting, Alyx is of necessity an outlaw sensibility—a rationalist in a world of superstitious mystique, an imaginalist in a world of empty, brutal pragmatism: in short, Russ implies, the ancestor of the intelligent modern woman. *Picnic on Paradise*, also built around Alyx, casts her again as an outlaw, here a ruthlessly sensible, martially skilled Trans-Temp agent abstracted from Tyre to a future world wasted by advanced

capitalist war. Alyx is Russ's *agent provocateur*: neither Amazon nor androgyne, she foils both old and new notions of the feminine ideal. At the same time, her unromantic heroics are designed to satirize the "he-man ethos" of Sword and Sorcery. For all its modesty in plot and narrative strategy, *Picnic on Paradise* may be Russ's most inventive novel.

It was closely followed by another ground-breaking novel of the future and several increasingly accomplished shorter fantasies. *And Chaos Died* is at once a penetrating social critique and a lyrical celebration of a psionic near-utopia. Russ maroons her hero on a pastoral planet where he is drawn into an egalitarian community and taught psi-powers. What is really new in the novel is its style: the magic arbitrariness of the narrator's experience is rendered by a stream-of-expanding-consciousness technique that registers his initial nausea, then his growing joy, and finally his disgust when he is returned to a dystopic earth wholly given over to violence and mental imperialism. In the novelette "The Second Inquisition," Russ makes a poignantly funny story of one of her central concerns, a young girl's need for a worthy feminine model to counteract her social training in self-extinction. The tutelary genius in this case is a Trans-Temp agent from a non-sexist future world. The heroine of "The Zanzibar Cat" is yet another Alyx-like subversive ironist, a medieval miller's daughter who faces down a lord of Fantasyland. By the end of the tale, the humble milleress has grown into the mother of all meaning, the author. The archaic setting of "The Zanzibar Cat" and the Hellenistic background of "Poor Man, Beggar Man," a story that splits the historic Alexander into ego and ghostly alter ego, testify to Russ's continuing interest in unwritten history.

With "When It Changed" and "Nobody's Home," Russ reached a new level of achievement. These visions of an emancipated future for women on the wistfully named Whileaway are thorough reconstructions of the standard manless-world story. They are utopian, but only in a special sense: the particular virulence of male-dominated culture is no more, yet life remains unpredictably anguishing and rewarding.

*The Female Man*, a reconsideration of Whileawayan possibilities, has become an underground classic in both science-fiction and feminist circles. The book is built around the digressive journal of a present-day woman who encounters three other selves: the victim of an altered past even more oppressive of women than our own, an ambassador from a Whileawayan future, and an intermediary figure from a world split by gender war into Manland and Womanland. Each is, in her way, an Everywoman. Janet is Russ's ultimate heroine, "the Might-be of our dreams," the goal of feminine evolution. The way to Janet lies through Jael, or Alice Reasoner, the sex warrior based on Alyx; Jael knows that liberation must be won at hard cost. Joanna, the sometime narrator, and Jeanine are both confused products of a culture which invalidates their every aspiration. These four life histories are super-imposed on one another to create an anti-novel: narrative with dense novelistic details interspersed with meditation, reverie, and fragments of the mythology and history of Whileaway. What holds all this together is impassioned articulation, a style as sensitive as ever to the bizarre complexities of women's lives, but here honed to laser precision by rage.

Russ distinguishes herself in *The Female Man* as radical intelligencer and stylist. Her next novel, *We Who Are About to . . .*, is a study of an hallucinating woman dying alone on an emptied planet. For all its eerie fascination, the book remains rather private and untransformed. In *The Two of Them*, Russ returns to the earlier mode of the politically and socially informed adventure. The Trans-Temp heroine of this novel has escaped from the stultifying world of America in the 1950's to

become an agent in the future. Sent to a sexist society that owes something to the Arabian Nights and something to the Islamic world of today, she rescues a girl from a hareem, discovering in the process the depth of her commitment to the child: "... it'll take longer than one woman's lifetime," she realizes, to free herself. Russ's own commitment to the liberation of the young has borne fruit in two recent short stories ("My Boat," "How Dorothy Kept Away the Spring") and *Kittatinny*, a fantasy written expressly for young girls.

*Extra (Ordinary) People*, Russ's latest work, evinces both a growing technical mastery and an increasingly subtle feminist consciousness in a series of tales about diverse female liberators. A wry, formally inventive book, *Extra (Ordinary) People* is comprised of five narratives, the first four centered on the extramundane adventures of these wise women and the last a romp of a parody—a plot outline for a lesbian historical romance. As a casual linking device, a fragment of a tutorial introduces each tale to a naive future "schoolkid." Repeating this structure, an ironic teaching and learning motif recurs in the stories proper: several of the heroine-mentors are isolated in dangerously ignorant, sexist societies of the past and future, and their often comic, always poignant reports are relayed as knowing letters home. Indeed, all of the stories present lessons in "the usual confusion and mess" of human sexuality. In the initial tale, the Hugo award-winning novella "Souls," for instance, a telepathic genius of a 12th-century abbess challenges the brutal sexual code of Viking invaders. In "The Mystery of the Young Gentleman" and "What! Did You Do in the Revolution, Grandma?," lesbians in male disguise traverse sexual boundaries, demystifying their own "outlaw" sexuality and defamiliarizing orthodox sexual behavior as they go. Rendering from the inside the extraordinary sentience of her heroines as they struggle to endure or elude the meshes of simplistic alternate realities, Russ creates a fiction both immediate and ironically layered—a work of and about science fiction. *Extra (Ordinary) People* should keep Russ at the experimental forefront of the field.

—Carol L. Snyder

**RUSSELL, Eric Frank.** British. Born in Camberley, Surrey, 6 January 1905; grew up in Egypt. Served in the King's Regiment, 1922-26, and in the Royal Air Force, 1941-45. \* \* \*

Eric Frank Russell will always be remembered as the author of *Sinister Barrier*, the story which helped John W. Campbell launch the magazine *Unknown* in 1939. Boosted as "the greatest imaginative novel in two decades," it established the British writer at the centre of the international science-fiction scene where he remained a popular figure for more than 30 years. It also drew attention to the abundance of plot material in the much-maligned works of Charles Fort, whose philosophy of scepticism Russell upheld consistently on behalf of the Fortean Society.

The novel relies on the notion that the Earth belongs to an alien race which feeds on the human misery it causes. With consummate skill, goaded by Campbell, Russell presented it as a mystery story in the tradition of the detective pulps he had studied in preparing to write for the American market. His taut, racy style had first attracted attention in *Astounding Stories* in 1937, when "The Saga of Pelican West" showed the influence of Stanley G. Weinbaum which affected many writers at that time. His contributions to the British *Tales of Wonder* and *Fantasy* also revealed a refreshing touch of humor coupled with a vigorous approach that was rare in science fiction. Typical examples were "Vampire from the Void," set in his Liverpool habitat, and "I, Spy!" concerning a Martian visitant that could simulate any form of terrestrial life. His amusing tales of Jay Score, the robot space-pilot, and his crewmen were collected in *Men, Martians, and Machines*. War service curtailed his writing, but "Metamorphosite," a story about a galactic empire, and *Dreadful Sanctuary* returned him to front-rank status. A fast-moving tale about a secret society which sabotaged the first attempts at space-travel, *Dreadful Sanctuary* seriously considers mankind's irrational ways while posing the question "How do you know you're sane?"

All through the 1950's Russell's lucid narratives delighted

readers. He broke new ground with "First Person Singular" by adapting the Adam and Eve legend to an interstellar setting; in other stories he revealed an unsuspected flair for emotional themes and moral issues such as racial intolerance. "And There Were None" postulates the effect of passive resistance on planetary invaders, which later became the theme of his satirical novel *The Great Explosion*. *Three to Conquer* reflected the interest in *psionics* fostered by Campbell. "Allamagoosa" (Hugo) is a clever piece of nonsense. *Sentinels from Space*, in which a highly evolved species keeps a watch over lesser beings, derives something from Olaf Stapledon, with whom Russell maintained friendly contact after introducing him to American science fiction. *Wasp* is an action-thriller relating the escapades of a secret agent preparing the way for a Terran invasion of the Sirian Empire. Simplest of all Russell's novels is *With a Strange Device*, almost a straight mystery story about a conspiracy to sabotage a new defensive weapon. Almost as intriguing as any of his fiction, too, is his collection *Great World Mysteries* in which he delved into some of the enigmas which have baffled scientists over the past century or more.

\* \* \*

Fred Saberhagen's gift is to dramatize familiar ideas with compelling thoroughness. For more than two decades his principal theme has been Life's war with Death across the evolutionary gradient. It is the very substance of his best-known work, the berserker stories. The berserkers are self-programming, self-replicating robotic spacecraft set by their "long-dead masters to destroy anything that lived." Fighting these ineradicable foes unites all life forms in the galaxy and, ironically, stimulates progress that might not have otherwise come about without the machines' challenge. The berserkers are computerized demons, high-tech symbols of utter Evil.

This "divergent" series is a novelty in that it is organized around a common enemy instead of a continuing hero. However, its premise, which originally grew out of games theory, is not unique. (See Theodore Sturgeon's 1948 novella "There Is No Defence.") But Saberhagen has made it so completely his own, "his murderous mechanisms are the recognized standard in the field." (For the author's own account, see "The Berserker Story" in *Algol*, Summer, 1977.)

Initially, style was Saberhagen's weakest point, a fault most obvious in his Orpheus tale, "Starsong." But he has gradually come to make a virtue of plainness and subordinates the accidents of his prose to the substance of his story. Works like *Berserker Man* let the inherent mythic power of his subject matter operate unhindered.

A second weakness is that plot schematics occasionally hobble his natural flair for narration. Rigid one-to-one correspondences spoil *Love Conquers All* making it harshly polemical instead of effectively thematic. Arbitrariness also spoils the Swords trilogy which was created to serve as a computer game module—and reads like it.

On the positive side, Saberhagen's rendering technique is

usually strong and sure. For example, notice how economically he establishes the hideousness of the demons and their mortal minions in his excellent science fantasy trilogy *The Empire of the East*. This lively variation on the familiar "world where magic works" premise translates scientific laws into spells and back again, yielding such curiosities as a technologist djinn and valkyrie robots. Unlike the current wave of technophobic fantasies, science is the liberating force here, freeing Earth from "the Old Dark Mystery."

A sound scientific imagination is the cornerstone of Saberhagen's art. He can see a story in a Foucault pendulum ("Brother Berserker"), a black hole (*The Veils of Azarloc*), or even a squash seed ("Pressure"). He gives a biochemical basis to Paleolithic ritual in *The Water of Thought*.

But as the berserker stories demonstrate, he also draws inspiration from literature ("The Masque of the Red Shift"), the arts ("The Smile"), history ("Wings Out of Shadow"), and myth ("Some Events in the Templar Radiant"). He is especially deft at combining the factual and legendary aspects of a subject and then infusing the result with theological significance. "Stone Place" recreates Don John of Austria, Philip II of Spain, and the battle of Lepanto in a way G. K. Chesterton himself would have applauded. St. Francis of Assisi, Galileo, and the mystical theories of Pierre Teilhard de Chardin are brought together to beautiful effect in "Brother Berserker." (The mythic resonances of his work are explored in Sandra Miesel's afterwords to *Berserker Man* and *The First Book of Swords*.)

Furthermore, Saberhagen has edited anthologies about two of his personal enthusiasms, chess (*Pawn to Infinity*) and archeology (*A Spade of Spacetime*). His interests in gaming and history unite in alternate history tales such as *Mask of the Sun* and *A Century of Progress*.

Perhaps Saberhagen's greatest strength is the sheer conviction he brings to his work. Because he believes in his stories, he convinces his readers to do the same. His best characterizations are precisely those which ought to have been the most difficult: Brother Jovann, his St. Francis figure; Johann Karlsen, his Don John; and Draffut the Beast-Lord, a godlike dog. *Berserker Man*'s child-hero Michel succeeds both as child and hero while at the same time carrying a heavy load of metaphysics on his shoulders.

Saberhagen can also make highly unpromising characters sympathetic: the second volume of *The Empire of the East* is told from the viewpoint of the first volume's villain. His excellent Dracula pastiches present the Count as entrancingly alien rather than monstrous and make him a force for rough justice. Placing this epitome of gothic horror in solidly realistic settings such as Renaissance Italy, Victorian London, and present-day Chicago intensifies his impact.

Saberhagen is unglamorous, ironic, and never sentimental. ("No world is safe for those who love," says the hero of "Young Girl at an Open Half-Door"). The unblinking eye he turns on evil records its horror with the utmost clarity. It allows no ambiguity: entities such as the berserkers and the demons are as totally depraved as any beings can be. They are to be fought without compromise or quarter.

Saberhagen's stated goal is "to impose different coordinates on the human condition," but the functions he plots are traditional Western Christian ones. Whatever the weaponry, his battles are wonder-wars between cosmic principles. Whatever the odds, he proclaims that Life will wear the final victor's crown.

##### Margaret St. Clair comments:

It would take me days to write adequately about my work. So I shall only say that I think I am better at short fiction than at novels—the short story is more philosophical—and that I like my amusing stories better than the frightening ones, and prefer both classes to what I call "uplift."

I am not a natural writer. Writing is painful and difficult for me.

\* \* \*

Margaret St. Clair is an example of a woman writer who did not have to disguise her sex in order to be successful as a writer in a male-dominated field. She was able to write in a natural "female voice" at a time when some women writers of science fiction were outdoing the men in tough-flavored style, and, particularly in her fantasy short stories (generally written as by Idris Seabright), to introduce some sensitive characterization, including portrayals of housewives, single mothers, and young children, into a field which was highly technologically orientated. In common with others writing in the 1950's, St. Clair's fiction was oriented toward adventurous episodes, but she had a penchant for tackling controversial themes and for using gadgetry and environments symbolically.

Most of St. Clair's short fiction was published during the

1950's. Some of her astonishing output of approximately 130 stories may be found in *Three Worlds of Futurity* and *Change the Sky and Other Stories*; both are representative of her work. Other individual stories are found in anthologies: "Short in the Chest" (in Greenberg and Olander's *Science Fiction of the 50's*, 1979), featuring Marine Major Sonya Briggs and a "philosophical robot" psychologist called a "huxley," is remarkable for its portrayal of women and its grappling with questions of sexuality. "New Ritual" (in Boucher's *The Best from Fantasy and Science Fiction*, 1954), also featuring a female protagonist, gives a futuristic twist to the plight of the dissatisfied housewife as a deep freeze turns everything from apricots to an inattentive husband into more desirable items. "Child of Void" (in Conklin's *Invaders of Earth*, 1952) shows a lonely boy grappling with the unknown in the form of a luminous egg which presents children with alluring visions of those things they most desire.

St. Clair's novels, not as consistently well-crafted as her shorter work, are usually adventures and may be relied upon to convey a message. *Agent of the Unknown* is set on the synthetic pleasure plantoid Fyon. An appealing non-conformist with a drinking problem finds purpose in life when he rescues from the edge of the sea a small but awe-inspiring "Weeping Doll," the creation of the master craftsman Vulcan. The protagonist muses "Sometimes I think everything in our world is synthetic, even happiness." While "Vulcan's Weeping Doll" passively changes in one world, *The Green Queen* and *The Games of Neith* both feature heroines as active characters who are chosen to inspire or lead their respective societies toward change. Histrionic talents, intelligence, and physical beauty are attributes possessed by the Green Queen, who lives in a post-holocaust society ripe for revolution, "a place where ten percent of the population monopolized eighty percent of the dwelling space and fifty percent of the unpolluted food, and where everybody, Uppers and Lovers alike, was always terribly afraid of damage from the omnipresent radioactive elements. . . ." In *The Games of Neith* Anassa, Priestess to the Goddess of Neith, possesses similar traits, and guides her seafaring society, which is threatening to return to the worship of primitive gods, to a new future. Anassa's relationship with Ehr'li Wan, a physics professor, is an excellent early example of a man and a woman in science fiction working in an equal part against evil forces.

*The Shadow People* is a striking work. Although the quality of the prose is uneven and the thrust of the narrative is excessively cheerless, an underworld of zombie-like people is memorably portrayed as scuttling through a rat-and-fungus-infested underworld in a hallucinatory, hopeless future. *Sign of the Labrys* portrays another dark underworld, this time inhabited by the survivors of a devastating plague who cower in damp caverns hacked out of rock until the hero, Sam Sewell, brings them awareness of an open, habitable world above ground. *Message from the Eocene* introduces Tharg, an ancient being of alien origin, who desperately attempts to overcome his condition of existing (for century upon century) as a disembodied sentient force so that he may convey a message to mankind. He eventually makes contact with a modern woman whose gift of mental sensitivity to unusual phenomena is sensitively portrayed.

St. Clair's best novel, *The Dolphins of Altair*, is a moving work critical of man's disregard for the ecosystems of Earth. Members of a well-drawn, intelligent dolphin society conspire with a few enlightened humans to preserve the world for an unusual new future. *The Dancers of Noyo*, like *Agent of the Unknown*, relies upon a male protagonist to hold together a tale of the future. A quest for personal identity is set against a world dominated by powerful androids.

St. Clair's best work is tightly written shorter fiction which introduced unusual protagonists to the pages of science-fiction magazines. While some of her longer works suffer from over-ambitious exploration of diverse themes, the best of her novels are those most concerned with an individual's experience with the extraordinary, or a group's commitment to a visionary future.

\* \* \*

James Sallis's extraordinary fiction is distinguished by its honesty and meticulous artistry. With his highly imagistic stories, he has regularly displayed a finely honed mastery of sophisticated literary techniques and sharply etched psychological insights. Often the stories are clearly autobiographical, presenting painful indications of their author's personal difficulties, even his torments. They are not always easy to read, and it is sometimes hard to discern their intent or meaning, but they affect readers powerfully, at least those readers who demand more than thrill-seeking and fantastic adventures from the fiction they read. (It always sounds a bit pompous to score the escapist reader in such terms, but writers like Sallis, who employ quite subtle fictional devices, *do* demand more from their readers. In "My Friend Zarathustra" Sallis writes: "Yes—I mean what I say, and you must listen; must hear what's not said if you're to understand properly what is said.")

Many of his stories are moving portrayals of troubled or dazed individuals who are dissociated from their environments. In nearly every Sallis story the main character is helpless, or at least quite passive. Things are dreadfully confused in his private life or are being disrupted in the outside world. Sometimes nothing much is happening, but even then the character does not cope well. At the rare times when the character is able to act decisively, the action turns out to be futile or grotesque. (The disposal of the child in the brilliantly executed "Jim and Mary G." is a harrowing example of such futility and ugliness.) Usually the character is still helpless at the end of the story. In many stories, the protagonists are last seen merely waiting or going off into darkness or standing still as the world begins to disintegrate, literally or physically, around them. However Sallis dramatizes it, the main impression the reader receives

from most of the stories is of humankind trapped in environments upon which they can have no effect, and for which they no longer have any effective responses or reactions. In "Faces, Hands: The Kettle of Stars" a courier is halted from his message-carrying mission and stranded in an intergalactic waiting room, where he contemplates art in the form of an also-waiting alien singer whose destiny is repulsive servitude on another planet, an injustice the courier perceives but cannot affect. The protagonist of "The History Makers" occupies himself with letters or music or sitting at a window while whole time-accelerated civilizations grow, decline, and fall nearby. The only movement he makes is to move away from a city's encroaching border. Nevertheless, he is able to speculate on the exigencies of time, as manifested in the slow progress of a beetle across sand or in a review of his own life or in the odd inverted timescale of the cities. In "A Few Last Words" a man attempts to decide what to do as a doomed city more or less empties before his eyes.

In such stories the sense of dissociation is pronounced both in the relationship of character to setting and in the character's own "inner space," the phrase emphasized by interpreters of the new wave of science fiction as its primary subject matter. Sallis's characters, even at their most articulate, are often in danger of breaking up themselves in just about the same way the setting is crumbling around them. In one of his most effective and painful stories, "Binaries," the narrator-writer (who perceives his immediate environment as being regularly broken up and moved away) is in a state of dissociation with himself as a person and as a writer:

Someone has written a collection of short stories and published them under my name; they have even put my photograph on the back cover. I received a copy in the morning post. Anonymous, no return address, postmarked Grnd Cntrl Stn. The stories reveal my deepest secrets. Only one person could have written them. Or had reason to. My attorney is investigating the possibility of a lawsuit against the publisher but, as the work was copyrighted in my own name, there seems little we can do. The publisher expressed to my attorney his desire to meet the author, his admiration for the book.

The passage's poignancy, its precise delineation of the character's troubled emotions, and—incidentally—its wrenching irony, are all hallmarks of the fiction of James Sallis.

Sallis also has an appealing knack for humorous, especially surrealistic, writing, which he uses in stories like "Kazoo," "The Creation of Bennie Good," and "Miranda-Escobedo." It is worth noting, however, that, even in these works, with their clever improvisations, sly allusions, and superb word-play, the sense of psychological and emotional dissociation generally remains, as dazed or momentarily baffled characters and even ghost-cops are disoriented by their absurd environments.

Sallis started publishing science fiction in the 1960's, a time when the field was being rattled by a number of literary experimenters who came to be dubbed, for better or for worse, the "new wave" of science fiction. He served some time as an editor of the British magazine *New Worlds*, the SF publication that became most associated with the new wave because it dared to publish the works of adventuresome writers during a period when many other SF markets were resisting anything that did not correspond with accepted approaches to the genre. Now that the new furor has somewhat subsided, upheld in print only by a few still petulant writers, it is clear that the contributions of the new wavers are legitimate literary extensions of established

science-fiction traditions, and that Sallis's stories are among the best writings to emerge from the phenomenon. In recent years James Sallis, never prolific, has published few stories, but the ones that have been published exhibit the same care for literary details and intellectual concerns as the earlier stories. One recent story, "Changes," ranks with the best of his fiction.

—Robert Thurston

**SARBAN.** Pseudonym for John W. Wall. British.

#### SCIENCE-FICTION PUBLICATIONS

##### Novel

*The Sound of His Horn.* London, Davies, 1952; New York, Ballantine, 1960.

##### Short Stories

*Ringstones and Other Curious Tales.* London, Davies, and New York, Coward McCann, 1951.

*The Doll Maker and Other Tales of the Uncanny.* London, Davies, 1953; *The Doll Maker* published separately, New York, Ballantine, 1960.

\* \* \*

The only true science-fiction novel to appear under the Sarban byline was *The Sound of His Horn*, a novel that evokes a mood of gloom and horror as well as anything that has ever been written. Kingsley Amis pointed out that it is one of the few novels ever to suggest a rural rather than urban dystopia, a future after Germany has won World War II and the other races of the world are viewed as little better than lower animals. Alan Querdilion wanders into an electrified fence while escaping from a German POW camp and finds himself somehow projected into a world where the Germans have already been victorious. After a brief period where he is the guest of a German landholder, he is set loose as prey for his host's periodic hunts.

Two other short novels appeared, both of which have been published as horror novels though the subject matter is such that they could as well be considered fantasies. In *The Doll Maker* a young girl is compelled to become a tutor at mysterious Brackenbine Hall, and soon falls under the influence of Niall Sterne, a peculiar reclusive man who roams the forests and exists only, it seems, for his collection of extremely lifelike dolls. In due course, the heroine learns of Sterne's connection with several past deaths, and comes to believe that he can transfer human souls into the dolls he creates. *The Doll Maker* also brilliantly creates a mood of despair and awakening horror. Sarban's skill at drawing the reader into his book is probably at its best, however, in *Ringstones*. A young woman is employed to tutor two young children at a remote estate, but soon becomes enmeshed in magic and the struggle to maintain her own personality and view of reality when faced with a form of existence that she had formerly considered only a dream. *Ringstones* is a haunting novel that is far more worthwhile than the hundreds of modern gothics which it in many ways resembles.

Although they are extremely hard to locate, Sarban also created several excellent shorter pieces. The most noteworthy of these are probably "Calmahain" and "Capra." In the former, two young children allow their fantasy world to become so real that it overflows into the real world and adults begin to experience elements of the fantasy. In the latter, a vicious lover's triangle at a costume party has unexpected results when the real God Pan makes an entry.

The most striking element in Sarban's fiction is obviously the evocation of a weird atmosphere, and the quiet construction of a world where things aren't quite as safe and logical as the characters have always believed. But the quality of the prose should not be overlooked either. Though couched in very formal style, Sarban's words flow and the current draws the reader along with it. There is never any hint that this is an amateur writing fiction as a hobby; the cool competent hand of the professional is obvious. Despite his small body of work, Sarban remains a unique and significant writer: the talent he displayed at creating a mood of slow despair has never been equalled.

—Don D'Amassa

\* \* \*

A deft writer and editor, Pamela Sargent did not aspire to become a full-time writer. Moreover, once she turned to writing, she did not view herself as a *science-fiction* writer, even though that was what she wrote (and continues to write for the most part). For Sargent, who had only begun reading science fiction three years earlier, science fiction posed a special attraction. Indeed, she viewed science-fictional devices and literary inventions as useful metaphors for embellishing a story, and most of her earliest stories (i. e., "Landed Minority," "Oasis," "Gather Blue Rose," and "Julio 204" were about the near future and close to the present day.

Sargent soon concluded that science fictional ideas could be of interest for themselves, and endeavored to make her work both realistic and plausible. For the most part, this is her goal today. Sargent eschews prediction; she *does*, however, seek plausibility. The imaginary settings of her stories are typified by an underlying reality and possess a solid grounding in what we know of science (and people) today. In that sense, Sargent resembles several of the "hard" science-fiction writers who ground their work solidly in science, but, unlike many such writers, she also emphasizes characterization.

This is best illustrated by her first novel, *Cloned Lives*. At the time, she found little of what had been written about clones and the possibility of cloning human beings plausible. She asked herself several questions: Why did some writers think clones might have a telepathic connection? Would clones, in fact, be exceptionally close because of their identical genes, or might they become estranged, as some identical twins do? Why would anyone want to clone an individual in the first place? Her objective was to write a realistic story about clones who were believable people and whose problems, however heightened or altered by the fact that they were cloned, would mirror the struggle for identity that we all share. She also wished to underscore several of the real issues such as an attempt at biological engineering might present, rather than to concoct a myriad of bizarre adventures with strange cloned characters. *Cloned Lives* not only raised these issues, but did so with sensitivity and grace, artfulness and illumination. Ursula K. Le Guin called it "solidly realistic, humane, and well-proportioned," while *Bestsellers* termed it "an exceptional first novel."

In Sargent's first anthology, *Women of Wonder*, and the two which followed ( *More Women of Wonder* and *The New Women of Wonder* ), Sargent felt a special obligation to the scores of women writers who had made pioneering contributions to the science fiction field. She was buoyed when observing what other writers had done (and also observing some of the pitfalls some writers fell into when writing about female characters) to

continue to develop well-rounded female characters in her own stories. Indeed, all of her works boast strong female characters in them, though, until recently (in "Fears" and in a novel that she is presently writing), she has not brought explicitly feminist concerns to the forefront. Each of the three anthologies include approximately ten science-fiction stories by women about women, as well as a cogently written introduction (and notes) by the editor. These essays, written in the classic scholarly manner, demonstrate Sargent's keen knowledge of the subject and her skillful research capabilities.

As for her goals, Sargent reflects: "I would like my work to be entertaining, believable (with some psychological resonance and truth about the human experience), emotionally involving, and maybe even, on occasion, intellectually stimulating." These goals have been amply realized in her work. For example, her anthology *Bio-Futures* features ten stories which explore biological metamorphosis, and which pose the question: Will we use these technological advances to transcend our biological destinies, or will we refuse to meddle with nature and reject them altogether? *Bio-Futures* represents an important first step in answering this weighty and often-debated question.

Sargent is a master of the short story, and *Star-shadows* includes some of her most well-crafted tales, among them "Shadows," "The Other Perceiver," and "Oasis." In addition to this work, Sargent has written several noteworthy novels, including *The Sudden Star* and *Watchstar*. The former, which raises a frightening vision of the future, suggests that the future rests not with mankind as we know it, but with a new mutant race. In the latter, Sargent chronicles the life of Daiya, a young girl from a telepathic society, who meets a boy whose people lack such mental powers. This novel, like Sargent's other works, combines the literary inventions of science fiction with the insights of psychology.

Sargent's characters are strikingly real people, characters who involve the reader, make the reader care what happens to them. As Sargent observes: "Almost always, I have the experience of a character suddenly appearing in my mind, and have almost no notion of what this person's story is, then discovering the story by writing it; the characters always seem like real people to me, and often resist any attempt on my part to manipulate them for the sake of plot." Perhaps this is why *Publishers Weekly* has called Sargent "a sensitive writer of characterization rather than of cosmic gimmickry," and Michael Bishop has written, "Sargent, without fanfare and hoopla, has become a strikingly able and unusual story teller . . . Her real forte is characterization, an ability to dissect and lay open the fears, passions, and yearnings of the intensely human people who invariably inhabit her books."

Lately, Sargent has written novels specifically for younger (teenage) readers: *Earthseed*, *Eye of the Comet*, and *Homesmind*. Artfully conceived, centrally developed, and well-plotted, these works constitute a natural progression of her literary talents. For example, part of *Cloned Lives* dealt with her characters, the Swensons, when they were young. *The Sudden Star* and *Watchstar* both include young characters, as does *The Golden Space*, which deals specifically with children and how they might act in a world of immortals, where only children would undergo growth and change. For Sargent, youthful experiences somehow seem more vivid, passionate, and exciting than what happens to many people later in life, when the decisions they made while young have overtaken them and set their lives along a certain path.

Modest by nature, Sargent seeks to cast a shadow on the field. Asked to assess her contribution, she opines: "I am reminded of the English writer, Jean Rhys, who said, 'All of writing is a huge

lake. There are great rivers that feed the lake, like Tolstoy and Dostoevsky. And there are trickles, like Jean Rhys. All that matters is feeding the lake.' " Many writers strive to be remembered. Sargent is not particularly interested in that. She would much prefer to have some of her books or stories remembered, whether or not anyone recalled who wrote them. Sargent simply wishes to feed the lake.

*The Stars Came Down*. London, Consul 1964; New York, Arcadia House, 1967.

\* \* \*

Richard Saxon's career was begun and ended in a single year. Although none of his novels was exceptional enough to attract any particular interest, they are not as unprepossessing as their poor success might indicate.

For the most part, Saxon eschewed melodrama in a period when action and suspense were the main attractions for most genre devotees. The protagonists of *Future for Sale* invent a time machine with which they travel to both the past and the future, but with considerable less liveliness than in, for example, Wells's *The Time Machine*. In the past, one character relives a poignant moment in his own life; in the future, he discovers that a scientific dictatorship has been created which provides mankind with all of its material wants but which exacts in payment an irresistible drive for conformity. Far from leading a revolt, the hero returns to our own time, where a quarrel mob destroys the time machine utterly.

*The Stars Came Down* is also more reflective than active. Humanity's first trip to the stars is over, and the returnees discover that a new civilization has evolved on Earth during the relative five millennia that have passed since their departure. For the most part, the latter half of the novel consists of a quiet discourse on the nature of Utopian society.

*The Hour of the Phoenix* is Saxon's most lively novel. The drive into space is cut short as a new astronomical object

appears, destined to destroy our world in the near future. The usual occurs, mobs riot, order breaks down into chaos, and through it all a small group attempts to make plans to allow humanity to carry on elsewhere in space. The waning chapters are a bit sentimental, and this is in balance no more than a very lightweight imitation of Wylie and Balmer's *When Worlds Collide*.

*The Cosmic Crusade* has another conventional plot, this time weighted with excessive ruminative discourses. An underground society slowly awakens to the reality of its existence and prepares to emerge onto the surface of its world. Once more, we are warned against the decay that inevitably accompanies conformity to the exclusion of individuality.

On balance, Saxton is a slightly above average writer whose talents might have developed had he remained active. The small body of essentially minor work which he produced are reasonable entertainments, but neither original enough or well-written enough to survive through the years.

Josephine Saxton comments:

I Have been called many kinds of writer: science-fiction editors say I am mainstream, mainstream editors say I am science fantasy, for example. I have written things with violent death in them, does this make me a writer of horror, detective, sadism, metaphysics? I refuse to be labelled, because metaphysical content embraces every possible experience and mode of existence which might be taken from real life, imaginary life. One theme seems to be emerging over the years which I was not aware of until I recently collected and revised my short stories, and that is a strong feminist theme. This does not make me a woman's writer, so forget it. I write about things which happen to people, for people to read; who needs more? I can say with authority that it takes just as much imagination to write well about something you do every day as it does to write about a trip to Aldebaran 62. People who only write and/or read SF are very narrow people and I don't wish to be identified with them, any more than if I set a story in the West of America I would want to be called a cowboy writer. Who started this ghetto of fiction, anyway? Publishers? Editors? It certainly couldn't have been thinking writers. However, if the only way I can get into print is by being labelled, then, I am a science-fiction writer. "Well, I bought this can of soup, but it tastes like nothing on earth to me. . . ?"

\* \* \*

The flying saucer sighted twice in Josephine Saxton's *Vector for Seven* is definitely not an integral part of its plot. *Group Feast* and *The Hieros Gamos of Sam and An Smith* also do not stress science fiction's usual trappings. Instead of positing fantastic planets and alien creatures, Saxton focuses upon man confronting his absurd world. In contrast to a typical power fantasy, her novels emphasize aspects of human existence which are both finite and ridiculous. Her characters must come to terms with their material culture and their social relationships. The reader must also come to terms with Saxton's style. In addition to de-emphasizing the expected extrapolative characteristics of science fiction, she writes counter to the genre's allegorical

clichés: the two “wild” children in *The Hieros Gamos* become a stereotypical married couple; Cora Caley, the rich self-obsessed heroine of *Group Feast*, does not suffer; the wanderings of the seven protagonists in *Vector for Seven* do not symbolize a death trip. Her technique causes one to question the validity of categorizing these novels as science fiction. An image of a barker standing outside of a circus tent shouting, “step right up folks and see the most terrible monster on Earth” helps to clarify this question. Those people whose curiosity is aroused venture within and view the promised exhibit: a mirror image of themselves. Similarly, marketing Saxton’s work as science fiction attracts readers by establishing the expectation of fantastic characters. To continue the metaphor, like those who enter the tent, readers of Saxton’s “science fiction” are directed toward an unexpected vision of man.

It is fair to call her work science fiction of the softest variety, a fiction of mundane existing technology—airplanes, buses, and an unusually long water pipe, for example—set against the background of a surreal vision of our world. Saxton’s earthbound characters encounter such things as a department store which fulfills one’s need without the necessity of remuneration (*The Hieros Gamos*) and a house with a seemingly limitless number of rooms (*Group Feast*). This is the way the world within that house ends: “there was a mushroom cloud containing caviar, shoes, bath mats, pot plants, priceless tapestries, parquet floors, starving cats, pickled peppers. . . . telephones, crystal chandeliers and eight gallons of cooking oil full of sodden French-fried potatoes.” Cora pedals off into the Australian sunset relieved to see the destruction of her innumerable possessions.

Journeys form the predominant image in Saxton’s novels. But despite the character’s incessant walking, driving, and pedaling, their travel through inner space is most important; they all complete a journey of inner mental change while confronting the juxtaposition between animalistic and civilized aspects of their existences. Cora contemplates an example of this juxtaposition while she eats: “this terrible animal content. . . . the thrill of hot meat juices between the teeth, albeit that many of those teeth were the skilled products of orthodontists.” Orthodontists artificially beautify meat-tearing teeth. We have many methods of masking or obliterating our natural characteristics. Saxton, on the other hand, will not allow us to forget nature. Description of all varieties of unpleasant bodily secretions are coupled with the novels’ discussions of material good. *Vector for Seven*, for example, immediately presents us with the image of bird droppings spattering over a proper British lady’s hat. And in *The Hieros Gamos*, after some years pass, the couple returns to a supermarket where they remove the excrement they previously left there. It comes as no surprise that Saxton’s characters are obsessed with washing and with bathrooms.

These characters illustrate the absurdity of people’s isolation and their mutual distrust. And Saxton’s plots—as well as her titles—emphasize togetherness. In *Vector for Seven*, at the conclusion of their journey through a surreal landscape, individuals of differing age, gender, and class who were at first suspicious of each other form a trusting communal unit. Hence what Saxton views as the evil forces of society and materialism can no longer separate these people; members of this once disparate group can no longer feel, according to the initial opinion of one of their fellows, that “these days no one had any thoughtfulness for anyone. . . . People did not like each other; it was the Labour government and the Commies, and the labour saving devices that had done all that.” While *Vector for Seven* fuses a group together, *Group Feast* breaks one apart. The

relationship between Cora and her servants is artificial and poisoned by the fact that money holds them together. Meaningful human interaction cannot take place in Cora’s world; even an unrealistically freely flowing money supply does not stop one of the servants from setting out to murder Cora while she plays hostess at her fantastically sumptuous party. This party, which continues throughout the novel, is not the work’s most thought-provoking group feast, however. We must not forget the cats who are locked in Cora’s basement, wallowing in their own filth, having only each other to eat. Like these cats, Cora, who has clawed her way to the apex of the social pyramid, devours members of her own species: three people die during the course of her 24-hour party. Yet, as opposed to the hopeless situation of the imprisoned cats, there is hope for her. Despite her history of unfriendly friends and unloving lovers, when she abandons her property Cora has the potentiality to find a fulfilling relationship.

Unlike Cora and the characters in *Vector for Seven*, the lone male adolescent we meet at the beginning of *The Hieros Gamos* immediately assumes a significant place in the life of a fellow human being. He encounters a female baby attached to her dead mother and faces a dilemma: does he sacrifice his solitude or allow the baby to die? He decides in favor of life, and the two grow up in their own natural world which, at the same time, affords them free access to all the material they need. A description of them dressing in proper adult attire just before removing it to experience coitus is one example of the novel’s preoccupation with man’s civilized and animalistic behaviour. This text’s most important *hieros gamos*, the Greek words for holy marriage, is the union between people’s biological and man-made roles. Its protagonists are Everyman. And, like every man, they must be civilized. The two individuals who once called themselves “boy” and “baby” assume many roles and names until they become the suburban couple, Sam and An Smith. It is sad to see these surreal children develop into characters appropriate to an Erma Bombeck column. This is not to say, however, that Sam and An’s relationship is devoid of positive aspects. An’s life was saved and she in turn becomes the mother of a female child. In fact, life literally springs from death in all of Saxton’s novels: in addition to the circumstances of An’s birth, Cora is impregnated by someone who dies immediately after he ejaculates; and a gentleman in *Vector for Seven* expires while holding an infant who bears his name.

Like another of the travelers in *Vector for Seven*, members of the Smith family might think that “it was good having people in the house all together, living with one another instead of being alone and isolated, all of them in different homes, not even knowing each other or acknowledging the existence of other people.” *Group Feast*, then, best articulates the main idea of Saxton’s work, an idea which Freud expressed in *Civilization and Its Discontents*: “Human life in common is only made possible when a majority comes together which is stronger than any separate individual and which remains united against all separate individuals.” Despite the novels’ attention to the absurdity of the human condition, they celebrate human life, which, after all, depends upon the fulfillment of cultural as well as biological needs.

—Marleen S. Barr

SCHACHNER, Nat(han). Also wrote as Chan Corbett; Walter Glamis. American. Born in New York City, 16 January 1895.

Educated at the City College of New York, B. S. 1915; New York University, J. D. 1919. Served in the United States Army chemical warfare service, 1917-18. Married Helen Lichtenstein in 1919; one daughter. Chemist, New York City Department of Health, 1915-17; admitted to the New York Bar, 1919; practicing lawyer, New York, 1919-33; free-lance writer from 1933; Editorial Consultant, American Jewish Committee, 1945-51; Director of Public Relations, National Council of Jewish Women, 1954-55. President, American Rocket Society, 1933. *Died 2 October 1955.*

\* \* \*

Nat Schachner was attracted for a time to the vigorous, young genre of pulp-magazine science fiction where he left an impression with his liberal ideas and earnest inventiveness. Schachner worked first as a chemist, spent a number of years in law practice, published hundreds of pieces of short fiction in the pulps (science, detective, mystery, western, and adventure stories), and wrote several scholarly books on history. During the Nazi threat before and during World War II he defended human liberties vigorously in all his writings—both pulp fiction and scholarly. Schachner's total commitment to the life of letters and to humanitarian values makes him a true 20th-century representative of the Romantics whom he said he loved as a child. He represents the writer as hero; and the heroic vigor of the science-fiction genre during the time that he was active in it corresponds well with his later American Revolutionary history. Schachner's hopeful ideas for progress through clever technology and rationality had their roots both in the 18th-century Enlightenment of Thomas Jefferson and in the pulp-fiction world of the early *Astounding*.

The first dozen or so of Schachner's science-fiction stories were written in collaboration with Arthur Leo Zagat, but it was

with the "thought variant" stories of the F. Orlin Tremaine *Astounding* that the inventive lawyer began to hit his stride as a writer who would extrapolate into the future his liberal ideas about the present and eventually about the past. The first thought variant story was Schachner's "Ancestral Voices" (1933), and new idea stories followed rapidly for the rest of the decade. In his book on the science-fiction pulp magazines, Paul Carter calls Schachner the earliest of the "anti-Nazi Paul Reveres" whose speculative fictions increasingly explored the opportunities for sociological themes that could be related to current events. A rather stiff and primitive story called "The Eternal Wanderer" contains a crude courtroom scene about interplanetary law that anticipates Schachner's only science-fiction book *Space Lawyer* (made out of two later stories, "Old Fireball" and "Jurisdiction").

Schachner's best writing and most memorable contribution to letters is undoubtedly his historical work, and he properly gave up work for the pulps in order to pursue that research. But one cannot help thinking that his thought variant extrapolations were both inspired by his knowledge of the Enlightenment and contributed greatly to his understanding of it. One of his more carefully written and sophisticated fictions. "Past, Present, and Future" (1937), performs just that balancing between a nostalgia for the heroic and glorious lost past on the one hand and an awareness of the challenges in the present on the other that creates the ironic complexity of mind that is necessary for true liberal thinking. Schachner was a hero among writers not only for the vast amount of work that he got done but also for how he did it—less an artist than a propagandist for democracy.

—Donald M. Hassler

**SCHENCK, Hilbert.** American. Born in Boston, Massachusetts, 12 February 1926. Educated at Williams College, Williamstown, Massachusetts, B. A. in physics 1950; Stanford University, California, M. S. in mechanical engineering 1952. Served as an electronic technician in the United States Navy, 1944-46. Married 1) Mary Low Taylor in 1950; 2) Anne Thompson in 1983; six children. Test Engineer, Pratt & Whitney Aircraft, East Hartford, Connecticut, 1952-56; Assistant Professor to Professor, Clarkson College, Potsdam, New York, 1956-66; Professor, 1966-83, and Director, Scuba Safety Project, 1968-80, University of Rhode Island, Kingston. Hilbert Schenck comments:

My stories have been mainly concerned with the technology of ocean exploration, but also may contain fantasy elements. My first two novels are concerned both with the ocean and the area of Cape Cod, Mass. My novel *Steam Bird*, serialized last year in *F & SF* departs from these topics and is concerned with the flight of a nuclear-propelled aircraft, a project on which I worked in the 1950's at Pratt & Whitney Aircraft. Most recently, I have been fooling around with the idea of recursive fiction, that is, fiction that is concerned with its own creation. My two most recent fictions in *Analog* are attempts to push the idea of recursion as far as it seems possible to go, although several other of my stories have recursive elements. My two Cape Cod novels represent attempts to introduce classic SF themes (the idea of

the superman and the idea of time travel) into a regional fiction setting. A third novel, not yet sold, adds a third basic SF theme, visitation from another world, into the Cape Cod geographic and historic situation.

\* \* \*

Hilbert Schenck's connection with science fiction goes back to the 1950's, but his rise to prominence is relatively recent. While it is dangerous to draw conclusions about an author from his work, Schenck's writing has the ring of enthusiasm and sincerity about it. If this is as genuine as it seems, then his fiction reflects his real beliefs and interests. Fortunately for his readers, he almost always avoids the trap of writing propaganda disguised as fiction.

The political position underlying his stories should be characterized as libertarian rather than conservative. "The Battle of Abaco Reef" is set in a community, in the strong sense of the word, which wants no more than to be left alone to pursue goals which most Americans would probably accept by means which would also seem acceptable. Unfortunately, the U. S. government does not find this acceptable. Fortunately, the community has the means to defend itself, the will to do so, and a moral stance which does not require them to be victims in the name of respect for life. At the same time, Schenck is vividly aware of the horrors of war, which tempers a belief in the possibility of just wars. The heroine of *A Rose for Armageddon* has all too realistic nightmares about a coming thermonuclear war.

Hope and optimism are characteristic of his stories, but not in the facile form seen in the problem-solving stories which were so common 30 years ago. When Schenck is writing about catastrophic events such as the imminent death of the ocean in "Three Days at the End of the World," it is clear that there is a real possibility of failure. Yet somehow, despite their weaknesses, his characters find in the depths of their souls the strength to rise to the occasion. That is the real subject of most of his stories, not how the doom that threatens is forestalled; and this is borne out by the fact that many of them end before the problem is solved.

Among Schenck's passions would seem to be the oceans and their dwellers, the local history of the islands off Cape Cod, and the technology of steam power. The members of the world of steam in "Steam Bird" are immersed in their subject and its history, about which they quarrel with the intensity of believing theologians. The descriptions of life in 19th-century Massachusetts in *At the Eye of the Ocean* are loving but not sentimental in their depictions both of riches and of grinding poverty, of enlightenment and of bigotry. And the oceans and their dwellers appear in so many places in such a wealth of detail that it is impossible to believe that the author simply worked up the subject for the stories.

A recurring theme in his work is spatio-temporal relations which define special places where the world changes for the right person at the right time. In *A Rose for Armageddon* two scientists find a place where it is possible to turn back the clock by analysing topography and the paths taken by people and animals on it. Abel Roon in *At the Eye of the Ocean* can sense the relations of sea floor, currents, and winds, which eventually lead him to a place at a time where he reaches a mystical enlightenment.

In passages such as these, Schenck's prose is almost lyrical; but when he turns to humor, as in "Steam Bird," his hand is heavy. Playing on the difference between the public image of right-thinking rectitude projected for political reasons and what

the person behind the image really is, he exaggerates the contrast, an effective device which he carries too far. The result is that we cannot believe in the better side his characters must manifest to arrive at the happy ending.

Schenck writes well. His best work does not fit easily into established categories, and this may prevent his becoming widely popular. However, he is probably assured of a thoughtful and dedicated following, even if it be of relatively modest size.

#### Stanley Schmidt comments:

In all my fiction I try to tell entertaining stories about people in situations which are directly shaped by scientific or technological changes, with neither the human nor the technical parts of the foundation slighted in favor of the other. Probably the best examples to date of the type of thing I try to do are the *Kyyra* or *Lifeboat Earth* series, of which, to date, two books are complete: *The Sins of the Fathers* and *Lifeboat Earth*.

\* \* \*

Stanley Schmidt seems to be one of the final products of the John Campbell influence on science fiction although it is probably too early in Schmidt's career to tell definitely. His three novels to date, however, as well as the short story versions of them that appeared in *Analog* all show the Campbell marks of hard science extrapolation, of positive-thinking problem-solving approaches to thorny human and social problems, and of two-dimensional human beings compared to a sense of rounded sublimity for whole planets and even galaxies. Schmidt's two later novels begin what will no doubt be a series in which galactic history unfolds much like Campbell taught the young Asimov to attempt sublime galactic history four decades ago. The first novel narrates a segment from the history of the planet Ymrek in which the natives seem more interesting than the human emissaries to the planet. Even if Schmidt had not told us that correspondence and ideas from Campbell influenced him, the effects of that influence are apparent in all three novels.

Schmidt is best when he begins to suggest the unresolved and, perhaps, unresolvable tensions that underlie the problems that must be resolutely solved by technology and engineering techniques; these interesting tensions lurking beneath the Campbell-like scenarios are almost exclusively associated with the alien species of the latter two novels. Although Ymrek is an interesting alien extrapolation, its natives are not nearly as symbolically (or scientifically) suggestive as the Kyyra who were originally from nearer the center of our galaxy and who literally set in motion all the action in *The Sins of the Fathers* and its sequel, *Lifeboat Earth*. The more suggestive passages appear in the first book of the series when the Kyyra seem to symbolize the dilemmas of maturation. We must destroy our pasts and even our gods to atone for our mistakes—almost Christian and yet more universal symbolism of the dying god.

The strength related to this symbolic suggestiveness is the detailed elaboration of the aliens themselves—his departure from Campbell. Without the concrete detail to make them credible, the Kyyra could suggest nothing. In fact, as Beldan conducts his human visitor on a tour of the immense Kyyra spaceship orbiting the earth, and explains to her the language and the customs of his people, the reader is reminded of the tours through Walden Two. These aliens are an advanced culture with a kind of social engineering that B. F. Skinner would admire. The Campbell positivism is not unlike Skinner's hopes for managing behaviour, and it is to Schmidt's credit that while the parallels are developed in his narrative, the dilemmas are lurking just beneath the surface that Campbell may not have noticed. We can anticipate, perhaps, more development of the Kyyra in future Schmidt stories; and we can wonder if their utopian, problem-solving traits will prevail or if the tragic implications in the death of their god will haunt Schmidt more.

Bibliography: *James H. Schmitz: A Bibliography* by Mark Owings, Baltimore, Croatan House, 1973.

\* \* \*

James H. Schmitz is a craftsmanlike writer who has been a steady contributor to science-fiction magazines for over 20 years. The best of his shorter works are collected in *A Nice Day for Screaming* and *A Pride of Monsters*. In the first work the stories repeat a consistent theme that the universe is stranger than we can imagine, and that unexpected discoveries will meet us at every turn. Although the stories are set in the far future, humans (and others) continually encounter both creatures and behaviors they could not have foreseen, from the alien automated service-station for spaceships of the title story to an alien so intelligent it keeps humans for pets in "The Winds of Time." But aliens can be surprised too, as "The Other Likeness" shows: agents genetically engineered to resemble humans become so much like us that they begin to sympathize with humans against their masters. There are new machines, too, like the fear broadcaster of "The Tangled Web" or the half-men, half-machines of "The Machmen." And there are some things so strange yet so intelligent they can conceal their very existence from humans, like the forest-sized organism in "Balanced Ecology."

*A Pride of Monsters* collects stories that attempt to rejuvenate the idea of "the monster" through tales of future encounters with alien life-forms. In "Lion Loose" Detective Bad-News Quillan, a favorite character of Schmitz's, meets a rug-sized creature with the ability to pass through solid matter, but it is not nearly so dangerous as the radiation creature of "The Searcher," which endangers a pair of private detectives working undercover against interstellar hijackers. "The Pork Chop Tree" is an alien plant whose very presence is addictive, a less forthright menace than the plant of "Greenface," a story which is unusual (for Schmitz) in being set in the present.

In his longer works, Schmitz has often shown a close cooperation between man and alien. The alien may be a machine, like the robot spaceships of the four thematically connected stories of *Agent of Vega*, or mutated animals, like the intelligent giant otters of *The Demon Breed*, who help to repel a threat to human civilization. The "aliens" may even be other humans, as in *The Eternal Frontiers*, in which the Swimmers have diverged so far from normal humanity as to be almost a different species. Rather than forming a close relationship, though, the two groups are keen competitors. And of course, there are aliens that, like those in *A Pride of Monsters*, are threats to humanity, ones such as the plasmoids in *A Tale of Two Clocks*.

A second theme that Schmitz has frequently used is that of supranormal mental powers: Telzey, a telepathic teen-aged girl, is the central character in a number of stories. Telepathy (and various other kinds of mental powers, chiefly psychokinesis) is central to Schmitz's most celebrated work, *The Witches of Karres*. The book is a fast-moving, episodic adventure story of an ordinary human, Captain Pausert, who becomes entangled with three psychically endowed girls. Its account of the wakening of telepowers in Pausert draws on familiar science-fiction recipes, mixing appropriately evil villains with nick-of-time escapes, and spicing the whole with an entertaining sense of humor.

—Walter E. Meyers

\* \* \*

Thomas N. Scortia's first published story, "The Prodigy," immediately established him as an accomplished storyteller. Detailing a violent conflict with a paranormal child, the story reaches one of the few unguessable resolutions of the theme. "The Shores of Night" is a vision of a solar-system-wide civilization straining for the stars; here are the sounds and colors of change, as the human spirit readies itself with a new strength. Scortia writes with a virtuosity comparable to Bester's, with the high emotional content of a Lem in depicting "cruel miracles" at their most intense. This story belongs, to borrow the words of C. S. Lewis, "to those works of science fiction which are actual

additions to life; they give, like certain rare dreams, sensations we never had before, and enlarge our conception of the range of possible experience." The work belongs to the period of Scortia's greatest attachment to the ideals of space travel. The story's success lies in its melding of personal loss with a haunting series of pictorial images.

His first novel, *What Mad Oracle?*, is based on Scortia's experience as a physico-chemist in the aerospace industry. It is a powerful story of engineers and corporations confronting the realities of American business and politics in the 1950's. SF in the sense that it shows the human impact of science and technology, the novel has a historical interest for SF readers.

As Scortia's involvement in aerospace increased, his SF production diminished; but stories continued to appear throughout the 1960's. One of the most notable is "Broken Image," depicting a future earth's attempts to have an ethical influence on an alien culture. Seldom has the theme of the saviour been given such a strong presentation. "The Destroyer" was an in-depth return to the theme of "The Prodigy," but this time the note was one of compassion. By 1970 Scortia was writing full time. The great success of this period is "The Weariest River," hailed by P. S. Miller and others as an instant classic on the theme of immortality, containing an original twist of great power; and *Artery of Fire*, a tense, taut novel of conflict over the building of an immense power system (the central image of the story is as strikingly original as that of Niven's *Ringworld*). John W. Campbell had turned down the novella version because he could not accept Scortia's prediction that fusion power would not be available by 1973 (appearing in 1960, the novella makes a striking contrast to "The Shores of Night" of four years before, prefiguring Scortia's critical approach to the products of technology).

Also appearing in the early 1970's was the novel *Earthwreck!* (the title was changed from *Endangered Species* without Scortia's consent), a strongly characterized story of human survival in space after an atomic war has devastated the earth. With the SF veteran Frank M. Robinson, Scortia wrote several disaster novels. These bestsellers earned the authors an international reputation, considerable monetary reward, and the often unfair scorn of the SF community. *The Prometheus Crisis* is of interest to SF readers because, in its depiction of a severe nuclear accident, the story is the legitimate descendant of such pioneering stories as Heinlein's "Blowups Happen" and del Rey's *Nerves*. There is a strong cautionary tone in all of Scortia's later work; it is the warning of the once idealistic, Campbell-influenced aerospace scientist who dreamed of space travel and found that human beings have a penchant for perverting any worthwhile project, from high-rise dwellings to atomic power plants.

Scortia's popular success outside the SF world is part of the continuing science fictionalization of our civilization, in the sense that many of the prophetic suggestions made by SF in the first half of this century, positive and negative, have become commonplace in the second half. That a veteran SF writer should take part in this infusion of what once would have been science-fiction themes and ideas into the body of popular fiction is not surprising. Scortia's special success lies in his genuine emotional and dramatic appeal to the average reader, and in showing how the real world has turned out to be more complex and full of human failure, darker than the idealistic SF on which he grew up had forseen. That human beings *can* do something is no longer enough; the problem is whether they will, or should.

Thomas N. Scortia's life might have been a science-fiction story, as written in some alternate dimension. He came to maturity in the 1950's, full of feeling and intellect, overflowing

with the wonder of human possibilities as pictured in Campbell's *Astounding*, only to learn that human beings don't always do their best for worthy dreams. One might say that Scortia's views were modified by the kind of satirical SF which Gold published in *Galaxy* (Gold himself was a Campbell writer who extended his master's approach to SF to include the "soft" social sciences). Scortia's stories of the 1950's and 1960's are powerful streams of thought and feeling, combined with rigorous speculation, flowing out of his critical but compassionate disappointment with the world. Though in his 50's, it is hard to think of Scortia as anything but a young man with his crowning work still to come. Some of it will be SF and some not. His work in aerospace enabled humanity to send probes into the outer solar system, while at the same time he was struggling in his fiction to understand the failing, often partly rational inner space of human nature.

Hank Searls's stories revolve around the emerging space program, astronauts and their families, and whatever political machinations are most likely to create problems. His realistic contemporary fiction is built on timeliness, as each novel has foreshadowed a stage in man's actual venture into space.

*The Big X* explores some potential problems, both technical and human, of manned orbital space flight. Norco's X-F18, the experimental rocket-like ship of the title, must reach a speed of Mach 8 and prove maneuverable for Norco Aircraft to land the government contract for construction of the first manned spacecraft. Mitch Westerly, the test pilot for the Big X, knows he will probably be chosen as the first man in space if his testing is successful. But the test schedule grows tense as a psychopathic chief of operations orders more and more telemetering equipment mounted in the cockpit, despite Mitch's protests that the additional weight has made the ship unstable. The suspense of the impending Mach 8 test flight builds as Mitch must decide whether to push the plane beyond its limits, at the expense of the girl he wants to marry, and possibly his life, in order to provide telemetric data necessary to the space program. Besides an inside view of the politics of the aircraft industry, there is much authentic-sounding shop talk, as well as a love story with the turmoil surrounding the personal lives of men such as Mitch.

A story of our race for the moon, *The Pilgrim Project* begins as a routine orbital flight is mysteriously ordered to abort prematurely. Except for the commander, even the men aboard do not know that a top secret plan must be put in to effect immediately to land an American on the moon ahead of the Russians. The reader remains in a sustained sense of urgency and intrigue as NASA officials, Congressmen, the President, the media, and the astronauts themselves unravel clues about a plan so secret that even the man who originated it does not know it is about to be carried out. The tempo accelerates even more when it is discovered that the Russian moon shot carries a civilian cosmonaut, and the American astronauts are quickly switched to include the civilian Steve Lawrence in order to prove our equally peaceful intentions. When the Pilgrim Project is finally revealed, all concerned must re-evaluate their psychological and moral attitudes about what appears to be a heroic but suicidal one-way flight to the moon. Both Russians and Americans launch, and the race is neck and neck all the way. Several subplots weave throughout the story, providing continuous action.

It is clear that Hank Searl knows his way around both the

technical and the human aspects of the space program, and if his stories have not retained their impact, it is only a matter of timing. The fictional Big X barely preceded North American's X-15, untested in free flight at the time, and *The Pilgrim Project* preceded the actual moon landing by less than five years. Still, Searls has incorporated enough human drama into his stories that these after-the-fact elements detract only negligibly for the modern reader.

\* \* \*

Arthur Sellings was interested in how man reacts to the unknown, whether in outer space or on his own planet. He believed man is slowly evolving but that his essential self, with its present weaknesses and strengths, will endure—even if in unrecognizable forms. Thus his works explore man's inner space, his adaptability, his sense of responsibility, his psychological reactions (to holocaust, time travel, alien confront-

ation, genetic engineering), and his psychological potentialities (to control bodily shape, change reality, span dimensions, read thoughts). Notable among his short stories are "The Well-Trained Heroes," which deals with a special task force trained to predict and reduce urban tensions by becoming scapegoats, "Homecoming," wherein a disturbed space explorer discovers he has spent centuries in suspended animation and now resides amid aliens, "Verbal Agreement," about a cosmic salesman who learns, through poetry, to adapt a telepathic society to his needs, and "Start in Life," which records the robot training of five-year-old survivors of a starship plague.

Always Sellings's stories and novels focus on a well-developed central figure who must come to terms with the unexpected, while in the background large military complexes and political groups vie for power. In *The Power of X*, a conspiracy novel, an art dealer learns that other dimensions may be ones of time, not space, as he explores the dangers of "plying," a modern duplicating process which perfectly reproduces originals whether Old Masters or a living President. *The Quy Effect* depicts an aging inventor's struggle to perfect and publicize anti-gravity power, while *Intermind* focuses on a secret agent injected with a dead spy's memory. In *Telepath* young strangers, suddenly intimate due to unsuspected telepathic powers, combat the destiny of their life form until they gradually understand and communicate to others this mutant power which can transform man's future, opening up the potentiality for preserving racial memories through generations in space. The intriguing and suspenseful *Uncensored Man* focuses on a nuclear physicist's contact with another dimension, one where racial memories and the minds of earth's dead have accumulated and developed and now seek to reveal to man the power in his genes and in his physical and chemical heritage. The novel includes disappearing bodies, sympathetic, multi-personality beings warning of man's self-destructive blindness, and a hero who develops a full range of psi powers to protect the future of two dimensions. In Sellings's finest work, *Junk Day*, a cynical, gripping, post-holocaust tale of survival, a traumatized artist joins forces with a wary novice to tackle the junkman, a tough lower-class bully who, in a ruined world, is king of the London junkpile. The junkman's protection racket helps reunite dispersed humanity, while destroying the basic values that, from the artist's view, make life valuable. Ultimately his power is confirmed by overbearing scientists who set themselves up as gods of the new order, reconditioning and transforming those who fail to meet their interpretation of the ideal citizen.

Sellings's works have interesting themes, careful characterization, sensory detail, and satisfying suspense, all handled with discipline and restraint. Frequently a central character is an artist whose special power of perception, temperament, and intuitive insight raise him above the limitations of those around him. Sellings's typical pattern is for such a character, confronted with the unusual, first to doubt his sanity, but then rationally confirm his perceptions, and ultimately learn to deal with new powers or concepts, and understand and accept the responsibilities they entail.

*How to Become a West Point Military Cadet.* New York, Tousey, 1891.

\* \* \*

During his lifetime, Luis P. Senarens was referred to as "the American Jules Verne" and a comparison of the work of both writers indicates the similarity. Senarens was writing stories of airships suspended by helicopter blades ("helices") three years before the *Albatross* took off in *Robur le Conquérant* (*Clipper of the Clouds*) in 1886. His epic serial *Frank Reade, Jr. and His Queen Clipper of the Clouds* leaned heavily on Verne. Even the illustrations were identical, with three of those in Senarens's story also used in Verne's *Maitre du Monde* (*Master of the World*). Senarens's story is basically a long air voyage hampered by the presence of several malcontents and a lunatic scientist intent on seizing Frank's vessel.

Frank Reade, boy inventor, was created by Harry Enton, who put himself through medical school writing dime novels and storypaper serials. The steam-driven robot in *The Steam Man of the Plains* (1876) is mainly a device for transporting Frank and his cousin, Charley Gorse, to the far West. The story is a tongue-in-cheek yarn of encounters with outlaws and Indians, named "Motzer-Ponum" and "Sholum Alarkum." Out west, Frank meets the comic Irishman, Barney Shea. Barney and the black man, Pomp (introduced in a later story), became regular members of the cast. The plot may be improbable, but the steam man (borrowed from Edward S. Ellis's 1865 *Steam Man of the Prairies*) is engaging and novel for its day. We are told just enough about how it works to make it plausible. Senarens seemed to take the stories more seriously then Enton when he stepped in with the fifth serial. He introduced Frank Reade, Jr., but kept Frank, Sr., and eventually gave Jr. a wife. No stylist, he often wrote in the choppy manner peculiar to writers paid by the line. Without the aid of a typewriter, he wrote fast, kept the plot moving, and the characters in hot water. In formula fiction the fascination is in the variation on the basic themes. A new airship, surpassing any effort of the imagination; a new type of submarine; electrified equipment to drive off enemies; aluminium bullet-proof armor; pneumatic revolvers; damsels in distress; gentlemen unjustly accused of murder; a race against time; evil men determined to steal the invention; the pranks of comic relief companions, forever quarrelling; the wonderfully strange foreign lands; the deadly beauty of an undersea cavern or ice-locked vessel. Along

the way a bit of social comment: does the U. S. government protect citizens abroad? Do the workshops in Readestown provide enough jobs for the community?

Senarens himself claimed authorship of most of the Frank Reade stories and all of the companion series about Jack Wright, who lived in Wrightstown and whose specialty was inventing submarines. His adventures were novelettes cut from the same pattern as the Frank Reads. In 1894 the two raced each other around the world for \$10,000. Jack's submarine won by 15 minutes because Frank set down his airship to save a girl on a runaway horse. The stories ended in 1904 when public sentiment decided the ideas were too bizarre and Senarens ran out of ideas, though they lived on in reprints.

Senarens's contribution to science fiction is in his early and imaginative use of so many scientific marvels harnessed for popular consumption to a mass market. Had it not been for the wonders of Senarens there might have been no Tom Swift.

—J. Randolph Cox

S. Steel Hour, Playhouse 90, Hallmark Hall of Fame, Suspense, Twilight Zone, Night Gallery, and Danger series.

\* \* \*

One of the handful of scriptwriters who consistently produced quality drama during American television's "golden age" of the 1950's, Rod Serling demonstrated an interest in science-fiction themes as early as 1956, when he adapted Pat Frank's novels *Forbidden Area* for television. Later, as one of the few writers to be given relative artistic control over a TV series, he turned again to science fiction and fantasy with *The Twilight Zone*, an anthology series which began in 1959. *The Twilight Zone* is often cited as one of the first serious attempts to bring intelligent fantastic stories to television, and, in addition to the large number of scripts that Serling himself wrote for the series, he elicited scripts from major writers within the science fiction and fantasy field, including Richard Matheson, Charles Beaumont, and Ray Bradbury. A later TV series, *Night Gallery*, retained a few science-fiction stories but tended more toward fantasy and the supernatural. Serling also wrote the filmscripts for *Seven Days in May* and the hugely successful *Planet of the Apes*.

Serling adapted several of his *Twilight Zone* episodes as short stories. These often reveal the constraints of writing for television, and Serling for the most part made no effort to take advantage of the new form to develop or expand upon his initial scripts. The characters tend to be exaggerated stereotypes, easily recognizable in a half-hour TV format; the style is often precious or portentous, reflecting Serling's own opening and closing narrations for the original shows; and the fantastic elements are kept elementary and at times even simplistic. With their moralistic lessons and often sentimental tone, the tales work more as fables than as serious attempts at character or idea development.

Serling's attitude toward technology, for example, is decidedly ambiguous. When he writes of robots, he is unabashedly sentimental, as in "The Mighty Casey," which concerns a robot pitcher who nearly saves the Brooklyn Dodgers until he gets a mechanical heart which makes him too kind to strike out batters

(the story is an odd combination of *Damn Yankees* and *The Wizard of Oz*), or "The Lonely," which concerns a prisoner sentenced to a lonely asteroid who finds companionship in a female robot brought by a kindly spaceship captain (a variation on a story by Ray Bradbury, who seems to be Serling's most consistent influence, even cropping up as a character name in a couple of Serling's stories). But in some stories mechanical contrivances become evil presences with minds of their own—a slot machine bent on destroying a compulsive gambler in "The Fever" or household appliances and a vengeful automobile in "A Thing about Machines." The implicit technophobia of "A Thing about Machines," however, is undercut by the almost pathological hostility of the victim who is the central character. Other stories also reflect technophobia in their concern with escape into a simpler past life ("A Stop at Willoughby," "Walking Distance"). The relatively few that deal with the familiar science-fiction theme of alien presences, such as "Mr. Dingle, The Strong" or "The Monsters Are Due on Maple Street," treat them as little more than background for stories essentially concerned with character relations.

Not surprisingly, the major strength in Serling's writing is the convincing dialogue and his ability to sketch recognizable characters quickly—both skills well-suited to TV writing. His exposition is weak and at times even cloying, his themes and plots derivative. He is most likely to be remembered for his powerful non-science fiction dramas, such as *Patterns* or *Requiem for a Heavyweight*, and for his contribution in bringing serious, character-oriented fantastic tales—however familiar such tales may have been to veteran readers—to the television screen.

—Gary K. Wolfe

**SERVISS, Garrett P(utnam).** American. Born in Sharon Springs, New York, 24 March 1851. Educated at Cornell University, Ithaca, New York, B.S. 1872; Columbia University, New York, LL. B. 1874. Married Henrietta Gros le Blond in 1907. Editorial writer, *New York Sun*, to 1892; then lecturer on travel, history, and astronomy, and writer. *Died 25 May 1929.*

\* \* \*

Most of the writings of Garrett P. Serviss were never read, or even suspected, by the generation which lauded his small but significant contribution to science fiction. As a staff writer for the *New York Sun*, and later on a newspaper syndicate, he produced many columns of popular science material, much of which was unsigned. Having made his name as the popular astronomer of his day, he wrote for several leading magazines on subjects ranging from "Facts and Fancies about Mars" to the Shakespeare-Bacon controversy. A series of articles (*Astronomy with an Opera-Glass*) in *Popular Science Monthly* was extended to become the first of a small library of works including such titles as *Other Worlds* and *Curiosities of the Sky*.

His first novel was serialised in 1898 in the *New York Evening Journal*, and was evidently designed to exploit the public interest engendered by H. G. Wells's *The War of the Worlds*. *Edison's Conquest of Mars* was in the nature of a sequel to the Wells classic, though it went far beyond the limits of imaginative conception that even the Master had essayed in a single story. The Martians, too, were rather more human than Wells's monstrous marauders; and they had no chance to launch a second invasion before the great American inventor had organised a counter-attack on Mars in a whole fleet of spaceships armed with deadly disintegrators. Though hurriedly written in a bombastic style, the story was remarkably inventive for its time, anticipating many of the devices which became the substance of later science fiction. No less remarkable is the fact that it was exhumed and published in hardcover only in 1947, having become legendary among fans who admired the author's subsequent stories.

One which attained classic status was *A Columbus of Space*, the tale of a voyage to Venus in an atomic-powered spaceship. Even more notable is *The Second Deluge*, in which a cosmic collision results in a universal flood. The story of how a latter-day Noah saved the human race from extinction proved so popular that it was twice reprinted by *Amazing*, where one reader found it so convincing that he wrote in asking for the plans of Cosmo Versál's ark so that he might save his family from the impending disaster. *The Moon Metal* concerned a

mysterious metal originating in the lunar crater Tycho which replaced gold when this became as plentiful as iron. "The Sky Pirate" dared to predict air travel at 140 miles an hour in the year 1936; and "The Moon Maiden," the least of all his works, marked the last appearance of Serviss, in *Argosy*, the magazines which pioneered science fiction long before the advent of the specialist pulps.

—Walter Gillings

**SEYMOUR, Alan.** Australian. Born in Perth, Western Australia, 6 June 1927. Educated at Fremantle State School and Perth Modern School. Free-lance film and theatre critic and educational writer, Australian Broadcasting commission, late 1940's and 1950's; script editor and producer, BBC Television, London, 1974-1977. Theatre critic, *London Magazine*, 1963-65, and contributor to *Overland*, Melbourne, *Meanjin*, Melbourne and *Bulletin-Observer*, Sydney. Recipient: Sydney Journalists' Club Prize, 1960; Australian Council for the Arts grant, 1974. Address: 74 Upland Road, London SE22 0DB, England.

\* \* \*

Alan Seymour produced his important science-fiction novel. *The Coming Self-Destruction of the United States of America*, when anxiety over Vietnam and racism were at fever pitch. Reviewers recognized its quality, but its plot and message, that racism will lead to guerilla civil war and the ruin of America, virtually guaranteed it would be no best seller. Such has been the fate of the host of works on these subjects, though Sam Greenlee's *The Spook Who Sat by the Door*, telling a similar tale, sold widely. In any case Seymour tells this story as well as it's been told. Its mysterious black revolutionary leader, "Hero," accurately recalls the authentic "Stagger Lee" of Black American folklore. Seymour keeps the focus on the experience of the individual human participants in the events with snippets of diaries, logs, tapes, and letters, and first-person narrating "editor." The effect is a mosaic of awful concrete detail in place of sweeping abstraction that so often diminishes the impact of science-fiction. The sociology is excellent. That the political and economic theory that vaguely bolsters the novel is questionable matters not at all. America's racism is a fatal expression of its mono-cultural obsession and paranoia. In this context a black revolutionary effort will give no quarter, even to sympathetic whites. The result will be, therefore, ruinous as well for blacks.

*Self-Destruction* is a fine representative of the ruin-of-America and racial civil war stories that go back to Martin R. Delany's *Blake; or, The Huts of America* (1859), W. E. B. Du Bois's *Dark Princess* (1928), Sinclair Lewis's *It Can't Happen Here* (1935), and Warren Miller's *The Siege of Harlem* (1964).

#### Jack Sharkey comments:

I enjoy writing imaginative fiction and stage plays because of the marvelous "elbow room" it allows me when plotting; unconfined by anything—even the force of gravity!—I can tell stories occurring in situations Polti never dreamed of, I can fly like a bird at the touch of the typewriter-key, and set my characters on any planet in the known or unknown universe without the bother of paying for rocket fuel!

\* \* \*

Jack Sharkey started publishing science fiction in 1959, but produced little fiction of any kind after 1965. In that span of time, Sharkey sold about 50 stories and seven novels.

Sharkey's best-known series featured Jerry Norcriss, Space Zoologist. These stories were typical SF puzzle stories where Norcriss would "merge" minds with an alien organism in order to solve the environmental puzzle and save a star colony. Two

novels which were serialized but never published in book form are "The Crispin Affair," a thrilling space opera, and "It's Magic, You Dope!," a wildly funny fantasy in the mode of Pratt and de Camp's *The Incomplete Enchanter*.

Sharkey's two SF novels published in book form are complete opposites. *The Secret Martians* is a first-person account of the mystery of the missing Space Scouts and the discovery of the ancient Martian civilization. The action is fast paced and laced with humor. *Ultimatum in 2050 A. D.* is the grim story, with overtones of *Logan's Run*, of revolt against an Earth Society where all its citizens are completely programmed. Sharkey's works are enjoyable, well written, and unfortunately completely out-of-print.

—George Kelley

**SHAYER, Richard S(harpe)**. Also wrote as Wes Amherst; Edwin Benson; Peter Dexter; Richard Dorset; Richard English; G. H. Irwin; Paul Lohrman; Frank Patton; Stan Raycraft. American. Born in 1907. Little is known of his life: probably a welder who lived in Pennsylvania. *Died 5 November 1975*.

- "The Heart of the Game" (as Richard English), in *Orbit 1*, edited by Damon Knight. New York, Putnam, and London, Whiting and Wheaton, 1966.

\* \* \*

If Richard S. Shaver is discussed today, it is usually as a curiosity in the history of science fiction, or as an early example of that dim area where fiction shades into UFO's and ancient astronauts. This is to some extent justified but not altogether fair. Although "The Shaver Mystery" series was presented for the most part as fact, it is for more akin to the science fiction of its time, both in execution and in sources, than most realize; and, taken as fiction, the stories do have intrinsic interest and merit.

During his writing career, spanning three decades, Shaver's stories and "non-fiction" explications were published in a number of magazines, primarily under his longtime editor and advocate, Ray Palmer, at first in science-fiction magazines such as *Amazing Stories* and *Other Worlds*, and later in "occult" publications such as *Hidden World*. A letter from Shaver (*Amazing*, December 1944) described the underground races called the "dero" and "tero" who had taught him the pre-catastrophe language of "Mantong." Then, at Palmer's request, Shaver sent 10,000 word manuscript from which Palmer wrote a 31,000 word story, "I Remeber Lemuria!" Constructed for high drama and written in colorful and traditional pulp style, it told the story of "Mutan Mion of ancient Lemuria," and fully outlined the background and dogma of the Shaver Mystery. The Atlans and Titans, Shaver reports, had been immortal giants of advanced technology; then the sun began to age and give off "heavy metal radiation," causing aging and death. Most fled the earth for a planet with a younger sun, but others burrowed beneath the ground seeking protection from the poisonous rays. These are the dero and tero Shaver claimed to have met in the caves—struggling remnants of a once-great civilization. Of these two warring factions, the dero are by far the more interesting; Shaver has developed the quintessential conspiracy theory. Whenever anything goes wrong, the degenerate dero, crazed by the sun's rays and using the almost-magical machines left by the Elder Races, are responsible. Against this depravity the tero fight valiantly but often in vain, sometimes aided by sensitive surface men like Richard Shaver.
