This is fairly basic stuff, at least in its psychological appeal both as archetype and as wish fulfillment, especially for *Amazing* with its younger and less demanding readership. What made it controversial was that, after the first story, the series was presented as fact. It is debatable whether Palmer believed this; it is probable that he saw it mainly as a way to increase circulation, at least at first. Shaver, however, apparently believed completely in his visit to the caves, in the voices that spoke to him from

underground, and in what those voices told him. In the May 1978 *Science Fiction Review* Palmer announced that the eight years Shaver spent "in the caves" were actually spent in the Ypsilanti State Hospital as a paranoid schizophrenic. This sheds light on the style as well as the content of Shaver's writing: besides adventure-writing devices and techniques, Shaver's style is marked by "schizophrenese" characteristics such as disjointed sentences and, more importantly, word-dismantling and "clang associations."

But it would be wrong to dismiss these writings as only psychotic ravings, or even as Shaver's ravings hammered into salable fiction by Palmer. For one thing, Shaver himself wrote for other magazines under a number of pseudonyms, including house names. Beyond that, the stories show an eclectic range of clearly literary influences. These include the lush fiction of A. Merritt, Wells's Morlocks and Eloi, and the fictional worldview of H. P. Lovecraft, from whose novel *At the Mountains of Madness* Shaver probably got the term "Elder Race." Harry Warner, Jr. (in *All Our Yesterdays*) mentions a possible influence from E. R. Eddison, "Whom Shaver once identified as his literary idol" and *A Reader's Guide to Science Fiction* demonstrates patterning, perhaps conscious, after the planetary romances of Edgar Rice Burroughs. Possible sources in occult non-fiction include Charles Fort, the Theosophy of Mme. Blavatsky, and James Churchward's Mu series, which Shaver mentions in his first letter to Palmer. Shaver also mentions Edith Hamilton's writings on mythology—which his own works explain and correct. The Bible, especially the Edenic theme, is also an important source.

What results is an odd but fascinating blend of high adventure, outrageous "science," and elusive but striking systems of cosmic speculation. If the characters are sometimes flat, if the plots too often seem "boy meets girl, boy beats dero, boy wins girl"—and this is not always the case—the sheer wealth and strangeness of the concepts Shaver develops more than compensate for that. There is a kind of Stapledonian scope to Shaver, a sense of epic, and mythic, panoramas; the races, societies, and technologies with which he populates his universe are varied and often impressive. The appeal of Richard Shaver to the reader then and now is, as Palmer said, "One thing only, his unusual imagination. His strange sense of the unusual, his feeling for emotion, his sense of the beautiful and his sense of the outré." For that reason Shaver's writings, shrouded in controversy and now largely neglected, are worthy of new attention.

Critical Study: *Bob Shaw* by Brian M. Stableford (includes bibliography by Mike Ashley), n. p., British Science Fiction Association, 1981.

## Bob Shaw comments:

It is very difficult, if not impossible, for an author to write objectively about his own work, but I sum up my output by saying that I write science fiction for people who don't read a great deal of science fiction. This doesn't mean that I curb my imagination. I'm quite prepared to deal with the most fantastic concepts, but I try to do it in such a way that the ideas can be appreciated by any reader. The technique involves a minimal use of in-group jargon and a very firm emphasis on relating every fictional event to real characters of a kind that the reader can immediately recognise and identify or empathise with. The universe is wonderful, but only when there is somebody there to wonder at it. Humour also plays an important role in my work, partly because I feel that science fiction shouldn't become too gloomy and portentous, mainly because one of the things we need most these days is a good laugh.

\* \* \*

Bob Shaw stands in the forefront of those SF writers able to combine scientific concepts with humanistic concerns to the detriment of neither element. Most of his novels are centered upon the experiences of a protagonist who would become, in the hands of lesser writers, mere stereotypic "heroes"—whereas Shaw transforms such characters into figures of alternating strength and vulnerability, and thus consistent credibility. Shaw's protagonists perform heroic acts out of a pragmatic need for order and integrity rather than out of desires for escape or sensual indulgence.

The first "Slow Glass" story, "Light of Other Days," focuses on such a diaemna. "Slow glass," an idea that Shaw uses in

various tales, is a special glass-substance that can slow down and "trap" light-images for years after their transmission. In "Light of Other Days" a federal judge must make a guilty ruling in a murder trial that will cost the defendant his life—in spite of the fact that a piece of "slow glass" may have trapped visual images proving or disproving the defendant's guilt. Rather than delaying the trial until the slow-glass image can develop, the judge makes his decision on the evidence at hand, a decision that signifies Shaw's commitment to the pre-eminence of humanity over technical constructs.

Several Shaw novels enable him to expand upon this confluence of human and scientific concerns, imparting to his novels a thematic texture enhanced by his rich, poetically evocative writing-style. *The Place of Eternity* is perhaps his best work, postulating what is termed a "panspermic" view of life—that is, the "concept of ubiquitous life. Justification for believing that every mind in existence was linked to every other mind." With this philosophy in mind, Shaw constructs an interstellar conflict in which humanity is being gradually beaten down by an uncompromising race of aliens called the Pythysccans (whose name Shaw certainly derives from the Greek "Python," monstrous enemy of the humanistic Apollo). Retreating from the unexplained alien attack, the human military takes refuge on Mnemosyne, a planet renowned for its natives' artistic accomplishments. The military's impositions on that culture lead ex-serviceman Mack Tavernor to side with the Mnemosyne natives, but ultimately he is killed in the conflict. However, on dying, his life-force finds verification of the panspermic theory when it encounters non-corporal beings called "Egons." Through the Egons Tavernor learns how humanity's own technology and its contempt for the imagination-developing artistry symbolized by Mnemosyne are leading to its victimization by the Pythysccans. In the tradition of archaic myth-saviors, Tavernor must be reborn in the body of his own unborn son before he can resolve the crisis.

*The Two-Timers* and *Vertigo* are two novels less cosmic in their scheme, but here as well Shaw's fine poetic diction and concern for the realistic concerns of humanity enhance concepts that could verge on melodrama, and make them into enthralling drama. In *The Two-Timers* John Breton loses his wife in a senseless street-killing, and becomes so traumatized by the event that he develops in himself psychic powers capable of transporting him to a parallel time-line, where he saves the life of another version of his wife. Thereafter he expects her to live the part of his deceased mate—much to the discomfort of both the women and the John Breton of that time-line. Interestingly enough, although the traumatized Breton eventually attempts to kill his rival in order to possess his "wife," Shaw maintains sympathy with all of the characters, and manages to resolve the dilemma without resorting to standard melodramatic clichés. In *Vertigo* Rob Hasson is an air-policeman who survives a devastating crash to earth which leaves him with a trauma regarding height, not unlike the protagonist of the Hitchcock movie of the same title. Similarly, Shaw's protagonist must overcome his trauma by forcing himself to endure it in the end, but, unlike the Hitchcock hero, who beats his vertigo through his monomaniacal obsession, Hasson's conquest of his fears is the outgrowth of a more gradual process of healing homeostasis. Shaw's heroes incarnate positive ideals, but he never loses sight of the intense efforts that must be put forth to live up to such ideals.

To be sure, some Shaw novels are of a more workmanlike nature, focusing more on a predictable world-endangering peril than on characters or concepts—for instance, *Medusa's Children*, about a colony life-form that dominates humans, and

*A Wrath of Stars*, about Earth's quasi-physical interaction with another world. Still, even when Shaw is less inspired, there are in his weaker novels moments of incisive character-study or intriguing conceptual elaboration that one never finds in the major works of other, more ballyhooed writers. At his weakest, Shaw is still stronger than most, and deserving of a more appreciative critical audience than he has thus far received.

\* \* \*

Robert Sheckley is, if we must find a category for him, a metaphysical wit and satirist. His major theme, manifested in dozens of superb stories and novels, is that in an infinite universe "reality" is infinitely variegated, depending upon one's environmental or psychological framework. While some writers would regard this as a nihilistic nightmare, for Sheckley it offers an opportunity for unbounded imaginative romping—precisely the sort of freedom that SF so eagerly welcomes. "The quest for non-ordinary reality is something more than curiosity and wishful thinking," Sheckley once said in a rare public address ("The Search for the Marvellous," delivered at the Institute of Contemporary Arts, London, 1975): "We are too crowded in our everyday lives by replicas of ourselves and by the repetitious artifacts of our days and nights. But we do not quite believe in this prosaic world. Continually we are reminded of the strangeness of birth and death, the vastness of time and space, the unknowability of ourselves." These somber thoughts

Sheckley clothes with highly imaginative and entertaining plots. For example, in *Dimension of Miracles* Carmody is brought to the galactic center for a prize he has won in the Intergalactic Sweepstakes. The prize is a sentient being in a gaily wrapped box which takes Carmody on a wild-goose chase through the universe in search of Earth (the Prize Committee does not know the co-ordinates for returning Carmody). Each episode makes it clear that the universe is such that one cannot go home again anyway, just as one cannot step into the same river twice. Carmody's search for home is also a search for self, and on this matter he has quite a bit to learn—such as the fact that the shapes of objects and creatures are a function of environment. What is evil or ugly in one environment may well appear benevolent and lovely when transferred to another.

This idea of the universe as protean and magical serves as a satirical ploy for Sheckley. In "The Petrified World" (*Is THAT What People Do?*, original title, "Dreamworld," from *The People Trap*) Lanigan, whose real world is one in which objects are continually changing shape and color, suffers from a recurring nightmare: he keeps finding himself on a world where change is largely imperceptible. "The pavement never once yielded beneath his feet. Over there was the First National City Bank. It had been there yesterday . . . but, worse, it would be there without fail tomorrow, and the day after that . . . grotesquely devoid of possibilities. It would never become a tomb, an airplane . . ." Lanigan finally becomes trapped in his nightmare—the nightmare which, Sheckley is suggesting, is our nightmare.

No matter how absurd and wildly episodic Sheckley's plots sometimes become, the metaphysician is always lurking in the wings, cueing us with tidbits of cosmic wisdom which are themselves refreshing. For example, *Mindswap* introduces us to a universe in which people can change bodies like garments. Marvin Flynn gets swindled out of his body by the notorious body-pirate Ze Kraggash, whose ruling philosophy is "If a man cannot retain control of his own body, then he deserves to lose it." During the galaxy-wide search Flynn begins to realize just how indeterminate bodies really are and how useless it is to attach any lasting importance to them. "The acceptance of indeterminacy was the beginning of wisdom," a hermit on some alien world tells him. And after he chases Ze Kraggash into the Twisted World, he attains ultimate wisdom: "Nothing is permanent except our illusions."

Perhaps Sheckley's most dramatic rendering of the indeterminacy of selfhood is "Slaves of Time." Like the solipsistic nightmare world of Robert Heinlen's "All You Zombies," this story (omitted, unfortunately, from *Is THAT What People Do?*) depicts some of the uncannily paradoxical things that can happen if one engages in some serious time traveling. Gleister builds a time machine and goes into the future. Because nature "can tolerate a paradox but abhors a vacuum," it instantaneously creates another Gleister to take the first Gleister's place. This new Gleister, identical to the other, but on a different reality-track, also builds a time machine and travels into the future. The inevitable, grim result: an endless stream of Gleisters, each following his own reality-track. "It is strange," Gleister/Mingus says at one point where all the Gleister manifestations convene, "that all of us are one person, yet we represent widely differing viewpoints." And Gleister/Ergon replies, "It's not so strange . . . . One person is many people even under normal circumstances."

*Options* offers yet another treatise on reality vs. illusion and mind-as-universe—embedded, but not too deeply, beneath a slapstick surface. Tom Mishkin, an intergalactic trader ("Frozen South African lobster tails, tennis shoes, air condit-

ioners") finds himself stranded somewhere in the Lesser Megellanic Cloud, in need of a hard-to-get spare part for his ship. He is directed to Harmonia, a bizarre world where, as is almost always the case in Sheckley's cosmos, nothing is quite the way it seems. Mishkin and a mealy-mouthed robot set off on a mock-pilgrimage across Harmonia in search of the elusive spare part. To be sure, Harmonia is Tom Mishkin's disorderly mind strewn across an external milieu like an overstuffed closet that had burst open. Monsters pause in their deadly assaults to discuss metaphysical issues with him; carnival men entertain him; he meets poker players who think they are inside their hotel room in Manhattan (and very likely are). In one of the final episodes we get the sense that Mishkin is "really" just a little earth boy who has been engaged in a daydream that would make Walter Mitty's look dreary ("Tommy! Stop playing now!" "I'm not playing, Mom. This is real. . . . " "Put down that broom and come into the house at once. " "It's not a broom, it's a spaceship. Anyhow, my robot says . . . " "And bring that old radio in with you").

Many of Sheckley's works explore to some degree the nature of selfhood. The early, masterful tale, "Shape" (*Untouched by Human Hands*; *Selected Stories*) is about a team of alien space explorers who possess the ability to change shape at will, but whose society has forbidden them to do so (shapes were assigned and had to be rigorously maintained). No wonder, then, that when they land on a strange planet called Earth, they are so awed by the multitude of shapes, that they cannot bring themselves to return home; instead they joyfully assume the shapes of trees, rocks, animals, humans. And in *Crompton Divided* Alistair Crompton, because of his multiple personality, is forced to undergo "Cleavage"—separation of the personalities, which are then placed in separate bodies and shipped, unknown to the main personality, to remote planets. Crompton, now mild-mannered but totally devoid of spunk, learns what has happened to him and, after raising sufficient funds by embezzling rare and exotic perfumes from his company, embarks on a galaxy-wide search for his lost selves. That this is yet another indictment of society for the pressures it exerts upon us to be consistent, predictable, content citizens is clear from the following passage:

On all sides of him, the envious Crompton saw people with all their marvelous complexities and contradictions constantly bursting out of the stereotypes that society tried to force on them. He observed prostitutes who were not good-hearted, army sergeants who detested brutality, wealthy men who never gave a cent to charity. Irishmen who hated talking, Italians who could not carry a tune. . . . Most of the human race seemed to live lives of a wonderful and unpredictable richness, erupting into sudden passions and strange calms, saying one thing and meaning another.

For Sheckley, to be fully human means to house a repertoire of selves, willing and able to assume different roles, changing our minds when we want to. The only danger is that one can get carried away with the ability to manipulate reality and start trying to play God, conquering and subjugating with no regard for the well-being—the selfhood—of others. Such is the circumstance we encounter in Sheckley's latest novel, *Dramocles*. "Travelling between realities," the power-hungry Otho tells his son Dramocles, ruler of Glorm, is "the way to life everlasting. " Despite Otho's efforts to persuade him that the lives of mere mortals are irrelevant "when the rewards of godhood are within your grasp," Dramocles manages to resist.

Unlike the young man in Sheckley's "The Language of Love" who learned to express his deepest romantic feelings with such precision that his sweetheart quickly lost interest in him, Dramocles discovers that too much of a good thing can rob one of one's very humanity.

*Man on Earth*, London, Sidgwick and Jackson, and New York, Macmillan, 1983.

*Space Careers*, with Carol Rosin. New York, Morrow, 1984.

Editor, with John L. McLucas, *Commercial Operations in Space 1980-2000*. San Diego, American Astronautical Society, 1981.

Author of some 50 technical papers since 1965.

\* \* \*

In a relatively short period Charles Sheffield has developed a substantial reputation as a writer of "hard" science fiction. His solid scientific background provides the technical basis for much of his work.

*Sight of Proteus*, his first novel, focuses on "form changing"—the machine-assisted ability to transmute the human body (look like anybody you please, or grow gills). Although form changing is outlawed in space and tightly controlled on Earth, illegal research eventually shows it to be the means of exploring space and of solving Earth's social problems. This novel is ultimately less concerned with the technology itself than with the impact of technology on society and the way that impact is handled.

Some of his other work is more concerned with technology. *The Web Between the Worlds*, for instance, deals with the construction of an elevator into space (a concept similar to Arthur C. Clarke's in *The Fountains of Paradise*, but developed differently). Yet even here a secondary plot, dealing with genetic manipulation, emphasizes human values rather than mere technology. *The McAndrew Chronicles*, a series of 5 episodic "chronicles" dealing with the scientific adventures of a physicist and his pilot, have an almost completely technological emphasis. Most interesting is Sheffield's appendix which explains where a real science leaves off and science fiction begins.

His other two books are not so much science fiction as science fantasy. *Erasmus Magister* is a collection of three tales inspired by the life of Erasmus Darwin, grandfather of Charles. In each, Darwin investigates some apparently supernatural phenomenon and discovers a perfectly rational explanation for it. *The Selkie*, written with David Bischoff, is a strange mix of mystery, science, and horror. The Selkies are wereseals (explained as a mutation with an all-male population dependent upon certain genetic strains of human females to reproduce) living in northern Scotland. This is a more ambitious novel than the others, striving (not altogether successfully) to deal with a love motif and to characterize Mary Willis more fully.

Sheffield seems to be developing; as his control and depth of characterization rise to the level of his scientific understanding his fiction should become much more interesting.

\* \* \*

In the year and a half since 1983, Lucius Shepard has published one novel, *Green Eyes*, and about a dozen short stories. Other works are scheduled to appear in 1985. Shepard's superbly styled pieces have been nominated for several awards, and he has already won the Clarion Award. The work of William Gibson, Connie Willis, and David Palmer notwithstanding, Shepard has a solid claim to being the most auspicious new writer to enter the science fiction field in some time.

Shepard's work is remarkably of a piece. The majority of his stories take place in the present or near future and are set on or near the Caribbean or the Gulf of Mexico. Most walk the narrow border between fantasy and science fiction and many involve some form of possession. "Solitario's Eyes," for example, takes place somewhere on the Caribbean coast and details the strange relationship between an army officer of upper-class Castilian heritage, his beautiful Indian wife, and the native healer she seeks out during her pregnancy and then seduces. Her son, when born, appears to share some strange physical and psychic bond with the healer (since murdered by

the army officer) and with his blind, possibly magical horse. In *Green Eyes* a scientific experiment in resurrecting the dead, set in the bayou country of Louisiana, goes awry, and leads its participants into a dark universe of perversion, murder, and voodoo. Both "Salvador" and "A Traveler's Tale" take place in the snake-infested swamps and forests of Central America and both involve spirit possession. In the former story an American soldier, stuck in an early 1990's Vietnam-like military campaign, is taken over by a native spirit seeking revenge against the gringos. In the latter story an American is possessed by an alien who, half insane, has been haunting the swampy site of her spaceship's crash for centuries. Somewhat similar is "The Night of White Bhairab" in which an *Amityville Horror*-like demon, accidentally transported to Katmandu, gets its comeuppance at the hands of a rather novel Nepalese household spirit. Shepard's finest story may be "The Man Who Painted the Dragon Griaule." With an ambience much like that of Le Guin's *Orsinian Tales*, "Griaule" is quite literally about a man who attempts to paint a 6000-foot long living but dormant dragon: not a picture of the dragon, it must be understood, but the body of the dragon itself.

Shepard's characters, like his settings, are remarkably consistent. His people are drifters, dreamers, and drug addicts, men and women with no real place to go and no real purpose, who end up on the edges of the civilized world. Many of them fall victim to strange events which they and we never fully understand. When they accomplish things—create works of art, make scientific discoveries, make babies—they usually do it almost in spite of themselves, and their creations are frequently two-edged swords. Shepard is a very talented writer, and to attempt a thumbnail analysis of his work is undoubtedly a disservice to him, but his clearly seems to be sensibility of a disenchanting member of the 1970's counter-culture. In the universe of Shepard's stories everything lies in disarray. Governments are corrupt, belief structures, those of the West at least, are dead, and, although good exists, it rarely prevails.

"Bounty," in *Again, Dangerous Visions*, edited by Harlan Ellison. New York, Doubleday, 1972.

\*

Manuscript Collection: Spenser Research Library, University of Kansas, Lawrence.

\* \* \*

T. L. Sherred's science fiction output was small but of excellent quality. The reason for this, as Sherred explained to Harlan Ellison in the introduction to "Bounty" in *Again, Dangerous Visions*, was " . . . I didn't write very much because I was too busy making a living; I only wrote when I got in a hole and needed cash. When I got the cash, of course, I had pulled out of the hole and didn't write any more . . . "

Sherred's most famous story is "E for Effort" published in *Astounding* (1947). Sherred takes ordinary people and elevates them to positions of great power. In "E for Effort" Ed Lefko is confronted by a television set that can look in on any scene in history. The implications, as developed by Sherred, are enormous. In "Eye for Iniquity" Sherred's main character can create ten-dollar bills out of thin air. "Cue for Quiet" presents us with a pipefitter who discovers that if he wishes hard enough, he can burst the noisy televisions, radios, and jukeboxes that annoy him. These stories are all included in Sherred's only short story collection, *First Person, Peculiar*.

Sherred's only solo novel, *Alien Island*, is a story of first contact. An alien commercial operation called the Regan Group opens relations with Earth by going through an ordinary laborer named Ken Jordan, a sometime alcoholic. By sharing minds with the Captain of the alien vessel, Jordan becomes changed, improved. The narrator of the novel is Dana Iverson, an American spy whose mission is to find out what Jordan and the aliens are planning. Jordan buys a Canadian island near Detroit and sets up a trading base: alien gold and other precious substances in return for Earth's luxury goods. Dana finds out what the Regan group is planning, yet finds their way of life attractive and joins them rather than reporting back to her superiors. The ending is bitter but appropriate.

\* \* \*

Although best known for his plays (the most recent of which include futuristic "visionary adapters"), R. C. Sherriff made two main contributions to science fiction, the 1933 screenplay of *The Invisible Man* and *The Hopkins Manuscript*, a story of planetary disaster. The screenplay focuses on the adverse psychological effects of physical transformation to depict the menace inherent in invisibility, while the novel contracts the menace of doomsday with the positive effects of crisis: growing loyalty, love, unity, and tolerance.

Though fanciful by scientific criteria, *The Hopkins Manuscript* is dramatic, imaginative, and mildly satiric. Its strength rests in its realistic psychological detail and its unusual point of view: an eccentric and rather Victorian Englishman, fussy, pompous, and endearing, a lunar scholar, breeder of prize poultry, upholder of rural values. He records his and his neighbors' reactions to the discovery that the moon, dislodged from its course and creating tornadoes and tidal waves as it nears earth, may well destroy all life; their preparation for survival, the actual catastrophe (the moon landing in mid-Atlantic), the attempt to rebuild civilization are fascinating because of the mildly satiric and detailed characterization. Throughout Sherriff eulogizes the common rural Englishman as basically honest and hard-working, with a strong sense of responsibility, a love of the land and of the community; but laments the fact that he can be baffled, betrayed, and destroyed by greedy politicians who use patriotism as a weapon to forward private manias and to manipulate the simple commoner, who, left to himself, would live and let live. Ironically, after demonstrating man's capacity to overcome his vanity and selfishness in the common interest of survival against nature, he shows man's capacity for self-destruction in a meaningless and unnecessary war over the crashed moon's extensive wealth. Ultimately a Persian barbarian on a jihad so thoroughly destroys what remains of European civilization that years later

an Abyssinian archeologist finds only traces of this lost civilization.

Bibliography: *The Works of M. P. Shiel: A Study in Bibliography* by A. Reynolds Morse, Los Angeles, Fantasy, 1948.

\* \* \*

Certainly one of the most idiosyncratic writers of fantastic fiction of the late 19th and early 20th centuries, M. P. Shiel is primarily remembered today for a single novel, *The Purple Cloud*, although during his own lifetime he was perhaps better known for his tales of imaginary warfare warning of Jewish conspiracies and invading hordes of Oriental devils. A capable

stylist whose fine attention to detail can make the most unlikely fantasies persuasive, Shiel also aspired to philosophy, psychology, economics, and historical theory. Unfortunately, his intellectual theories are often no less bizarre than his imaginative situations, and tend to weaken most of his narratives.

Though Shiel produced more than 20 novels and a number of short stories, many of them are occult and historical romances, and relatively few are of interest to modern readers of science fiction. His first major work of science fiction followed in the tradition of future war narratives that became popular in England in the 1870's and 1880's. *The Yellow Danger* concerns the conquest by Japan and China of all Europe except for England, which successfully retaliates with torpedoes and biological warfare and finally comes to rule the world itself. The novel is as notable for its blatant racism as for its detailed and well-thought-out accounts of imaginary battle movements. In *The Lord of the Sea* Europe is again conquered, this time by Jews, and the retaliation comes from a kind of superman who constructs enormous floating fortresses to rule the seas, has the Jews banished to Palestine, and—in a decidedly strange denouement—reveals himself to be a Jew, and in fact the Second Coming! *This Knot of Life* combines themes from both novels in a tale of an Oriental invasion repelled by a European master race (literally called "Overmen") who invent a weapon that causes blindness. *The Young Men Are Coming!* concerns another favorite theme—the superiority of science to religion. A scientist is inspired (by aliens, who kidnap him to a moon of Jupiter) to set about a kind of reverse holy war to overthrow religion with science.

While few of these novels have retained readers, Shiel's masterpiece, *The Purple Cloud*, remains one of the most widely read end-of-the-world stories. Loosely modeled on Mary Shelley's *The Last Man* (1826), *The Purple Cloud* is essentially a study of conflicting creative and destructive impulses as characterized by a single man, Adam Jeffson, who conspires to be the first man to reach the north pole and returns to find the rest of humanity annihilated by a purple volcanic gas that has since dissipated. The "black" and "white" forces that struggled for Jeffson's personality even before he left for the pole create a strange and conflicting pattern of behavior in this last man. His only recreation becomes the burning of the huge cities that humanity left behind, and when he finds another survivor—a girl whose mind is a virtual *tabula rasa* from having lived alone in a dungeon her entire life (she was born just as the gas was dissipating)—he experiences a strange impulse to kill and eat her. But her companionship finally seems to restore a moral balance in Jeffson, and with her he sets out to start the race anew. Although the novel may not quite deserve the lavish praise heaped on it by H. G. Wells, Hugh Walpole, and Arthur Machen, it is an eerily fascinating and strangely powerful novel.

Shiel probably deserves greater attention than he has thus far received as an important figure in the history of science fiction. The intolerance and racial paranoia that characterize many of his works understandably put off many readers, but his works are not without substance, and at least one of them has become an acknowledged classic.

#### Wilmar H. Shiras comments:

"In Hiding" grew out of my wondering whether very high-I. Q. children would have problems; the rest of the book deals with other such children and their problems.

\* \* \*

Wilmar H. Shiras's total literary output has been far from copious, and even of the total number of works, not all have been science fiction. In fact, she is known almost entirely for a single volume, *Children of the Atom*. Though it reveals serious shortcomings and limitations, its virtues are even greater.

*Children of the Atom* originated in three stories published in *Astounding*; the author added two further stories, collecting the five into an episodic work which experienced a considerable vogue in the 1950's. ("In Hiding," the first story in the cycle, has been anthologized no fewer than a dozen times.) The basic premise of the stories, questionable even in 1948 and now recognized as an absurdity, is that an accident in a nuclear industrial plant will produce a uniform mutation in the offspring of all workers in the plant. Specifically, all children born to women pregnant at the time of the accident, or conceived by workers present at the accident, will be of genius-grade intelligence and of highly creative temperament. The author postulates, further, that all of the workers exposed to the accident will die within approximately two years, but that their children will be perfect. Shiras's main concern is the problems of adjustment and development of these children in later years. Her major adult protagonists are a group of sympathetic educators and psychologists who discover the existence of these children (who are "in hiding"), and the existence of a network of communication among them. The author assumes that these mentally superior children will be automatically outcasts. The boys, with their inclination to study science, will not fit into a society which emphasizes athletics and violent competition; the

girls, inclined toward art, will be similarly excluded from a society which emphasizes prettiness and socialization. Thus the children, in order to survive, hide their superiority beneath a veneer of assumed ordinariness.

Although the author's notions of mutation were quickly seen as absurd, her portrayal of the "superior" children—hyperintellectual adolescents, the boys frequently myopic and unathletic, the girls similarly not adept at the sex-role dictates of the day—struck a strong responsive chord in the typical science-fiction readers of the period. Both Marion Zimmer Bradley and Barry Malzberg, in notes published with a 1978 reissue of the book, comment upon the sense of identity felt by the original readers with the youngsters in the book. It is this uncanny identification of reader with character which gave the book its popularity in the 1950's. In later years the reading of science fiction gained a far greater acceptance in schools, *aficionados* ceased to be automatic outcasts, and this sense of identity became weakened although it did not cease altogether.

In its later segments the novel shows unfortunate tendencies to degenerate into piously one-sided theological argumentation, and at the end the adult sponsors of the brilliant children are told by the children themselves that it will be best to terminate their experimental community and disperse themselves among the general populace. This ending, too, has proved controversial among readers of the book, many of them indicating that they see in it a surrender to the very standards of mediocrity and conformism which the children had earlier sought to escape. Shiras has continued to produce short works of science fiction at long intervals. These have been uniformly pleasant, low-keyed, generally concerned with children, and have received little attention from readers.

#### John Shirley comments:

My early stories show that I was enamored of the surrealists; surrealist and expressionist painting influenced me more than writers. Although there was a political iconoclasm intrinsic to my writing, I've never sided with any particular political philosophy; I feel that the major political and economic theories have all been satirized even-handedly in my fiction. My newest novel, *Eclipse*—easily my most significant book—is essentially a political thriller set in the year 2020, when a non-nuclear world war has ravaged Europe, making it possible for an opportunistic cabal of genuine fascists to take over, through nationalistic puppets, one country after another. Essentially, Europe becomes a massive police state, and the heroes of *Eclipse* are the resistance. They're not Communists, particularly—that is, some are, some aren't. Nor are they radicals. They're simply the resistance to fascism. It happens I really and honestly believe that a resurgence of racism on a vast scale is about to transform Europe, due to the myopic and xenophobic reaction of European natives to the influx of third world immigrants, and also due to other sociological factors. *Eclipse* is a kind of warning novel about it, and an attempt to redefine the cultural backdrop of the near-future. The landscapes of bizzarrities typical of much of my earlier writing, the attempt to realize abstractions in physical description—these are missing from *Eclipse*, at least in explicit manifestation. *Eclipse* is real life, contemporary life, seen through a science fiction lens. I've also

given a much greater emphasis to characterization than ever before.

\* \* \*

John Shirley probably is the most controversial younger sf writer. Some of his writing has acquired a cult following, but he has also been dismissed as a demented poseur. In fact, Shirley has worked hard to produce strong reactions. He would much rather offend readers than leave them unmoved. And his work generally does succeed because his ideas and images are too vivid to dismiss, pummeling readers in the pre-rational way Shirley intends.

In a recent letter, Shirley explains his purpose in his early sf and fantasy: "I was trying to make the impossible seem possible and palpably real, to make it seem so concrete and visualizable, so cinematically striking, that the reader would end by questioning his or her own sanity. I wanted people to question reality, their assumptions, political, social, existential, everything." In his early novels such as *Dracula in Love* and *City Come A-Walkin'*, Shirley's main character suffers because he is empty of purpose. He thus is attracted to an unchanging (but vicious) force trying to preserve itself; however he winds up on the side of an amoral but stability-shattering entity that plots to destroy that stifling "father" power. The novels' action is morally equivocal at best, with huge numbers of people being vividly mutilated and/or slaughtered. The central character never is sure he is doing the right thing, and Shirley offers the possibility that his thirst for freedom might actually be a craving for oblivion (in madness or death). *Transmaniacon* is probably the most successful of Shirley's early novels in demonstrating hatred of a status quo, thanks to its fierce images of bizarre obsessions; the novel's conclusion explicitly links escape from constraints with mortal danger, but Shirley's hero gladly makes that choice. Also memorable is *Three-Ring Psychus*, set after some people has been given psychic powers that let them transcend some physical limits; Shirley's characters discover that the change has given them new possibilities for growth but that some of the possibilities threaten the survival of human consciousness. The book ends with determined uncertainty.

Reading these novels is unsettling as much for the manner of their telling as for their content. The stories refuse to let a reader sink into them as comfortable escape fiction. The action lurches along. The characters let moral qualms interrupt what the reader expects to be a smooth, exciting flow of action. On the other hand, what might be key personal decisions are summarized in an offhand manner. Shirley began experimenting with less obtrusively jarring narrative techniques when he turned away from science fiction briefly to write a mainstream suspense thriller (*The Brigade*), a horror fantasy in the vein of Stephen King (*Cellars*), and various pseudonymous action novels for paperback series (such as the "Traveler" series of post-WW III adventures, which are notable for Shirley's wholesale bloodletting and his bitter, witty contempt for the U. S. government responsible for launching the nuclear missiles). Having returned to the science-fiction novel, he says that "Now, I'm trying to write with crystalline realism about *this* world, but I'm still trying to make my readers question their assumptions. I'm spending a great deal more time investigating character, and controlling tone, the overall quality of writing."

Shirley's early novels were paperbacks, now out of print and difficult to locate. It is even more difficult for a curious reader to seek out Shirley's short stories in the anthologies and magazines where they are scattered. The effort is worth it, however, for although Shirley's novels present his message more fully, some

of his short stories are more successful at giving a burst of startling argument and stunning imagery that pry readers loose from their comfortable preconceptions. In particular, "The Almost Empty Rooms" plays with the idea of free will in a wry story of WW III seen as a frolic of event-animals whose cells are human beings. Another outstanding story, "What Cindy Saw," seems to begin as a study of mental illness, then becomes a surrealistic look at modern life, but ends by affirming the existence of a nightmarish world under the surface of normal "reality." In these and other short stories, Shirley demonstrates that he not only has an imagination that can take reality apart and put it together inside out; he also can seize a reader's attention and rivet it on *his* vision.

With that power and with a growing range of skills, Shirley is just entering his full maturity as a writer. He describes himself as "a performer," and his life as a writer may be compared to his other career as a rock musician. In a column for the semi-professional magazine *Thrust*, he describes himself being injured in a fight with an unappreciative member of the audience and considering quitting his band: "I got disgusted and thought 'What do I need this noise for?' But I'm singing tomorrow night, my lyrics my group and my risk." If this is a gutsy attitude for a young musician, it also is not a bad one for a beginning science-fiction writer. Shirley will keep writing because he cares so passionately about reaching more people in his audience, forcing them to listen for things they've been ignoring, showing them that they must give up the safety of their settled viewpoints to run the risks of freedom.

—Joe Sanders

**SHUTE, Nevil** (Nevil Shute Norway). British. Born in Ealing, London, 17 January 1899. Educated at Dragon School, Oxford; Shrewsbury School, Oxford; Royal Military Academy, Woolwich, London; Balliol College, Oxford, 1919-22. E. A. in engineering 1922. Served as a private in the Suffolk Regiment, British Army, 1918; commissioned in the Royal Naval Volunteer Reserve, 1940; Lieutenant Commander; retired 1945. Married Frances Mary Heaton in 1931; two daughters. Calculator, de Havilland Aircraft Company, 1923-24; Chief Calculator, 1924-28, and Deputy Chief Engineer, 1928-30, on the construction of Rigid Airship R. 100 for the Airship Guarantee Company; twice flew Atlantic in R. 100, 1930; Managing Director, Yorkshire Aeroplane Club Ltd., 1927-30; Founder and Joint Managing Director, Airspeed Ltd., airplane constructors, 1931-38. Lived in Australia after 1950. Fellow, Royal Aeronautical Society, 1934. *Died 12 January 1960.*

Manuscript Collection: National Library of Australia, Canberra.

Critical Study: *Nevil Shute (Nevil Shute Norway)* by Julian Smith, Boston, Twayne, 1976.

\* \* \*

Nevil Shute's science-fiction novels make up only a quarter of his output of 22 novels. Yet like all his work, the science fiction profits from Shute's ability to create strong, interesting characters. Although without exception ordinary middle-class people, living calm, almost prosaic lives, these characters are of interest because of their devotion to duty and their pursuit of some personal goal. These goals are as divergent as planting

next year's garden in the face of death, finding a missing aircraft part, or providing proof for the Viking settlement in North America. But it is the people and their absorption in their goals in the face of gargantuan difficulties that draw the reader into the story. Shute's novels move at a very leisurely pace, full of details of country, city, and daily routine. Through the wealth of detail a verisimilitude develops so that the sufferings and triumphs of the characters are shared rather than observed. *On the Beach* is filled with characters who draw such interest. Peter and Mary Holmes calmly plant next spring's bulbs and buy a playpen for their daughter Jennifer, even though they know they will never see the bulbs bloom, nor see their daughter use the playpen. So slowly does the atomic fallout move that the Holmes's wait becomes the reader's wait as the worlds moves inexorably to its end.

*No Highway*, too, contains characters whose dedication to duty provides a way to live. Mr. Honey, a scientist studying metal fatigue, allows his daughter to locate the missing tail of a crashed plane through a clairvoyant hypnotic session. Unlike the characters who watch the proceedings, the reader is not shocked, for we are convinced, along with Honey, that the experiment is vital. *An Old Captivity*, *In the Wet*, *What Happened to the Corbets*, and *The Rainbow and the Rose* are science-fiction works filled with ordinary people who face tremendous odds yet manage to survive.

Critical Studies: "Robert Silverberg Issue" of *SF Commentary* (Melbourne), March 1977; *Robert Silverberg* by Thomas D. Claeson, Mercer Island, Washington, Starmont House, 1983.

\* \* \*

Robert Silverberg's writing career spans four decades. A prolific writer, Silverberg's writing and themes have changed as the writer has matured and gained the skills of a master storyteller. In his revealing autobiographical essay, "Sounding Brass, Tinkling Cymbal" (*Hell's Cartographers*), Silverberg admits to producing over a million words per year of published material in his apprenticeship years 1955-59. Much of this was hackwork; stories like "Slaves of the Star Giants" and "Secret of the Green Invaders" and novels like *The Planet Killers* and *Stepsons of Terra*. Yet some of the stories were outstanding, like the dark "Road to Nightfall" and the clever "Translation Error," giving notice of the superb stories Silverberg was about to produce.

The late 1950's saw the decline and sudden contraction of the number of science-fiction magazines coupled with the declining market for science-fiction novels. Silverberg responded by shifting his main writing emphasis from SF to juvenile non-fiction where he achieved critical acclaim for excellent works like *Treasures Beneath the Sea*, *Empires in the Dust*, and *Lost Cities and Vanished Civilizations*. Silverberg also produced over a hundred soft-core pornopaperbacks most under the Don Elliot/Eliot pseudonym. Yet Silverberg did not entirely abandon the SF field during the years 1960-68. Frederik Pohl,

then editor of *Galaxy*, *If*, and *Worlds of Tomorrow* SF magazines, invited Silverberg to write whatever he wanted. Silverberg, intrigued by the offer, submitted his now classic "To See the Invisible Man" (1962). Silverberg's narrator is punished by a future society for his crime of "coldness" by being completely ignored by everyone in that society for one year. Silverberg plays with the possibilities such a situation presents, showing the themes of the individual reacting against a society, even though the society is benign. "To See the Invisible Man" shows a shunned man in turn shunning a society: this is a sophisticated story light-years from Silverberg's earlier action adventure SF like "Battle for the Thousand Stars."

The end of this transition period saw Silverberg begin to emerge as a powerful short-story writer. With "Flies," written for Harlan Ellison's *Dangerous Visions*, Silverberg breaks new ground. An alien race restores a dead starship pilot named Cassiday and enhances his powers. Sent back to Earth as a kind of transmitter for the aliens, Cassiday commits hideous acts of violence since he is incapable of emotion. The aliens, realizing their mistake, return Cassiday to their world and give him back his conscience, providing the means of self-torture. The story deals with major moral and religious themes, themes Silverberg will expand on in his major novels. Silverberg won his first Nebula Award for "Passengers," a horror story of humans dominated by parasitic aliens called Passengers who ride their host humans and utterly control them. "Passengers" explores the question of free will versus determinism, a major theme of later novels like *The Stochastic Man* and *Shadrach in the Furnace*.

Like the explosion of writing in Silverberg's early period, the years 1969-76 produce a similar flood of works; the difference was in the quality. *Nightwings* presents Silverberg's vision of the far future. Earth is a ruined planet, with the Americas sunk beneath the seas. Yet its super-science which produces genetically engineered Flyers coexists with a medieval political structure. Tomis the Watcher is a beautifully realized character who narrates this powerful story of hope, renewal, and redemption. In *Tower of Glass* Silverberg's dark vision returns. 23rd-century Earth is ruled by Simeon Krug, inventor of the android. His quest is to contact an alien race by building a mammoth tower of glass to send signals deep into space. At the same time, the androids are organizing to be granted person status instead of being considered property. The book abounds with racial and moral themes, yet the conclusion is very bitter. (About the time *Tower of Glass* was written, Silverberg suffered a fire to his house that destroyed part of his New York City home and left him depressed.)

*A Time of Changes* (Nebula Award) is a book misinterpreted as a vehicle for advocating the use of psychedelic drugs because of the dreamlike quality of many sections of book where the characters use a Sumaran drug which allows a person to link minds with another person. *Son of Man* is a strange blend of Olaf Stapledon and David Lindsay's *A Voyage to Arcturus* that results in a surreal plot that goes nowhere. But the characters Silverberg creates in Clay, Hanmer, and Ninameen remain unforgettable.

*The World Inside* presents some of Silverberg's more controversial solutions to overpopulation. Silverberg presents a world of gigantic living units, a thousand stories high, containing 800,000 people each. It is a unique future society that encourages sexual experimentation, encourages bearing children, encourages an anti-privacy culture. Contrast this to the situation Silverberg presents in *The Book of Skulls* where a student finds a manuscript in the rare books of a university library that promises immortality. This launches a quest that

results in what Barry N. Malzberg calls Silverberg's finest novel. Yet most critics consider *Dying Inside* Silverberg's best book. David Selig is a compelling character: he's forty years old and writes term papers for college students to make enough money to survive. He also has the power to listen to other people's thoughts. As a young man, he considered his power a curse, but now Selig finds he is gradually losing his power to receive the thoughts of others. Silverberg creates a complex, sympathetic character whose plight—although strange and bizarre—becomes realistic and emotional through the exploration of the themes of loss, old age, racism, and change. In *Dying Inside*, Silverberg's powers as a novelist are most completely realized.

In 1976, *The Best of Robert Silverberg* appeared along with Silverberg's announcement that he was withdrawing from the SF field. Silverberg complained critics ignored his work and the science-fiction publishers failed to reward SF writers to the extent writers in other fields were rewarded. At the same time, other SF writers were announcing their flight from the science fiction ghetto: Harlan Ellison, Barry N. Malzberg, and Kurt Vonnegut. Ellison and Vonnegut fought to remove the SF label from their new works and reprinted ones. Yet Silverberg did not withdraw from the SF field completely: in the years 1976-79 he edited *New Directions* original SF anthology series as well as numerous SF theme anthologies—from 1966 to 1981 Silverberg edited over sixty SF anthologies.

As early as 1979 rumors abounded that Silverberg was working on a "big book." Times had changed in publishing: science fiction and fantasy, often ignored and ill-funded lines, became much more popular with the success of *Star Wars* and the *Star Trek* movies. Silverberg received critical acclaim and a six-figure advance for *Lord Valentine's Castle*, in which he created a huge planet called Majipoor with twenty million human and alien beings. Valentine's quest is one of identity. He is a wandering juggler who is actually a king dethroned by treachery which robs him of his memory. The book lacks suspense: we know early on Valentine's quest will be successful, but Silverberg holds our interest for over 500 pages with adventures on Majipoor that are a delight. But the light fantasy of *Lord Valentine's Castle* gives way to the darker stories in *Majipoor Chronicles* where Silverberg explores in more detail his mammoth planet. "The Desert of Stolen Dreams" gives us a lesson in Majipoorean guilt when the main character faces the death of a companion. "The Soul Painter and the Shapeshifter" shows us a love affair between Majipoor's humans and aliens. The other stories fill out Silverberg's marvellous creation with a detailed history and philosophy of Majipoor. This culminates in *Valentine Pontifex* where Valentine's promotion from Coronal to Pontifex bring him up against an awesome challenge: the Metamorphs, shape-shifting natives of Majipoor, have broken the thousand years of peace with an attempt to dominate the planet. The fate of the planet is in Valentine's hands and this seemingly concluding volume of the Majipoor saga generates the most suspense.

*The Conglomeroid Cocktail Party*, Silverberg's latest collection, contains some of his finest short stories. "The Pope of the Chimps" is a revealing study of religion as an experimental group of chimps begin to worship humans. "The Changeling" is a clever twist on alternate reality themes. "Gianni" is a marvelous time-travel story where scientists bring 18th-century musical prodigy Giovanni Pergolesi, who died at the age of 26, back to the future with deterministic results.

Silverberg's latest novel, the fantasy *Gilgamesh the King*, received excellent reviews in the *New York Times Book Review* and other literary journals. Silverberg takes us back to the ancient civilizations of 5000 years ago when the Sumerian god-

king grew to maturity and reigned over an empire. With a blend of myth and magic, Silverberg makes Gilgamesh's narrative come alive despite the strangeness of the culture. *Gilgamesh the King* is Silverberg's best fantasy novel.

Robert Silverberg is certainly a giant in the field of science fiction, a writer whose long career has produced classic novels and short stories. The impressive fact that Silverberg continues to produce first-rate, sophisticated work only adds to his stature.

—George Kelley

Bibliography: *The Electric Bibliograph 1: Clifford D. Simak* by Mark Owings, Baltimore, Alice and Jay Haldeman, 1971.

\* \* \*

Who but Clifford D. Simak would expose invaders from space by mobilizing skunks in a large midwestern city? Since 1931 he has retained popularity, writing about time machines and mystic quests, a man in touch with his world. He is SF's special ambassador to the stars, casually introducing robots, goblins, sociable monstrosities, cyborg ships, and alien intelligences from shades to slugs. Perhaps his popularity is explained by his engaging escapism: communication with other beings is established; the war avoided; the talisman found; the boy and girl (even werewolves) get together.

Much early and minor Simak is gadget SF. "The World of the Red Sun" is a time-machine story with an uncharacteristically unhappy ending, though his interest in time, man's destiny, and illusion is obvious in this first publication. *The Trouble with Tycho* is a treasure hunt on the moon. "The Answers," "The Fence," "Beachhead," "Goodnight, Mr. James," "The Street That Wasn't There," and "To Walk a City's Streets" are classic stories. Although the message in "The Answer" is that life is an insignificant accident, most disasters are avoided by courage and determination. Such is the case in *They Walked Like Men*, *Why Call Them Back from Heaven?*, *Out of Their Minds*, and *Our Children's Children* up to *Where the Evil Dwells*. One man who risks life and reputation to save mankind is joined by a tough but feminine friend and at least one unique being. With this mixed cast, what should be terrifying becomes humorous. Another SF gadget is the robot. "How-2," "Earth for Inspiration," "Installment Plan," "All the Traps of Earth," "Ogre," and "Lulu" feature strong-willed, people-loving robots, stock characters in his works, companions, guides, and occasionally scatter-brained troublemakers. Hezekiah of "Installment Plan" and *A Choice of Gods*, Richard Daniel of "All the Traps of Earth," and Jenkins of *City* are interchangeable. Although *Time and Again* is concerned with the plight of human-looking androids, Simak's robots are usually obviously machines in all but personality.

Simak frequently deals with time and parallel universes. His ideal is a place outside time where things remain the same and a

body can rock peacefully on his front porch while auks and dinosaurs frolic by the stream. He is unquestionably the leading exponent of the pastoral mode in SF. "The Autumn Land," "Auk House," "New Folks' Home," "Kindergarten," "The Sitters," "Retrograde Revolution," and "The Marathon Photograph" offer simple, out-of-the-way retreats, often in the Wisconsin countryside. "Neighbor" is perhaps the best statement of Simak's ideal rural utopia where crops never fail, machinery does not break down, and people are friends. A house or a car waits to take someone to a higher existence. "The Ghost of a Model-T" and "New Folks' Home" are particularly appealing because they carry old men to new value. In *Mastodonia* and *Cemetery World* the adventurers remain in their isolated world, Adam, Eve, and machine. Simak's characters share his love for home by returning to childhood spots and fishing in *Ring Around the Sun*, *All Flesh Is Grass*, *Out of Their Minds*, and *Cemetery World*. Small town distrust of strangers often makes the plot move forward by sending the heroes into hiding. In *Our Children's Children* ravening beasts from time invade back yards, combining the everyday with the fantastic.

Into the everyday, however, comes the world in which all creatures are brothers and all time is linked. The most important of Simak's works combine his themes into allegories of man's need to establish peaceful, respectful communications with all creation. As his world experienced the cold war, racism, ecological deterioration, and loss of faith, Simak responded with works that were at once good SF adventures and parables. *Cosmic Engineers* is one of the earliest and most typical of the works dealing with man's destiny. Two newspapermen, a thousand-year-old lady mathematician, and a group of super-robots save two universes. Their antagonists are the vicious Hellhounds who reappear in *Enchanted Pilgrimage*. The Cosmic Engineers summon every possible life form, including nightmarish, misshapen creatures and goblins. Only man can help—present and future. The one remaining man on Earth explains that the others have migrated to the stars, pushing on to their inheritance as masters of the universe; the Engineers were their creation.

Interstellar cooperation also prevents total annihilation in *Way Station*, Simak's masterpiece. A Civil War veteran, Enoch Wallace, in spite of his 124 years, looks 30. Living alone with only one friend, a mailman who delivers reading material and supplies, he survives by selling precious jewels for less than their worth. Enoch works for the Galaxy, running a way station for interstellar travelers. When the CIA digs up the remains of an extraterrestrial and he rescues a psychic deaf-mute, Lucy Fisher, from a beating, Enoch is thrust into his troubled world. Just when the world is on the brink of war and the Galaxy is torn by strife because its talisman is lost, he is threatened by irate townspeople and his station is to be closed by offended officials. As Enoch packs his records and treasures, a ratlike saboteur invades and he must kill him. Lucy is found to be a Guardian when she reactivates the stolen talisman the rat had with him. Because of Lucy, Earth is spared war and given Galactic status.

This improbably plotted book is significant for its messages of universal brotherhood and the significance of life. It is also a storehouse of Simak's materials. The talisman is a spiritual force that unites planets. The ability of the Andromedans to adapt by changing shape appears in *City* and *The Werewolf Principle*. The picture cube, five-person sexual unit, companions created by thought, affable aliens, lonely hero, old-fashioned romance, bad government, powerful simple person, and narrator who mulls over the meaning of his existence all are traits of Simak's work. "The Big Front Yard" is a similar tale of the

establishment of a portal through which citizens of other worlds may pass peacefully. In *All Flesh Is Grass* a rural area is the entry point for a flower-like group-being that brings peace. "Mirage," "Contraption," "Limiting Factor," "Construction Shack," and *Time and Again* bring man into contact with far greater but non-threatening powers.

*City* is the most sweeping of his speculations about man's destiny among the stars. In eight stories written as myths passed on by the dogs and robots of the Webster family, Simak relates a history in which man takes to space, leaving his successors behind to doubt he ever existed. *City*, *The Creator*, *Time and Again*, and "Founding Father" suggest that man, as we know him, may not inherit the universe after all. In *Time Is the Simplest Thing* and *Ring Around the Sun* paranormals are resented and hunted.

Simak's recent works return to optimism and move into man-glorifying fantasy. All are quests for meaning in a vastly changed world. In *Cemetery World* Earth has become a glorified graveyard; in *A Choice of Gods* it has been left to robots, Indians, and a few conservatives. *Enchanted Pilgrimage*, *Destiny Doll*, *A Heritage of Stars*, *The Fellowship of the Talisman*, and *Where the Evil Dwells* have a medieval flavor, with ominous, degraded antagonists, magic, and waste lands, matching the interests of the times. They suggest a guiding cosmic principle.

Simak's work has great consistency. Names like Horton, Duncan, Hezekiah, Thorndyke, Bounce, and Bowser recur. Ideas like creating beings from thought, changing bodies for colonization, gateways to other world, and characters like long-winded, argumentative robots, friendly worms, mythical creatures like brownies, and strong-willed but malleable women are predictable. Above all, Simak insists on the dignity of all life and the irresponsibility of undervaluing any. Time stops while Simak spins his leisurely yarns.

—Mary S. Weinkauff

**SINCLAIR, Upton.** Also wrote as Frederick Garrison. American. Born in Baltimore, Maryland, 20 September 1878; moved with his family to New York City, 1888. Educated at the City College of New York, 1893-97, A. B. 1897; Columbia University, New York, 1897-1901. Married 1) Meta H. Fuller in 1900 (divorced, 1911); 2) Mary Craig Kimbrough in 1913 (died, 1961); 3) Mary Elizabeth Willis in 1961 (died, 1967). Writer from 1893; wrote Clif Faraday stories (as Ensign Clarke Fitch) and Mark Mallory stories (as Lieutenant Frederick Garrison) for various boys' weeklies, 1897-98; founded socialist community, Helicon Home Colony, Englewood, New Jersey, 1906-07; Socialist candidate for Congress, from New Jersey, 1906; settled in Pasadena, California, 1915; Socialist candidate for Congress, 1920, and for the United States Senate, 1922, and for Governor of California, 1926, 1930; moved to Buckeye, Arizona, 1953. Recipient: Pulitzer Prize, 1943; American Newspaper Guild Award, 1962. *Died 25 November 1968.*

Upton Sinclair is best known as a socialist muckraking novelist, and has a spectacular history as a much-admired and much-traduced political crusader. However, as an "Economic Scientist" he has experimented in both science fiction and fantasy, especially of the time-travel variety. Since his talents are journalistic and narrative rather than evocative of character and subtle human relations, his SF drama is less skilful than his novels are.

One group of novels takes America into a possible alternative world, consequent upon Sinclair being elected Governor of California and his EPIC programme being adopted by the USA. *I, Governor of California, and How I Ended Poverty* is fiction only in the sense that it projects a political campaign into the immediate future, emphasising the virtues and values of the co-operative movement that defeats the Depression. *We, People of America, and How We Ended Poverty* expands the canvas and the time-scale, but is still more argument than fiction. *Co-op* is a genuine fiction, but leaves the reader to debate whether President Roosevelt will or will not embrace the Co-operative Commonwealth ideal. That ideal is interesting in itself, uniting patriotism with socialist and collectivist principles, but the protagonists of the novel are more typical than individually memorable.

Genuinely science-fiction and fantasy novels are *The Millenium: A Comedy of the Year 2000*, a satirical parable on the need for socialism combined with social justice, and the rather stiffly Utopian *The Industrial Republic*. More striking juxtapositions of modern American assumptions with those of very different societies make *Prince Hagen* still interesting; the avaricious Nibelung ruler is impressed by the superior chicanery and greed of "Christian" American capitalism. In *Roman Holiday* a rich young American playboy, in the delirium following a motor-racing accident, finds himself back in patrician Rome, which tells him a great deal about his 20th-century life-style and society. *They Call Me Carpenter* also uses a rich and idle American as principal observer: laid out after a scuffle with "patriotic" demonstrators against the film *The Cabinet of Dr. Caligari*, he sees Christ step down from a cathedral window; inevitably "Carpenter" loves His fellow men, but is forced to denounce the press, the society's privileged, and especially the church that has deserted the revolutionary doctrines of its supposed Founder (the novel stops short of the crucifixion which its logic seems to entail). Sinclair's other major time-travel fantasy, *Our Lady*, is excellent in both research and the basic contrast between the mother of Jesus and the modern Californian Catholic world to which she is translated. Both her reaction to the ball-game where she first appears and her total alienation from any element of Roman Catholic faith which

theoretically invokes her mingle comedy, pathos, and a genuine reverence for human spiritual exploration; even the exorcism climax has an obsessive power lacking in most of Sinclair's endings.

Most of Sinclair's immense number of novels were written too quickly, and stumble into structural faults as well as psychological shallowness. Yet the best of his writing carries immense compassion for human suffering and frustration, and the force and courage of his defence of human relations against capitalist priorities is worth the loss of many graces. Although genuinely convinced that all good art is primarily propaganda, Sinclair avoids portraying all capitalists or playboys as fools or oroges, and often relishes the sudden understanding that can spring up between characters socially alien to each other. In his drama there is genuine development between the versions of the "noble savage" girl in *The Naturewoman (Plays of Protest)* and *The Enemy Had It Too*, where the unspoiled maiden kills the sophisticated gangster by the use of flirtation and curare! Nonetheless, the exploration of Great Issues does not suit the stage, and mixing the world-disaster (or last-men) theme with the return-from-Mars, the noble savage, the satiric portrait, and the all-aboard-the-Ark themes makes even the latter too overloaded. It is for such novels as *Our Lady* that Sinclair most deserves the fantasy reader's attention.

—Norman Talbot

\* \* \*

As novelist, screenwriter, and film director, Curt Siodmak has had a long career, first in Germany and then in Hollywood, popularizing for the mass audience basic and extremely banal

science-fiction motifs originated long before by other writers: an airfield floating in mid-ocean, the building of a trans-Atlantic tunnel or a spaceport, experiments with artificially induced telepathy or genetic manipulation all provide formulaic grist for some very melodramatic mills. Siodmak's protagonists in his novels and films are either Frankensteinian mad scientists in the grand pulp tradition or strong-willed and far-sighted entrepreneurial over-reachers in the Faustian/Ayn Rand mold. Indeed, perhaps the only redeeming feature of Siodmak's early German science-fiction work of the 1930's is that the films based on his novels (three versions of *F. P. 1 Does Not Reply* and two versions of *Transatlantic Tunnel*) utilized some impressive special effect. Not even that much can be said for most of the movies based on his Hollywood screenplays in the 1940's, which were invariably low-budget programmers, that attempted to milk tried-and-true monster-movie formulas that had long been dried out.

Siodmak is best known, however, within both the science-fiction field and the mainstream of literary and cinematic popular culture, as the creator of *Donovan's Brain*, which has itself been adapted three time for the movies, with varying degrees of success: *The Lady and the Monster* (1947, with Erich von Stroheim), *Donovan's Brain* (1953, with Lew Ayres), and *The Brain* (1963, with Peter Van Eyck). In all of its manifestations, the story has held up durably and has retained to a certain extent its queasy fascination. The reclusive scientist-physician Patrick Cory extracts the still-living brain of the powerful industrialist Warren Horace Donovan after an airplane crash had mangled the tycoon's elderly body. Despite the stereotypical warnings of his devoted wife and an alcoholic colleague, Cory establishes telepathic contact with the disembodied brain, which, nurtured by chemicals, is growing daily in size and telepathic power. The brain quickly takes control of Cory's body, forcing it to wreak vengeance on Donovan's enemies. What gives Siodmak's novel its inherent power is not only its central theme of physical possession caused by unchecked and thus finally destructive scientific research, but also the first-person narration from Cory's panicky point of view. Unfortunately, the story eventually degenerates into unduly complicated histrionics detailing Donovan's desire to pay off an old debt by intruding on a murder investigation involving the heir of one of Donovan's early business partners. By plunging Donovan and his hapless, progressively will-less surrogate into such a desultory and pointless subplot so late in the proceedings, Siodmak conveniently sidesteps the more somber medical, legal, and metaphysical implications of his initially intriguing concept.

Siodmak's later novels continued his career-long tendency to graft mainstream genres onto science-fiction settings. Thus, *City in the Sky* is a kind of *Grand Hotel* in orbit, mixed in with political intrigue and prison-escape heroics, while *Skyport* is like a space-age *Fountainhead*. A bit more interesting to the genuine science-fiction enthusiast are *The Third Ear*, which concerns the chemically created cultivation of ESP abilities, and *Hauser's Memory*, Siodmak's belated sequel to *Donovan's Brain*, with the intrepid Cory again blazing new scientific trails, transplanting a German chemist's overactive, revenge-minded RNA onto another ill-fated human guinea pig. Despite the pseudo-scientific trappings, both books are relatively straightforward espionage thrillers, demonstrating again that Siodmak's talents lie in welding worn-out science-fiction themes with other conventional, pop-cultural formulas.

Kathleen Sky comments:

It's difficult to analyze my fiction on the basis of past output because I know that my best work still lies ahead of me. Nevertheless, I recognize some themes in my books that will continue to appear. Just as blacks and Chicanos need strong positive images in their literature, I feel that the increasing number of women who read science fiction will require strong female characters to give them a positive self-image. It's easy to write a strong woman as a bitch, but much harder to write her as a loving, caring person (the "mother" aspect). Nevertheless, I try. In my forthcoming fantasy series, *The Witchdame Trilogy*, I have a strong character, Princess Elizabeth, who eventually becomes the queen of her realm and consequently a strong mother figure. In my novel *Shalom*, there are several strong women, most notably Judith, who eventually becomes a mother figure to her entire planet.

In writing about strong women, I find I need strong male characters to match them. It's no use liberating only one gender; men and women need to share their strengths equally. I felt that everyone is psychologically bisexual—that is, each human being has both masculine and feminine components to his personality. Only by bringing out *all* the strengths, masculine and feminine, can people truly become liberated from the stereotypes of the past. Because of this, I reject the role of the traditional feminist. Too many of the radical women writers tend to view men as an enemy to be overcome. In doing so, they are doing more harm to themselves than to their supposed enemies. I view men and women as but two halves of a single race. If one side loses, we all do; only by having both sides succeed can humanity be the victor.

\* \* \*

Kathleen Sky is good at understanding a special variety of emotion: the grief of a creature coerced by its own nature into a task both valuable to others and costly to itself. One could say it is a woman's grief—Sky makes it into the grief of a tired little man, or a green alien, or a Vulcan. Sky has the visibly struggling competence of a new writer, but also a depth of emotional perception which is already formed. The plight of her characters is both cleverly illustrated and deeply felt.

"One Ordinary Day, with Box," her first story, functions with the simplicity of a parable. A little old man travels from place to place with a big black box. To those who reach inside, the box gives what they need, but not what they want. The disparity between imagined want and true need runs like a moral lesson through this quick, effective tale, but the emotional focus is finally on the old man himself. Scorned by the people that the box has frustrated and insulted, he goes off alone, and at last reaches into the box himself. He is given another box. His need, the box implies, is to continue his thankless task, his unappreciated giving.

Sometimes the task is change itself. In the somewhat overwritten but surprisingly moving "Lament of the Keeku Bird" Sky details the painful process of an alien initiation ritual, a menopause by violence in which a female creature makes a ceremonial journey that wears off her sexuality. The writing task is difficult—Sky narrates in the first person present from the alien's point of view and thus must develop landscape, species, and personality all indirectly. The development is coherent and interesting; Sky manages not only to establish a believable extraterrestrial world but also to show the beginnings of personal change, the openings of thought in what was at first a thoughtless breeding animal. The mingling of grief and triumph at the end is consistent with Sky's awareness of the inner price to be paid for anything of value.

This awareness is carried into Sky's Star Trek novel, *Vulcan!* Enough young science-fiction writers have written Star Trek continuations that it may become a set exercise for entering the craft. As such it provides a useful device of classification: *Trek to Madworld* by Sky's husband, Stephen Goldin, is whimsical and extravagant; Sky's version has a deeper concentration on personality, and is in effect a serious consideration of what it means to be a Vulcan or to love one. The fan's potential delight in this can be easily imagined, and Sky does well in capturing Spock's angular appeal, his passionless speech, his promise of intensities withheld. Her portrayal of Katalya Tremain, the scientist who tries to hate Vulcans in order to avoid loving them, is less consistent, but the book as a whole works. Sky transmits both Spock's calm appreciation of the powers he has and his regret at his limitations. He helps Tremain to change but cannot

change himself. His last request to the women is that she help him to rediscover his childhood imagination and thus find a way out of his box of logical competence.

Sky's style is as yet unremarkable; she chooses the nearest words to communicate what she envisions—the view from inside a sensitive mind looking at a landscape both alien and alienating, where endurance is a value and change expensive. This view is one that lends itself to science fiction, to making new landscapes and locating characters in them emotionally as well as sensually. Sky's work is not an investigation into science or ideas, but into experience, and she succeeds, even in her career's outset, in making the experiences both strange and believable.

—Karen G. Way

**SLADEK, John (Thomas).** Also writes as Thom Demijohn; Cassandra Knye; Richard A. Tilms; James Vogh. American. Born in Waverly, Iowa, 15 December 1937. Educated at College of St. Thomas, St. Paul, Minnesota, 1955-56; University of Minnesota, Minneapolis, 1956-59. Married in 1970, one child. Engineering assistant, University of Minnesota, 1959-61; technical writer, Technical Publications Inc., St. Louis Park, Minnesota, 1961-62; switchman, Great Northern Railway, Minneapolis, 1962-63; draftsman, New York, 1964-65. Editor, with Pamela A. Zoline, *Ronald Reagan: The Magazine of Poetry*, London, 1968. Recipient: British Science Fiction Association Award, 1984. Agent: Richard Curtis Associates, 164 East 64th Street, New York, New York 10021, U. S. A.; or, A. P. Watt Ltd., 26-28 Bedford Row, London WC1R 4HL, England.

John Sladek comments:

Most of my novels and short stories are set in the near future, in a recognizable America in which technology has either solved all of our problems or failed to solve any of them, or something else entirely has happened. Something else entirely is always happening in science fiction, I understand. My work is usually called satire or black humor, but it also reflects my preoccupation with certain themes.

I am endlessly fascinated by machines which can mimic or displace human beings. So a number of my characters are robots (such as "The Steam-Driven Boy") or computers or cyborgs, or selfreplicating machines (as in *Mechasm*). This theme informs *Roderick*; or *The Education of a Young Machine*, first of a two-part novel which attempts to cover the entire "life" history of a robot learning machine, and efforts to assimilate him into human society.

A parallel concern is with dehumanizing processes—ways in which governments and other institutions, mistakenly modelled on machines, attempt to reduce their citizens or members to mechanical components. This is the argument of three novellas, "Masterson and the Clerks," "The Communicants," and "The Great Wall of Mexico," and of at least a dozen short stories, and it creeps into the novels, too. It seems almost as though machines, evolving rapidly towards a kind of mimetic humanity, are meeting humans on the way down.

People do of course escape the process of robotization, and one escape route is madness, another recurring theme. Most of the stories in *Keep the Giraffe Burning* seem to deal with mad people (as well as bad, sad, and silly people) and how they succeed at their madness. As the title indicates, these stories are steeped in Surrealism; they are meant to blur the border between dream and reality.

That border is blurred by science fiction all the time. Science fiction, it seems to me, constitutes the right brain hemisphere of contemporary fiction (the dreaming part). My work, if it isn't buried in the hypothalamus or the hippocampus or something, is probably somewhere near the lobotomy scars.

\* \* \*

John Sladek's literary accomplishment since his start as an expatriate American with the British New Wave in the late 1960's has been steady, significant, and generally not adequately appreciated in the genre though his conventions and effects are firmly in the science fiction tradition. But since he

experiments with a variety of narrative modes (usually within the same fiction) and often dazzles his reader with complexity of tone and allusion, he is often set aside as a rather non-science-fictional satirist and a writer who is most brilliant in his short pieces. He does pun continuously and wonderfully; writes the one-liner of bitter disgust as well as any black humorist; and creates the short, surreal image with the energy of Robert Coover or Richard Brautigan or his fellow Iowa expatriate Thomas M. Disch, whom he often names in his fictions and with whom he has collaborated. Sladek should not be categorized as a black humorist, however, or simply as a mainstream writer of experimental fiction.

His most ambitious novel to date, *The Müller-Fokker Effect*, with the defiant pun in the title is an early example of deconstruction, satiric disgust, and yet wonderfully modern intricacy in which sympathy for disembodied intelligence, artificial intelligence run wild, replaces usual characterization. The financial tycoon who eventually reassembles the technical writer and later author of *The American Book of the Dead* who has been deconstructed on four "M-F tapes" is named Mac Hines, or "machines." What Sladek's punning supports is a sustained program of speculation about the interfaces between mind and machine. This theme was also introduced in his first novel and most recently has reached another full expression in his robot novels, the two volume "education" of Roderick Wood (the little robot who is a Tin Woodman with a heart) and the story of Tik-Tok, who is the violent obverse of Roderick.

In other words, Sladek's treatment of the mind/machine theme may be not only stylistically too experimental for the American SF market but also too divergent from Asimov's. Actually from his early parody of "Iclick as-i-move" that first appeared in *The Steam-Driven Boy* through incisive analysis in the Roderick texts to the ultimate violation of the Three Laws in *Tik-Tok*, Sladek has carried on a running debate with Asimov and with over-simplifications in thinking about machine intelligence. One might conclude that for Sladek Asimov is the Whig progressive, the hopeful journalist of the new science and of our new inflationary universe whereas Sladek sees himself as the Tory Swift for whom the human animal and progressive technology (the media are a main target for his satire) have become disgusting Yahoo thoughts. He does show continually real sympathy for "other" intelligence. The sympathy, then, brings him back to hard science fiction so that his readers learn and do not just experience Tory disgust. Realizing with Shakespeare in *The Winter's Tale* that no art changes nature unless "the art itself is nature," Sladek at his science fiction best speculates about the nature of things and the position of man and machines in nature—closer, in fact, to Asimov than to black humor.

\* \* \*

The magazine *TV Guide* once called Henry Slesar "the writer with the largest audience in America." This accolade, whether true or not, was due primarily to the fact that Slesar spent nine years as head writer for the daytime TV serial *The Edge of Night*, and also wrote 100 teleplays for *Alfred Hitchcock Presents* and other dramatic TV series, as well as plays for CBS Radio Mystery Theater. Most of Slesar's work in science fiction has been in the short story form. (His only SF novel is a version of the film *Twenty Million Miles to Earth*, not published in hardcover, although the suspense novel *The Bridge of Lions* may be considered borderline science fiction.) About 20 of his stories have been anthologized, most notably such excellent and provocative short-stories as "Examination Day," "The Jam," "After" (four post-apocalyptic vignettes), and "Victory Parade." The best of Slesar's work is not only entertaining but offers quite horrifying statements on human folly and cruelty ("Examination Day"). Clever O. Henry-type surprise endings are also used to good advantage, as they are in his mystery short stories.

—Bill Pronzini

**SLOANE, William M(illigan, III)**. Also wrote as William Milligan. American. Born in Plymouth, Massachusetts, 15 August 1906. \* \* \*

William M. Sloane had an extremely brief career as a science-fiction writer, completing two novels and a single short story, but those two novels have probably won him a permanent place in the history of the genre. He blended science and horror with consummate skill, and his calm, smooth-paced novels are more successful at developing suspense and tension than most of the lurid thrillers that reach the bestseller lists.

*To Walk the Night* utilizes a plot device so standard, so familiar, that it has long since become a cliché avoided even by the less inventive film makers, but in the hands of a writer with Sloane's talent it is transformed into an entirely new vehicle.

Two young men make a surprise visit to an old friend, and arrive just in time to see his body mysteriously incinerated as if from within. Although they are unable to explain the peculiar nature of his death, they are freed by the authorities. But one of them has become infatuated with the unexpected widow of his late friend. The perceptive reader will realize fairly soon that the mysterious death resulted from the scientist's researches into the nature of reality. Sloane leaves myriad hints of other oddities as well, the widow's awkwardness in familiar human situations, the disappearance of a young girl with virtually no intelligence, the mystery of yet another death, this time clearly suicide. Despite the fact that the reader has a clear idea what comprises the general nature of the mystery, the details provide the true suspense, and the climactic confrontation is one of the most effective scenes in the genre.

*The Edge of Running Water* broke no new ground either, and moves even further toward the supernatural, while still retaining the scientific rationale of its mystery. Although the characters are not as well drawn in this story of a man convinced he can develop a machine that will enable him to communicate with the dead, the element of suspense is just as expertly handled. There is little overt action, even though one character is eventually killed and another destroyed, propelled into another universe, but the reader's attention is unlikely to waver despite this fact.

Both novels have been published as mysteries, which they are, as horror stories, which they are, and science fiction, which they also are. Sloane's sole foray into more conventional science fiction, "Let Nothing You Dismay," is singularly unremarkable, a pedestrian examination of human refugees adjusting to a new world after the death of Earth. He was at his best at greater length, using a familiar setting and coloring it with a series of hints of something totally unfamiliar. His style was highly advanced for his time, and both novels are free of archaic anomalies and outdated prose. It seems clear that had Sloane chosen to pursue his career as a genre writer, he would have become one of the dominant forces within it.

\* \* \*

Clark Ashton Smith was a contributor to the early science-fiction and fantasy pulp magazines whose output, despite its unevenness, became a seminal influence on modern science

fiction. Jack Vance, Harlan Ellison, Theodore Sturgeon, Fritz Leiber, H. P. Lovecraft, Robert E. Howard, and Ray Bradbury, among others, were influenced by his work.

Smith's earliest short stories—he wrote no novels—are the primitive interplanetary narratives common in the pulp magazines. Of these, "Marooned in Andromeda" and "The Amazing Planet" are typical. They recount the adventures of the crew of the space ship *Alcoyne* on distant worlds, and are odysseys of perilous adventure distinguished only by Smith's exotic language and bizarre imagination.

Smith, also a poet, was concerned mainly with the poetry of death and the alien. His protagonists are decidedly unheroic, being either misfits or rogues who seek other worlds because they do not fit into their own. In "The Monster of the Prophecy" the suicidal poet Theophilus Alvor agreeably becomes the instrument through which the Antarean wizard Vizaphmal assumes control of his world. This lack of virtue does not prevent Alvor from finding true love in the arms of an Antarean woman. Similarly, the renegade and thief Datu Buang lives out his life in peace after assassinating an evil ruler with the aid of his consort in "As It Is Written."

The search for a better reality is the predominant theme in Smith. In his haunting classic, "The City of the Singing Flame," the author Giles Angarth discovers the gateway to another dimension where the Singing Flame lures the unwary into its fires. Angarth finds himself finally drawn to the flame and discovers it is the entrance to still another, better, reality beyond.

Those stories set wholly on other worlds, in which he gives his poetic vision free rein, are considered Smith's best. Among these are the sardonic tales of the world of Xiccarph and those set on the continent of Zothique in the last days of Earth. In "The Maze of Maal Dweb" the hunter Tiglari seeks his kidnapped lover in the stronghold of Xiccarph's tyrant, Maal Dweb, but falls victim to the tyrant's powers. Maal Dweb, on the other hand, is the protagonist of "The Flower-Women." It is a peculiarity of Smith's fiction that the amoral flourish and the good become the victims of ironic fates. Like Tiglari, the hero of "The Demon of the Flower" ultimately fails to rescue the woman he loves from the plant ruler of his world. The tales of Zothique, although set in Earth's distant future, are closer to fantasy. In these Smith's macabre poetic vision is at its highest. "Xeethra" is a poignant story of a goat-herd who partakes of strange fruit and imagines himself the ruler of a distant land. He goes in search of that land, only to find it in ruins. "The Last Hieroglyph" is an ironic tale of an astrologer, Nushain, who reads in the stars that he must go on a journey which will fulfill his destiny. At the voyage's end, he meets his end. "The Weaver in the Vault" relates the weird doom of two individuals who desecrate a tomb. Hope and futility are expertly balanced in "The Isle of the Torturers."

Despite the weird trappings of his stories, Smith's work cannot be rightfully labeled as horror stories. He was a fatalist who delighted in spinning phantasms, not terror. With rare exceptions ("Master of the Asteroid" and "The Dweller in the Gulf"), his work is too remote from reality to evoke a convincing mood of horror and his imaginings thus fascinate instead of terrify. The power of Smith's writing, and the reason for its widespread influence, lay in the fact that Smith shared with many of his protagonists a yearning for a reality *truer* than the one he knew, and he discovered a language which enabled him to express his unique vision.

—Will Murray

**SMITH, Cordwainer.** Pseudonym for Paul Myron Anthony Linebarger; also wrote as Felix C. Forrest; Carmichael Smith. American. Born in Milwaukee, Wisconsin, 11 July 1913. Educated at schools in Honolulu, Shanghai, and Baden Baden; University of Nanking, 1930; North China Union Language School, 1931; George Washington University, Washington, D. C., A. B. 1933 (Phi Beta Kappa); Oxford University, 1933; American University, Washington, D. C., 1934; University of Chicago, 1935; John Hopkins University, Baltimore, M. A. 1935; Ph. D. 1936; University of Michigan, Ann Arbor, 1937, 1939; Washington School of Psychiatry, certificate in psychiatry 1955; Universidad Interamericana, 1959-60. Served in the United States Army Intelligence Service, 1942-66; helped found Office of War Information, served in Chungking, 1942-46, and as consultant to British Forces in Malaya, 1950, and to 8th Army, Korea, 1950-52; Lieutenant Colonel. Married 1) Margaret Snow in 1936 (divorced, 1949), two daughters; 2) Genevieve Cecilia Collins in 1950. Instructor, Harvard University, Cambridge, Massachusetts, 1936-37; Instructor, then Associate Professor, Duke University, Durham, North Carolina, 1937-46; Professor of Asiatic Politics, Johns Hopkins University School of Advanced International Studies, Washington, D. C., 1946-66. Visiting Professor, University of Pennsylvania, Philadelphia, 1955-56, and Australian National University, Canberra, 1957. President, American Peace Society. *Died 6 August 1966.*

\* \* \*

Paul Linebarger, who wrote science fiction under the name Cordwainer Smith, certainly stands as one of the most unusual and imaginative writers of fantastic literature of this century. Though his total output of fiction is relatively small, Smith's reputation and influence have grown consistently since his death in 1966. Virtually his entire science fiction output was in print in book form by early 1979, and the theme that ties most of these stories together—a future galactic civilization called the Instrumentality of Mankind—has emerged as one of the most striking and detailed future history constructs in all of science fiction. His non-science-fiction novels *Ria* and *Carola* also reveal the strength of imagination, idiosyncratic style, and sensitivity to character that make his better-known work stand out.

Smith was a Christian, a romantic, and a shrewd political theorist who had written under his own name an internationally influential text on psychological warfare. All of these strains come together in his fiction, giving it a complexity and depth of meaning that are sometimes confusing to readers encountering one of his stories for the first time. The first of his mature stories to be published (his first science-fiction story, "War No. 81-Q," had appeared when he was only 15), "Scanners Live in Vain," appeared in 1950, and clearly implied a more detailed imaginary universe than the story itself explained. Set early in the history of the Instrumentality, the tale concerns a threat posed to the guild of "scanners"—humans mechanically restructured to survive in space—by the discovery of a new and safer means of space travel. In a characteristically bizarre Smith touch, the new method depends on lining the spaceships with oysters to insulate the passengers from harm. Clearly, this odd version of a technological breakthrough represented an event of historical importance to this future world, but the nature of that world itself remained unclear.

During the next decade and a half, Smith gradually filled in some of the gaps. Following a series of disastrous wars that nearly reduced Earth to barbarism, humanity gradually recovers its vitality, aided by a powerful family called the Vomacts, descended from the daughters of a Nazi scientist who were placed in suspended animation in orbit and who returned following the wars ("Mark Elf" and "The Queen of the Afternoon"). The Vomacts help give rise to the universal government called the Instrumentality, which initially explores space with the aid of scanners, briefly replaces these with the oyster-shell ships, and in turn replaces these with ships powered by massive photonic sails ("The Lady Who Sailed *The Soul*,"

"Think Blue, Count Two"). Finally, a near-instantaneous form of space travel, called planoforming, is discovered ("The Colonel Came Back from the Nothing-at-All," "The Burning of the Brain"), but planoforming ships are subject to attacks by hideous, incorporeal outer-space "dragons" and must be protected by telepathic technicians called pinlighters, sometimes assisted by telepathic cats ("The Game of Rat and Dragon"). As the Instrumentality grows increasingly powerful and decadent—offering humans near-immortality through a life-extending drug called stroon—its economy comes to depend on a slave class of converted animals called underpeople. Aided by a few heroic underpeople and the sympathetic Jestocost family, the underpeople finally attain civil rights ("The Dead Lady of Clown Town," "Under Old Earth," "The Ballad of Lost C'Mell"), and a renaissance of humanism, the Rediscovery of Man, set in ("Alpha Ralpa Boulevard," *Norstrilia*). In the far distant future, civilization finally seems to be achieving some kind of stability (*Quest of the Three Worlds*), but the actual conclusion of the history of the Instrumentality, if planned by Smith, was not completed during his lifetime.

Although there is an abundance of political and social satire in Smith's work—the Instrumentality is clearly not a simple utopia—what stands out most are the memorable characters of near-mythic proportions, the romantic legends he weaves, and the oddly nostalgic style, reminiscent of oral history or folktales, in which he writes. Smith has a unique ability to make a romance between a man and a cat convincing ("The Game of Rat and Dragon") or to make an unconsummated romance between a servant girl and a lord as powerful as a medieval legend ("The Ballad of Lost C'Mell"). Occasionally, he turns to actual legends for his source material; "The Dead Lady of Clown Town" is a retelling of the Joan of Arc legend, with Joan made into an underperson converted from a dog. In other cases, he turns to literary culture for his sources; "Drunkboat" is essentially a tour de force on themes from Arthur Rimbaud. "Golden the Ship Was—Oh! Oh! Oh!" is at once a satire on the bureaucracy of war and a retelling of the Trojan horse story—with the horse becoming a 90-million-mile-long decoy spaceship used to frighten an enemy while the second-level bureaucrats drop poisonous bombs. Other of his stories are supposedly based on Chinese narrative techniques, and occasionally he deliberately plays games with the reader, such as working anagrammatic references to the Kennedy-Oswald assassinations into *Quest of the Three Worlds*.

One wonders, at times, whether Smith's curious style and unusual way of structuring stories is due to his great sophistication or to his ingenuousness as a writer. *Norstrilia* does not stand up as well as do many of the short stories, partly because the narrative tends to ramble, partly because the style seems to grow self-conscious over such an extended narrative. But Smith's short fiction includes some of science fiction's finest stories, but demonstrates that an author need not abandon sensitive insights into love and ethics in order to create imaginary universes of great imagination.

Critical Study: *The Universes of E. E. Smith* by Ron Ellick and Bill Evans, Chicago, Advent, 1966.

\* \* \*

It is difficult if not impossible to overestimate the impact of E. E. "Doc" Smith on 20th-century science fiction. He developed and perfected the space opera, a form which had existed only in a rudimentary state prior to his work. As one of the two major forms of "pulp" science fiction, space opera should be distinguished from interplanetary romance. The latter, with strong roots in 19th-century works, was perfected about 1912 by Edgar Rice Burroughs, and continued in later years by innumerable others of whom the greatest was probably Leigh Brackett. In interplanetary romance an adventurer is transported rapidly by any convenient means to an alien planet. This planet is generally primitive, inhabited by non-technological societies, and in these societies the adventurer rises by means of derring-do not very different from those described in the works of Rafael Sabatini. The space opera, in contrast, involves the clash of two or more technologically advanced societies. The protagonist society is normally human; the antagonist may be human or otherwise. Major segments of the action take place in outer space, usually in spaceships or fleets of spaceships quite comparable to 20th-century navies. A frequent sub-theme of space opera is the interplanetary or interstellar alliance of wildly differing intelligent species.

Precursors of space opera may be found in works of the late 19th and early 20th centuries. Smith's contemporary Edmond Hamilton actually preceded Smith into print with relevant works, starting with *Across Space*, serialized in *Weird Tales* from September 1926. However, with the appearance of Smith's *The Skylark of Space* in *Amazing Stories* in 1928, Smith achieved pre-eminence in the field and never was surpassed. (Smith actually began the novel in 1915 and completed it in 1919.) A secondary point concerns the role of Mrs. Lee Hawkins Garby in the writing of the book. It is widely known that Smith asked Mrs. Garby to assist him with "the love interest." The usually perceptive critic Paul A. Carter infers from this that "so incidental was the heroine to the plot that the author himself need pay no attention to her!" Carter quite misinterprets Smith's motive: Smith was concerned that he might delineate his heroine and "the love interest" inadequately, and sought assistance in doing a proper job. (The result was still thoroughly stilted and unsatisfying, and in later works Smith omitted the collaboration. With passing years, Smith's delineation of character—regardless of gender—improved substantially, but neither characterization nor dialogue nor "the love interest" was ever his strongest suit.)

Once Smith was established, numerous others wrote within the arena he had created. The two who did so most effectively were Hamilton and Jack Williamson. Clifford Simak, in *Cosmic Engineers*, produced a single, brilliant space opera. John W. Campbell, Jr., before switching his energies from authorship to editing, also wrote a number of such works. More recently the film *Star Wars* has been classed by many viewers as the "purest"

space opera yet produced in dramatic form. The bulk of Smith's works falls into two series. The *Skylark* series runs to four volumes. It opens with a thoroughly familiar love triangle, the rival suitors being the noble, brilliant Richard Seaton and the villainous, brilliant "Blacky" DuQuesne. When Seaton invents an atomic-powered spaceship, he and DuQuesne proceed to battle on an ever-growing canvas for the favor of the lovely and accomplished Dorothy Vaneman. Upon this rudimentary framework, Smith built the most audacious and energetic series of super-scientific adventures—often harking back to the geographic wonder-tales of Verne—written up to that time.

But Smith's *Lensman* cycle exceeded even the *Skylark* series in scope, audacity, and power. They represent space opera at its very peak of development; the two central volumes of the series, *Galactic Patrol* and *Gray Lensman*, certainly embody both the greatest virtues and the greatest faults of the space-opera form. These novels are based on the premise that a cosmic struggle is taking place, between the Arisians, godlike protectors of the galaxy, and the Eddorians, satanic invaders and destroyers from another galaxy. The epic spans eons of time and inconceivable volumes of space, in the tradition of the works of Olaf Stapledon. Its central phase involves a family saga, the most notable character being Kimball Kinnison, Smith's supreme hero. In sequence after sequence, seemingly cosmic struggles between the two great forces are seen to be merely local incidents in the titanic war which only Smith fully knows. The *Lensman* are a cosmic "elite corps" of the forces of Arisia; as such they are carefully selected individuals of the highest intellectual, physical, and moral perfection. Each receives, as badge of membership in this corps, a lens which not only identifies its owner but amplifies that owner's outstanding abilities into the superhuman range. Smith's advocates have suggested that the struggle between Arisia and Eddore, if it is to be read as more than a grand but literal-minded adventure, may be considered a sort of Juedo-Christian allegory, with the Arisians representing the forces of Heaven and the Eddorians the Adversary. In this regard, congruences are obvious between the series and Tolkien's *Lord of the Rings*. Both cycles, in this aspect, are further comparable to Wagner's great operatic cycle. On the other hand, Smith's critics have pointed out that the elitism, the (at least implicit) racism, the ruthlessness, and the authoritarianism involved in *Lens* philosophy make the works more Nazi-like than Biblical in theme.

In addition to his two major series, Smith wrote a number of other works. *Spacehounds of IPC* is a charming retelling of the babes-in-the-woods story, with boy and girl castaway on an alien planet. *The Galaxy Primes* is an unsuccessful attempt to write a more modern novel with psionic themes. *Subspace Explorers* is a very readable volume intended as the first of three in a final series. The other two volumes never appeared but it is believed that Smith had completed at least a draft of the second before his death.

Smith was the very paradigm of the great "primitive" novelist, perhaps comparable to Grandma Moses in painting. Where the formal or academic novelist may be judged on the basis of subtlety of characterization, polish of style, complexity of plot, ambiguity of theme—and, in the case of the science-fiction writer, detail, plausibility, and accuracy of scientific background—the primitive novelist is subject to a quite different set of criteria—*vividness* rather than subtlety of characterization, *dynamism* rather than polish of style, *power* rather than complexity of plot, and *directness* rather than ambiguity of theme. In the case of the science-fiction writer in particular, the primitive may be judged by the audacity, emotional and structural effect of any scientific postulate not

obviously absurd. By these criteria, Smith was the absolute champion of his realm.

—Richard A. Lupoff

\* \* \*

Although Evelyn E. Smith's individual works of SF vary greatly in style, mood, and focus, it is possible to characterize her work as making a wry statement about human nature. Here is an author who is optimistic in spite of herself; even in those works

which focus on post-nuclear holocaust worlds, humanity has survived and—whether or not its representatives are honorable or otherwise admirable—they do possess the ability to meet wild challenges and to survive their own foibles.

Smith's comments on human nature range from sharp and ironical to light and ludicrous. Her first story, "The Last of the Spode," is a terse portrayal of three Britishers who, by a twist of fate, seem to be the sole survivors of nuclear holocaust. A "correct" professor and a young chap join a figure of British womanhood in an afternoon tea at the end of the world. As the Spode teapot is poured out, they reveal their chief concern as to whether or not their tea supply will last them to the end of their days. "No point in anything, really," the young chap remarks. "We must face the facts, lad," the professor says and then adds, in a gem of understatement, "pity about the Bodleian, though." "The Hardest Bargain" envisions another post-holocaust future, in which the American populace is weakened with hunger and racial debility. Presidential advisor Dr. Livingston, who believes that "the thinking man is the despairing man," urges President Buchbinder to accept extraterrestrial aid in decontaminating the lands, but when the earthlings fail to keep their bargain to pay the extraterrestrial Foma in famous works of art, the Foma reveals his true identity as a pied piper to the robots which are so desperately needed by human society. "Not Fit for Children" is representative of Smith's more lighthearted stories. Here a group of alien children pose as war-dancing "natives" on an asteroid-like space chip which is visited regularly by human tourists. In payment for their antics, the children receive coins which are melted down by their disbelieving elders into metal which is needed to repair their space ship.

Most of Smith's short stories appeared during the 1950's; just as they varied in seriousness of theme as well as sophistication of writing technique, her novels represent the extremes of the author's abilities. *The Perfect Planet* shares the wry ironic tone of so many of her shorter works, as the author tells an amusing but insubstantial tale of two astronauts, one male and one female, who land on a planet populated by vain health enthusiasts who foist their obsession with slim, perfect physiques upon the slightly pudgy, space-weary duo. While the book does have some impact as a critique of mindless conformity, sadly the astronauts, who start out as rebellious to the ways of this world, come to have a fondness for the pampered inhabitants of "the perfumed planet." The initially gutsy female astronaut Moodie comes to value herself as an alluring female using charm, artifice, and cosmetics to enhance her self-worth while the captain learns to be protective of his changed space partner. *Unpopular Planet* is also preoccupied with questions of sexual identity. While it, too, features some portrayals of women which would not please feminists—the hero's partner is a female who is fully mature sexually although mentally and chronologically she is but three years old—such characterization is used with more sophisticated satirical purpose. An aspiring musician, Nicholas Piggot, careens perplexedly yet enthusiastically through a series of picaresque adventures observed by blue dragons. They turn out not to be the result of drunken fancy but to be "real" beings from another dimension who have a particular genetic purpose in store for the hero, who rises from life as an unknown in subterranean Manhattan to become father of a new future.

George H. Smith comments:

(1981) Science fiction was my first love in writing, and I've done it off and on for the last 25 years. Five of my novels are set in the imaginary Celtic other world called Annwn. I am currently committed to a series of historical novels so it will be some time before I get back to science fiction, but when I do I hope to continue the Annwn series.

\* \* \*

The career of George H. Smith as a writer of science fiction is a peculiar one. Since most of his early novels were written for small paperback houses specializing in lurid action and violent sex, there is a certain crudity about them that masks his positive values as a writer. It was not until the 1970's that Smith began to sell novels to the more prestigious paperback houses, and the quality of his novels seems to have improved proportionately.

The early novels made use of a standard set of characters. The typical male protagonist was an indecisive man who had some insight into the future and realized that a significant change was coming to the world, but who was unable to communicate this to those around him. Typically, he spends the first half of each novel infatuated with a woman obviously unsuited for him, gradually awakening to the fact that some third character is actually the person with whom he wishes to spend his life. This is the pattern of *The Coming of the Rats*, for example; the hero finally convinces his totally impractical girlfriend to accompany him to a remote cave as nuclear war hovers just over the horizon. In the aftermath, the rats of the title challenge man for supremacy with predictable results. The pattern repeats itself in *Doomsday Wing*, also about a nuclear war, this time threatening to extinguish all life on Earth, and *The Unending Night*, wherein runaway nuclear reactors knock Mars out of its orbit, and threaten to pull our own planet away from the warmth of the sun. In the former the dedicated military man cannot convince his ambitious wife of the importance of serving his country, and in the latter a hyper-liberated woman is convinced that the best thing that can happen to the human race is for it to descend to a primitive culture. The scientist hero of the latter is thoroughly enamored of her until she proves insane. This basic arrangement of characters also appears in *The Four Day Weekend*, involving a plot by secret aliens to take over the world by reprogramming the computers that direct our motor vehicles. Although there is some amusing satire here, it is rather silly most of the time, possibly the worst of Smith's novels.

Surprisingly enough, one of his better novels was published by a softcore pornography publisher. *1976: Year of Terror* is set in a future America in which the Libertarian Party has seized power by assassination and clever plotting by the head of the Federal Security Police. Opposed to him is a secret agent intent on finding the missing Vice-President and restoring democratic rule to the country. This anticipates a number of thrillers along similar lines, and is fairly well written.

Somewhere along the line, Smith became interested in mythology and druidism. It crops up first in *Druid's World*, a fairly dull novel, then to much better effect in *Witch Queen of Lochlann*, written in the mode of the stories made famous by *Unknown* magazine. Duffus January is a magician of sorts who undertakes to restore the rightful queen to the throne of Lochlann, a Welsh alternate world where magic works. A low-key sword and sorcery tale, this seems to have set the stage for a major series of novels. *Kar Kaballa* is named for the king of the Gogs, a barbaric nation of nomads whose existence is barely noted by their neighbors, the civilized inhabitants of Avalon, a nation comparable to 19th-century England in our universe.

Dylan MacBride, a young adventurer, is convinced that the imminent freezing of the channel between Avalon and the northern regions will result in a massive invasion, but he is unable to convince anyone in authority of the seriousness of the threat. Despondent, he seems doomed to failure when he encounters a man from our own universe who plans to sell Gatling guns to the alternate world. Smith went on to chronicle the Martian invasion of his alternate world in *The Second War of the Worlds*, an entertaining novel throughout, and a magical plot to destroy civilization in *The Island Snatchers*, the weakest in the series. These latter books are far better than his earlier efforts, with more complex characters, a quieter and more careful style, and more significant care taken in establishing settings, mood, and suspense.

Although he has written shorter pieces, Smith's only interesting story is "In the Imagon," an enigmatic piece about a machine that allows its user to create the mental world of his choosing. It seems unlikely that Smith will add to his reputation with short stories, but it is quite possible that his novels will continue to improve.

—Don D'Amassa

**SMITH, George O(liver).** American. Born in Chicago, Illinois, 9 April 1911. Attended the University of Chicago, 1929-30. Served as an editorial engineer, National Defense Research Council, 1944-45. Married 1) Helen Kunzler in 1936 (divorced, 1948), one daughter and one son; 2) Dona Louise Stebbins in 1949 (died, 1974), one son. Radio Serviceman, Chicago, 1932-35; radio engineer: General Household, 1935-38, Wells-Gardiner, 1938-40, Philco, 1940-42, 1946-51, Crosley, 1942-44; Manager, Emerson Radio components engineering, 1951-57; Analyst, ITT Defense Communications, 1959-74. \* \* \*

When one mentions "the golden age of science fiction," several stereotypes come to mind, including bug-eyed aliens who act like humans, humans who act like supermen, mysterious gadgets and even more mysterious ray guns. Fortunately, much of the science fiction written during this period did not employ such stereotypes. A few became classics. Many more, while certainly not classics, have to be considered as good, solid science fiction.

One such work is George O. Smith's *Highways in Hiding*. Although it might be classified as a science-fiction mystery, it moves fast enough and has enough action to keep your attention. In fact, it is difficult to put down. The characterizations are only adequate, but the plot is well thought out, involving psychic phenomena, a mysterious disease, and a baffling disappearance. There is a political message here, too, which is common in Smith's works: the fruits of science should be for all and not just the elite. *The Fourth "R"* is another Smith work which makes use of this underlying idea. This time it is the Holden Electromechanical Educator which promises to be mankind's salvation. However, Jimmy Holden's parents, who developed the device, are murdered by an unscrupulous business associate who wishes the device to further his own aims. Because Jimmy's parents had used the device on him, he is no ordinary five-year-old, but practically an adult trapped in a child's body, and his adventures protecting the device make a very clever work.

*Fire in the Heavens*, *Nomad*, *Hellflower*, and *Troubled Star* are less interesting. The first has a lot of science but not much plot: the sun is about to go nova and a young scientist who doesn't believe in the Law of Conservation of Energy or in neutrinos must save the day. The plot of *Hellflower* is a little worn, though suspenseful. Space pilot Farradyne crashes his ship, killing 33 people. He is banished to the Venusian fungus field until a federal agent gives him a chance to prove himself anew by becoming an undercover agent and helping to break the hellflower smuggling ring. *Troubled Star* may not have been intended as a tongue-in-cheek stab at 1950's science fiction, but I take it as such. Dusty Britton of the space patrol has so many TV followers that, when a group of aliens plan to make Sol into a three-day variable beacon, they approach Dusty to be their spokesman. In *Nomad* humans are made out to be monsters who use sub-science life forms for vivisections and who annihilate the "10th" planet of the solar system with little provocation. It is a particularly frightening projection of the future of mankind.

No discussion of Smith's works would be complete without mentioning *Venus Equilateral*. Venus Equilateral Relay Station is a manned satellite circling the sun at the orbit of Venus, but 60 degrees ahead of that planet. Its purpose is to relay radio transmissions among the inhabited planets whenever the sun interferes with direct transmission. The stories mostly concern technical problems and their solution by the station's scientists. Most of the problems are archaic by today's standards, but the stories are of interest, at least from a historical perspective. Many of the stereotypes of golden age science fiction are found here.

\* \* \*

The stories of the North American Confederation are a product of the Libertarian movement which in recent years has sprung up to question the idea that increased government power is the answer to anything. It was once summed up as "How to hate your government on principle." L. Neil Smith's stories are, like those of F. Paul Wilson and J. Neil Schulmann, openly propagandising for this movement which claims a great deal of support from the more individualist wing of science-fiction. In calling them propaganda I imply no necessary criticism although as I indicate below I feel their political viewpoint may make for one major flaw in the series.

All the stories follow much the same pattern: a naive but basically decent individual is gradually introduced to the world view of Libertarianism, the idea that aggression is wrong no matter for what cause and that the State is organized aggression. (This gives the stories a built-in excuse for explaining to the newcomer What Is Going On And Why.) The Confederacy is a world in which Government has been gradually abolished over the past 200 years, starting with the execution of George Washington during the Whiskey Rebellion, and the stories find their villains (who tend to be smooth sophists with sado-masochistic tendencies) from the Hamiltonians, who are trying to reestablish Death and Taxes. As the central character sees a stateless world in action he comes to question the values of his own world and eventually comes round to identify with the forces of Anarchy (wearing the white hats).

Much of the fun comes, as with all parallel-world stories, from the distorting mirror it holds up to our own world. Most vivid in my memory are John Wayne (who in the confederacy never abandoned his real name) going off to shoot a space opera in the Asteroids ("Only thing th' people wanna see, these . . . days. Feels downright silly 'thout a . . . horse under me") and Senator Proxmire as a science-fiction writer. In fact Smith takes a great delight in placing politicians in the shady or menial roles

he feels they would occupy in an ideal world, like Dante assigning his enemies a precise place in hell.

Another strength lies in the creation of eccentric minor characters to contrast with the more staid heroes. For some reason his non-humans (although he never tries to make them truly alien in their thinking) are the most entertaining; I think especially of Mr. Meep, the chimpanzee restaurateur ("Our Food Untouched By Human Hands") and "Georgie" the computer/ship/mistress of the hero in *The Nagasaki Victor* ("The Ship Who What?"). One thing you can count on with Smith, he will never resist the temptation to make a silly joke or wisecrack.

The major faults of the series are two: firstly a love of "in jokes" and obscure references, either to the lore of science fiction or to Libertarian political writings. A certain amount of this is tolerable, even fun but by *Tom Paine Maru* it has turned into a incestuous reference back to the earlier novels which must be irritating to those coming to the later work first. The second fault is the determinedly upbeat nature of the stories which prevents them from achieving any emotional depth. Libertarianism is an optimistic philosophy, rejecting as sickness the idea that suffering is necessary to the human condition. But Smith seems to be prevented by this from showing suffering by his major characters who though they have to make choices never have to pay prices. At the end of *Tom Paine Maru* he dangles before us the possibility of the heroine's death only to say a moment later "Yah, fooled you! I didn't really mean it." That such childishness is not a necessary characteristic of Libertarian writers may be seen by contrasting Smith with J. Neil Schulmann's *The Rainbow Cadenza*.

Jerry Sohl comments:

The corpus of my science-fiction work reflects, I believe, rather accurately what was fashionable in the genre from 1950 to 1970, moving from gimmick as story to people as story. Although superior to what it was prior to 1970, today's science fiction is often too abstruse to be understood.

While I continue to write science fiction now and then, my interest has shifted to mainstream and I am at the moment at work on a super-suspense novel entitled *The Pacem Complex* as well as novels I can only describe as *avant-garde*, one entitled *Mortal Coils* and the other *The Gold Triskelion*.

\* \* \*

Like many fans-turned-writers, Jerry Sohl reveals an appreciative understanding of the surface structures of science-fiction narratives but often fails at deeper levels of conceptualization and extrapolation. Although Sohl has contributed little of originality to the genre, he is in many ways a representative popular writer of the 1950's, skilled in generating an initial sense of mystery and wonder, but often confusing or even absurd in his resolutions.

Most of his novels and stories deal with familiar science-fiction themes. *The Transcendent Man*, for example, borrows a premise from Charles Fort via earlier treatments by Eric Frank Russel, L. Ron Hubbard, and others: the idea that humanity's intelligence and civilization are the creations of a vastly superior race of invisible aliens who feed off the emotional energy generated by catastrophes such as war and plagues. Although these aliens, called the Capellans in this novel, might serve as an interesting metaphor for the paradoxical quality in human nature that somehow accounts for both creative and destructive impulses, Sohl develops the story into little more than an adventure narrative concerning one supernatural human who discovers the alien secret and, in the end, singlehandedly takes on the task of maintaining civilization. *Point Ultimate*, Sohl's contribution to the literature of dystopia, concerns a world conquered by communists who seem to come right out of the nightmares of Joe McCarthy, and quickly descends into a welter of germ warfare, gypsies, underground railways, and secret Martian colonies. *The Altered Ego* involves the somewhat more intriguing notion of a society which has learned how to resurrect important citizens after death, but soon becomes a familiar tale of chases and conspiracies.

Sohl's more successful novels are those in which the science-fiction element is kept fairly simple or relegated to the background. *The Time Dissolver* is an intriguing amnesia mystery for most of its length, with the protagonist and his wife awaking one morning to find that their memories from 1946 to 1957 have disappeared—and that, consequently, they do not even know each other. The carefully wrought details of the investigation into the missing years of their lives provide a suspenseful narrative, and the rather weak explanation concerning a memory-dissolving machine does not interfere greatly with the overall impact of the novel. *Costigan's Needle*, an exploration of the parallel-universe theme, is perhaps Sohl's

best novel: an account of a group of people who pass into a parallel world through a needle-shaped machine invented by a Chicago scientist, only to find themselves trapped in the other world and forced to spend years redesigning the technology that will enable them to build another machine (which, it turns out, will only enable them to enter another of an apparently infinite series of parallel worlds). Understandably, the people choose not to abandon this new world that they have created with their own hands. Although the characters in the novel are a familiar assortment of popular fiction stereotypes, the exploration of the problems inherent in trying to recreate a sophisticated technology from raw materials is well-handled.

Sohl has had relatively little influence on the genre, although one of his novels, *Night Slaves*—concerning a community dominated by alien visitors—provided the basis for a television movie. A writer with undeniable skill in constructing suspenseful situations, and one who enjoyed some popularity during the 1950's, his works in retrospect seem weakened by inadequate conceptualization of the scientific and social ideas he dealt with.

Bibliography: *Le Livre d'Or de Norman Spinrad* by Patrice Duvic, Paris, Presses Pocket, n. d.

\* \* \*

Norman Spinrad's most original and insightful fiction emerges from his remarkable grasp of the potential impacts of the communication revolution on American ways of living, loving, and dying. He can create for us the archetypes and myths we need to understand the new electronic milieu which he sees overloading our senses and sensitivities, creating a "multi-valued, post Age-of-Reason reality." Spinrad helps us to imagine what we are becoming in the hands of the "media pros" and even what might happen if the "pros" had a case of conscience and a commitment to something more than improving the ratings.

In what remains his best novel, *Bug Jack Barron*, Spinrad creates the ultimate American TV hero, who, in the style of Joe

Pine, electronically extends his brand of kick-em-in-the-ass confrontation of the power structure into the tube minds and hearts of all the "losers" and "suckers" sitting in front of the glass teat. Barron is a latter day cousin of Robin Hood and Billy the Kid – the bad guy turned good cowboy; hating authority, power and civilization; riding to danger with his tube blazing; shooting it out verbally at OK TV studio; and walking into the fade out with his sexetary, after Sweet Sara, his good-hearted whore and first love has laid down her life for him and changed him from hired gun (or mouth) to public hero number one and president of the United States. It may be familiar, but it's the stuff of which democracy is made. Americans have to believe the good guy could save the damned town. Spinrad, in fact, accurately predicts Ronald Reagan's two terms as town savior, invents the format that has made Ted Koppel's *Nightline* a success, and prepares us for the recent poll that indicates a substantial percentage of the electorate think that Phil Donahue would make a fine president. His sense of the relationships between politics and the media is as accurate as it is frightening.

Similarly, in *A World Between* Spinrad's strongest writing and most effective imagining occur as he describes the media campaigns used to influence public opinion in a totally participatory electronic democracy. In *Riding the Torch*, a novella that is in the main a typical science-fiction confrontation between man and the uncaring universe, Spinrad's protagonist is an artist producing sensos, total recreations of experience. His task is to help mankind face the truth about having to live forever in space. Despite his own fears and doubts the artist achieves affirmation and hope. At least Spinrad himself is seeking to make such an affirmation.

Spinrad's hope that the electronic media can serve the common good, is not, however, mindless optimism, and four of his best short stories explore the manipulation that the media message can produce. "National Pastime" finds a TV producer inventing a modern gladiatorial version of football that capitalizes on race hatred, sexual intolerance and the national love of violence to win the ratings "wars." "Blackout" details the sheep-like response to an alien take-over created by stopping the flow of network news. "The Conspiracy," an interesting experiment in style, uses news-flash diction and headline typography to reveal and/or parody the growing sense of paranoia that leads many to a conspiratorial view of modern life. "The Big Flash" explores the possibilities of using a media-hyped rock group to sell the populace on the ultimate death trip, a thermo-nuclear flash. In each of these stories Spinrad is raising serious questions about the ethical vacuum that produces the wasteland we call the entertainment industry.

All of this is not to say that Spinrad has not written or imagined well in a multiplicity of other areas. In fact, with the exception of Burgess in *A Clockwork Orange*, no one writing speculative fiction has explored 20th-century manifestations of violence and sadism more thoroughly. *The Men in the Jungle* is an account of the crimes men and women commit in running revolutions to "free" or "save" one another and comes too close to the truths of living in Northern Ireland, Afghanistan, Lebanon, and Central America. In *The Iron Dream* Spinrad imagines an alternative past in which Adolf Hitler as a science-fiction writers gives us a novel bad enough to be pulp science-fiction, and which, unbelievably, in the real world was sold to Nazi Germany. His earlier novels, *The Salaris* and *Agent of Chaos*, reveal the same concern with the problems of government, power, individual freedom, and social responsibility found in the later work. A more recent novel, *The Void Captain's Tale*, returns to these themes turning them around a search for self and transcendence. The captain telling the tale

plays Ishmael to his female pilot's Ahab. Her quest for ultimate experience serves as the literal force driving their ship through space and time toward an unutterable union with the universe which is achieved through a kind of perpetual platform orgasm. A Moby-Dick indeed. Only a writer with Spinrad's talent can make all this even marginally believable, and his continuing experimentation with style, language, and point of view produces some fine moments in an interesting failure.

Spinrad's short stories are among the best of the past 20 years. *The Last Hurrah of the Golden Horde* contains stories published between 1963 and 1969. The works are tightly structured and contain flashes of brilliant characterization. As might be expected, several of the stories tend to be formulaic, but "Carcinoma Angels," "The Last of the Romans," "The Ersatz Ego," "It's a Bird! It's a Plane!," "The Entropic Gang Bang Caper," and the title story reveal a command of the form, an active sense of humor, and a whimsical imagination. In *No Direction Home* there is little that could be called conventional science fiction. In terms of topics, themes, and approaches we are in a universe that is Spinradian. The stories are highly crafted and the characters are well drawn; to use Spinrad's own distinction, the stories are "speculative fiction," a modern form that seeks to explore the "could-be-but-isn't." They cross whatever boundaries there are that define what Spinrad calls "science fiction as a commercial genre-cum-subculture." In *The Star-Spangled Future* Spinrad reprints several stories from his other collections with a series of annotations and essays that make clear the way in which he sees speculative fiction-science fiction as the literature of the American present. What the collection makes clear is that Norman Spinrad is a sensitive observer of his culture, a skilled craftsman of the short story, and one of the best writers of his generation. Let us hope that the failings of his last two novels are not signs that he is no longer able to avoid the problems of the "genre-cum-subculture" so clearly delineated in his essays and notes in *Modern Science Fiction*. *The Void Captain's Tale* ought to have been a better book than it is. It does not provide the intelligent criticisms and affirmations that characterize Spinrad's earlier work; unlike his best work it does little to help us understand and shape ourselves and our world.

## Steven Spruill comments:

My purpose in writing is primarily to entertain the reader and produce an emotional experience in the process. I believe people read in order to feel. Consequently, I consider it extremely important to write in the technical sense in such a way that the reader feels him or herself to be the viewpoint character, wanting what that character wants, fearing what he or she fears, and sensing along with the character. In the process or writing this way I feel it is quite important for the author to remain as nearly invisible as possible.

In addition, I prefer the extraordinary to the ordinary (which is all too readily available to us in real life) when I structure the plots of my novels. Consequently, most of my novels are concerned with the bizarre, the complicated, the strange, and the psychological, hopefully made clear through "simple" writing, and engaging through the hopes, needs, fears, and, in general, the emotional journey of the characters through their rather baroque plots and landscapes. I might sum up my position as a writer by naming the two other authors I most admire—Bob Shaw and Ken Follett.

\* \* \*

Reviewers have not been especially kind to Steven Spruill. His non-science-fiction novels were given bad reviews, and a pre-publication reviewer accurately suggested that his first science-fiction nove, *Keepers of the Gate*, was not only uninspired and routine but one that the reader could skip and not miss anything of significance. On the other hand, despite several less than enthusiastic reviews, his Elias Kane novels, *The Psychopath Plague* and *The Emperor Plot*, which bear a superficial resemblance to Asimov's Elijah Baley series, are well plotted, well written, and entertaining. Elias, a former Navy lieutenant, is highly intelligent, possessed of eidetic memory, and has spent years in various educational institutions studying, among other things, psychology, criminology, physics, and biology. A superman he is not, for he makes the kind of errors caused by human fallibility and emotion, a touch that obviously draws heavily on Spruill's background as clinical psychologist.

In *The Psychopath Plague* for some unknown reason people are being seized by a compulsion to maim or even kill anyone who happens to be nearby. The computers predict a rate of increase in outbreaks that will soon alter Earth society beyond reclamation. Despite the usual false clues and attempts to stop him that are common to such works, Elias, aided by the

Cephantine Pendrake, locates the source of the contamination, pinpoints the criminals, and wins his true love Elizabeth, the million-credit reward, and the gratitude of the Emperor, who rules Earth and the nine, sometimes rebellious, colonies.

In *The Emperor Plot* three years of happiness with Elizabeth end when Elias is summoned by the Emperor to head the investigation of an assassination plot. Unfortunately the assassin strikes first, Elizabeth dies saving Elias, and the Emperor, his body destroyed, is saved only because his personal physician, Martha Reik, quickly attaches his uninjured head to an advanced life support system. The extent of the real plot is uncovered only after a long series of harrowing experiences and sidetracks, during which Elias learns much about himself and humanity.

What lifts these novels from the ordinary is often at first reading almost unnoticeable. Thus, in *The Psychopath Plague* only further reflection shows parallels between a seemingly insignificant conversation about the difference between perception and reality, between the human being's belief that his or her thoughts can control behaviour and the view of all other intelligent creatures in the galaxy that this belief is irrational and that it is really environment, physical, mental, and emotional, that controls all behavior, including that of humanity. Since the attack on Earth is alien, partly physical and partly through the tremendous mental powers of the innocent-appearing invaders, it is a nice touch that this discussion is conducted with a friendly alien not yet identified as part of the problem.

In *The Emperor Plot* the significance of the demands of the bodiless head for a new body, for a way to experience the pleasure of eating, even the desire for a human touch on its forehead, is not at first obvious. Only later do certain questions arise: How would the Emperor deprived of all sensation accept the situation? What would be the effect on his behaviour? How does it affect his Ornyl bodyguard? An integral part of the solution is Elias's own experience of a temporary total sensory deprivation and his subsequent understanding of both self and the Ornyl.

Spruill's human characters are well developed and believable, their actions made plausible by the motivations established early on. He also has an inventive turn of mind where aliens are concerned, and some of his creations are most interesting: Pendrake, the Cephantine, is an orange-skinned giant of enormous strength from a species known for its inability to permit violence or death, empathetic with all plant and animal life, and respected as incapable of uttering a falsehood; his absolute loyalty to Elias who has gambled him out of slavery is a major ingredient in the successful investigations. The musal trees have overrun their planet with their roots and eliminated the fauna except for two species; they use one of these, the humanoid Krythians, to create technical devices and serve as bodyguards to the illusory, comical, penguin-like traders, the Chirpones, who actually carry out their plot. The Moitans, "fish-people," are an advanced technological civilization. The Ornyls, humanoid giant insects, are fierce warriors; their binding to their chosen masters is irrevocable and complete. In every case the behavior of these aliens is consistent with the internal psychology established for them when they first appear on the scene.

Spruill writes well, invents interesting plots, and uses his own technical knowledge effectively. He is a comparative newcomer to science fiction, but he appears to have a major career in the field awaiting him.

\* \* \*

Prolific in his reviews and criticism of science fiction, Brian M. Stableford is likely to be better remembered for them than for most of his fiction.

He writes genuine science-fiction novels, whole-heartedly adopting the conventions, devices, motifs, and themes that characterize space opera or galactic adventure. He adopts these elements with gusto, interweaving among them elements of modern detective, western, and mystery stories. What he does, he does well; a Stableford novel is always an interesting read, entertaining and engaging if not intellectually profound or thought-provoking. A biologist and sociologist by training, he uses his learning well to provide background material for his tales, but he does not seem to want to explore the ramifications of the social, biological, or ecological systems he is good at creating. Critics and reviewers generally agree that Stableford will raise important questions: he will query, for instance, the nature of Mankind and its place in the Universe, only to have his cynical central character utter a wise-acre crack that sidetracks the thought. It is true the sarcasm and cynicism ordinarily reflect his hero's hard-boiled nature, but the promise of a realistically drawn person considering significant relations of important human concerns never materializes, and the character remains a prop. Nonetheless, Stableford by impulse and by training seems to have more in him than he lets out in his fiction; this impression may very well indicate that he has an idea that the purpose of fiction is more to entertain than to philosophize. And this thesis seems to be borne out simply by the content, the volume, and the general excellence of his reviewing and criticism.

The general assertions made above are supported by a quick look at Stableford's major efforts in the novel. The earliest important novel was *Halcyon Drift*. One of the six "Swan" novels, it is formula science fiction. The main character, the cynical Grainger—a kind of hard-boiled space pilot—crashes or an out-of-the-way planet and before being rescued becomes symbiotic host to a benevolent parasite. The Earth he returns to is as morally empty as the social life of one of those detectives on whom Stableford seems to have modelled Grainger. Accepting a job to find a lost spaceship, Grainger experiences various adventures, finds the ship, and destroys its cargo in fidelity to a promise made to an old alien colleague who helped in the quest but who did not survive. Grainger thus satisfies a need to vent his anger at the injustice and stupidity of the human race. He escapes easily from various dangers and relaxes until another commission comes along. The story contains rich thematic possibilities for exploration: the degeneration of Earth-side institutions is hinted at, and the ship Grainger uses in his quest, the "Hooded Swan," is imaginatively conceived, as is the reaction of the jungle on the planet Hallsthammer to the presence of forms of life alien to it. But none of these and other interesting possibilities is developed or explored.

The same phenomenon occurs in the other five novels of this series and in the more recent works. For instance, the recent novel *Journey to the Center* features a hard-boiled hero of the Grainger type, and *The Gates of Eden* is a mystery story; both are ultimately judged unsuccessful by most critics. Although the premises are interesting and the backgrounds are well worked out, the stories seem finally too formulaic and appear to be hurried toward conclusion so that the deeper significance of the people and situations are left unexplored. As one reviewer pointed out, Stableford does not seem to want to take his art seriously. He is, consequently, among the best of the light adventure science fiction writers, and he brings to the genre an ease with the conventions of other popular literary genres such as the mystery and the western.

But his copious criticism and his reviews are not to be faulted.

To his criticism he brings a strong craftsman's awareness, and he bolsters this awareness with the sense of place and time he derives from his professional training as a sociologist.

**STALLMAN, Robert.** American. Born in 1930. *Died in August 1980.*

#### SCIENCE-FICTION PUBLICATIONS

Novels (series: *The Beast*)

The Book of the Beast:

1. *The Orphan*. New York, Pocket Books, 1980; London, Granada, 1981.
2. *The Captive*. New York, Pocket Books, 1981; London, Granada, 1982.
3. *The Beast*. New York, Pocket Books, 1982; as *The Book of the Beast*, London, Granada, 1982.

\* \* \*

Robert Stallman's exquisite fantasy novel *The Orphan* was published in March 1980. By August 1980 he was dead of cancer at fifty. He had completed two more volumes of the series, published posthumously, *The Captive* and *The Beast*. The vanguard novel, *The Orphan*, would have been enough: it was so good that it was nominated for a Hugo Award in 1981—a great honor because it was the only work of fiction that Stallman wrote.

Summarized very superficially, the three volumes of the Book of the Beast narrate the four-year maturation process of an other-worldly creature and the mate who will finally join him in love. *The Orphan* begins in mid-1930's south-western Michigan at the farm of Catherine and Martin Nordmeyer, where the "Beast" appears for the first time and "shifts" into the person of Robert Lee Burney, a boy of about five. Robert is adopted by the kindly Nordmeyers. So begins the kinship of the Beast and the matriarchal line of Aunt "Cat" as the six major episodes of the three volumes unfold. With Aunt Cat and her husband Martin, Robert/Beast begin to mature. But the idyllic summer months end in tragedy when drifters terrorize the Nordmeyers and Martin is killed by an errant shotgun blast, even as the Beast, shifting from Robert's five-year-old person to its physically and mentally superhuman self, intervenes to save the family. Witnessing the connection between the Beast and Robert, Aunt Cat, driven insane with grief at the loss of Martin, hounds it until it flees and arrives in Illinois as early teen-aged Charles Cahill to live with Grandmother Stumway, Aunt Cat's mother. Charles goes to school for the year, at the end of which the Beast, in a fit of springtime lust, is discovered coupling, as Charles, with a cow. He shifts to Beast and flees to Chicago. *Orphan* is a stunning work.

In *The Captive* the beast joined with the person of Barry Golden, falls in love with Rene, daughter of Aunt Cat. Rene's alcoholic husband, William Hegel, nearly succeeds in killing Barry in a car/train wreck. Shifted into Beast, however, Barry/Beast survive, only to be held in captivity in an open cage by a farmer. Escaped and reunited with Rene (divorced from William), Barry, Rene and her daughter Mina move to Arizona.

All is not finally well until Barry/Beast rescue kidnapped Rene and Mina from William and his American-Nazi training cell mustered in the mountains. In *The Beast* the Beast's female partner-to-be saves the life of George (Bo) Beaumont from cancer. Bo is the father of Charles Cahill of *The Orphan*. Bo believes Charles is dead in his early teens. Charles is dead, provisionally. But the Beast can make Charles live if Bo wishes, though Bo must relinquish the life of a woman he loves in exchange. Bo chooses Charles's life. The two beasts finally get together in a mystical marriage, leaving Bo reunited with his resurrected son, and Barry, also permanently resurrected, with Rene and Mina.

The adventure of the Beast in *The Orphan* is a pristine metaphor. The successor volumes, *The Captive* and *The Beast*, provide ethers, metaphysics, transcendence, and substantial explanation. Ironically, they are lesser in quality than *The Orphan* just because their purpose is to finish its story and to explain its vision. Aesthetic considerations aside, the three volumes together are in initiation story, a tale of a Beast's quest that tells us, thereby, about human quests. It is full of lovely natural-state settings and objects plucked from contexts by the super senses of the Beast to convey a feeling of seeing the essence of the landscapes, the flora, the animals—indeed the very furniture and trinkets in the Nordmeyer farm house. It evokes many wonderful traditional motifs. Principally there is the shape-shifter tale such as that about the bear-man in the ancient Icelandic Grettissaga, and reused by Tolkien in the Beorn character of *The Hobbit*. We may also remember R. L. Stevenson's *The Strange Case of Dr. Jekyll and Mr. Hyde*, or think of Robert Silverberg's sinister tale "Passengers." It recalls "beauty and the beast" stories. It erects an occult universe and, in the relationship of the Beast to its "persons," reinterprets notions of the golem and zombie. The basic narrative gives the reader humor, cleverness, and, best of all and mostly, unposturing clarity.

In a telephone interview Mrs. Stallman has spoken of her husband's interest in the Jungian notion of a collective unconscious. The suggestion is helpful in an attempt to explain what a meaning of the story might be. Surely the elegance of the tale is rooted in the daring simple obviousness of its theme. The theme is a progress that beings, "there is a Beast in all of us . . ." It feels and tastes things more sensually. It is physically stronger. It is smarter. Its appetites are keener—for food, for sex, for beauty. It loves music. It is the foundation of our emotions. It is the source of our creative drive. In the story the Beast might be the novelist himself—is, in fact, when he is personed with writer Barry Golden. The Beast is always trying to fit itself into the human world. It participates in virtually all of our meaningful existence. But it is not us. It is not human. It can be a guiltless maverick to our human ideas of order and morality. It is amoral, yet innocent. It is heedlessly curious, willing to learn what may be fatally dangerous for humans to know. Therefore, it is a mistake to imagine that humanity and Beast are an identity—or even a unity. People are always human. Beasts are only Beasts.

—John R. Pfeiffer

**STAPLEDON, (William) Olaf.** British. Born near Wallasey, Cheshire, 10 May 1886. Educated at Abbotsholme School; Balliol College, Oxford, M. A. 1909; University of Liverpool, Ph. D. 1925. Served in the Friends' Ambulance Unit in France,

1916-19. Married Agnes Zena Miller in 1919; one son and one daughter. \* \* \*

Between the age of Verne and Wells and the Golden Age of American science fiction in the 1940's, the greatest achievement in the genre belongs, without much question, to Olaf Stapledon. Future history, galactic wars and empires, sympathetic presentation of alien psychologies and cultures, science and technology conceived critically in their reaction upon society (and even upon sexuality), man's mind itself seen as radically mutating, evolving toward a trans-earthly destiny either tragic or superhuman (or both), and in that evolution exploring the depths of time and space in the quest to find some ultimate meaning in the Universe—these themes and motifs enter the genre, or receive for the first time ample and serious treatment, in Stapledon's work.

*Last and First Men*, the most ambitious and systematic of future histories, is also memorable as the first attempt in science fiction to create a full-scale apocalyptic "myth" (Stapledon's own term in his Preface). Man's future is projected here through unprecedented magnitudes of time and change, not because of some compulsive need in Stapledon to write a "titanic" book, but because only a vast, flexibly protean counter-myth could challenge effectively the dominant patterns of belief—orthodoxies both of right-wing religion and left-wing politics—that he saw usurping the sense of the future in his time. Not from any irrepressible pessimism in himself but to demolish—or shock awake—such complacencies among his readers, Stapledon has his First Men perish after a few more millennia of steadily degenerating civilization. World-unity of a sort, the First World State, is achieved, but only through a tyrannous, super-technologized culture. After several million years, the Second Men emerge, gifted with larger bodies and more acute senses, but these amiable semi-Utopian giants fail to reconcile their will to universal human communion with their cosmic awareness, especially after that awareness is fatally darkened by a long and hopeless conflict with invading, biologically alien, intelligent "clouds" from Mars. Not until the Last Men, sixteen species later—that is, almost two millennia and several interplanetary migrations later—do we learn in retrospect what the controlling model of transcendence, the ideal relationship of human will to cosmic reality, is in Stapledon's myth.

The Last (Eighteenth) Men are, in one sense, the First of Men—the first to attain full humanity, to "awaken" thoroughly from animal "sleep," to develop latent powers of both body and mind beyond man's evolutionary childhood to something like "maturity." The great civilization that flowers on Neptune succeeds in remaking man's nature by correcting the tragic imbalance of powers, and especially the will to overtranscendence, of the earlier species (e. g., the abstract intellectuality of the Fourth Men, the love of tragic "ecstasy" that lures the Flying Men on Venus to racial suicide). Although their bodies are made superstrong by artificial atoms, man's mammalian sexuality has not now been left behind but enlarged and enhanced in sensibility, so as to become the sympathetic basis of world-community. The "racial mind" achieved on Neptune is thus both—and equally—human and "astronomical" in its modes of consciousness; it has both psychic and electromagne-

tic dimension, capable of reaching telepathically far out into galactic space and far back through historical time (hence the virtual omniscience, where the past is concerned, of the narrator, one of the Last Men). The supreme test of this transcendent "spirit" comes when radiation from a supernova dooms the Neptunian race to extinction: they plan to "seed" the galaxy with artificial life-spores but they themselves—and with them the entire human past—cannot escape obliteration. What enables the Neptunians to meet, and even "salute," this fate without despair is not only their tragic wisdom about the cosmos but a renewed influx of animal courage and "loyalty to life," gained from telepathic interaction with the primitive minds of the First Men. It is really therefore the indomitable will of all humanity in time that speaks through the well-known words of the young prophet, last-born of the Last Men, which close Stapledon's epic "symphony":

Man himself, at the very least, is music, a brave theme that makes music also of its vast accompaniment, its matrix of storms and stars. . . . It is very good to have been mad. And so we may go forward together with laughter in our hearts, and peace, thankful for the past, and for our own courage. For we shall make after all a fair conclusion to this brief music that is man.

*Starmaker* takes the mythic history of "spirit" beyond the solar system into all space and time. This may not be, as Stapledon himself thought, his best book but it is certainly his most marvellously inventive. The first-person narrator (we may think of him as Stapledon) finds himself magically transported from a suburban hillside at night on a disembodied journey to the stars, where he is soon joined by like-minded spirits from other worlds. At first the telepathic abilities of the travellers are limited to their own level of experience—to their sympathetic awareness of "the human crisis" that results whenever a planet's civilization develops transcendent consciousness and struggles toward world-community. Very few of these worlds achieve Utopia; most succumb to war or cataclysm; and even many of those that emerge triumphantly from the crisis lapse into a "mad" imperialism of galactic conquest. A true community of "minded worlds" is at last realized, but its survival is not assured until the traumatic discovery that stars, too, are "living minds." Only after this breakthrough does the ever-enlarging communion of spiritual travellers become the multi-galactic "cosmical mind"—and only then does the narrator, now the "I" of this supremely human spirit, attain the long-sought vision of the Star Maker. Himself evolving, this neo-Bergsonian yet teleology-minded Deity, experimenting with one cosmos after another (our own, a middling success, occurs about halfway through His education) may be Stapledon's boldest and most brilliant but not therefore his best invention in the book. The Creator-God of this cosmos seems to me surpassed, even in sublimity, by many of its psychozoic creatures (the Nautiloids, the Plant Men, the symbiotic Arachnids and Ichthyoids). More indifferent Star than man-inspiring God, the Star Maker remains, almost by definition, a loveless Deity, despite Stapledon's insistence that He is worthy of "adoration." And at the end this ambiguity of attitude seems to have become intentional. For when the traveler returns to his suburban hill, he finds that he needs "two lights for guidance," the human and the astral, living radiances linked in a symbiosis of "spirit." The human warmth of "our little glowing atom of community" is defined and valued by its dialectical contrast with "the cold light of the stars," in whose "crystal ecstasy . . . even the dearest love is frostily assessed."

Stapledon's later drift toward mysticism, which takes increasingly religious (though always agnostic) form after *Starmaker*, was first strongly evident in *Odd John*. Between his two myth-histories Stapledon wrote two novels—the first of which, *Last Men in London*, generally fails to wed philosophical fantasy (his Last Man narrator reappears here as a time-explorer trying to "influence" a young First Man's mind) with autobiographical realism (the novel faithfully reproduces Stapledon's experiences before and during World War I). The second novel, *Odd John*, has become, however, a justly popular classic of the genre because it dramatizes both the good and evil latent in the post-Nietzschean myth of the Superman. The intrepid, ultra-intelligent John (he too acquires telepathic powers) is in many ways a hero, even a martyr, of Stapledonian "spirit," and the island-colony in the Pacific that he establishes with other "super-normals" is, in its organization and way of life, a model of Stapledon's philosophical ideal of "Personality-in-Community." But in the effort to make his colony secure and viable John commits a series of tactical murders, with little or no remorse; and such acts would have been for Stapledon (not in this book to be confused with his narrator, a rather servile hero-worshiper) violations of the only surely real vehicle of spirit, namely, "human personality," without reverence for which no society can long endure. And such is the fate awaiting John's colony, which rapidly perishes—or vanishes. Hopelessly threatened by all the world's powers, the colonists blow themselves up, confident that the "music" of their minds, their immortal being, is destined for new and greater realms of Spirit.

What is tragically wrong with John is clear by contrast with Stapledon's protagonist in the last of his four major works of fiction. The eponymous hero of *Sirius* is a hero without hands—and therefore free of the supple-handed John's delusions of power through manipulations of men and their world. Sirius is a huge Alsatian sheepdog, with an artificially mutated brain capable of reaching all but the very highest levels of human intelligence. Like John, Sirius rebels against his human conditioning, but this time the will to transcendence is informed by a passionate commitment to love (love of Plaxy, the girl with whom he has been raised as an "equal") and by profounder intuitions of "spirit," gained through this love and the life-sympathies of his animal being. Yet, again not unlike John, Sirius never reconciles the two halves of his being; he continually succumbs to a violent "wolf-madness" seemingly rooted in his nature. And at the end, as Plaxy stands in the moorland dawn over the dead body of her lover—he has been hunted down by a rifle-armed pack of human wolves—we are left looking more to the skies than to earth for hope.

The theme of divided consciousness, of an insuperable, darkly ambiguous contradiction in man's nature, haunts most of Stapledon's fiction in his last decade. It appears throughout *Darkness and the Light*, where man's future prospects for good and evil are divided into alternate time-streams, and even the Utopian triumph of the Light scenario is threatened by inscrutable forces of cosmic Darkness. It is much less apparent in the exceptional *Death into Life*, neither a novel nor a myth-narrative so much as a work of visionary rhetoric designed to promote the belief that death is a passage to higher forms of cosmically immortal Spirit. It returns with a vengeance in *The Flames*, a novella of ambiguous fantasy, where the protagonist, a mental patient, may be hallucinating or actually encountering (at the end he dies mysteriously in a fire) a race of flame-like beings—self-declared aborigines of the Sun, in some ways spokesman of Stapledonian "spirit" yet also lethally dangerous to man and his planet. The theme finds consummation in the semi-autobiographical novel *A Man Divided*, a Psychic Double

story, where the philosophically awakened Victor struggles unsuccessfully with his "doltish" other self, who in turn rebels against the former's "beatitude," until both perish together in an act of suicide, despite the efforts of the loving Maggie to save both her husbands.

Offsetting the decline of Stapledon's prophetic confidence in his last years was a generally finer command of the art and craftsmanship of fiction. First strikingly apparent in *Sirius*, which is perhaps his most aesthetically satisfying fiction, the greater range and variety of his literary skills are most observable in several fantastic short stories written in this period (or slightly earlier)—three of which, "A Modern Magician," "Arms Out of Hand," and "The Man Who Became a Tree," show Stapledon succeeding impressively in a form that he had hitherto avoided. Not that Stapledon in the 1930's was ever a stylistically incompetent writer, as he is sometimes said to be. The theme of the myth-histories necessarily demanded prose of a certain rarefied abstraction and austerity of feeling. And if his purely narrative talents were then sometimes weak, his poetic and dramatic powers—the powers, in a word, of a gifted myth-maker's imagination—were always demonstrably present. Certainly if his literary abilities had not been in large measure commensurate with his intellectual originality, Stapledon would never have exercised so great an influence on, or have won the continued admiration of, so many science-fiction writers in our time, most notably Clifford D. Simak, Cordwainer Smith, Arthur C. Clarke, Brian W. Aldiss, Ursula K. Le Guin, and Stanislaw Lem.

Christopher Stasheff comments:

I'm not concerned with the novel as an end in itself, but as a means towards the end of trying to awaken the audience to an awareness of the issues I consider important, and to convey some vital facts and a few opinions. I'm also trying to reverse some trends I discern in popular literature, which I believe to be detrimental to us as people and as society. But none of this will do any good if no one reads it; so, first and foremost, I try to entertain.

\* \* \*

Christopher Stasheff wrote a wild and ribald mixture of science fiction and fantasy with his first novel, the fabulous *The Warlock in Spite of Himself*. Rodney d'Armond, who renames himself Rod Gallowglass, and his goofy robot, Fess, arrive on Gramarye, a planet where magic works. Their mission is to bring democracy to this feudal society. They find themselves kidnapped by elves, encounter ghosts and goblins, and meet other legendary creatures. Gallowglass falls in love with a lovely witch and saves Gramarye from a force from the future who are intent on preserving Gramarye's feudalism. All of this is told in a bold, swashbuckling style with great humor. *The Warlock in Spite of Himself* is more than a successful blending of science fiction and sword and sorcery; it is wonderful entertainment.

The original sequel to *The Warlock in Spite of Himself*, *King Kobold*, received negative reviews, chiefly from Lester del Rey who was reviewer for *Worlds of If*. When Stasheff's publishers wanted to re-release the book, Stasheff insisted on rewriting the book to take into account del Rey's criticisms. The rewritten book, *King Kobold Revived*, is better than the original 1971 edition. Rod Gallowglass has to save Gramarye from an evil band of time-travelling Neanderthals who are the latest weapon in the transtemporal wars. To defeat them, Gallowglass needs the assistance of a power witch and a clever wizard; however, the plot revolves around their reluctance to get involved and Gallowglass's attempts to recruit them.

*The Warlock Unlocked* carries the story farther: Gramarye is still threatened by sinister time-travelers, and Rod Gallowglass is its main defender. The plot centers around the attempt to cause a rift between the Church and the State. Rod Gallowglass is cunningly trapped and sent with his family to an alternate world. There he must defeat wicked elves and monsters before he can return to Gramarye to save it from ruin.

*Escape Velocity* is a "prequel" to the Warlock series and answers some of the questions about Gramarye's origin. But too much of the action takes place on decadent Earth, and the lead characters, Dar and Samantha, tend to deliver speeches on sociopolitics rather than engage in the glib dialog Stasheff is famous for.

*The Warlock in Spite of Himself* remains Stasheff's best book with each sequel or prequel diminished from the original vision. Stasheff's lone non-series book, *A Wizard in Bedlam*, reworks Stasheff's themes about bringing democracy to a feudal planet and lacks the charm of the Warlock books.

Andrew M. Stephenson comments:

The notion of making any sort of introductory statement on my work repels me: it feels as though I am being required to define what I wrote about, whereas the work itself is sufficient definition. All I will say is that I am content to be described (where relevant) as a writer of science fiction, provided my works are judged on their *individual* merits, not as samples of "science fiction," whatever that may be.

\* \* \*

Andrew M. Stephenson began his career in SF as an illustrator. "The Giant Killers," like *Nightwatch*, is highly

technophilic but at the same time possesses a deep concern and sensitivity for human and animal suffering. Whereas in the short story man is seen at war against himself, in the novel he is seen pitted against an alien intruder. It is a competent if unoriginal novel about semi-sentient machines and their creator, set mainly on the moon.

A much lengthier and far more successful novel is *The Wall of Years*, moulding together two traditional SF themes—time travel and parallel worlds—into a story which is both convincing and compelling. Experiments into parallel worlds reveal that there are nearby worlds of possibility and that the majority of these are engaged in warfare. The bonds that separate the worlds break and they begin to intermingle. As the world falls into chaos some humans escape into the future of the 26th century where they set about trying to stabilise their own history (in this alternate world). The protagonist, Jerlan Nilssen, goes back to the time of Alfred the Great to ensure that history is not changed by an outside agency which might wish to see the future city destroyed. Stephenson ties the plot threads tightly together and manages to portray accurately the clash between modern and 9th-century worldviews. There is, again, a marked sensitivity, but with a much more defined skill in the writing. The crudity of the dark ages is well drawn, and the nobility is subdued as Stephenson leads us through the laws of necessity that govern behaviour in those times. By comparison, the world of the 21st century (the time of the break-up of reality as the parallel worlds impose upon one another) is not so well focused, and seems to hint that Stephenson's future direction may be toward historical fiction, or like Keith Roberts, toward charting parallel worlds based on the past.

With a quite clear command over the intricacies of plot and a constantly improving style, Andrew M. Stephenson appears one of the most promising of the young British SF writers, although his reputation at present rests upon a single book.

\* \* \*

Although not prolific, Bruce Sterling is one of the most respected younger sf writers. Part of this reputation is due to Sterling's apparent self-assurance; even his early writing is deft in structure and coolly precise in style. He seems to believe in himself. Actually, even in his first publications (*Involution Ocean* and *The Artificial Kid*), Sterling began exploring the very nature of self-control as his protagonists gain experience and self-knowledge in bizarre future societies. Each character must adjust to so many unsettling situations that it would be comforting if he could find someone else who has found a way to interpret experience and act effectively. Instead, the young narrators see that older people generally drift toward death because they have tried different beliefs and roles until no faith is convincing enough to hold their attention. The few old men who do manage to cling to one purpose do so with a foolish fanaticism that also leads to death. At first, Sterling's protagonists escape confusion by using drugs (*Involution Ocean*) or edited versions of experience (*The Artificial Kid*) to give themselves an illusion of controlled action pursuing significant goals. When events strip them of their illusions, they must begin to explore the notion of commitment. They come to realize how much any belief depends on lies or contrivance, but they also recognize that humans cannot long exist without belief.

From the beginning of his career, then, Sterling was grappling with a major human concern: believing in a set of values gives consciousness a center but narrows it; how can one gain the focus that faith makes possible without the accompanying destructiveness? Sterling considers this repeatedly in his series of short stories describing the struggle between the Shapers (who have restructured people through biosciences) and the Mechs (who augment human powers through mechanical means). Each of these movements, the factions they spawn, and the sub-factions they produce, attempts to dominate the race after most of "humanity" has abandoned Earth and begun to spread through space. In form, the stories give glimpses of events that readers must strain to interpret and connect. In substance, the stories focus on characters who attempt to find something that they can confidently assert in their confusing milieu. Conclusions tend to be somewhat equivocal, as in "Swarm," which challenges readers' comfortable assumption that humanity equals exploring, intelligence equals mastery. With wit and

ironic ambiguity, Sterling describes the multiplicity of beliefs that develop as human consciousness is fragmented.

The Shaper series concludes with *Schismatrix*, in which Sterling shows one man's trying out many identities and beliefs. Even though the book does explain the future history into which the Shaper stories fit, this remains so complex that the reader (like Sterling's hero) is challenged to grasp nuances and adapt to them rapidly, avoiding both confusion and staleness. No one faith finally satisfies Sterling's protagonist. The important thing is that his wide sympathy and flexibility eventually make him a fit companion for a Presence that has observed humanity's development but disdains the idea of taking part in its unrestricted evolution even if that might lead to godlike consciousness and power: "I want what I already have! Eternal wonder, eternally fulfilled . . . Not the eternal even, just the Indefinite, that's where all the beauty is . . . I'll wait out the heat-death of the Universe to see what happens next! And in the meantime, isn't it something, all of it?"

That statement may or may not be Sterling's own final position, but it certainly does reflect his central subject: the wonder of the "human" response to experience, the fascinating ways people liberate or limit themselves. In his latest short fiction, such as "Dinner in Audoghast," he continues to examine a debate between different human certainties, showing how small "certainties" lead to cruelty because they are determinedly ignorant of others.

Thanks to his ability to center on a key human concern with intelligence and skill, Bruce Sterling already has created an impressively mature body of work. He is not satisfied. He considers himself just past the "apprentice" stage of his career. Almost certainly, his future work will disturb readers' complacency with even greater impact. As the protagonist of *The Artificial Kid* concludes, "Just wait till the Kid grows up."

—Joe Sanders

\* \* \*

The body of writing for which the name Francis Stevens is remembered was published during a span of little more than six years (1917-23), and was probably written in an even shorter period. Gertrude Barrows Bennett, the woman who used the pseudonym Francis Stevens, wrote under pressure of economic necessity, and stopped when the immediate need for extra income was removed. Through the years those readers who have fallen under the spell of her remarkable fantasies have had cause to regret not only the premature cessation of her fiction-writing, but also the fact that some already-completed work remained unpublished (and is now presumed to be lost).

Francis Stevens wrote mainly for *All-Story* and *Argosy* magazines during the same period in which the first of A. Merritt's fantasies were published. It has been said that some readers thought Francis Stevens was a pen-name of Merritt's. The conjecture could just as easily have gone the other way, for when Steven's first major novel, *The Citadel of Fear*, appeared, Merritt had published only a few short works. Merritt was, in fact, a great admirer of Stevens's work, and was instrumental in having several of her stories reprinted during the 1940's. Although the first part of *The Citadel of Fear*, which takes place in the lost city of Tlapallan in an uncharted corner of Mexico, is superficially similar to Merritt's work, Stevens replaced Merritt's romantic/tragic outlook with a much more down-to-earth viewpoint. The story, while forfeiting none of its appeal as an exotic lost-race adventure, is told with liveliness and humor, to which the hints of darker things form an effective counterpoint. In the latter two-thirds of the novel, the very real and concrete evil of Tlapallan reappears in the quiet American countryside, and a succession of mysterious events builds up to a climactic confrontation between supernatural forces.

The second of Francis Stevens's three major works, *The Heads of Cerberus*, was serialized in *The Thrill Book* in 1919. Like *The Citadel of Fear* the novel opens with an episode of Merrittesque fantasy, involving a substance called the Dust of Purgatory which transports people into the strange alternate world of Ulithia. But once the main characters have passed through Ulithia and find themselves in a future Philadelphia in the year 2118, the novel becomes political and social satire of a high order. The two parts of the novel fit somewhat oddly together, but each is so good in itself that one is willing to accept the discontinuity between them. In the introduction to the Polaris Press edition, P. Schuyler Miller is quoted as saying that the novel "can be read as perhaps the first work of fantasy to envisage the parallel-time-track concept, with an added variation that so far as I know has not been reused since"—the idea that times moves at different rates in the alternate tracks.

The third of Stevens's important works is *Claimed!* Here the focus of attention is a carved oblong box found on a volcanic island in the Atlantic. The box comes into the possession of millionaire Jesse Robinson, whose creed is, "What I want, I get—and what I get, I keep." The novel tells, in a straightforward narrative without any of the subplots or side-trips evident in earlier works, of the attempts at recovery of the box by the supernatural being who had created it many thousands of years in the past.

Three novels by Francis Stevens have so far appeared only in magazine form. Her first work was the short novel "The Nightmare," of which Stevens herself said that its only merit was "a rather grotesque originality." "Serapion" is a grim and

powerful story of psychic possession which stands up well in comparison to more recent works on the same theme. "Sunfire" was a return to both the lost-race fantasy and the light-hearted narrative style of earlier works.

Of Stevens's short works, "Friend Island" is notable for its background of a future world when women are the dominant gender, but the story itself is little more than an extended joke. (It is probably nothing more than coincidence that the byline "Francis Stevens" appeared on a story called "The Curious Experience of Thomas Dunbar" in the March 1904 issue of *Argosy*.)

Critical Study: *George R. Stewart* by John Caldwell, Boise, Idaho, Boise State University, 1981.

\* \* \*

In 1951, George R. Stewart received the first of the International Fantasy Awards for *Earth Abides*, the only one of his novels to fall into the SF genre. He is also the author of non-fiction works which, like his novels, all touch on some aspect of American history or culture.

*Earth Abides* inverts the famous story of Ishi, the last wild Indian in North America, a story recently retold by Theodora

Kroeber in *Ishi in Two Worlds* (1962). Ishi, the last member of the Yahi, a tribe of California Indians long thought to be extinct, emerged from his Stone Age world to live in the early 20th-century world of trolley cars and electric lights. He was rescued by an anthropologist at the University of California, and taken to live in its Museum of Anthropology, then located in San Francisco, where he passed his remaining years. He showed the anthropologists the native Yahi way of making and hunting with a bow and arrow, and of making fire. With these lessons Ishi paid his way and enjoyed the fruits of civilization, which for him were mainly glue (for the easier feathering of arrows) and matches. His name in Yahi means "man."

The hero of *Earth Abides* is named Ish, which in Hewbrew also means "man." Ish is one of a very few to survive a pandemic disease to see civilization collapse and his descendants return to the life of Stone Age hunters like that of Ishi. Ish is the last of the civilised Americans as Ishi is the last of the aboriginal Americans. Naked, hungry, and weakened by snake bite, the real Ishi stumbled into industrial America on 29 August 1911. The last of the Yahi, he wandered down from his native hills into the corral of a slaughter-house near Oroville, California. There he fell exhausted, was jailed as a "wild man," was finally recognised for what he was, and taken to the museum in San Francisco. Weakened by snake bite, the fictional Ish stumbles out of the same hills into a dead civilization, its populace almost wiped out by some deadly virus. He had been studying the ecology of the Sacramento Valley, Ishi's tribal home, for a master's degree at the University of California. Throughout the novel, Ish watches with ecological detachment the transformation of a world emptied of men.

He returns to his home in a suburb of San Francisco, overlooking the Golden Gate bridge. The few survivors he gathers around him facetiously call themselves the "Tribe." Everybody forages in stores for food and other goods, trying to maintain the old way of life under new conditions. One couple brings home a bridge lamp and a fancy radio set, even though no electricity is available. Even Ish, the only one to think about the future, teaches spelling and arithmetic, although the world is so depopulated it cannot sustain occupational specialities based on literacy. At last Ish realises the futility of his classroom lessons and school is dismissed. He then teaches the children a game, which he knows will have to become a way of life once there are no more store goods to scavenge: he teaches them how to make and use the bow and arrow, and how to make fire without matches, the same technology he knew from his study of anthropology to have been the basis for successful living by our pre-civilized ancestors.

In time, the tribe departs the crumbling ruins of San Francisco. By then Ish is an old man and the tribe, now skilled hunters, sets out to cross the bridge to new lands. Crossing the bridge, Ish slows to a stop. Before he dies, he reflects on the course of human history and the fate of his grandchildren and others of their generation, who squat in a half circle around him. "They were very young in age, at least by comparison with him, and in the cycle of mankind they were many thousands of years younger than he. He was the last of the old; they were the first of the new. But whether the new would follow the course which the old had followed, that he did not know." But the moral of the novel is certain. Inverting the story of Ishi, Stewart dramatizes the humanistic fact that man is man, be he civilised or tribal; that a Stone Age culture is just as valid a setting for being human as is an industrial culture.

—Leon Stover

##### Novels

*Thrill City*. New York, Essex House, 1969.

*The Prisoner: A Day in the Life* (novelization of TV series). New York, Ace, 1970; London, Dobson, 1979.

*The Prisoner 2: A Day in the Life* (novelization of TV series). London, Dobson, 1979.

\* \* \*

Hank Stine's *Season of the Witch* included a moodpiece "Postscript" by Harlan Ellison, was given a warm welcome by the few critics who found it, and then allowed to drift into obscurity. It is notable as a special combination of science fiction and pornographic detail and rhetoric. The quality of the novel artistically justifies this radical strategy and invites association with other well-known pieces of science fiction that have employed it. In *Season of the Witch* Andre Fuller rapes murders Josette Kovacs under the influence of a hallucinogen. He is punished in a low-population civilization by having his brain put into his victim's body. His own body is given to someone else. He/she, as Celeste Fuller, begins an odyssey in which, after confusion and pain, Celeste makes a new and happy life as a woman and a wife. Plot and setting are minimal. The story combines dramatic narrative and stream-of-consciousness in a tight control of point-of-view that vividly exposes the painful psychological transformation of Fuller from male to female. The shock to the male psyche directly experiencing the vulnerability of the female body is stunningly revealed. The pornographic elements of the novel can titillate only briefly before the reader is plunged into the agony of the ordeal. Where science fiction as well as pornography are often male chauvinist, the novel might raise male consciousness.

Explicit sexual descriptions as well as sex-changing effects are not rare in important science fiction works. They appear in such novels as Theodore Sturgeon's *Venus Plus X*, Norman Spinrad's *Bug Jack Barron*, Robert Heinlein's *I Shall Fear No Evil*, Ike Dolinsky's *Mind One*, David Gerrold's *The Man Who Folded Himself*, and Sam Delany's *Dhalgren*.

\*

Critical Study: *Frank R. Stockton* by Martin I. J. Griffin, Philadelphia, University of Pennsylvania Press, 1939 (includes bibliography).

\* \* \*

Frank R. Stockton's science fiction has been neglected in histories of the field, perhaps because his literary reputation has suffered such eclipse in this century (he was highly praised during his life-time), and because science fiction was only a small part of his literary output. Except in his two important novels, *The Great War Syndicate* and *The Great Stone of Sardis*, his science fiction was light and humorous popular magazine fiction. A recent collection, *The Science Fiction of Frank R. Stockton*, assembles all his SF stories (and *The Great Stone of Sardis*), and the introduction by Richard Gid Powers is notable for its disdain for his lack of "seriousness."

Most of Stockton's SF stories have a similar plot: a gentleman amateur wins fame and fortune and gets the girl by means of an invention. This is true in "My Terminal Moraine," *The Great Stone of Sardis*, "My Translatophone," and, to a certain extent, "A Tale of Negative Gravity." The remainder are fantasies laced with contemporary science: "The Water Devil" concerns the trans-Atlantic cable and a ship whose cargo is electricity; "Amos Kilbright" is a ghost story; "The Knife That Killed Po Hancy" is a Jekyll and Hyde story concerning blood transfusions. Powers points out that *The Great Stone of Sardis* (the stone is a great diamond at the earth's core) combines Jules Verne's books *Journey to the Center of the Earth* and *The Adventures of Captain Hatteras* in a novel of polar exploration (Clewes, the amateur scientist/hero is first to reach the North Pole) and geological theory (Clewes invents an "Artesian Ray" to explore the interior of the earth). Clewes's adventures (set in 1947) are a significant contribution to the development of the "wonders of science" novel.

Stockton's major novel, however, is *The Great War Syndicate*. Although not mentioned in I. F. Clarke's *Voices Prophesying War*, Stockton's novel of a war between the US and England, fought using such new technology as an ultimate weapon (a disintegrator), is perhaps the most important SF novel in the "future war" tradition between *The Battle of Dorking* (1871) and *The War of the Worlds* (1898). World peace, capitalism, and the English language are enforced by an Anglo-American syndicate using the threat of ultimate destruction. The novel surpasses its many contemporaries, which characteristically dealt with politics, military tactics, and unimaginative technology (with minor innovations such as a new gun which would cause tactics to change) and were warnings clothed in fictional attributes. *The Great War Syndicate* is a true science-fiction vision of a new world created by a war to end war and a weapon to end war, the archetype of that naive hope which led to

the building and use of the first atomic bombs and the "pax Americana."

That Stockton's immediate followers in this mode were for the most part popular hacks (e. g., George Griffith) has not enhanced his reputation as progenitor. However, despite its failings as a novel (principally a lack of adequate characterization), *The Great War Syndicate* repays serious examination.

\* \* \*

Craig Strete has the flamboyance of R. A. Lafferty and Norman Spinrad, combining flights of fantasy with intense social criticism. He capitalizes on his Indian heritage in theme, motif, humor, plot, story-telling technique, and subjects of social criticism, leaning heavily on the mythic to generate a felling of universality. His works are relatively short and indicate fascination with the sound and rhythm of sentences, giving the poetic effect of the native American oral tradition. Exaggeration, word play, and comic, low-key dialogue are characteristic. Because he often omits transitions, becomes pyrotechnical, and demands close attention, Strete is not to be read rapidly.

Strete's recurrent theme is society's attempt to mold human beings into productive working parts of the white man's big world machine. What does not work is thrown out (the old man of "Time Deer"), or put to better use, providing blood for transfusions ("Bleeding Man") or adding color to movies ("A Horse of a Different Technicolor"). "Bleeding Man," his most conventionally narrated work, is most illustrative of the clash that occurs when emotionless bureaucracy meets the supernatural. On one level, it is a parable of the policy of first making war with Indians and then studying them. "Time Deer" similarly contrasts values. "A Horse of a Different Technicolor," a horror story of mind control, and "Why Has the Virgin Mary Never Entered the Wigwam of Standing Bear?" attack materialism and forced conformity, using television as a metaphor for the regimented spectator/consumer life. In fact, the stories published in *The Bleeding Man* frequently refer to cultural conflict and genocide.

Strete's novels for children, published under the name Craig Kee Strete, though not science fiction, should be taken into account as contributing to understanding the more complex

stories. In "Paint Your Face on a Drowning River" Old Cat tells his grandson, who is about to leave the reservation, about his early life. The story is part of "Time Deer" and prophetic of the young man's life in the white world.

\* \* \*

In Kurt Vonnegut's fictional universe, Kilgore Trout writes SF stories pregnant with emotion and philosophy, but relegated to the unread pages of pornographic magazines, while he ekes out a living with odd jobs. Trout's most likely model is Theodore Sturgeon, whose much-anthologized stories have made him probably the best *loved* of all SF writers. Inclined toward magic and fantasy, unashamedly romantic and psychologically penetrating, Sturgeon commonly writes about the yearning for wholeness that characterizes love in a disjointed, repressive society. This emotional edge and his mastery of styles, using a classically restrained vocabulary, make him second only to Heinlein as a contemporary model for other SF writers. Bradbury and Delany acknowledge their debt openly; others, like Vonnegut, are more indirect. Beside extensive writing outside SF, Sturgeon's fantasies fill over a dozen volumes of stories and several novels, plus the novelization of the movie, *Voyage to the Bottom of the Sea*.

Of his earliest work, *It* and "Killdozer" concern menaces whose life and terrestrial origins are in question. The latter is a compelling metaphor of machine malevolence. Another horror story, extraordinarily sensuous, is "Bianca's Hands" which tells of an idiot with beautiful hands that work without conscious direction, eventually strangling her lover. Other early stories include "Shuttle Bop," about a mysterious shop selling talents people inevitably misuse, and "Microcosmic God" in which a misanthropic scientist drives the evolution of a race of tiny creatures who propitiate him with remarkable inventions. "Maturity" concerns a charming self-educated polymath whose perpetual youthful irresponsibility stems from a glandular defect; when it is corrected medically, he ripens and dies. The maturing of a society is the subject of "Thunder and Roses" in which a beautiful entertainer, dying from radiation sickness, persuades the men at a key military base in an America crippled by nuclear attack to spare their enemy and the human race.

Sturgeon's first novel, *The Dreaming Jewels*, is a mad melodrama of circus freaks and humanoid products of living crystals. Its few poetic moments cannot overcome simplistic conflicts among telepathic cardboard characters, but elements in it look forward to *More Than Human*, which won the International Fantasy Award. In "Baby Is Three" a boy finds out in a marathon psychiatric session why he tried to kill his

foster mother. With the analyst's vocabulary and his own repressed memories, he discovers his role as the central ganglion of a multi-person form, or gestalt, whose other members are also children with parapsychological powers complementing his own. Actually killing off the governess in the middle section of the novel, Sturgeon begins it with the youthful outcasts and an older "idiot" coalescing into the gestalt's "first draft," and ends it with the addition of a moral component who binds the entity to homo sapiens while he opens the door to the superior race, homo gestalt. Written in a vivid, impressionistic style, this parable of social organization and psychological integration became for many readers the one SF classic. Completing this parapsychological trilogy, *The Cosmic Rape* finds another outcast repelling a group-mind invasion by uniting Earth's mental forces over the galaxy-spanning alien being. In the process, he breaks through his isolation and finds himself, while healing the fragmentation of the individualistic human race.

Featuring magic and wish-fulfillment, aliens and esp, Sturgeon's stories exploit the most peripheral of science-fiction content. In "Saucer of Loneliness" a girl learns from a miniature flying saucer that someone is lonelier than she is. Though it brings tribulations, it sustains her through them, finally bringing the love of the narrator, who saves her from suicide. "The World Well Lost" appears to concern a pair of aliens, "loverbirds" from Dirnadu, a planet closed to mankind. It is really about the love between two human space crewmen, which literally "cannot speak its name," and which taints the entire human race from the perspective of the aliens, whose gender differences are more pronounced. Apparent homosexuality also surfaces in "Affair with a Green Monkey" in which a slightly built young man is rescued from thugs by a pompously "well-adjusted" psychologist. Overbearingly tolerant, the host throws his wife and his guest together, and a platonic affair develops. Its consummation is prevented not by the guest's being gay but by his being an alien, far too well-endowed sexually for interspecies sex. But what may seem merely a dirty joke is in fact a sensitive plea for understanding, tolerance, and tenderness.

Closer to hard science fiction, "Bulkhead" (originally "Who?") tells of an astronaut kept company by the childish half of his artificially split personality, supposedly beyond a bulkhead which actually separates him from the vacuum of space. More utopian is the far-future pastoral world of "The Skills of Xanadu" where people are integrated by means of "belts" that virtually transcend technology, freeing them to realize their (and our) potential. Three other tales show the variety of Sturgeon's production in the 1950's. In "The Girl Had Guts" a symbiotic alien saves human lives by becoming a false digestive system, vomited out in times of peril. Marooned on Mars, a man disguises from himself, with lyrical impressions and memories, his impending death as the first human to take this next evolutionary step into an alien environment ("The Man Who Lost the Sea"). The comic elegy "Like Young" suggests that fun-loving others have already inherited the Earth from a doomed human race.

Never avoiding controversy, Sturgeon anticipated by a decade Le Guin's Gethenians in *Venux Plus X*. In alternating chapters, suburbanites talk about sexual variety and stereotypes, and a downed aviator with macho hangups fails to be integrated into a utopian society of surgically created bisexuals. Flirting with another taboo, *Some of Your Blood* takes the vampire theme seriously, probing its causes in a fictional case history of a man's bizarre need. Like these novels, Sturgeon's later stories tend to be talky, as well as controversial. "When You Care, When You Love" extends love to one's own creation, a cloned replica of a lost beloved. "If All Men Were Brothers,

Would You Want One to Marry Your Sister?" posits a world in which keeping sex in the family is the "healthy" rule, not a frequently broken proscription. In perhaps his best story about healing, "Slow Sculpture" compares it to raising bonsai plants (Hugo and Nebula awards). His more recent work is less successful. A case in point is "Case and the Dreamer"; ambitious but diffuse, it is about an astronaut and his lover, resurrected by an indrawn human race to explore the universe for it, in the company of a clownish "god" (the dreamer) with whom their ship's computer has fallen in love.

A science-fiction writer largely by courtesy, Sturgeon equates "science" with "wisdom," not with hardware and limitations. Moving even when they are talky, his fantasies are wrought from emotional experiences his readers recognize as theirs, but which his skill with words can distance artistically. As unselfishly giving and fiscally "irresponsible" as the protagonist of "Maturity," Sturgeon never profited much financially from his writing. But he turned his suffering into beauty, encapsulating in fiction the longing for alternatives which characterizes many people's fascination with science fiction and fantasy.

\* \* \*

Often described as "droll," "cosmic," "symbolic," "mythopoetic," "startlingly original," and "inventive," but also as "cryptic," "unrestrained," "ponderous," and "convoluted," the works of Somtow Sucharitkul echo the familiar, either historical (Romans, Olmecs, lost tribes of Israel), or present (the threat of nuclear holocaust, lab-born plagues, and the slaughter of whales), or pseudo-mythic (Bigfoot, flying saucers, and vampires), but also partake of the alien and the bizarre (sentient suns, cities in the heads of monstrous snakes, a Throne of Madness, a Utopia of the dead, a dust sculptress, a web dancer, and a rainbow king). Sucharitkul is at his best exploring sentient cultures grudgingly forced to face the common bonds that link them despite appearance, tradition, and culture, whether they be earthlings and lizards (*The Alien Swordmaster*), Windbringers and Inquestors (*Light on the Sound*), Selespidons and humans (*Mallworld*), Romans and American Indians (*The Aquiliad*) or whales and Japanese (*Starship and Haiku*). His works, whether set eons in the future or in an alternate antiquity, show benevolence and compassion devolving into a mass blood lust until salvation comes from some unexpected quarter, some unknown hero who spearheads a resistance, engages in a strategic game of life and death with thousands of lives or thousands of planets at stake, and proves his/her mettle defending old-fashioned values, goodness, justice, and family. Often it is the very young or the very old in Sucharitkul's works who are the most perceptive and the most attuned to the pain and the tragedy of other sentient beings.

In *The Alien Swordmaster*, one of the *V* series, a ninjitsu expert and a Japanese-American anthropologist shelter an orphan and aid an alien Martial Arts Master to counter a saurian plot to retake the earth through a well-trained cadre of soulless Martial Arts killers; in doing so they find love and family and self-respect.

*Light on the Sounds*, the first of the Inquestor series, introduces those vigilant guardians of the Dispersal of Man, the anti-Utopian, omnipotent, immortal, absentminded, despotic Inquestors. Because they need the disembodied brains of a whale-like sentient race (Windbringers) to power their faster than light vehicles, they have developed a race of deaf and dumb humans genetically designed to be impervious to the beauty of light and sound, the Windbringers' only defense. Ultimately a sympathetic Inquestor heretic leads the fight to save both races. In *The Throne of Madness* (second in the series) Inquestor despotism, cruelty, and madness sends more rebels across the galaxy seeking the means to destroy the Inquest and in so doing experiencing numerous wonders. *Utopia Hunters* provides the history of the Inquest through a series of ornate, and moving, linked tales told a young "lightweaver," Jenjen, by an ancient. They reveal the sadness, the guilt, the madness that afflict beings who must destroy worlds in order to preserve them. Chosen to fashion a great lightsculpture celebrating the Inquest's crusade against utopias, Jenjen gradually learns to overcome her fear of darkness and to see in her own conflicts and creations the dark that is a texture in every light and that threatens and Inquest and yet could save it. She finally learns to understand the need to destroy false utopias that blind man to truth and make him a

slave to false hopes. The final tale of the destruction of flaming phoenixes that will rise no more sums up the paradoxes of dark and light.

*Fire from the Wine-Dark Sea*, a short story collection, includes two early Inquestor stories and a precursor of *Starship and Haiku*, entitled "The Last Line of the Haiku," a compact, intriguing piece. *Starship and Haiku* juxtaposes the modern and the ancient, the technological and the artistic in a story of a dying earth, its land and seas polluted, its inhabitants diseased and mutated. Therein the Japanese prove to be the offspring of whales, and, led by a madman, commit mass *seppuku* for having slaughtered their ancestors. But a hybrid race, whale and human, will survive in space.

*The Aquiliad* delineates an alternative world wherein the Roman Empire extends to America and an Indian Chief aids the Romans in their search for China. An evil time-traveller, pre-columbian genetic engineering, flying saucers and cops helping Olmecs are only a few of the unusual twists of this sprawling plot. The narrator, a dim-witted general favored by Nero, continually clashes with the aged Indian, whose Latin wordplay is the wittiest part of the novel.

*Mallworld* is a delightful series of bizarre glimpses of the inhabitants of a futuristic shopping mall world being investigated by a superior alien race, the Selespidons, who are fascinated by the strength of the human spirit and appalled by human barbarism and bad taste. It depicts a world of the unexpectedly familiar transformed: St. Betty Crocker, St. Martin Luther King Kong, a nude female Pope, babies custom designed at Storkways, Inc., suicide parlors featuring death by vampire, a megacredit card system that permits the shopping spree of the century, and the Bible belt, a mixture of Amish, Buddhist, and Hare Krishna, and the center of that ancient art, reading. Yet amid this modern insanity, man struggles to create, to free his body and soul, to achieve human dignity, love and understanding, and so touches the heart of jaded aliens that they cannot escape man's pull.

In sum, Sucharitkul creates worlds and languages, customs and cultures in narratives that are gripping, moving, well-crafted set pieces, with dense prose and metaphorical overtones, though at times his attempts at complex poetic diction and epic scope distract and obscure. Always he is a wildly imaginative mythmaker, projecting topsy turvy worlds that somehow remain human, entertaining, and compelling. He offers an Eastern perspective on art and nature, and a humanistic concern for man and his world.

\* \* \*

Jeff Sutton's career as a writer of SF has been checkered. In spite of the fact that its melodramatic plot of conflict between the United States and Russia is a reflection in miniature of the then Cold War, *First on the Moon*, his first novel, was considered promising because its technological detailing seemed authentic, perhaps owing to the author's engineering background. His second novel, *Bombs in Orbit*, again elicited some praise for its handling of technological details and for what appeared to be an increased skill in manipulating plot and creating suspense. However, the next two novels, *Spacehive* and *The Atom Conspiracy*, aroused substantial critical misgivings. No one doubted Sutton's ability to describe technological processes, current and extrapolated, and to suggest thereby verisimilitude. But plotting and characterization seemed more and more throwbacks to 1930's space opera; further, Sutton's style increasingly manifested an embarrassing fondness for cliché.

*The Atom Conspiracy* aptly illustrates Sutton's limitations. Its portrait of the Empire of Earth in 2449 when research in the atom is outlawed because of previous nuclear catastrophes, and a World Government is directed by an elite Council of Six who possess the highest IQ, is neither original nor convincing. The world looks and society functions very much the way they do today, and the Council of Six appear no better or worse than anyone with normal IQ. For reasons not entirely clear the Empire also looks with disdain upon anyone with ESP powers. The novel's hero, Max Krull, a government agent and a secret ESPer, is sent to investigate the circumstances behind the death by nuclear burning of a long-missing man. Most of the action, consisting of conventional intrigue, flight and chase, confrontations with supposedly all-powerful figures, and a gingerly touch of sex, is designed to keep Max from being where it was foretold he would be regardless of anything done to prevent it. Finally, Sutton's use of ESP owes more to a need for narrative gimmicks than a desire to investigate seriously an important topic.

Perhaps believing that his ability for describing technological processes and penchant for conventional plotting and characterization might be better utilized in children's SF, Sutton pointed his next novel, *Apollo at Go*, at the juvenile market. Buoyed by the novel's positive acceptance, Sutton turned out seven additional children's SF novels, most of which were written in collaboration with his wife Jean. (Several more Jeff Sutton adult SF novels have been published but none has made any stir.) Unfortunately, after initial acceptance and subsequent tinkering to find other effective ways of attracting young readers, the Suttons have been unable to come up with the one unqualified success that would establish them as significant authors of SF. Still their children's SF is as good as the representative Nourse or Lightner juvenile, and superior to a typical Hugh Walters story. *The Programmed Man*, *Lord of the Stars*, and *Alien from the Stars*, in particular, are all action-packed, quick-moving novels. Considered as a whole, then, Jeff Sutton's SF, whether intended for adults or children, has fallen short of the first rank. Although always solid in its depiction of technological process and procedures and usually adequately grounded in its scientific speculation, his fiction has yet to move beyond the merely competent and predictable and to achieve originality and literary distinction.

—Francis J. Molson

**SZILARD, Leo.** American. Born in Budapest, Hungary, 11 February 1898; emigrated to the United States, 1937; naturalized, 1943. Educated at the Budapest Institute of Technology; University of Berlin, D. Phil. 1922. Married Gertrud Weiss in 1951. Staff member, University of Berlin, 1925-32; research worker in nuclear physics, St. Bartholomew's Hospital, London, and Clarendon Laboratory, Oxford, 1934-38; staff member at Columbia University, New York, 1939-42, and, with Enrico Fermi, University of Chicago, 1942-46: devised chain reaction system with Fermi; resident fellow, Salk Institute of Biological Studies, La Jolla, California, 1964. Recipient: Atoms for Peace Prize, 1959. *Died 30 May 1964.*

\* \* \*

Leo Szilard will always be remembered more for his involvement with the atomic bomb than for his literary achievements. His sole work of science fiction, *The Voice of the Dolphins and Other Stories*, is of interest more because it is written by a famous physicist than for any particular merit. All the stories are told in dry, lecture-tour manner, rather like the crudest efforts of the Gernsback era. Szilard was a vigorous thinker but he showed no interest in character development or plot. Instead, he merely presented ideas. The title story concerns efforts by dolphins to control the human race, using scientific organizations as fronts. They do fairly well for a while. All this is told in straight exposition, as a "non-fact" history. Some of the political predictions have turned out to be uncannily on the mark, others way off. "My Trial as a War Criminal" concerns the possible guilt of the early atomic bomb scientists. The others are less important. "Report on 'Grand Central Terminal'" has future extraterrestrial archeologists puzzling over pay toilets.

\* \* \*

John Taine was the pseudonym used by the prominent research mathematician Eric Temple Bell in his science-fiction novels. Taine was a respected science-fiction novelist during the 1920's who turned to the pulp SF magazines with the depression. His best work blended theoretical inquiry into the unknown with high adventure in the H. Rider Haggard tradition, and he combined sound science with a rare storytelling ability.

The major preoccupation in Taine's handful of novels is that of technological disaster. In almost all his work, scientific inquiry into the unknown precipitates an impending cataclysm. These disasters can be man-made, as in *Seeds of Life*, natural, as in *The Iron Star*, or accidental, as the monsters created in *White Lily*. In *The Greatest Adventure* and *The Purple Sapphire* unknown cataclysms in remote antiquity have their effect on the modern world. *The Time Stream* links the destruction of a future world with the great San Francisco earthquake.

Taine's novels invariably focus on individuals who band together to quest into the unknown. Often, he teams a scientist with an adventurer. On one level his narratives function as scientific mystery stories in which inexplicable phenomena screen a hidden truth. Taine slowly—in *White Lily*, ponderously—reveals the solution through his close-mouthed scientist characters. At times complete and final answers are withheld in order to maintain a sense of wonder and mystery. This is particularly true in *The Greatest Adventure* and *The Purple Sapphire*, both of which concern survivals of ancient super-civilizations of Earth's past. In *The Greatest Adventure* an Antarctic expedition uncovers the remnants of such a civilization. Under the ice is a city which had entombed itself alive rather than allow the possibility of escape to the mutated creatures spawned when they discovered the secret of life. The expedition inadvertently activates the menace. Taine concentrates on the biological nightmares, and neither explores nor identifies the ancient civilization, but this enhances the power of the novel. On the other hand, this reserve limits the otherwise excellent *Purple Sapphire*. Three seekers of fortune discover a fantastic city in the heart of Central Asia where a degraded theocracy guards its technological marvels against the day its true inhabitants return. They do not return, and the three successfully rescue the kidnapped daughter of a British General but lose the secret of transmuting matter.

Genetic mutation is a theme Taine finds fascinating. Two novels, *Seeds of Life* and *G. O. G. 666*, deal with the consequences of human genetic tampering. *Seeds of Life* chronicles the brief career of a dissolute research scientist, Neils Bork, who becomes a superman when exposed to radiation. Bork, who considers human life beneath contempt, masterminds a fiendish plan to eradicate all humans, but is stymied when he regresses and falls in love with the women he has chosen as the instrument of annihilation. A similar figure is Gog, the hulking travesty of a man whom plant geneticist Dr. Clive Chase encounters in his investigation of a Soviet plan to liberate its

workers from drudgery in *G. O. G. 666*. Gog is the keystone of the plan, and he hides a secret darker than that of Neils Bork. *G. O. G. 666* is somewhat marred by its Cold War preoccupations. *White Lily* also depicts Russia in an uncomplimentary light. In China, two despicable Russian agents foment revolution. Against this bloody backdrop, a US soldier has unwittingly introduced silicon-based lifeforms on Earth, which run unchecked.

Considered to be his greatest work, *The Time Stream* is a complex excursion into the dynamics of time travel and cyclical universes. The Time Stream is the medium by which ten individuals from the future send their minds back to 20th-century San Francisco. There they live new lives in an attempt to determine if a scientifically forbidden marriage will result in the destruction of their world. Although somewhat confusing in its narrative structure, *The Time Stream* is nevertheless a compelling example of imaginative writing. Of his other works, *The Iron Star*, a novel of a destructive asteroid, and "The Ultimate Catalyst" are noteworthy.

\*

Stephen Tall commented:

(1981) I was born in Tennessee near the Big River, the Mississippi, the son of a country doctor and a cultured, sensitive mother. The levees, the cotton fields, the cypress swamps, and the cane breaks were my first playgrounds. And in our home books and good reading always had status. Respect for knowledge and how it is acquired was instilled early.

I have always been a biologist writing fiction, not the other way around. I write because I like to tell a good story, and because the mechanics of good writing are pleasing to me. My stories are about what I know, and about what I have concern for. They have always reflected my awareness of and interest in the living world other than man. I wrote stories based on ecology before the word was generally familiar. I regard science fiction as almost the ideal medium for expressing ecological concerns: any species, any race, anywhere.

\* \* \*

Approximately half of Stephen Tall's science fiction concerns the crew of the interstellar explorer ship *Stardust*: six short stories collected as *The Stardust Voyages* and one of the two published novels, *The Ramsgate Paradox*. They are in many ways from the same mold as the television program *Star Trek*. A crew of 400 staffs the ship as it makes its way from one star system to another, but for all practical purposes, there are only three characters. Roscoe Kissinger is the obligatory hero, not too long on brains, but courageous to a fault. Equally necessary is Lindy Peterson, the attractive female scientist whose major significance seems to be to require rescue by Roscoe. The last is Pegleg Williams, the tried and true best friend, comic relief, and jack of all trades. There is also an elderly woman whose psychic abilities manifest themselves in her cryptic paintings.

There is no doubt that the entire series is built around pure stereotypes. Nevertheless, some of the adventures have been very well received. Perhaps the best known is "The Bear with a Knot on His Tail", in which the star Mizar is about to explode and the *Stardust* arrives to carry off significant records and frozen germ plasma of the local intelligent species. Perhaps the most interesting, however, is the first, "Seventy Light-Years from Sol" (retitled "A Star Called Cyrene"). This time our protagonists land on a planet inhabited by two very distinct races. The first consists of featureless vari-colored cubes who

can teleport themselves about from one location to another, and do so frequently in order to escape the predations of a species of carnivorous wheel. But now the cubes face a new threat, invasion from a nearby island of formless blobs, against which they have no defense. Human policy is to avoid taking sides in local squabbles, but the crew decides that offering advice is not tantamount to interference. This strange twist of logic seems not to present any problems to the characters or the author, and the story is well written enough for us to ignore the chauvinism. These two stories set the pattern for the rest of the series, in which the three central characters meet and overcome a variety of menaces ranging from a manifestation of ancient Greek gods to mutated giant crabs. The latter appear in "The Invaders," another above-average story that suffers from problems of internal logic.

A non-series story of note is "Allison, Carmichael, and Tattersall" which seems to have been molded at least in part by recollection of the Arcot, Morey, and Wade stories of John W. Campbell Jr. Indeed, much of Tall's fiction would not have been at all out of place in the 1930's, although the level of literary achievement is substantially higher. This was also the beginning of a truncated series, and is a satisfying light adventure story marred by over-reliance on coincidence, a flaw which appears in many of the other stories as well.

*The Ramsgate Paradox* is distinguished from the shorter *Stardust* pieces only by length, making no serious effort to add substantial depth to the characters. The second novel, *The People Beyond the Wall*, is also a return to a tradition largely abandoned in the genre, the Utopian novel. A pair of adventurers set off to explore an area of glacier in the Antarctic and find themselves in a hidden land where people have returned to a pastoral existence unmarred by organized strife. Although this is probably the most ambitious work Tall produced, it falls prey eventually to an internal problem of most such novels; the plot begins to slow to a crawl as the varied aspects of the totally sane but rather dull society are revealed. Tall loses control totally in the final chapters, jumping forward years in time, introducing new characters, and confusing the reader. Nevertheless, the early chapters are quite well done, and the move away from the repetitiveness of the *Stardust* stories is promising.

—Don D'Amassa

*Seagulls under Glass.* New York, Doubleday, 1975.

\* \* \*

Although Peter Tate can be a futurist, an allegorist, and a fantasist, in his major work he is a realist who utilizes current trends in natural and social science as well as technology for conveying his values. His concept of science fiction is a "work styled in protest at a particular facet of . . . technology and using research to qualify that protest" (introduction to "The Post-Mortem People" in *Seagulls Under Glass*). Unlike futurists who project their characters onto other planets, eons removed from the present, Tate remains on a familiar earth only a few years distanced from the copyright date. He chooses recognizable settings (Waukegan, Zimbabwe, New Forest) and with them creates an illusion that his scientific and technological projections have already left the laboratory and are threatening the balance in man and nature. Likewise, he interweaves imagined crises with references to current headlines (Che Guevara, Vorster, Kent State, Mozambique), thus enabling the reader to fuse fabrication with newspaper fact. Sobering is his recognition that heroes sometimes die. Tate further asserts the realness of his fictions by overlapping characters and plots. Simeon and Tomorrow Julie star in *The Thinking Seat*, *Moon on an Iron Meadow*, and *Faces in the Flames*; Scarlatti and Prinz counter each other in *Gardens one to Five* and *Faces in the Flames*. Famous Gogan slips in and out of *The Thinking Seat*, *Gardens One to Five* and *Faces in the Flames*; and Shem of *Gardens One to Five* is a memory in *Faces in the Flames*. Even more interesting than overlapping is Tate's technique of using fiction to authenticate fiction, as in *Moon on an Iron Meadow* where he returns to the buildings, people, and atmosphere created 50 years before by his mentor Ray Bradbury (*Something Wicked This Way Comes*).

Many of Tate's plots are compelling in their fast-paced intrigue ("Skyhammer"); their allegorical assessment of social and political foci (*Gardens One to Five*); or their subtle ambivalence between realism and fantasy (*Greencomber*). A few are bizarre. In "Mars Pastorale" a defenseless poppy seed invades a defenseless human's throat; in "Post-Mortem People" licensed ghouls stalk dying men for healthy body parts; in "The Gloom Pattern"—whose science, says Tate, is "bunkum"—a youngster is sucked up from his earthly existence on an "ecstasy beam" when he craves a sad man's happiness. Tate's humor surfaces in the provocative "Same Autumn in a Different Park." In this parody of the Adam-Eve story, Addison springs from the side of Tina who with the help of "molecular rejig" turns into an apple which is eaten by the new Adam.

Tate sees the world as essentially good; but it has been contaminated by ignorance, indifference, misguided heroics, self-serving, and malice. As in Bradbury's *Something Wicked This Way Comes*, the spirit of evil is pervasive and its confrontation inevitable. It periodically erupts in such "bodies" as the United Nations, desalination plants, canisters of biological weapons, defoliants, contaminated rabbits, atom bombs, church "Prinzes," and Hitlerian megalomaniacs. Once this force is loose, balance between good and evil can be restored only by a figure who embodies the spirit of pristine Christianity: "the time of authenticity on the lake shores of Nazareth before two thousand years of controversy and schism and compromise and commerce had muddied the waters beyond perception" (*Faces in the Flames*). Simeon, along with Shem, Nelso Ojukwe (*Faces in the Flames*), Greencomber, and Adams ("Mainchance"), insists on rational, willed self-involvement—even to the point of death—against any sort of manipulation of humans. Like the Galilean, all of these heroes provoke action in the quiescent; by the force of their integrity, they transform

Judases and self-deceivers into disciples. A developing theme from *The Thinking Seat* to *Greencomber* is individual and social transformation effected by altruistic love.

Tate enjoys language. He puns, makes memorable metaphors, and sometimes achieves a mesmerizing lyricism. His use of myth is haunting: blood is the price for exaltation; life consciously saved counterbalances that which is wantonly taken; love dispels enslaving myths created by malevolent scientists. At times he mistakes clichés for original expression, or reaches too far for an apt comparison. But Tate is a stimulating writer who structures complex materials into convincing fictions.

William F. Temple commented:

(1981) I've read SF since childhood. At first, uncritically: I didn't notice it was only two-dimensional, i. e., lacked depth, especially in characterization. Then critically: I decided to try to add that third dimension in my writing. Then despairingly: Nobody noticed that I had. Then cynically: Nobody wanted it, anyway. They preferred their robots. Then uncaringly: I don't bother to write it any more.

\* \* \*

Most critics would agree that the golden age of modern science fiction occurred in the 1930's. Then were found the pulp magazines with such visionary editors as John Campbell to encourage and develop the writers who were to become almost legendary figures in the field. While Asimov, van Vogt, and others were honing their skills in the United States, William F. Temple was drawn to science fiction in England. Temple's interest, like that of his counterparts across the sea, was fostered by his companionship with Arthur C. Clarke, John Wyndham, and John Christopher. In the early days of science fiction there seemed to work among such individuals a kind of cross current which stimulated and sustained them in the creation of materials at which conventional critics of the day looked askance. Only the hardy survived those pioneering times to bring forth such

books as *Childhood's End* and *No Blade of Grass*. That Temple was of durable stuff was demonstrated by what he went through to turn out what was perhaps his most notable work, *Four-Sided Triangle*. While serving in Africa with the Eighth Army in World War II, Temple converted what had been a short story into novel length. Despite the novel's publication delay, its survival qualities could not be extinguished. In a fascinating variation of the trite, a woman selects one of the two suitors who vie for her. The man who loses uses a matter-copying device to create an "exact" duplicate of her—which loads the novel's plot structure engrossingly.

Some readers may find Temple's work a bit stuffy at times, but his plots employ interesting contrasts and conflicts: a group of explorers investigates the alien topography of the Moon, but the real territory to be mapped is the unknown personality of warring party members. His story ideas are usually quite interesting, as in a short story like "A Date to Remember." This yarn seems almost banal in some ways—a wife about to bring forth a child, rainy night, success/failure conflict of two old school chums. Then we discover the central idea, that Martians have long "passed" as Earthlings, struggling to civilize the inhabitants of Earth while disguised as Byron, Pasteur, Haydn, and others throughout the centuries.

—Robert H. Wilcox

\* \* \*

"The incredible William Tenn," as he has been dubbed by Brian Aldiss, started a whole school of comic and satiric science fiction in the 1940's. Tenn quickly perfected a way of looking at things, at once funny, bitter, and serious, that made him the natural heir to the nearly silent tradition of Swift and Voltaire. Sheckley, Pohl, Ellison, Russell, Goulart, Knight, Kagan, Eisenberg, Brown, Lafferty, and Malzberg have all echoed Tenn's work at one time or another. A serious humorist, Tenn has had a double problem. The science-fiction genre has always made it difficult to tell serious writers from entertainers, through the manner of publications and because the entertainers often claim to be serious, or have it claimed for them; also, satirists and funny men have rarely risen high in the genre (in terms of awards and sales). Tenn was a pioneer whose example was imitated by writers who developed in different ways, but who also became known for the angle opened up by Tenn, thus diffusing the effect he might have had if his plumage had not been confused with that of imitators. Tenn imitations might have been more acceptable to some editors of the 1950's because they were watered-down versions of Tenn-like material—less serious and not so critical of the world and human nature. Tenn's stories are always a bit disturbing at some level, even when they are breathlessly readable, amusing, or cute.

An outgoing but sensitive man, Tenn fell silent by the end of the 1960's, even as his work was gathered into an impressive, though editorially flawed, six-volume set from Ballantine. One suspects that neglect made him feel that perhaps his work was not worthy. He went on to become an excellent college teacher, leaving behind a body of work sufficient to secure the reputation of any major writer in this field, and a name often confused with another Klass in various reference works. He published one story in the 1970's, "On Venus, Have We Got a Rabbi," which Damon Knight called "the great story he was talking about in the fifties." It was well received, garnering award nominations and appearing in a best of the year collection. There have been recent signs that he will soon have several works, including a new novel, to offer his readers. Tenn was also the editor of *Children of Wonder*, a pioneering theme anthology which was notable for its variety of stories and non-parochial choice of authors. Two incisive essays, "The Fiction in Science Fiction" and "Jazz Then, Musicology Now," are both required reading

for anyone who cares about the ideals of literate science fiction, if not its practice.

Notable stories from Tenn's first two decades include "Brooklyn Project," which Fritz Leiber has called a "Marvelously cynical" time-travel story, and "Firewater!," one of the most sophisticated stories ever published by John W. Campbell, with its unforgettable lament by Larry for the loss of what he was and what he cannot be as humanity struggles to keep its sanity before the seemingly superior aliens who have taken up residence on earth. The story should have taken all the awards. "Generation of Noah" is one of the finest atomic threat stories ever written. "Of All Possible Worlds," "Wednesday's Child" (a fascinating sequel to the much reprinted classic "Child's Play"), "Time Waits for Winthrop," "Eastward Ho!," and "The Malted Milk Monster" all drew honorable mentions in Judith Merrill's best of the year collections, while "Bernie the Faust" took pride of place as the first story in the 1964 collection. "Time Waits for Winthrop" shows a remarkable use of exotic ideas, among them fairly advanced biological concepts, another feature of Tenn's stories that makes them unusual for the 1950's. "The Discovery of Morniel Mathaway" shows an understanding of the creative process that is usually beyond most SF writers. Jacques Sadoul has called it "the most beautiful example of a temporal paradox offered by science fiction." "The Custodian," with its plea for the blending of art and utility, and "Down among the Dead Men," with its clever use of offstage space opera to heighten a pathetic predicament, both manage to do what few SF stories can do—move us emotionally and intellectually on a mature level.

Tenn is always a master of situations, which at first prod and intrigue, then provoke curiosity, make us laugh a bit, then explode into some thoughtful irony or observation. Once you catch on to a Tenn situation, you can't stop reading. The satirical tones of irony, mockery, slapstick, and occasional bitterness do wonders for genre materials, precisely because Tenn joins these materials to human experience outside the insular worlds of SF wish-fulfillment and power fantasy. The science-fiction materials are all there, strong and clear, but just as you're about to accept the story at its face value Tenn hits you with something real and painful. He's a very sly writer, inserting polished, precise narratives into our minds through unexpected channels. Many of his stories have the effect of blossoming into a single line of great beauty and illumination; but always the aesthetic fires are banked by irony and, above all, eloquent wit, behind which sits the ultimate authority of an author who has something to say, who sometimes seems to believe with Oscar Wilde that eloquence and wit alone can make the scales fall from human eyes. One senses an author laughing and crying at the same time, writing, exhibiting intellect and dramatic talent within the confines of a narrow genre.

Tenn's two long works are the novel *Of Men and Monsters* and the short novel *A Lamp for Medusa*. The second work is easily worthy of having appeared in *Unknown Worlds*. Funny, atmospheric, and wonderfully paced, this neglected work has seen only a shabby book appearance. It is not surprising, given Tenn's tendencies, that it recalls the poise of the *Unknown Worlds* tradition, since that magazine was the only sizable market for humorous work of the early 1940's, and Tenn's only antecedent within the SF genre.

*Of Men and Monsters*, a story of humanity living in the walls of the houses of giant aliens who have occupied the earth, is a vivid, energetically paced story which best embodies one of Tenn's main points: that humanity is not what it thinks itself to be, that implicit in our biological history is a nature not of our making; we may glimpse it, even understand it at time, but it may

be a while before we can remake ourselves, if ever. In his awareness of biological and anthropological complexities, Tenn has at the center of his work the most thoroughgoing of science-fiction methods: the collision of the possible with the actual, with the actual displaying fantastic holding power. Eric the Eye, the Lilliputian viewpoint character of the novel, learns that his society is not what he thought it was, that its rites of passage are a sham, and finally that human beings are not what he thought they were either; since change seems unlikely on a radical scale, he accepts this human nature and joins the plan to make of it something pervasive and influential. Eric becomes part of the reverse invasion of human vermin as they begin the infestation of the great alien starships. The story is very vivid, the characters charming (Eric meets Rachel Esthersdaughter, one of the nicest nice Jewish girls in all science fiction). The death of Eric's uncle is shatteringly presented. There are great wonder and awesome confrontation, sharply realized. Most importantly, there is an anthropological sophistication in the depiction of social systems; the aliens are properly terrifying, puzzling, and *other*. Tenn's tendency to romance, compassion, and brief, hard-bitten sentimentality shows through his bitterness just enough to be believable. The novel may be compared to Daniel Galouye's *Dark Universe* and Thomas M. Disch's *The Genocides*.

It is regrettable that Tenn stopped his development in the 1960's, when it was clear that the continuous practice of his craft, coupled with his acute and constant rethinking of the nature of fiction and science fiction, would certainly have produced a mighty progress over his very worthy body of work. Now that he seems poised at the start of his most mature period, it remains to be seen whether he will continue the main line suggested by his previous work, or whether his silence is a sign that he has been developing a new direction. He can do anything he wants, except hack work ("I have no talent for it," he has said). Few writers have ever suggested so much promise at the start of their sixth decade. Tenn belongs to the great generation of Asimov, Heinlein and Clarke. He is the most perfect example of the failure of the awards system within the science-fiction community, and an obvious candidate for the Grand Master Nebula Award. His work is a clear example that SF can be literature, that it can provoke us to see, feel, and think. Tenn belongs to that unbroken chain of sayers who expose our delusions and foibles, our willful blindness and stupidity, and who ultimately stand against death and the amnesia of generations. "Tenn is another artist," Damon Knight has written, "who won't stop till he's had the last word."

\* \* \*

Emma Tennant's fiction explores realms of satirical, psychological, and apocalyptic fantasy, worlds where past and present, reality and illusion, mingle freely, if often uneasily. Although a sophisticated humor marks much of her work, a sense of futility and loss ultimately prevails, and Tennant's novels generally conclude on despondent if inconclusive notes.

The threat of apocalypse which frequently underscores this sense of failure is emphasized most fully in Tennant's first novel, *The Time of the Crack*. In this tale a cataclysmic earthquake levels London and splits the Thames, creating a startling image for what one character refers to as a "schizophrenic society" and providing a visual metaphor for Tennant's contrast between a collapsed city and "the other side," an idyllic world where life will be perfect. The characters in the novel strive to reach this promised land—particularly the women, banded together and led by a charismatic liberated leader named Medea Smith. Of course, as in all of Tennant's stories, the striving is usually in vain and the paradise does not measure up to its illusion.

The apocalyptic shadow is less ominous in *Hotel de Dream*, but the lure of an alternate reality is even stronger. The occupants of a seedy boarding house in Kensington, *The Westringham*, escape the fetid and oppressive atmosphere of the hotel and of their failed lives by sleeping, dreaming their various versions of a British paradise—royalty, position, exotic adventure, wealth; but gradually, they begin to wander in and out of one another's dreams, and soon the force of the collective

dream overtakes and controls them, and the outside world as well. The ultimate failure of the dream world to transcend reality suggest not only the futility of fantasizing but also the failure of a past England of aristocratic grandeur and glory to connect with the modern world. As Mrs. Routledge, the hotel's despairing owner, feels, the future "only seemed capable of presenting itself as a revamped and frequently misty version of the past."

This sense of collapsed time also permeates Tennant's other two novels, *The Last of the Country House Murders* and *Woman Beware Woman*, both of which are rooted in the murder and gothic mystery genre but are reshaped by Tennant's peculiar vision and clever plotting. The first one, set in an overpopulated future after an unspecified Revolution, centers around the government's plan to arrange the murder of the last great country-estate occupant—with his knowledge—as a means of bolstering the vital tourist trade. Again, reality and fantasy intertwine: long-dead relatives of the estate owner casually appear, and an intriguing character named Cedric suspects that the entire universe is an optical illusion. This novel, satirizing such groups as tourists, decadent aristocrats, and bumbling government authorities, is probably Tennant's most entertaining, though it does broach some thin political commentary.

The outcome is more grim in *Woman Beware Woman*, the most sophisticated of these novels. The setting shifts from England to southern Ireland, where a prominent writer is found dead near his seaside estate; the narrator, Minnie, who practically grew up with this family, returns to the estate after a ten-year absence, only to become entangled in an increasingly bizarre psychological web of circumstance. This is a tale of love and passion, jealousy and obsession, but is lifted above mere melodrama by Tennant's skillful and imaginative plot structure, by the supernatural allusions (the widow's mother is said to have possessed "the eye"), and by the disturbed narrator, whose chilling unreliability gradually becomes apparent.

Tennant's obvious concern with women—their desires and needs, their roles, obligations, and subjugation—receives its darkest, most sinister treatment in this novel, which ends in betrayal: woman against woman, a contrast to the bond of sisterhood suggested in *The Time of the Crack* and *Hotel de Dream*.

Tennant is an imaginative author whose clever plots unfold in futuristic and fantastic settings juxtaposed with the ordinary: a run-down hotel filled with dream, a crowd of regressing psychoanalysis patients at a funfair, a cracked river in London, a British manor house where a reddish-haired dandy is trying to decide on his murderer. Against these backgrounds, Tennant sets characters who often serve simply as allegorical roles; they are, for the most part, thin, cardboard-like, easily disposed of, and usually recognizable types.

Nor are Tennant's themes especially new: the end of the world, dreams as reality, utopian promise, social and political satire, the gothic mystery or murder of manners—most of these have long traditions. Rather, it is her particular blending of these elements, along with her peculiarly beguiling style, humor, and imagination, that distinguishes Tennant's works.

However, Tennant offers no solutions, no alternatives, in the quirky worlds she creates, where characters are caught between a failed past and a bleak future. She merely implies that we cannot return to a treasured past and that illusions of an idyllic future are false. Perhaps these stories are warnings, perhaps only nihilistic views disguised as satire, or perhaps merely reflections of the human condition and its absurdity.

\*

Walter Tevis commented:

(1981) I suppose I write disguised autobiographies. The idea, as far as I know, is to move other people. I feel alienated from other people sometimes; when I was younger the feeling was stronger than it is now. My major characters are alienated, by virtue of being pool players, from Mars, robots, the only people alive who can read, or alcoholics. I like to write about people under psychological stress, and when I write I am very serious about it.

\* \* \*

Thomas Jerome Newton, in *The Man Who Fell to Earth*, is an emissary from the dying planet of Anthea, sent to prepare a refuge and transportation for its last few survivors. We never learn his real name. By introducing advanced Anthean technology Newton amasses the necessary millions of dollars, but attracts the attentions of the FBI who imprison and interrogate him, blinding him in the process. Eventually released, he abandons his project and dwindles into perpetual

alcoholic exile. Earth, though they colonised it in the first place, is no place for Antheans. Walter Tevis's novel is the classic refutation of the alien invasion theme in SF. He reduces the interplanetary war to a case of depression, the story of the loneliest man in the world. Newton could save mankind, but represents a threat to the American economy. He is disabled not by military might or scientific ingenuity, but by smothering bureaucracy. Seeing Newton decrepit and drunk in a bar, Nathan Bryce, his only human confidant, reflects that he "certainly would not have been the first means of possible salvation to get the official treatment." Christ, it seems, was an Anthean too. The failure of Newton's mission is a slow, pathetic crucifixion. Bryce remembers Thoreau's dictum: "quiet desperation" is the mood of the novel, an unobtrusive tragedy in an unostentatious style that conceals irony, bitterness, and ultimately cold fury. "I worked very hard to become an imitation human being. . . ." Newton says. "And of course I succeeded."

*Mockingbird* is altogether less original and distinctive. In a future America run and serviced by robots human faculties, emotions, and even social urges have been eroded. The senior robot, Bob Spofforth (Mark Nine), is an interesting figure of moral ambivalence, sexless and immortal, but plagued by human dreams that slipped in under his mental programming. As in Bradbury's *Fahrenheit 451*, literacy is suppressed but the hero learns to read, and is emboldened to further rebellion when he meets a woman less obedient to convention than he is. The book is efficiently plotted and written, but suffers from too much formula and too little variation.

Tevis's only collection, *Far from Home*, divides neatly into six competent but routine novelty stories, mostly from *Galaxy* at the end of the 1960's, and seven more searching pieces from 1979-80, including four previously unpublished highly Freudian self-examinations. These latter fictions demand to be read with a sympathy for their author which they do not altogether repay, but it seems that in its primary therapeutic purpose Tevis's writing finally, if precariously, succeeded. *The Steps of the Sun* tells how a big, rich, glum, impotent American restores himself and his impoverished nation by an illegal venture into space. In Tevis's quaintly benevolent cosmos, Ben Belson swiftly finds not only "safe" uranium but also a perfect analgesic and a sentient planet that mothers him through his self-induced psychological crisis. What is hard is bringing these gifts back to Earth, whose authorities treat the returning explorer with all the suspicion and hostility they showed to the extra-terrestrial benefactor in *The Man Who Fell to Earth*. Whereas Thomas Jerome Newton is last seen drunk and defeated, Ben Belson's life on the run culminates in a period of stringent purification in a bleak, utopian China before a final symbolic tableau in which he and his wife switch on all the lights of a New York dark for 30 years and more. *The Steps of the Sun* annoys those who insist on reading science fiction literally, but as a fantasy quest through a damaged psyche it is effective and affecting. It ended Tevis's melancholy career on a hopeful note.

#### D. M. Thomas comments:

Most of my science-fiction poetry is collected in one publication, *Penguin Modern Poets 11* (1968). Since then I have remained interested in the mythic aspect of SF, but have moved away from "pure" SF into other areas of myth.

\* \* \*

D. M. Thomas's SF writing is largely restricted to his earlier poetry, published from the mid-1960's through the 1970's. Since that time he has turned increasingly to fiction, and he has gained considerable attention, especially for *The White Hotel, Ararat*, and its recent sequel, *Swallow*. Thomas's work in these forms is unified by common themes, particularly by the emotional and psychological structures that link sex, love, death, and artistic creation.

Thomas's SF poetry is often narrative, relying on SF settings and tropes to explore the emotional tangles that might arise in these placements with effective imagery, striking metaphors, and evocative language and tone. Poems like "Missionary," "A Dead Planet," and "The Strait" tell the stories we identify with science fiction—alien contacts and troubles with androids. Other poems show Thomas moving confidently across a variety of forms: from the evocative lyrics of "Fire Victims" and "Elegy for an Android" to striking dramatic monologues reminiscent of Browning like "Tithonus" and "Hera's Spring." The poet

can produce both the traditional dialogue "A Conversation upon the Shadow" and visually stimulating concrete poems like "Symbiosis" and "Mercury." In most of these, Thomas demonstrates his skill at reworking the mythic inspirations supplied by science-fiction stories. The most striking examples of this latter strategy are "The Strait," based on Bradbury's *Marionettes Inc.*, and "Hera's Spring," arising in response to Clarke's *The City and the Stars*. The former work poignantly captures the painful emotions aroused when a living woman must be replaced by an android duplicate. In "Hera's Spring" the motherly speaker tries to allay the sudden sense of loss and sorrow that a newly reminded Jeserac faces when he realizes the hundreds of lives he has lived before his present existence.

Thomas often relies on the myths of SF to emphasize isolation and alienation, love, sex, and violence, concerns especially apparent in his formally innovative, tabular poem "Hospital of Transplanted Hearts." In its multiple possibilities for reading and interpretation, this work seems to anticipate Calvino's *Castle of the Crossed Destinies*. In "The Head-Rape" Thomas explores the need for personal mental seclusion, especially in the complex and powerfully charged atmosphere of sexual violence—here as brutalization, but in "A Conversation upon the Shadow" as part of intimacy and love.

These themes continued to fascinate Thomas, and his later work often returns to them, often published in *New Worlds*. Indeed, pieces appearing in this periodical reveal Thomas's progression from poetry within the genre to work belonging more in the mainstream. Long and extremely complex poems like *Two Voices* and "Computer 70: Dreams and Love Poems" still rely on technology and estranged settings to examine love and sorrow; and the former is particularly evocative of a post-holocaust survivor's experience balanced by the reflections of a woman who is both the unwilling human and the mythic earth mother. "Mr. Black's Poems of Innocence" marks the first of Thomas's incursions into the social sciences for his estranging material, and the poem is a masterpiece of parody mixed with serious, if fictionalized, psychotherapy. A mute schizophrenic suffers operant conditioning therapy, but between his outward, verbal answers we read his inner figurative musings. These center on a fantasy of his own entrapment and isolation, first associated with being a trapped sweep in a labyrinthine chimney, and then with passages from Rider Haggard's *King Solomon's Mines*. This latter material is especially important because it returns in yet another guise in Thomas's latest novel, *Swallow*, where once again the writer feels compelled to rework the figures of desire, greed, and death.

Although Thomas published several more pieces in *New Worlds*, these were increasingly removed from the usual settings and tropes marking SF. With the series that appeared in September 1979 ("Primitive Behavior," "A Letter From Marina," "Fathers, Sons and Lovers," and "The Woman to Freud"), he seemed to have given up the technological side of SF altogether. Here, we find material anticipating that in *The White Hotel*—for example, in the next to last, a historical fictionalization of the letters preceding the suicide of one of Freud's disciples, and in the last the sexual fantasy about a hysteria victim and Freud's son, which becomes the first section of the "Don Giovanni" section in the novel.

Throughout his work, Thomas shows the potentiality of science fiction's myths for poetic expression. We can only hope that he will again turn his prodigious skills in this direction.

—Len Hatfield

THOMAS, K. See FEARN, John Russell.

**THOMAS, Ted** (Theodore L. Thomas). Also writes as Leonard Lockhard; Cogswell Thomas. American. Born in New York City, 13 April 1920. Educated at Massachusetts Institute of Technology, S. B. 1947; Georgetown University, Washington, D. C., J. D. 1953. Served in the United States Army, 1943-46: 1st Lieutenant. Married Virginia Kent Paton in 1947; two daughters and one son. "The Magnificent Profession," in *Fantastic Universe* (Chicago), November 1955.

\* \* \*

Over a period of more than two decades, Ted Thomas has produced a small but steady stream of short stories of unusually high calibre. Although he has yet to produce a novel that is solely his own work, he has collaborated with Kate Wilhelm twice at novel length, and in each case the end product has been of superior quality. *The Clone*, for example, based on a short story of the same name by Thomas alone, is one of the most frightening and plausible tales of biochemistry gone wild. An amorphous creature is spawned in the sewers of a major city, able to absorb virtually any other organic structure—including people—upon contact.

*The Year of the Cloud* deals with the theme of world disaster. The Earth passes through a strange interstellar cloud that has catastrophic effects on the planet. Tidal waves and volcanic activity are only short-term problems. The oceans turn into a gelatin-like substance and water is in short supply everywhere. The disaster is seen through the eyes of a number of characters, some of whom are working to reverse the effects of the cloud. But the cloud eventually proves to be a mixed blessing in this story, which combines scientific investigation with straightforward adventure.

Thomas himself is best known for his short stories, including those set against a background where the Weather Control Board controls the Earth because of its ability to affect the lifestyles and commercial undertakings of everyone on Earth. In "The Weather Man" a section of Australia refuses to abide by their authority and is threatened with a drought as a consequence. In "The Weather on the Sun" the efficacy of the government is endangered when the nature of the sun begins to alter, with unpredictable effects on the weather of our own planet.

"Satellite Passage" is a poignant tale of the near passage of two manned satellites, one from the United States and one from the Soviet Union. As the time of passage nears, there is considerable worry by the Americans that the Russians will commit some overt act of violence, but ultimately there is an accident in space and a Soviet cosmonaut is rescued by the Americans. Thomas also portrays the effects of a prolonged stay by a team of two men on the moon in "The Far Look." After experiencing a number of near disasters, the returning men possess a difference in demeanor that is quite noticeable.

Thomas assumed that H. G. Wells was correct about the Martians in "Day of Succession." When a ruthless general begins destroying the inhabitants of landing space vessels without warning, the authorities remove him from authority. The next capsule unleashes a technological onslaught against which human armies cannot stand, and the general assassinates the President in order to resume his program of eradication. A criminal is sentenced to be hanged each year in "December 28th," then brought back to life and allowed to recover in time for his next execution.

Thomas's use of irony is perhaps best illustrated in "The Doctor." A physician is stranded in prehistoric times when an accident destroys his time machine. He attempts to help the local residents by using his medical skills, but his attempts to extract teeth, set bones, etc. are viewed as hostile acts, as his intentions are totally misunderstood. Similarly, in "The Tour" a scientist realizes that visiting politicians do not understand his policy of using drugs to treat incurable murderers, and he subsequently commits murder himself in order to protect his program.

Thomas has several times collaborated with Theodore Cogswell, most notably with "Early Bird", a humorous tale of a human space pilot whose ship becomes transformed when it

arrives on a most peculiar planet, evolving in a strange merge of mechanical and organic development, and in "Paradise Regained," in which political exiles decide to terraform the planet upon which they have been confined. "The Players at Null-G", written with Cogswell and Algis Budrys, is a humorous spoof of the time-travel story.

\* \* \*

Robert Thurston established himself as a significant new writer in the science-fiction genre on the basis of his short fiction and has only recently turned to original novels, some of which develop themes presented earlier in short form.

One of Thurston's earliest short stories, "Carolyn's Laughter," hovered around the border between science fiction and the supernatural. A young man is troubled by memories of his first wife, now deceased, and eventually resorts to a computer medium in a half-hearted effort to contact her spirit. Carolyn had agreed to have her organs used in transplants, and there is some evidence that she may have reached across the borderline between life and death in an effort to reclaim the parts of her body that survived. This theme recurs in a very recent story, "The Fire at Sarah Siddons," in which a man's life is completely dominated by a message he receives from his dead wife.

Both stories are well plotted, but the outstanding quality of these and most of Thurston's short fiction is the detailed and convincing development of characters. "Under Siege," for example, works only because of its fine characterization. Within the context of a racist police state, a white liberal with a black wife is plagued by the constant silent presence of a black man. The growing tensions among the three are superbly handled, and the story might well have attracted much serious attention if it had been published in mainstream markets.

Time travel is ostensibly the subject of "Kingmakers," in which a man travels through the past to write a biography of a pivotal figure, but the four visits he makes, spaced widely apart in the lifespan of both men, cause tensions and contrasts that are the main focus of the story. Thurston's short stories run the gamut from comic to surreal, occasionally strongly plot oriented but more frequently concerned with character and theme. Doppelgangers show up frequently, with inexplicable duplicate women in "Goodbye Shelley, Shirley, Charlotte, Charlene," a host of people with no apparent pasts in "Searching the Ruins," and two virtually identical wives in "Theodore and Theodore." Some of his stories deal with controversial themes, such as "Aliens," wherein a human male is used as a sex object by non-humanoid aliens, and "The Oonaa Woman," also quite explicitly sexual in subject matter.

Thurston's first novel, *Alicia II*, was uneven. As might be expected, Thurston did a remarkable job of developing his characters as human beings. Voss Geraghty callously accepts the society he lives in, one which classifies people early in their lives, designating some as "rejects" whose bodies will be confiscated in young adulthood to become the home of non-rejects. But Geraghty's new body was sabotaged by its former owner, and cannot function sexually. Following this blow to his view of the world, he must then re-examine much of what he believes about his own society. Unfortunately, the setting of the novel is unconvincing, and the long delay before the advent of organized resistance to its system is not particularly credible.

*A Set of Wheels* was a bit of a disappointment after the promise of Thurston's first novel. In the not too distant future, a young man becomes involved in a love affair with an illegal

automobile. The setting is brutal and dirty, a world of clandestine repair shops, police nearly as corrupt as the people they hunt, love tainted by mistrust and self-interest. Thurston uses unconventional dialogue, perhaps to emphasize the depersonalization of his future, but it also serves to flatten his characters as well.

*Q Colony*, his most recent novel, uses "The Oonaa Woman" as its opening and proceeds from there to provide a history of a failed human research colony on an alien world. It is easily Thurston's most successful full-length effort. The characters are not particularly admirable or heroic, but they are certainly original and convincing. The Oonaa and humans can interbreed, which might not make much sense scientifically, but it is an effective device by which to launch the tale of two colliding cultures and their different sets of values. As Thurston continues to develop as a writer, his themes have become more mature and complex, and the consequent rewards to be derived from his work become greater as well.

Patrick Tilley comments:

The books I write are designed primarily as entertainment but they are, essentially, about the human condition. For me, the elements of a story should go together like a Swiss watch. The plot has to have a logical basis; the story should not insult the reader's intelligence. A writer's job is to communicate with his readers as simply and effectively as possible. He should not make them reach for a dictionary, or try to impress other writers with the quality of his prose.

\* \* \*

One of the hallmarks of writers of stature is that they can take a standard plot and do something novel with it, something that makes it stand out among a crowd of similar stories. Perhaps one of the oldest, most overdone situations in science fiction is the invasion of Earth by aliens in flying saucers, and almost as hoary a plot is the first contact story. So it is particularly interesting that Patrick Tilley's debut novel, *Fade-Out*, is in fact a melding of both of these into a novel that should have been derivative and uninspired. The result was quite the contrary.

Borrowing from the film *The Day the Earth Stood Still*, Tilley has his aliens cut off all power to human machinery during their landing. Soon the government of the United States must cope with a mysterious vehicle and its inhabitants who either cannot or will not communicate, but who possess abilities far beyond those of the human race. The novel covers several months of tentative and then increasingly strident attempts by the government to regain control of the situation. Tilley has done in this novel much the same thing that Michael Crichton did for the space plague in *The Andromeda Strain*, that is, examine the situation in incredible detail, and portray the unfolding events in such convincing fashion that the reader is convinced that this really is the way things would happen.

Tilley's second novel, *Mission*, on the other hand, was further from the mainstream of science fiction, although it also is pervaded by a sense of absolute conviction about the sequence of events, the details of official reaction, and the manner in which the characters react to the situation. A dead body is discovered bearing the same wounds as those of Jesus when he died on the cross. But shortly after the body is declared officially dead, there are signs of life. The medical staff is understandably amazed, but their investigation is cut short when their patient mysteriously disappears from the hospital. The protagonist finds his life disrupted even further when his missing patient reappears, apparently quite healthy, and identifies himself as being Jesus himself. At this point, readers might dismiss the novel as an allegorical religious fantasy, but Tilley has more surprises in store. "Jesus" is actually an alien from another universe, using a human body from our far past, travelling through time because, to his/its perceptions, all times are simultaneous and it is an act of will to move from one to the other. In fact, the protagonist ends up travelling back through time himself in what is a very strange adventure novel, more ambitious than *Fade-Out*, and in some ways more interesting, but less successful as entertainment.

The most recent Tilley novel as of this writing is *The Cloud Warrior*, as different from its predecessors as they were from each other. Once again Tilley uses a standard science-fiction theme as the background for his story, in this case a post-nuclear-collapse civilization. The comparatively primitive culture that survives is essentially tribal, and the hero, one of the Wingmen, is captured by his enemies, the Mutes. His sojourn as a prisoner exposes him to the culture of the rival tribe and, rather than continuing to view them as an opposing force, he begins to

accept them as individual human beings. Peace begins to occur to him as more desirable than conflict or even triumph. But how can the gulf between the tribes be overcome?

*The Cloud Warrior* appears to be the beginning of a series, so presumably Tilley will have room to develop his future society even further. It is in this kind of detailed construction of setting that he excels, and it is likely that he will attract an increasing readership as his reputation grows.

—Don D'Amassa

**TIPTREE, James, Jr.** Pseudonym for Alice Sheldon, née Bradley. American. Born in Chicago, Illinois, in 1916. Educated at Sarah Lawrence College, Bronxville, New York; University of California, Berkeley; George Washington University, Washington, D. C., Ph. D. in psychology 1967. Served in the United States Army Air Force, 1942-46. Married 1) William Davey in 1934 (divorced, 1938); 2) Huntington Denton Sheldon in 1945. Worked as an art critic, for the Central Intelligence Agency, in personal business, and as college teacher and experimental psychologist. Recipient: Nebula Award, 1973, 1976, 1977; Hugo Award, 1974, 1977; *Locus* award, 1984. Agent: Virginia Kidd, Box 278, Milford, Pennsylvania 18337. Address: 6037 Ramshorn Place, McLean, Virginia 22101, U.S.A.

Critical Study: *The Fiction of James Tiptree, Jr.* by Gardner Dozois, New York, Algor Press, 1977.

\* \* \*

With the revelation that James Tiptree, Jr., is Alice ("Raccoona") Sheldon, the SF community that had praised Tiptree for treating feminist themes in a "masculine" style had to rethink its categories. In fact, Tiptree is simply a gifted writer who brings to her feminist concerns a critical knowledge of traditionally male domains—"all the huge authoritarian organizations," as one of her heroines puts it, "for doing unreal things."

Tiptree's early work is marked by a certain manic inventiveness and a preoccupation with far-future sex and science. Some of the best of these tightly written short stories are pure farce: "Birth of a Salesman," for instance, turns on the proposition that commercial packaging meant for distant client planets may trigger bizarre sexual and religious reactions among alien dockworkers. With powerfully dark stories like "The Last Flight of Dr. Ain," however, it became clear that Tiptree is more than a comic artist. Indeed, the twists of her fiction suggest a deeply skeptical turn of mind, wary of all absolutes, suspicious of all power.

These stories often have errant sexuality in the foreground. Human types encounter aliens whose sexual morphology is unstable or haploid ("All the Kinds of Yes," "Your Haploid Heart"), animal orgiasts who form delicious Lovepiles ("Pain-wise"), primitive mud-beings who offer "gentle glubbering" satisfaction ("The Milk of Paradise"). Tiptree exploits such situations to satirize our own sexual parochialism and, occasionally, to make a further point: even on alternate worlds or among weirdly equipped life forms, sexual existence is pain for the powerless.

In two overtly feminist stories, Tiptree's work revealed a new clarity and firmness of purpose. "The Girl Who Was Plugged In" translates social truths into grotesque literal images; it describes a near-future society that secretly uses devastatingly attractive waldos to sell goods and preserve the commercial status quo. The girl of the title is a monstrous socio-sexual reject who finds momentary happiness wired into an empty android playgirl. "The Women Men Don't See" is a vivid story of the invisible real women in our own world, surviving, as the protagonist tells the Hemingwayesque narrator, "by ones and twos in the chinks of your world-machine."

By one means or another, every recent Tiptree story condemns that world-machine as a tyrannical yet ultimately doomed system. Typically, her protagonists live anxiously on its margins. In "The Psychologist Who Wouldn't Do Awful Things to Rats" the system is the present scientific establishment, and the hero, himself a ratman of sorts, a "failed" researcher, "failed" because humanely dedicated. "Houston, Houston, Do You Read?" is Tiptree's most powerful anti-system work and a landmark in the recent feminist revival of the manless world story. In it, Tiptree identifies the male ethos of aggression and domination with life-plague. An epidemic in the past has left only women, their clones, and androgenic creations to refashion human existence. This history, patchily revealed to the crew of a NASA ship plunged 300 years into the future, is intercut with the scientist narrator's memories of their rescue and his efforts to comprehend a stunningly different reality.

An extension of this concern with sexual politics often surfaces in the short works and wholly informs the novella "A Momentary Taste of Being": the ambivalent force of the biologic urge itself, mercilessly driving toward the completion or transformation of species. The title of one of these stories, "Love Is the Plan, The Plan Is Death," could serve for them all. In "A Momentary Taste of Being" humanity is forced to the stars to fertilize like spermatozoa alien ova. Surrender to the female half of a zygote is seen by most as an estatic taste of being,

but the narrator, a quasi-objective male doctor, sees it as doom—"Sex equals death." The death literally occurs; the worth of the sacrifice remains a matter of faith.

For *Up the Walls of the World*, her first novel, Tiptree creates an epic transformational journey through space and time for a group of painfully human telepaths. In alternating chapters that shift from our own botched world to a dying parallel world and into the center of a vast star-destroying being, a drama of destruction versus creation unfolds. Philosophically rich and formally ambitious, the novel is evidence of Tiptree's powers.

In sharp contrast to her expansive first novel, Tiptree's second, *Brightness Falls from the Air*, is a tightly constructed thriller. In cast and situation, the novel recalls the film noir, *Key Largo*: during a tense day and night, an outpost planet in the far future is taken over by thugs while a nova front, the auroral detritus of an exploded star, approaches. As the conflict develops between three planet administrators, their tourist allies, and the gangster types, Tiptree exploits the thriller form to consider the recurrence of evil and the permanence of the past. The planet is the site of an old crime against its native race of flying creatures, now threatened anew; the female administrator has been responsible for the murder of the star whose husks, as they pass, bring momentary "time-flurries," allowing instant revision of the immediate past. Intriguing as these possibilities are, the mix of thriller action and philosophical speculation never quite jells, and the novel lacks the trenchant wit, psychological clarity, and sexual percipience of the earlier stories. *Brightness Falls from the Air* is, however, clearly the work of an accomplished artist still reaching for new forms.

\* \* \*

While serving as Assistant District Attorney for New York County, Arthur Train began to write stories about the procession of human comedy and tragedy that passed through the criminal court building. Train wrote fewer than 100 short stories and only one short novel about Mr. Ephraim Tutt, Counsellor and Attorney at Law, but it is for Mr. Tutt that he will always be remembered. The Lincoln-esque lawyer with his frock coat, stove pipe hat, and fondness for stogies is a vivid part of American folklore. Most of his books deal with human nature and not with crime or the law, but his few attempts at fantasy suggest he had abilities in that direction which ought to have been exercised further. Unfortunately, he often allowed the literary conventions of the day to undercut his imagination. The wonderfully weird theme of the dead man's hand grafted onto the wrist of Sir Richard Mortmain ( *Mortmain* ), which thus gives him the fingerprints of a murderer, is marred by the revelation that it has all been a dream.

*The Man Who Rocked the Earth*, written with the scientist Robert Williams Wood, was planned to demonstrate Wood's theories that the man who exploded the atom would be master of the world, able to dictate peace and banish war forever. The story features the mysterious commander Pax of the atomic-powered *Flying Ring*, and has echoes of Jules Verne's *Clipper of the Clouds* and *Master of the World*. The "lavender ray" which can tilt the earth's axis and level the Atlas Mountains to force the world powers to stop the war is never completely explained scientifically, yet it has a plausibility that only a creative writer can give. Train claimed never to have understood Wood's scientific data, but found it didn't matter in telling the story. Some parts of it turned out to be strangely prophetic. The description of the German bombardment of Paris from a distance of 60 miles came true several years later. The story is told in a lively style which overcomes the obvious propaganda of its theme.

The ending makes the publication of a sequel, *The Moon Maker*, inevitable (it was serialized in 1916-17, but not published in book form for 40 years). The physicist Professor Benjamin Hooker, having captured the *Flying Ring* from Pax (who has disappeared), takes it into outer space to deflect or destroy an asteroid which may destroy the earth. There is more scientific detail in the story as well as the added presence of a mathematician and romantic interest, Rhoda Gibbs, who accompanies Hooker on the mission. Forced to land on the moon to replace a uranium cylinder for the trip home, the party demonstrates some of the real problems in space survival when Rhoda loses sight of the ship. Absent-minded scientist and would-be feminist, Hooker and Rhoda are near caricatures, but very appealing. Their marriage at the end of the story seems a proper romantic outcome to their adventure, while Train's imaginative and humorous use of traditional themes in science fiction make his work of more than historical interest.

\*

Louis Trimble comments:

The basic purpose of my science fiction is to entertain while at the same time commenting on some of the unchanging characteristics of humans. I have chosen one of the least complicated ways of showing this—by setting my books several thousand years in the future, when “earth-originated” people have spread throughout the galaxy, colonizing. In some cases they conquered and at times displaced native peoples; in others living harmoniously with them or mixing (when possible). By using this galaxy and this time period in all of my books. I hope to show that in several thousand years there has been little change in political attitudes, social attitudes, and—in fact—the way people act and think.

\* \* \*

Louis Trimble made his debut as a science-fiction novelist in 1968 with the publications of *Anthropol*. Trimble has mastered one form of the futuristic novel, the lyrical fantasy, quite handily. Especially entertaining are *The Wandering Variables*, *The City Machine*, and *The Bodelan Way*, books which share a motif of whimsical fantasy underpinning the rather standard fare of futuristic gadgetry and intergalactic conflict. In each the setting reminds one of the more familiar works of C. S. Lewis and Jules Verne; there are botanical wildernesses, shimmering islands, stark winter steppes, deep pools, and medieval valleys.

The lyrical tone is a result of the presence of fantastic goddesses, women of divine birth or superior knowledge, who accompany kind-hearted and competent, if somewhat insecure, males on their adventures. Because Trimble's novels transpire under this divine feminine sanction, the gratuitous violence

typical of so much popular science fiction is diminished, and in its place has come the spirit of romance. His books move from loss to reacquisition, from discord to harmony, from problem to solution.

However, Trimble often achieves the effect of romance at the expense of sound narrative construction. There is frequently too much fortuitous coincidence in his books, too many miraculous rescues of the protagonists, too little real threat of failure or death. We are too rarely awe-struck by what happens and too often left incredulous. Neither are his romances of the heart or of the head: his problems tend to be created and resolved by machines rather than by human experience. The problem for Trimble's characters is always to escape physical threat or to build a new city or to return to a familiar planet. Thus only rarely, as in the final scenes of *The Bodelan Way* and *Guardians of the Gate*, does the solution involve the emotional or intellectual growth we demand of first-rate fiction. There is altogether too little development of Trimble's characters and too little engagement of our deeper human sympathies in his situations. Another difficulty arises from the fact that Trimble's novels sometimes cannot sustain their futurism through an entire narrative. In particular, *The Wandering Variables* and *The City Machine* retain their futurism only through the initial phase of exposition before finding their true subject in earth's Middle Ages. At the center of these books are dirt floors, oxdrawn carts, and bellicose medieval clans. Consequently, one feels that in these books science fiction is more peripheral than central, more a vehicle to Trimble's real interest, which is in the past rather than the future.

Nevertheless, after more than 50 books Trimble has developed a prose style which is elaborate yet efficient, and vividly descriptive yet never excessive. Like so many others, his narratives are fastpaced and full of action, yet one does not have the sensation that their pace and action are purely an exploitation of commercial appeal. More often, one feels that though Trimble's novels may fall short of the very best, his concern with the remote future is sincere and his imagination sufficient to include the human condition in that future. For young readers initiating themselves into the worlds of futuristic literature, Trimble's works are fine preparation for the more distant and rewarding vision of Lewis and others like him.

Bibliography: in *Science Fiction Collector* 7, February 1980.

\* \* \*

The quantity of E. C. Tubb's output can be gauged by the fact that he has used nearly 60 pseudonyms. Since 1951 he has been turning out novels and stories on a monthly basis, occasionally editing on the side; Michael Ashley in *The History of the Science Fiction Magazine* calls Tubb "an inspired fiction machine." His popularity, well established in England, is now sizable in America as well. He is quick to turn ideas into stories set out in hard, clear prose, and many of his plots have been repeated by younger writers, not always with as much success.

Tubb writes of a hostile universe where men seek to dominate each other, and nowhere is it as hostile or extensive as in the Dumarest saga. Stretching now to a score of novels, the long quest of Earl Dumarest for his lost Earth is an effective device for creating science-fiction adventure. Reticent, grim, dressed in grey, and quick with a knife, Dumarest travels from planet to planet pursued by the Cyclan, cold zealots whose emotions have been surgically removed and who are psychically linked to an organic computer of a million embalmed brains. They want Dumarest because he has the secret to another kind of psychic linking, and Dumarest wants his mythical Earth because it is his own home. In effect the books form a 20-novel chase sequence. Some aspects become repetitive—for example, the description of Low and High travelling (frozen vs. time-accelerated) is transferred almost verbatim from book to book. And in each

story Dumarest is injured in ghastly detail, which he stoically endures until advanced medicine repairs him. But the planets are different—vivid landscapes and weathers similar only in their exoticism and their environmental exacerbation of the baser emotions. There is also range in the interpersonal plots. Sometimes Dumarest finds friends, sometimes only enemies; sometimes the lush women (all of whom desire him) have to be taught a lesson, and sometimes they do not; and in *Jondelle*, with creditable devotion, Dumarest defends a child. All this escapes being ludicrous through the stolid understatement in Tubb's competent style, and through the character of Dumarest himself, who is so determined and so quiet that he remains something of an enigma even after repeated adventures. That he has no sense of humor can be attributed to the desperate situations his author devises for him, situations in which genuine heroism can only consist of bleak courage and violent action.

Violence is important to Tubb; his interest in it is conscious and explicitly defended, not only in the Dumarest series but in novels like *Century of the Manikin* as well. The "manikins" are people who have been conditioned to believe violence is wrong. They live on a decadent, drug-controlled Earth where sex is so free that the only secret pleasure is violent. It takes a 20th-century woman, thawed out from cryogenic sleep, to tell them that men need weapons and honest fighting in order to be truly masculine and alive. Like almost every woman in Tubb's books, she finds male combat sexually exciting. But violence is not Tubb's only theme, however much it motivates his characters. His plots cover the full range of traditional science fiction, from first-contact riddles like "Random Sample," to sad tales of awakening computers like "J Is for Jeanne," and even to mood pieces like "The Last Day of Summer," where a man waits for the Bureau of Euthanasia. Tubb can also play with concepts of time and space; in *S. T. A. R. Flight* the instantaneous transport Gates of the dictatorial Kaltich are a puzzle to be solved, rather bloodily, by Earth's resistance organization.

E. C. Tubb is a good candidate for the theory that science fiction is essentially conservative. Against varying backgrounds of unexplained technology, Tubb talks about the most basic human passions. And however many suns are in the sky, the framework for ethical decision remains the same. For Tubb, the old values matter in the new places—matter more, since the strangeness isolates the grasping nature of men in plainer sight. Dumarest appears as a appropriate alter-ego for a man whose prose is lean and unsentimental. Tubb works in a highly colored imaginative landscape, but like Dumarest he does his job quickly and then moves on, convictions unchanged, to the next world.

—Karen G. Way

**TUCKER, (Arthur) Wilson ("Bob").** American. Born in Deer Creek, Illinois, 23 November 1914. Educated at Normal High School, Illinois. Married 1) Mary Jan Joestine in 1937 (divorced, 1942); 2) Fern Delores Brookes in 1953; one daughter and four sons. Motion picture projectionist, 1933-72, and electrician for 20th Century Fox and the University of Illinois at Urbana and at Normal. Publisher of many fan magazines: *The Planetoid*, 1932, *Science Fiction News Letter*, *D'Journal*, *Le Zombie*, 1938-75, *Fantasy and Weird Fiction*, 1938-39, *Yearbook of Science*, *Fanewscard Weekly*, *Fanzine Yearbook*, 1941-45, *Fapa Variety*. Wilson Tucker comments:

I write to entertain an editor, his readers, and myself, in that order. If I fail to entertain the editor, there will be no readers; if I fail to entertain the readers my own livelihood will be reduced accordingly. Some critics have said that my books may paint a bleak picture for humanity but that I always offer hope and sunshine for the future. That's news to me. I had always believed that I was writing adventure and offering entertainment, nothing more.

\* \* \*

Wilson Tucker's stories have the modesty of realistic black and white films. His casts are small, his scale intimate, and his settings familiar. He develops his plots and characters using human actions and reactions. He prefers concrete imagery to abstract verbiage: he tells by showing. In *The Years of the Quiet Sun*, for example, shots of the same swimming pool in four different years give instant summaries of intervening events at the site. Indeed, the cinematic flow of Tucker's narratives may reflect his 40 years' experience as a motion picture projectionist.

Tucker's style is economical and unadorned. He understates so much that careless readers sometimes miss the full implications of his text, such as clues to the hero's race in *The Year of the Quiet Sun* or the practice of cannibalism in *The Long Loud Silence*. He actually had to revise the ending of *Ice and Iron* after its initial publication to supply additional explanations. Characterization is his strongest gift. His heroes are marked by a certain ornery ordinariness and a stubborn integrity that the critic Bruce Gillespie calls "the ability neither to give in to the world nor to push it around" (*SF Commentary* 43, 1976). These heroes crave simplicity and distrust institutions. They wield their talents—anything from telepathy to acting to survival skills—without bravado. They establish prickly, often unsatisfactory relationships with heroines as stubborn as themselves. Tucker sensibly combines appreciation of feminine charms with respect for feminine strength.

Historical, not physical, sciences have been Tucker's major inspiration. His personal enthusiasm for history and archeology fuels the well-researched vitality of *The Lincoln Hunters* and *The Year of the Quiet Sun*. The human dimensions of time travel have seldom been better portrayed in SF, for instance in the chief Lincoln-hunter's joy at meeting people from past eras: "They were living *now* and he was among them." Although he does plot with time paradoxes, Tucker always makes time travel a means rather than an end in itself. In *The Lincoln Hunters* it enables the author to place his hero in two radically different environments—a sterile, repressive future and a burgeoning, liberal past—and then generates a eucatastrophe to leave him in the happier world. Tucker keeps restating the proposition that life itself is a kind of time machine operating at the maximum rate of one second per second.

A poignant version of temporal translation is achieved through extreme longevity in *The Time Masters*. A marooned extraterrestrial who had been Gilgamesh in ancient Sumer waits thousands of years while the mayfly lives of ordinary humans flicker out around him before he finds an alternative to both loneliness and escape. The hero of *The Time Masters* reappears in a minor role in *Time Bomb*, a novel in which mechanical time travel changes history by eliminating a McCarthy-like villain in his larval stage. This premise is inverted in Tucker's finest work,

*The Year of the Quiet Sun*, when data gleaned from temporal research preserve a villain and trigger a catastrophic world race war. Every element in this honest, solidly built book meshes securely and unobtrusively to present a close-up of Armageddon.

Tucker thriftily incorporated the same research on Biblical archeology and the Dead Sea Scrolls used for *The Year of the Quiet Sun* into his mystery novel *This Witch*. He prefers doing mysteries because he finds them easier and more fun to write than SF, but his dual careers cross-fertilize each other. He often uses SF elements (even facts about SF fandom) in his mysteries and employs mystery/thriller conventions in his SF. (Compare the espionage apparatus and psychic elements in *Wild Talent* and *The Warlock*.) The clearest instance of Tucker's debt to the hard-boiled mystery styles of the 1940's is *The Long Loud Silence*. Its protagonist is a mono-maniac scrambling for survival in a plague-devasted eastern United States. Although the unrelenting brutality of his novel cost it popular acceptance on its initial publication, it remains a chilling reflection of Cold War attitudes.

Yet despite the grimness that underlies much of his professional work, Tucker has been one of SF fandom's favorite humorists—in person and in print—for half a century. His close friend Robert Bloch calls him "a legend in his own time." Tucker's chief handicap as a writer is an excess of humility—even after a score of novels he still refuses to think of himself as a professional writer. But the author of *The Year of the Quiet Sun* need stand in awe of no one.

George Turner comments:

Since it is my personal view (admittedly shared by few contemporary SF writers) that SF long ago lost its way among erotica, exotica, wishdreams, metaphysical guesswork, "mind-blowing" conceptions, and plain bad writing, I prefer to maintain a low key in my own work. To this end I have concentrated on simple, staple SF ideas, mostly those which have become conventions in the genre, injected without background or discussion into stories on the understanding that readers know all they need about such things. So in *Beloved Son* I used only the everyday ingredients of the genre—genetic manipulation, telepathy, the nature of World War III, the politics of renaissance—in order to rethink them and point out that all is not as obvious as conventional SF usage would have the readers believe.

My work will always be concerned with how human beings

behave—as all fiction ultimately must be. Super-heroes, super-intelligences, and unlikely worlds created for melodrama or the spelling out of doubtful metaphors for the future of man do not interest me. My SF method remains the same as for my mainstream novels—set characters in motion in a speculative situation and let them work out their destinies with a minimum of auctorial interference.

\* \* \*

A well-known and prize-winning mainstream novelist of the 1960's, George Turner has earned a reputation as Australia's most rigorous and astute science-fiction critic and reviewer. (He claims, with justification, that his "thirty-year apprenticeship" in the writer's craft has given him "the critical confidence to stand in awe of no-one but Shakespeare and Tolstoy.") His autobiography, *In the Heart or in the Head*, shows his lifelong commitment to literature, expounds his view of the history and shortcomings of the SF genre, and acts as a model for literary criticism in its engrossing blend of the personal and the critical, the subjective and the objective.

Turner's reputation as an SF writer rests upon the three novels of his Ethical Culture series: *Beloved Son*, *Vaneglorry*, and *Yesterday's Men* (which, though linked, do not form a trilogy). Each book is set in the post-holocaust reconstructed world of the 21st century. The Collapse of 1992 (caused by genetic interference with food-crops, worsened by the spread of mutated-disease epidemics, and climaxed by hysterical nuclear bombing) has left the world's population greatly reduced, but within half a century a new world has emerged. Built on the Ethic of Non-Interference, the new culture relies upon an imprinted fear of the greed, obscenity, and cruelty of the past, and many of these old-world ills have genuinely been overcome—but only through fear and ignorance, not intellectual resolve.

Old social problems soon emerge, for dissent against the new order grows. But new problems also arise; experiments in cloning lead to attempts to tinker with human genetic stock (in *Beloved Son*), and further manipulations take place after the discovery of mutant humans with a lifespan of centuries (*Vaneglorry*). (*Yesterday's Men* draws the series to an intellectually satisfying close when the new society finally seeks to learn the truth about the "barbarians" of the 20th century . . . and discovers that human nature has not (and possibly cannot) change.

Ostensibly, the three novels are about the abuses and consequences of supposed "progress" in the biological sciences, but they are more centrally concerned with the pitfalls of romantic idealism and utopian thinking. The emblem of this sad, depleted future is the Security Headquarters building: "Plain, ugly, efficient and temporary, it was uncompromisingly an administrative block. Like this entire civilization, it was there only to serve a passing purpose and be torn down. It symbolized with repellent neatness a world with an immutable past and a hopefully solid future but only a ramshackle, disposable present."

The compelling wisdom of Turner's novels lies in his ability to see with this kind of clarity: to perceive the shabby present amid the rosy dreams of the future. Such qualities have attracted charges of dourness, cynicism, and pessimism, but these accusations miss the point of the novels' achievement. The books may be forthright and uncompromising in their judgements of man and society, but they are also honest—bluntly, harshly honest. To use a phrase from *Beloved Son*, they deal with "the unholy competence of man," demonstrating that man's wisdom is less than his ability, and that the human talent

for self-delusion and naive dreaming can be disastrous in its consequences. Just as *Brave New World* and *Nineteen Eighty-Four* brought home to an earlier generation the general socio-political dangers posed by the unevaluated advancement of science, so Turner's work brings home to our age the dangers lurking in the test tubes of the biologists and the fatal weaknesses inherent in man's slothful complacency. The Ethical Culture novels can fitly be mentioned side by side with Huxley's and Orwell's classics; they are a major work of science-fiction.

\* \* \*

George R. R. Martin has called Lisa Tuttle's writing "distinctive, delightful," and Ted White attributed to her "a reputation for strong stories which deal with human responses to the unusual."

Tuttle has called her first story, "Stranger in the House," a "going home story." A young woman returns home and attempts to regain her childhood. This is a theme writers such as Bradbury and Ellison have used to produce stories of ineffable sadness, but Tuttle goes a step further to produce a work of genuine horror, catching an aspect of our desire to relive the past that few writers seem to understand. It was a fitting start. Tuttle quickly revealed herself as a writer of interesting variety and skill.

It's just as important that she's revealed herself as a writer of highly original horror fiction. "Changelings," for example, is a nicely extrapolated sociological vignette about a society that employs surgery to cure anti-social behavior; in it, a father is betrayed by his pre-school-age child. "Flies by Night," written with Steven Utley, is a psychological study of a woman who longs to turn into a fly. "Stone Circle" is a complex character study set in a near-future welfare state. "In the Arcade" depicts a future where racism is offered as a sideshow attraction. "Sangre" and "The Horse Lord" are almost, but not quite, conventional, the first juxtaposing the story of a woman's affair with her stepfather with a tale of vampirism, the other telling of a family that encounters Indian superstition that turns out to be justified—again, parents are betrayed by their children.

In "The Family Monkey" a rural Texas couple saves an alien from a crashed spaceship and adopts it as a servant. The story is simple and straightforward: the alien is saved, becomes a sort of family retainer, is discovered years later by its own people, and leaves. The story acquires a remarkable depth, however, because Tuttle's interest lies not with the plot, or even the alien, but with character relationships. Relationship provides the focus of most of her work, in fact. "The Hollow Man," set in the near future, concerns a woman whose husband commits suicide. She has him brought back to life through new medical techniques only to discover the flesh has been revived, but nothing else. Cold and indifferent, the husband lacks even the interest necessary to kill himself. The tragedy of the ending is classically inevitable, and quite powerful.

Little of Tuttle's fiction takes place away from the Earth. In "Wives," one of the few set on another planet, aliens are permitted by their Earthman conquerors to exist only so long as they pretend to be the human's wives. "The Birds of the Moon" is set on Earth, but tells about a woman whose astronaut husband has been to the moon. The voyage has changed him, and his wife hallucinates about beings—strange, ugly birds—which live on the moon. As with many of Tuttle's stories, the line between hallucination and reality is impossible to discern, particularly in man-woman relationships. In "Flies by Night" the woman who longs to be a fly is captured by men who have become spiders—or so she believes.

As striking as such images are in a writer of Tuttle's talent, they never dominate her stories; neither, for that matter, does her interest in relationships. If anything, they seem to provide a focus for what appears to be a still-emerging concern for the nature of her characters' humanity. In "Bug House" a young woman, visiting an aunt who lives in a lonely isolated house, finds her aunt sick and the house overrun by insects. When the aunt dies, it is apparently as the victim of a strange young man whose connection with her, the house, the insects, becomes apparent only when it's too late. As in "Stone Circle" sex is treated as a numbing, enslaving element.

"Flying to Byzantium," another "going home" story, is about a writer elevated from a drab, lonely life by the modest success of a fantasy novel. At a science-fiction convention, she finds herself forced, through a confrontation with her readers, back into her hated, previous existence. The story permits some

cogent observations on the problems of being a writer in the 1980's, and its last paragraph is as powerful as the idea itself. But the story fails to satisfy, possibly because the matter-of-fact style in which most of it is written fails to deliver the emotional impact it demands. "Need" is a far more successful story in which a young woman's fears and insecurities lead her into a situation that neatly brings a twist to the conventional ghost story plot—but in a way that is emotional and satisfying: few writers other than Tuttle could have pulled it off.

*Windhaven*, written with George R. R. Martin, is not typical Tuttle fiction, but it would be wrong to call it typical Martin, either. It's a superb collaborative effort set on a planet whose inhabitants, descendants of the survivors of a spaceship wreck, are dependent on the skills of messengers who travel on artificial wings, similar to hang gliders. It's good, solid science fiction, carefully crafted. It makes the most of Martin's eye for the exotic and ability to plot, and Tuttle's graceful style and sensitivity to people.

Tuttle's first solo novel, *Familiar Spirit*, is more in line with her short fiction. A commercial horror novel, it is well written, carefully plotted, and marked with Tuttle's customary vivid characterization. Its weakness lies in an unsatisfying formula ending. Even so, it's head and shoulders above all but a handful of the horror novels of its decade.

In the mid-1980's, it's difficult to appraise Lisa Tuttle's career, in part because she is at that period of transition, apparently, from the short story to the novel. While *Familiar Spirit* makes fewer demands on her talent than such shorter works as "The Family Monkey" or "The Hollow Man," her skills and the several themes she has been developing, seem to demand the longer form.

—Gerald W. Page

**TWAIN, Mark.** Pseudonym for Samuel Langhorne Clemens. American. Born in Florida, Missouri, 30 November 1835; grew up in Hannibal, Missouri. Married Olivia Langdon in 1870 (died, 1904); one son and three daughters. \* \* \*

Frequently Twain's science-fiction works are labeled as mimetic fiction (ultimately what occurs can be explained as dreams rather than actual time travel resulting from scientific extrapolation), still his dystopic creations and employment of the ideology of science within or preceding the dream structures qualifies some of his works as science fiction. In other works his use of alternate settings and actual scientific extrapolation outside of the dream/reality contexts appears, particularly in his shorter and sometimes incomplete stories.

*Report from Paradise*, *The Mysterious Stranger*, and *Letters from the Earth* are fantasy rather than science fiction: satires on man's place in the universe in which science is neither used as a tool to create the condition of the stories nor as a thematic consideration within them. Twain's fascination with comets, particularly Halley's comet, is evidenced in "Captain Stormfield's Visit to Heaven," "A Letter from a Comet," and "A Curious Pleasure Excursion." The interstellar travel included in each is either in or on a comet rather than in any kind of man-made space vessel and relegates these writings as fantasy.

Several of Twain's shorter works, "Mental Telegraphy," "Mental Telegraphy Again," and "My Platonic Sweetheart" focus on parapsychology in which Twain professed a firm belief, thus excluding them from his science-fiction works. Two other stories which have been classified as science fiction by some are "Earthquake Almanac" and "Petrified Man." However, both depend on natural phenomenon rather than on extrapolated science, social or physical.

Twain does extrapolate on technology of his time, predicting long distance telephone service in "The Loves of Alonzo Fitz Clarence and Rosannah Ethelton," and long distance balloon flight in *Tom Sawyer Abroad* and in the incomplete manuscripts of "A Murder, A Mystery, and a Marriage," and "The Mysterious Balloonist." However, *The Comedy of Those Extraordinary Twins* is neither extrapolative nor predictive, it being based on the Tocci Twins. Physical science extrapolation is used in "Sold to Satan" where Satan is made of radium, and Twain predicts the isolation of various elements by Madame Curie, and in the incomplete "Shackleford's Ghost" where a man becomes invisible after taking a potion created after numerous experiments by the local scientist.

Two works containing alternate settings, "The Curious Republic of Gondour" and "History 1,000 Years from Now," are seeming utopias. In "Curious Republic" weighted universal suffrage has developed; education, common sense, and, to a lesser extent, money earn the citizens extra votes. In the

incomplete manuscript "History" society has evolved from a democracy to a monarchy. Three incomplete works by Twain employ alternate settings: "The Generation Iceberg," "The Secret History of Eddypus, The World-Empire," and "3000 Years among the Microbes." In "3000" Twain satirizes the human condition. By having a wizard accidentally turn a man into a cholera microbe instead of a bird, Twain creates a setting which affords a distancing from reality which has been a science-fiction technique used by many writers to allow social criticism without immediately alienating the reader. The setting is the diseased body of a tramp within which millions of microbes live where nations have their own languages, customs, and governments, all patterned after nations existing during the early 20th century. The microbes are not described as aliens; instead they look, act, talk, and think precisely as man does. This setting allows Twain to comment on his favorite themes: the stupidity of government officials, the hypocrisy of organized religions, the prejudices evident in class systems, the problem of the lie—here related to the tall tale. The microbe tells his friends about the real world and they compliment him on his poetic inspiration—with one exception he is flatly not believed.

Unlike Hank of *Connecticut Yankee in King Arthur's Court*, the microbe does not introduce new technology to the society. Instead the society is ahead of his time, having a device which records thoughts and images and condenses them to perfectly understandable encapsulations of facts and meanings. Notably, a religious scientist reveals to the microbe a world view akin to Twain's by expounding on the absurdity of man's false sense of superiority. Technology is celebrated when a microscope is used to discover that on every level of organism the cycle of life is the same; thereby enforcing the moral treatise of the absurdity of man's presumptuous superiority.

In "The Secret History of Eddypus, the World-Empire," Twain presents a 29th-century dystopia ruled by the Christian Science church which is comparable to the late 18th-century lifestyle, dominated by religious persecution, arrogance, and misinformation. He presents no new technology, scientific inquiry having been effectively stopped by the church. He shows the absurdities of organized religion which perpetuates the status quo, encourages a distinct disrespect for truth, and consistently and with a vengeance destroys knowledge for fear that it would abrogate the power of the church. The narrator has begun to write a history of the world, all such references having been destroyed by the church and replaced by the church's version. The history is a humorous mish-mash of erroneous facts until the 19th-century section which contains an accurate delineation of scientific discoveries and their effects, focusing on evolution, both biological and societal, in which he identifies circumstances and environment as those factors which chart the course of the world.

In "The Generation Iceberg" Twain speculates on the type of society which would evolve in a group totally isolated. This fascination with isolated groups and the effect of their exposure to technology is also evident in "A Murder, A Mystery, and A Marriage" as well as *A Connecticut Yankee in King Arthur's Court*.

"From the 'London Times' of 1904," "The Great Dark," and *A Connecticut Yankee in King Arthur's Court* all reflect the increasing cynicism of Twain's later years. In the confusion of dream and reality accompanied by alteration of time and space, Twain creates different worlds for his protagonists to struggle in. These dystopias present Twain's perception of the unchanging human condition; man as a petty being, always willing to prey on his fellowman.

The comic relief in *Connecticut Yankee* (a literary burlesque

of Malory's *Morte d'Arthur*) erupts through Twain's satire of the age of chivalry whose precepts had been adopted by the Old South, a frequent target of Twain's social criticism in his mainstream works. But primarily Twain investigates the effects of industrialization on a pre-industrial society which was a matter of public concern both in relation to the United States and to our foreign policy at the time. In this view, Twain attacked Social Darwinism: the establishment of an industrialized, capitalistic society where the common man was once again suppressed by the financial power of a few individuals who had gained their power through that technological revolution.

Hank, the protagonist of *Connecticut Yankee*, a 19th-century common working man, rises to power in King Arthur's Court through creative use of his technical skills and scientific knowledge. By introducing industrialization, Hank attempts to change the economic, political, and intellectual structures of a nation of oppressed people, but his failure results not so much through the powers of the church and state as through his own failure. He succumbs to one of the primary evils of capitalism (according to Twain): once Hank gains power, he becomes self-absorbed. The megalomaniac Hank instigates a civil war (purportedly in the name of creating a viable civilization for the common man) which results in the ultimate destruction of all that he has established. What makes *Connecticut Yankee* science fiction is not just the question of whether Hank actually experiences time travel and suspended animation or whether he dreams it. Instead it is Twain's questioning of the effects of technology, his concentration on the idea of technology in another time and space.

The problem of dream versus reality occurs again in "The Great Dark." Whereas in *Connecticut Yankee* the protagonist goes back in time to a setting already familiar to the reader, in "The Great Dark" Twain concentrates on establishing a setting in which circumstance, not time, is important. Presenting a tiny world as seen through a microscope, Twain creates a whole watery universe filled with monsters, destruction, and suffering for his protagonist to attempt to survive in. Like Hank, Mr. Edwards returns to the present no longer accepting it as real, finding his other existence to have all the qualities of reality and his present that of the dream. This exploration of dream versus reality is closely linked with temporal/spatial relationships so that time and setting become an integral part of what makes these works science fiction. In *Connecticut Yankee*, science, or at least technology, is a thematic consideration, whereas in "The Great Dark" technology is used only as a tool to create the setting in which the characters must question temporal/spatial relationships. Twain embarks on another approach to science in "From the 'London Times' of 1904." Instead of employing a thematic consideration of technology as in *Connecticut Yankee* or using an already existing scientific instrument to create the circumstances of the story as in "The Great Dark," Twain invents the teleoscope (television) to use in conjunction with his usual exploration of thought and visual transference in temporal/spatial relationships.

In these works, Twain, as an early writer of science fiction, presents three different approaches still frequently used in the genre. Additionally, through his social criticism, Twain is one of the first mainstream writers to present dystopias rather than utopias to show by comparison rather than by contrast the inequities of the social institutions he questions: religion, government, taxes, prejudice, slavery, censorship, and politics. Yet his dark view of man is made bearable through his caustic humor. He invokes our laughter even as we accept with humility his accusations of our greed, jealousy, lack of common sense,

thirst for power, cruelty, and ultimately the smallness of mind of the human beast.

##### Steven Utley comments:

I don't have much to say, meaningful or otherwise, about my stories. I did, of course, think rather highly of some of my own work when I wrote it. I was possessed of considerable enthusiasm for what I was about. Disenchantment with the SF field, when it set in, set in hard, and now time has made all the difference. Anymore, I view my having been a writer as just a phase, like puberty, into which I entered at one point in my life and from which I emerged, not exactly unscathed, at a subsequent point. I've done some writing since the, ah, divorce, but I no longer *think* of myself as a writer, only as someone who every now and then misses the actual grueling work of sitting in front of the typewriter for hours on end. Most of my energy goes into other pursuits which are quite unrelated to SF and, more to the point, quite satisfying.

\* \* \*

Between 1972 and 1979, Steven Utley established a reputation as a prolific author of short stories and novelettes, either alone or in collaboration with a number of other Texas-based writers, almost notably Howard Waldrop and Lisa Tuttle. With George W. Proctor he edited a volume of SF and fantasy by Texans, *Lone Star Universe*, whose appearance Harlan Ellison hailed as a "watershed event." Working exclusively at less-than-novel length, Utley has produced fiction either competent but undistinguished or astonishing for its inventive mordancy. At his best, his pervasive angst leavened with humor, angry wit, or local color, he has written chilling horror stories ("Ghost Seas"), scathingly funny satires ("Upstart"), outrageous

pastiches ("Black as the Pit, from Pole to Pole," with Waldrop), and evocative, melancholy science fiction ("The Man at the Bottom of the Sea"). The strongest contemporary influences on Utley's development appear to be the October landscapes of Ray Bradbury, the ironic pessimism of the later Robert Silverberg, the pop-culture eclecticism of Philip José Farmer, and the manic-depressive black humor of Barry N. Malzberg, whose style and subject matter Utley affectionately parodies in "Losing Streak." In one conspicuous but hardly damning sense, then, he is a writer still in the process of discovering his own voice and métier.

"Custer's Last Jump," with Waldrop, first secured wide recognition of Utley's talents. It postulates a frontier America in which the Oglala Sioux, equipped with Krupp monoplane, defeat the 7th Cavalry of George Armstrong Custer and its airborne auxiliary, the 505th Balloon Infantry. Told in earnest text-book prose, this off-the-wall tour de force concludes with a "Suggested Reading" list as whacky and authentic-seeming as the "historical" matter preceding it. This final bibliographic fillip may owe something to Farmer's convoluted appendices in the mock-biography *Tarzan Alive*.

A second Utley-Waldrop collaboration, "Black as the Pit, from Pole to Pole," pays homage to Farmer (again), Mary Shelley, Poe, Verne, Burroughs, and others. Its protagonist is that quintessential symbol of alienation, the Frankenstein monster, and its setting is the perilous hollow interior of the earth. Although the disparate elements of this tale do not always mesh convincingly, sheer narrative *chutzpah* often effectively disguises the fact. Like "Custer's Last Jump," it has been much discussed and anthologized.

Among Utley's solo efforts "Upstart" is a pointed, and hilarious, satire of the spacefarer-as-superman ethos in science fiction, perhaps the last word on this indefatigable idiom. "Ghost Seas," meanwhile, invokes the desolate West Texas landscape in the service of a terrifying tale of avarice and revenge. "The Man at the Bottom of the Sea" demonstrates Utley's ability to dramatize, poignantly, a private sense of loss; it is notable for a calm descriptive overlay at odds with the emotional intensity of its characters.

Another effective story, set against the historical backdrop of World War II, is "Time and Hagakure," wherein the son of a Japanese kamikaze pilot attempts to preserve his own sanity by mediating, through time, the salvation of his doomed father. In "Getting Away" Utley makes effective use of his deep-seated interest in dinosaurs—creatures which frequently raise their huge, anomalous heads in his fiction—to give his protagonist a means of psychological escape from a polluted and regimented future.

In many ways Utley has been an undervalued writer, perhaps because he shows little interest in writing a novel. The fact that even his best short stories and novelettes remain uncollected has also obscured his accomplishment.

\* \* \*

Jack Vance's works will never fit any definition of science fiction or fantasy. In fact what makes his stories distinctive is the fact that he writes science fiction that feels like fantasy and fantasy that feels like science fiction. In over the 30 years he has been writing, Vance has distinguished himself for his ability to create fictional worlds with a richness of detail and inner logic rarely encountered in either science fiction or fantasy. If, for example, a future Earth is described as in *The Dying Earth* and *The Eyes of the Overworld*, the reader's attention is soon focused on the remarkable creatures that share this world with humanity rather than on a particularly original plot or a strongly stated theme. His plots are usually based on classical and Germanic mythology, medieval romance, and earlier space operas. What prevents such yarns as *The Eyes of the Overworld*, *Slaves of the Klau*, and most of his novel series from becoming repetitive is the setting, newly invented for each work. A Vance story teases the reader; there is always something new added to top what he has already done.

The six interconnected stories that make up *The Dying Earth* illustrate well Vance's use of fantasy in science fiction. Using a popular science-fiction device, a future in which magic has replaced science, Vance leads his characters on a series of adventures reminiscent of the quest in fantasy. Though the stories are populated with magicians, half-humans, tree creatures, and deamons, the air cars, antigravity devices, and the great machines of science fiction are equally present. Vance combines a folklore atmosphere with a science-fiction future and theme (humans can overcome any hardship they have the will to overcome). The stories read like fantasy, but they mean like science fiction.

It is this balance between fantasy and science fiction that Vance returns to so often in his works. *Big Planet*, *Son of the Tree*, *The Houses of Iszm*, the Tschai, Durdane, and Gersen series all show Vance's lavish care in settings. And their human characters are just as lovingly presented. Each is identifiably human despite the strangeness of the world he or she inhabits. Vance has occasionally been accused of spending too much time on his settings. Recent works such as *Wyst: Alastor 1716* sometimes appear to sacrifice plot to the details of their worlds. But if there are times when attention to imaginative details upsets the balance between story and setting, there are also times when that balance is magnificently maintained.

The *Languages of Pao* is such an achievement, a classic science-fiction story. Using a simple plot of palace intrigue, Vance explores the complicated issue of the interconnection of man's perception of himself and his world with his universal use of language. Does language so filter a speaker's sense of his world through providing names for each object and experience that human perception is limited to what is contained within the language? Can these limits be expanded? What is the cost of such expansion? Vance raises each of these questions, and he finds satisfying answers for each. What allows for the successful resolution of the novel is the care with which Vance first presents the worlds of Pao and Breakness. Pao is a passive world in which a massive population is favored by a planet with a geology that sees to all its needs. The planet Breakness, however, is rugged, harsh, indifferent to the needs of its inhabitants. On Pao, "The typical Paonese saw himself as a cork on a sea of a million waves, lofted, lowered, thrust aside by incomprehensible forces—if he thought of himself as a discrete personality at all." The people of Breakness, on the other hand, can only see themselves as individuals. On a world in which the individual is in constant danger, concern for individual identity remains uppermost. Given these two worlds, and the care with which Vance develops their contrasting natures, the exploration of the languages of each world and their implications for mankind as the race confronts a future that increasingly demands flexibility is both believable and happily clever. *The Languages of Pao* deals with a complex concept with significant implications for humanity's future, but does so in a straightforward story that dramatizes the issue without trivializing it. The balance between setting and theme is largely responsible for this success.

Perhaps the most endearing characteristic in Vance's work is the way in which he turns the unusual into the familiar. What starts out as a totally alien world ends up as comfortably recognizable. This process usually results from Vance's interest in the social customs and cultural institutions of his fictional worlds. *Big Planet*, for example, contains many such descriptions, and *Space Opera* has the same in a more humorous vein. "Moon Moth" combines the detective story with science fiction and, at the same time, presents a credible picture of a society in which all people wear masks and use music as an important aid in communication. In each of these works what becomes significant is not the strangeness of the societies but the fact that they are all human societies. No matter how alien the environment or the customs, humanity remains identifiably human.

*The Dragon Master* is perhaps Vance's finest and most poetic example of his ability to translate the strange into the familiar. Using a rather evocative vocabulary, Vance describes the world of Aerlith as a place of wind and stone with a few beautiful, fertile valleys. Genetic engineering has become commonplace on Aerlith and appears to be tinged with a bit of magic, and this allows Vance plenty of room for introducing some of his most exotic creatures. Yet, by the end of the novel Aerlith is not an alien world. Because Vance carefully shows how his human characters (particularly Joaz Banbeck) have learned to live with its strangeness and not lose their human traits, the world and its society are believable. The reader is convinced that given such circumstances human beings would create just such a society on such a world. While *The Dragon Masters* is Vance's most successful attempt at the union of the bizarre and the common, *The Last Castle*, *The Blue World*, *Emphyrio*, and *The Anome* all illustrate his love for this technique.

Finally, there is the range of styles Vance writes with. In 1983 two novels were published that illustrate just how broad that range is. *Lyonesse* is based on Celtic folklore and is written in a

lush and intricate language worthy of these elaborate tales. Its plot is equal to its language. *Cugel's Saga* (part of the Dying Earth series) is the opposite. Based on Norse mythology, its language is sparse and understated. In both novels, Vance exhibits his talent in using words to evoke the atmosphere most fitting to the world he creates. Readers who are familiar with the traditions of Celtic and Norse literature will appreciate what he has achieved. Those who are not will still respond to the radically different voices with which each work resonates.

Jack Vance creates by taking extremes that initially threaten to tear a story apart. But these forces finally come together in worlds in which every element appears exactly as it should. Vance creates neither science-fiction nor fantasy worlds. They are Jack Vance worlds.

\*

Manuscript Collection: California State University, Fullerton.

Sydney J. Van Scyoc comments:

My earlier short fiction was set on Earth in the non-too-distant future and dealt primarily with individuals struggling against an increasingly dehumanizing technological society. I took several years off from writing in the mid 1960's, while my children were very young. Soon after I began writing again, I found my focus had shifted to short fiction set on other planets and dealt primarily with communities struggling against inexplicable alien environments. I am increasingly intrigued now by the genetic and social changes which I believe will overtake the human race once we begin to colonize other planets. I prefer not to deal in much detail with the inevitable technological changes we will see. Instead I like to set my fiction on isolated worlds inhabited by a relatively small human population. My personal orientation is increasingly pantheistic, and in my longer fiction I am attempting to deal with the spiritual relationship of human to environment.

\* \* \*

Sydney J. Van Scyoc's early stories are set on earth not very far in the future and show the dehumanization of persons in an advanced technological society. The dehumanization is primarily apparent in the characters' lack of personal freedom and

conscious choice in such stories as "Pollony Undiverted," "Soft and Soupy Whispers," and the chilling "Visit to Cleveland General." The recent "Nightfire" is an unusual story in which a stalemated war in North America has confined 12 million non-combatants as virtual hostages in orbit above the earth for 41 years. The protagonist, Corneil Rothler, in a carefully planned coup d'état ruthlessly engineers a truce alone.

A major shift in her work becomes apparent in the long short story "Little Blue Hawk," set in the 21st century; this story focuses on the personal and social costs of human genetic engineering. Van Scyoc's interest in the relationship of human with alien species and an alien ecology appears in "Noepti-Noe," "Sweet Sister, Green Brother," and "Aberrant." These stories emphasize the interdependence and unity of all life forms.

Van Scyoc's impressive first novel, *Saltflower*, takes the basic premise of a dying race seeding earth to generate a transpecies who will be able to reproduce and be viable. The novel is set on earth in the year 2024, and follows the adventures of one of the "transracial" children, Hadley Greer, who is under surveillance by the US government agency SIBling. Most of the action takes place at the Purification Colony's headquarters near Salt Lake City. The Purification Colony is a cult headed by a psychotic leader, Dr. Braith. The novel deftly blends government intrigue, and burgling, religious fanaticism, mysterious murders, and credible alien consciousness, reactions, and biology.

*Assignment: Nor'Dyren* is an anti-utopian novel with strong satiric elements. It begins on earth in the not-too-distant future with a maintenance sub-engineer, Tollan Bailey, attempting to get a job in the huge company CalMega. Only a few people are employed; the rest live comfortable, futile lives without realizing the social controls that narrow their existence. Bailey wins a trip to the planet Nor'Dyren inhabited by three humanoid species whose rigid social roles and asexual inter-species marriage are leading to a breakdown of the moneyless economy and culture. The Gonnegon are the thinkers and administrators, the Allegon serve, and the Berregon manufacture. The novel follows Bailey's attempts to understand the culture and his maturation. He is an appealing character, particularly in his enchantment with trying to repair machines on Nor'Dyren and help the aliens. The anthropologist Laarica Johns, sent to aid him in his legal battle, discovers the reason for the de-evolution on Nor'Dyren with the help of Patt, a rebellious Berregon. The satire of earth bureaucracy, rigid social and sexual roles, and crippling cultural assumptions both on earth and Nor'Dyren is effective. The novel is an impassioned plea for a humane culture in which persons can be free to develop their capacities and make ethical choices.

*Starmother* presents the pathos of ostracized human mutants on a colony world, a race of aliens, the dirads, and the testing of the young protagonist, Jahna Swiss, a cadet of the Service Corps from the planet Peace. The novel alternates the points of view of Jahna, Zuniin, an alienated social outcast, and a young mother, Piety, who is a victim of the superstition and fanaticism of the puritanical human colonists, known as The First Fathers, on the planet Nelding. The alien planet, the various social groups, and species are vividly realized. Suspense is generated by the attempt of Zuniin to kill Jahna out of insane jealousy and xenophobia. Jahna's ethical dilemma and her final commitment to the mutant children enrich the novel. Van Scyoc contrasts the civilization of Peace, Jahna's planet, with Nelding, showing the deficiencies of rigid social roles, fanatic religion, and superstition which make life almost unbearable on the unlovely Nelding.

*Cloudery* is an expansion and development of the short story

"Deathsong." Around the core of the earlier story of an encounter with still-powerful alien artifacts resembling flutes by members of two humanoid races on an alien planet, Van Scyoc has added the frame story of the human space adventurer Verron's search for the man-leopards of the planet Rumar and the complication of a deadly space disease called bloodblossom. Verron is exiled on the quarantine planet, Selmarii, along with another human, Sadler Wells, and a sentient bird-man alien because they have the disease. Aleida, one of the descendants of the ancient race, has psionic powers and heightens them with a crystal which focuses solar energy. The radiation from the light dancer's flute cures the bloodblossom disease. Verron leaves the abandoned isolation planet haunted by the prospect of Aleida and a new race of powerful light dancers who do not share humane values. *Cloudey*, like Van Scyoc's other novels, is distinguished by vivid imagery and sensuous detail, particularly when she portrays non-human perceptions and consciousness.

*Sunwaifs* continues the author's focus on humans struggling to adapt on uncongenial planets. The sunwaifs are six children born with paranormal mutant abilities, resulting from unusual solar activity during their conception on the harsh planet Destiny. In two alternating points of view over 14 years, the reader follows their development and deepening relationship with the planet. The adaptation of the other humans is aided by the mutant teenagers' increasing understanding of the planet ecology. The climax and resolution of personal and social difficulties comes from an ecological pantheism based on cooperation with natural forces. This hopeful ending promises further enrichment of all intelligent life on the planet Destiny.

Two short stories, "Mountain Wings" and "Darkmorning," set on the harsh planet Brakrath, show the promising direction of Van Scyoc's imagination. This promise is brilliantly fulfilled in the following three novels, set primarily on the same planet. The trilogy, *Darkchild*, *Bluesong*, and *Starsilk*, forms a major achievement demonstrating her strengths as a science-fiction writer: invention of believable alien environments and psychologies which are truly strange, powerful new myths, and striking relationships of humans and aliens with action plots and memorable characters. Perhaps the finest invention is the sentient starsilk which appears in each novel. The starsilk can form a symbiotic relationship with various sentient beings, providing the occasion for effective poetic description; various types of consciousness are presented which have been a strength of Van Scyoc's style for some years. Also notable is the sun goddess myth which functions to explain the harnessing of solar energy and is the basis for the testing of characters in all three novels. The individual works fit together in a satisfying whole with an epic sweep encompassing several planets, but each novel can be enjoyed independently as good adventure science fiction.

\* \* \*

In the stories of A. E. van Vogt all things are possible, for saying makes them so. It seems of little moment that any event logically follow the preceding one or that one character dominate the action. For readers expecting tightly structured plots, careful characterization, polished prose style, and a logical extrapolation van Vogt affords a field day for criticism. (For a classic lambasting on such matters see Damon Knight's "Cosmic Jerrybuilder: A. E. van Vogt" in *In Search of Wonder*.) But for the reader willing to submit his reason to another's wide-ranging imagination van Vogt is a "good read."

Van Vogt's canon offers a melange of intriguing situations spiced with telepathy, teleportation, shape control, inner and outer space, mass consciousness, time shifts, technological wonders beyond count. Humans, super-creatures, androids, and aliens perform an intricate dance of adventure on a cosmic stage, existing in past, present, and future time, out-of-time and space as we know them, and often out-of-phase with each other. Incidents bombard us, with little transition to ease the pace. Disconcerting as this can be, it does have the trade-off value of keeping one in continual suspense. In "Complication in the Science Fiction Story" van Vogt explained his method of writing scenes in 800-word blocks, the first one to introduce both scene and story purpose. As the main plot develops logically in succeeding scenes, van Vogt adds a secondary plot and minor plot threads deriving from "theme science and atmosphere." While one may question the success of the logical development, there is no argument about van Vogt's ability to handle the minor threads skillfully to induce a sense of mystery, wonder, and suspense.

Since van Vogt writes both short stories and novels, often combining the former to create the latter, a mixed sampling of these modes makes a valid introduction to his characters, situations, and techniques. One especially notices van Vogt's emphasis on superior beings, well exemplified in *The Mixed Men*, a novel combining three short stories. In the earliest story

of this group, "The Storm," we meet three super-creatures: the Dellian robots, physically and mentally advanced over man; the non-Dellian robots, higher in creativity; and the Mixed Men of human form but with double brains. Another superhuman, Gilbert Gosseyn of *The World of Null-A*, also has the extra brain, in addition possessing the ability to evade death, thus becoming a more godlike entity than Captain Maltby of the Mixed Men.

Van Vogt's catalog of aliens ranges from BEM's to intelligent forms fearsome in appearance but cooperative in action, once accepted by men. In *The Voyage of the Space Beagle* four aliens appear; the catlike Coeurl, the Ixtl, the Riim folk (a colony-psyche), and the anabis. All four pose grave problems to the expedition whose aim is "to explore limits of deep space and contact alien life forms." By contrast, two sympathetic aliens aid men in *The War Against the Rull*. For mutual survival they contribute their telepathetic ability and energy-conducting bodies respectively. The inimical Rull in turn infiltrates human society, using its capability to assume human form. This minor theme of replication appears in many van Vogt tales, starting with "Vault of the Beast" (1940), with the ultimate example being the title character of *The Silkie* which can shift from fish to bullet-like spaceship to human form to innumerable other shapes for its own purposes and protection.

These aliens often educate man about his own nature. In *The Replicators* a harmless alien assumes the form of its first human contact, an ex-Marine full of anger and aggressiveness. The resultant trouble is predictable. A more gentle lesson comes from the super-intelligent, catlike creature in "The Cataaaaa." On assignment to study man on earth the Cat does so from the stage of a carnival freak show. The title, linking the Cat with the spontaneous awed exclamation of the carnival crowd, spotlights the human response. The Cat's response comes in the final act of his study when he communicates to one man the conclusion that the basic human characteristic is self-dramatisation. This may well be the most agreeable comment van Vogt can offer about humans. All too often the enemy turns out to be one of our own. In the power struggle which runs as a major theme throughout van Vogt's stories, the specific enemy is often the trusted man-in-charge. Morlake of "The Earth Killers" tracks down the destroyers of civilization, only to find them racists headed by a power-driven ex-senator pretending to be the altruistic guardian of the people.

Critics note in van Vogt a predilection for the power of monarchy, such as held by the Isher empire in *The Weapon Shops of Isher* and the House of Linn in *Empire of the Atom*. More notable is van Vogt's sense of the drama inherent in all authoritarian systems. Finding authority operating all around us, he exploits the emotional possibilities in such situations as the struggle of the "dynasties" in *Rogue Ship*, the parent-child confrontations in *Children of Tomorrow*, and the professional friction aboard the *Space Beagle*. However, van Vogt always supplies an antithesis to authoritarianism. Most intriguing are those single characters who perform this duty, those superior beings motivated by a sense of mission and possessing a gift or a powerful idea to be manipulated for benefit of all. The combination is varied: Lesley Craig and "toti-potency" in *Masters of Time*; Elliot Grosvenor and "Nexialism" on the *Space Beagle*; Robert Hedrock and the Weapon Shops opposing Isher power; Gilbert Gosseyn with Null-A training (here van Vogt gives a nod to Alfred Korzybski's *Theory of General Semantics*); and others. A natural extension of this balance is a recognition of the cyclic nature of human society in the character of Morton Cargill of *The Universe Maker*. The most famous "saviour" of human values and idealism is Johnny

Cross of *Slan*, the novel usually considered van Vogt's most outstanding. A member of a mutant group hated and persecuted by the majority, the slant Johnny Cross is a telepath, superior both in intelligence and physique to ordinary men. From childhood his training points toward the end of bringing slants and normal men closer together in harmony. He must contend not only with John Petty, the human chief of the secret police, but also with Kier Gray, the head of the government and a slant passing as a normal human.

*Slan* epitomizes van Vogt's major thematic issues: the tenacity of the life force whatever its form, the need of cooperative effort for mutual survival, and an overwhelming optimism that a consciousness shared with all life forms can work only to a mutual benefit. For the new reader approaching van Vogt, *Slan* provides a satisfactory entry into van Vogt's provocative and imaginative worlds.

For the seasoned reader of van Vogt, *Computerworld* over 35 years later addresses these major issues in the context of a very contemporary concern: computerized control. In the near-future of 2094 the omnipresent, multiform computer has relieved humans of all onerous labor but has sapped them of moral energy. Through Eye-O ports it tracks human activity, registering data for identification and correcting aberrant behaviour with weapons of graduated power. Questions arise. Who will control this force? How can the spiritual sense necessary for humanness exist in the strictly logical environment of the machine? The protagonist-computer asks the key question: "How does a human differ from a machine?" Only when it develops a "sense of self" comes the recognition that uniqueness requires cooperative understanding for co-existence, that recognition being a basic van Vogtian theme.

Although John Varley has produced relatively few novels, he merits consideration for his inventiveness. His first novel, *The Ophiuchi Hotline*, takes place in a time in the future after mysterious invaders have come to our solar system and done away with human technology. This novel exhibits an environmentalist's bias in that the Invaders have abolished Earth's industrial-technical system to save whales and dolphins who, as some have long suspected, outclass humans in their intellectual potentiality. Yet someone out there wants humankind to survive, for, over the decades, a "hotline" to a mysterious presence in another part of the universe continues to feed the remaining people information vital to their survival. Part of the story revolves around the attempt to discover who these "good Samaritans" are. For a short novel, *The Ophiuchi Hotline* certainly does not lack action; in fact, so much goes on that the plot at times becomes confusing.

Varley exhibits better control over his enthusiasm for inventing new worlds and improbable beings in his series consisting of *Wizard*, *Titan*, and *Demon* which chronicle the adventures of a displaced earth woman, Cirocco Jones, sometimes-NASA-spaceship-pilot and adventurer. Not content simply to send her to another planet—in this case Saturn—to struggle against aliens, Varley turns the planet itself into a sentient being, the quasi-goddess Gaea. The trilogy follows Jones's transformation from friendly adventurer learning about Gaea's whimsical personality, to an alcoholic "wizard" in Gaea's employ, and finally to the only adversary who can vanquish the "goddess"—gone-mad and save the many lifeforms that populate this fascinating ring world. In this series we are asked to consider space opera from a moderately feminist point of view. At least that seems to be the perspective Varley wants his readers to take, for most of his major characters are either

completely female or oddly bisexual. In some ways his focus on lesbian relationships is gratuitous; ultimately, the romantic couplings and jealousies add little to the trilogy's sense of entertainment which, in fact, is derived from the familiar quest-adventure motif found so frequently in science fiction.

*Millennium* considers an equally odd topic, human catastrophes. It seems that for as long as people have been mass-murdering each other or having accidents involving large numbers of people, a group of time travelers have been snagging the victims and whisking them through a time port to the far-future. These time travelers stand close to the end of life on earth; these kidnapping efforts represent their attempt to perpetuate life at a time millions of years beyond their immediate destruction. Varley combines and makes interesting twists on catastrophe/Bermuda Triangle themes, theories concerning the nature of time, and an old-fashioned love story between future alien and 20th-century deadbeat. The results entertain because *Millennium* resists the standard clichés of time travel and end-of-the-world tales.

Varley's short stories concern themselves with the same topics that he raises in his novels: speculations of the quality of life in the future, cloning, the nature of the alien "personality," to name a few. Like his novels, these stories are entertaining, and, like his novels, they also demand a certain degree of patient toleration on the part of their reader. Varley likes to pack his writing with action, gadgets, and many characters. Frequently the reader must untangle some of the snarls this type of writing inevitably creates. Although such roughness can irritate, Varley is a writer worth reading: he entertains because he isn't afraid to take risks with his plots, characters, or inventive view of the future. Furthermore, he takes fresh and timely perspectives on old chestnuts: love, war, the environment, and a human's place in the universe.

\* \* \*

A. Hyatt Verrill was one of the more distinguished writers who helped in the development of *Amazing Stories* during its early years, and who continued to contribute to it until the mid-1930's. Many of his stories were set in the South American jungles with which he was so familiar, or dealt with ancient civilisations whose cultures he studied for more than half a century. But he did not limit himself to such themes, drawing on astronomy, biology, optics, atomic physics, and fourth-dimension theory for ideas which he developed with equal facility.

The magazine was only six months old when his first offering, "Beyond the Pole," dealing with a race of intelligent crustaceans discovered in the Antarctic, appeared late in 1926. It compared favourably with the stories of Wells and Verne which almost monopolised those early issues, while the editor, Hugo Gernsback, contrived to nurture new writers to displace them. Some of Verrill's longer stories went to fill out the inch-thick *Amazing Stories Quarterly*; "The World of the Giant Ants" was remarkable for its engrossing narrative combined with an enlightening insight into its subject. Even more fascinating was "Into the Green Prism," with its sequel, "Beyond the Green Prism," which sought to dispel the storm of controversy over the scientific fallacies it raised. "The Astounding Discoveries of Doctor Mentiroso" began the endless argument in the readers' columns over the time-travel theme. "Death from the Skies" was about a bombardment of Earth by the Martians, and "The Bridge of Light" took readers to a hidden city where the Mayas still thrived. Verrill's flights of imagination reached their peak in 1931 with "Monsters of the Ray" and "When the Moon Ran Wild"; but his later contributions, such as "The Death Drum"

and "Through the Andes," were pure adventure tales which reflected the gradual decline of *Amazing*.

—Walter Gillings

**VIDAL, Gore** (Eugene Luther Vidal, Jr.). Has also written as Edgar Box. American. Born in West Point, New York, 3 October 1925. Educated at Los Alamos School, New Mexico, 1939-40; Phillips Exeter Academy, New Hampshire, 1940-43. Served in the United States Army, 1943-46: Warrant Officer. Editor, E. P. Dutton, publishers, New York, 1946. Member, Advisory Board, *Partisan Review*, New Brunswick, New Jersey, 1960-71; Democratic-Liberal candidate for Congress, New York, 1960; Member, President's Advisory Committee on the Arts, 1961-63; Co-Chairman, New Party, 1968-71. Recipient: Mystery Writers of America award, for television play, 1954; National Book Critics Circle award, for criticism, 1983. Address: Ravello, Salerno, Italy; or c/o Random House Inc., 201 East 50th Street, New York, New York 10022, U.S.A.

\* \* \*

Only a part of Gore Vidal's varied literary production strongly relates to science fiction and fantasy: two plays, *An Evening with Richard Nixon* and *Visit to a Small Planet*, and five novels, *Messiah*, *Myra Breckenridge*, *Myron*, *Kalki*, and *Duluth*. Vidal's "Edgar Box" detective novels are similar to science-fiction formula writing, while his many historical novels, *Julian*, *Creation*, *Washington, D. C.*, *Burr*, *1876*, and *Lincoln*, have some Utopian elements. In *Julian* and *Creation* Vidal speculates about an alternative development of the West out of the grip of Christianity and Greek thought. *Julian* and Persian thought, Persian religions, which ponder the origin and purpose of man and the world, provide alternatives to the dominant patterns of Western thought, religions, and social institutions. The *Washington* tetralogy is mostly realistic historical fiction. Some of the characters reappear in *Burr*, *Lincoln*, and *1876*, the latter resembling a Henry James novel with Europeanized Americans, Charles and the Princess, socially evaluating the politics and manners of the United States while pursuing marriage for the Princess and a writing career for Charles. *Lincoln*, while not debunking the great man in the manner of Charles Beard, focuses on Lincoln's shrewd political savvy and strength, although, as in the rest of the tetralogy, all the major political figures of the period are examined such as Seward and Chase.

*An Evening with Richard Nixon*, dramatically showing the high points of Nixon's career, does so by framing Nixon's own words and some fictional dialogue and action with a chorus and narrative commentary by former Presidents George Washington, John Kennedy, and Dwight Eisenhower. These fantastic characters are used for satiric purposes, not only by their views

of Nixon but by their views of one another. Only Washington seems genuinely decent; the others are mocked. The play *Visit to a Small Planet* uses a typical science-fiction action, alien invasion, for satiric purposes. What is devalued by Kreton, unintentionally because he loves it, is man's hostility. By performing a miracle of telekinesis, Kreton nearly starts a war between Russia and the United States, prevented only by Delton 4, who as *deus ex machina*, hauls Kreton (cretin) away, bending time prior to Kreton's visit. Of course, Kreton's plan depends on destructive human passion, which projects hostility from a visit, glories in hate, and is secretive about love, as the Conrad-Allen plot illustrates.

*Messiah*, a memoir by Eugene Luther, is a futuristic retelling of the Christ story and the development of Christianity, except the Good News by John Cave, the Christ figure, is that death is good. Luther, writing about the year 2000 in Luxor, Egypt about his involvement with Cave, recounts his relationships with Clarissa, a witch-like woman supposedly over 2000 years old, Iris, who becomes a new Virgin Mary, and Paul Himmel, a PR version of St. Paul. In an opening similar to H. G. Wells's *War of the Worlds*, Marx, Freud, and modern science have failed to organize the world well, so a new mystic, John Cave, argues that death is a friend to be embraced. Luther likes the message, but sees it as the existentialists would, that life's value increases because of death. As Cave is forced to practice what he preaches and is killed, Eugene is forced to flee the Cavites, realizing later that he should have been the Messiah.

*Myra Breckinridge*, also a memoir, is a comic, Frankenstein-like sex-change story. Though treated as soft pornography, Vidal's satiric targets are frequently sophisticated, such as Robbe-Grillet's theories of anthropomorphic projection in *For a New Novel*. When Myra says "Nothing is like anything else. Things are themselves entirely and do not need interpretation, only a minimal respect for their precise integrity," Robbe-Grillet is being reduced. Though the novel's action climaxes with Myra's sodomizing of Rusty and winning her inheritance from Buck Loner, as Myra goes through two sex changes, the satire caused by her alien encounter with the world is subtly clever. *Myron*, the sequel to *Myra Breckinridge*, uses a staple of fantasy, the alternate universe, as Myron is pushed into his television set while watching *Siren of Babylon* by the suppressed personality of Myra. As Myron seeks to return to his wife, Mary Ann, by finding the exit to the film in production, Myra seeks to change cinematic history, thereby changing cultural history—even Watergate and the election of Richard Nixon. Myra, as many science-fiction authors have fabulated, is trying to manipulate the present by changing the past.

*Kalki* is a dystopian novel in which a former GI poses as the Hindu god Kalki and poisons the world population except for four chosen followers. Though a mystery plot dominates the novel with its two catastrophes, the poisoning and the doublecross of Kelly by Giles, Vidal's social concerns are still present. The memoir and additional narrative voices, common in *Two Sisters*, *Julian*, *Messiah*, and other Vidal novels, combine with science-fiction and Utopian strategies so that Vidal's satire, his social criticism and liberal social message, appears with the ease of Petronius and the power of Juvenal.

*Duluth*, a satire on middle America, is not as biting as *Kalki* because it has too many targets. Vidal's Duluth features a good deal of changed geography—New Orleans and Tulsa are surprisingly close, which is possibly a slap at geology's plate tectonics. Narrative action has many strands; however, a mayoral election ending in assassination, a pull-out from the race by the present mayor, and the successful candidacy of a former black crime figure is prominent. Through the figures of

Rosemary Kantor Klein and Chloris Craig, romance novels and melodramatic serials such as *Dynasty* and *Dallas* are mocked along with Derridean notions of erasure, as parts of Duluth are temporarily wiped out by Kantor Klein's word processor. All human action is erased permanently, though, when the alien centipedes from outer space who have crashed their space ship in a Duluth swamp eradicate human life in disgust at their stock market losses.

If satire is the ridiculing of a specific person, practice, or object, Vidal has thousands of satiric targets in *Duluth*. Though he is primarily a realistic novelist, one can expect Vidal to continue to experiment with science-fiction, Utopian fiction, and fantasy, for they are all strategies of his primary aim, satire.

—Craig Wallace Barrow

\* \* \*

Of Harl Vincent's stories, few are familiar to the present generation of readers. With the possible exception of "Barton's Island," none of his tales has been granted "classic" status, and most of his output was of an order consistent with the pulps of the 1930's. Yet he will be remembered by a few as a writer who, even when conforming to strict editorial policies (which he did with remarkable facility), never failed to evoke the sense of wonder which is vital to science fiction.

Following his initial appearance in 1928 with "The Golden Girl of Munan," he soon became a favourite with *Amazing Stories* readers. His full-length novel, "Venus Liberated," was typical: a tale of interplanetary adventure, full of incident, yet told with restraint and with equal regard for both scientific and romantic interest. "Barton's Island," the story of an inventive genius at odds with a future dictator, revealed a penchant for novel variations on more realistic themes. In "The Colloidal Nemesis" the War of Extermination ended abruptly in 1953 when the Western Alliance let loose on the Asiatics a monstrous mass of devouring protoplasm. He was not so original that he could ignore the note of menace which resounded through science fiction's pages in those days. As well as arriving from Callisto, the threat lurked among the super-apes of Subterranea, or loomed up from the microcosmos. But his ideas were so diverse and his hand so adroit that, having catered equally to *Science Wonder* and *Air Wonder Stories*, he was able to produce a string of lusty tales for the new *Astounding* which further enlarged the field in 1930. "Vagabonds of Space" and "The Copper-Clad World" were typical of the formalised space opera on which the magazine relied for much of its appeal.

Meanwhile, *Amazing* continued to feature Vincent's work in more reflective mood, as "Power," a significant tale of conflicting forces in 23rd-century New York which hinted at nuclear fission as a new source of energy. Several of his stories at this period were set in the "drylands" of Mars, among the superstitious savages of the parched plains between the canals ("Red Twilight" and "Beyond the Dark Nebula"), "Faster Than Light" brought back the heroes who had liberated Venus for another adventure in remoter realms.

When *Astounding* reappeared under new management towards the end of 1933, Vincent was among those who found their way back into its pages. But, except for "Cosmic Rhythm," he was not particularly successful in meeting its "thought-variant" demands; and some of his more interesting concepts, such as "Parasite," were still to be found in *Amazing*. By 1942 he seemed to have given up writing; but in 1966 he made a brief comeback with *The Doomsday Planet*, an interplanetary adventure.

##### Joan D. Vinge comments:

(1981) Because I have a degree in anthropology, I tend to write anthropological science fiction, with an emphasis on the interaction of different cultures (human and alien) and of individual people to their surroundings. The importance of communication across barriers of alienness often becomes a theme in my stories. Mythology and music also influence my work; my novel *The Snow Queen* was in large part inspired by Robert Graves's *The White Goddess*. I have written several stories with a "hard" science background, thanks to the borrowed expertise of my husband, who is a mathematician and also a science-fiction writer; however, I've written other stories which I hope cover a wide range of moods and styles, I feel as if I'm just beginning to explore the infinite possibilities of the future.

\* \* \*

Joan D. Vinge has produced a wide variety of fiction within the genre, from popular stories for children and young people (for example, the *Return of the Jedi Storybook*, *Ladyhawke*, and an excellent young adult novel, *Psion*), to adult works that have twice won the Hugo Award (*Eyes of Amber* and *The Snow Queen*). Vinge writes within the milieu established by New Wave SF writers like Le Guin, Russ, and McIntyre; and Vinge uses the freedom won by these writers to explore characters' emotional and psychological responses to the new worlds she envisions. Her emphasis on feelings will sometimes render her work too sentimental for some readers, but her skill at depicting the inner states of her characters—human or alien—makes her stories often insightful and compelling.

In her best work, Vinge balances the evocation of personal struggle with her considerable understanding of physical and social science, as in shorter works such as "Phoenix in the Ashes," "Mother and Child," and most of the tales in her important collection *Eyes of Amber*, especially the title novella, "To Bell the Cat," and "Crystal Ship." In all of these, once a firm scientific base is established, Vinge goes on to explore the ways characters deal with common human emotions. Various focusing on human/alien contacts, exploitation, and the failures of communication, these stories keep our attention and enlarge our sensibilities. A compulsive explainer (as evidenced by the afterwords following every story in her two collections), Vinge is also a deft one. Her stories are subtle and pithy.

But beyond her excellence in stories of novella length, Vinge is also effective in the novel. In the longer works, Vinge has often demonstrated her skill at capturing the mental life of the protagonists, especially on their telepathic jaunts through space and time. Her depiction of Cat's mentalistic journey and discoveries in *Psion*, and of the mindlink experiences of Moon in *The Snow Queen*, and the frighteningly evocative near-madness suffered by BZ Gundhalinu in the sequel come to mind. But in

addition to these personalistic qualities in her stories, Vinge also consistently displays a powerful social conscience, and much of her writing either directly or tangentially addresses major social issues. A central motivation in all these novels is the need to resist the institutionalized abuse of beings and resources, and the author pays particular attention to the various forms of prejudice that oppress the gifted (the telepathic in *Psion*). She also gives special attention to the sufferings of the lower social classes and of women: beyond his special gift, Cat's troubles also stem from his being poor; issues of class pervade the fabric of the Snow Queen novels, especially in references to the Khare-moughi social structure, and the struggles of women in a male-dominate culture are epitomized in the sufferings of Jerusha PalaThion in *The Snow Queen* (these concerns also dominate stories like "Mother and Child" and "Phoenix in the Ashes"). BZ's near breakdown in *World's End* powerfully suggests the ways that rigid social structures oppress even those they privilege.

Vinge's interests also extend to reworkings of powerful mythic materials, and her understanding and application of Robert Graves's *The White Goddess* help to make *The Snow Queen* even more resonant. In effect, the novel argues for an ecologically conservative, heart-oriented, yet technologically aware culture through its major figures: the Winter Queen's association with exploitive technology and her Summer counterpart's beginnings in a naive but profoundly correct mother religion form the basic opposition in the tale, which is ultimately overcome when the Summer Queen comes to power having learned the values of technology. The opposing mythic forces are united in the new queen, promising a new social order. The revisionary unification of opposing social systems is also a crucial part of Vinge's earlier *The Outcasts of Heaven's Belt*, though there the opposing figures are female and male.

When readers recollect a Joan Vinge story, it won't be ideas separated from their personal and social ramifications that come to mind. Instead, we remember the characters and their feelings—Moon Dawntreader Summer, Arienhrod, Jerusha, BZ, Tuupieh, Etaa, Tarawassie and Moon Shadow, Amanda and Cristavoia. These are characters working through the trouble and delight generated by the friction between the individual and culture. We can look forward to much writing from Joan D. Vinge that will be culturally and personally satisfying.

\* \* \*

Vernor Vinge is not a prolific writer but his significance is considerably greater than the size of his output because of the high quality of much of his work. Especially in his best stories, Vinge deals with extreme social situations, with crises within a society or with intercultural conflict. Much of his work is permeated with a melancholy awareness of the evanescence of all human institutions. Typically, Vinge's characters are faced with some personal problem arising out of social change. They furnish the best possible solution given the initial conditions, but it is never more than a half-solution, and they must live with their failure as well as with their success.

Vinge's first two novels, both set on other planets, move in the characteristic Vinge pattern. *Grimm's World*, set on a retrogressed colony planet now climbing back to high technology, centers on the intrigues and struggles of a native-born superwoman whose only intellectual equals are two visitors from a higher interstellar culture. The novel focuses our greatest sympathy not on the superhumans but on the ordinary people caught up in their machinations. The various cultures of this largely archipelagic, metal-poor world, and especially its alternative technologies, are described in fascinating elaboration. *The Witling* has many of the same story elements (covert interplanetary visitors, an emotionally crippled woman genius, a person of ordinary capacity caught up in all this, a pet with psionic powers), but the combination is less successful. For one thing, much of the exposition is taken up with a brilliantly logical but never quite believable development of a world where practically everyone has an inborn ability to teleport. The title (which Vinge uses to mean approximately "half-wit") is a pun: at first it is applied in scorn to Pelio, the native hero who lacks his race's usual teleportational ability, but by the end it applies with more justification to the genius heroine. In a typical Vinge twist-of-the-knife ending, she suffers brain damage which both impairs her intellect and renders her a more balanced, happier

person, a suitable partner for the love-stricken Pelio.

In his next two novels, Vinge returns to Earth. The widely acclaimed *True Names* features a computer net perceived by its users as a magical realm, and centers on a struggle by hobbyist "wizards" against a bloated Federal bureaucracy on the one hand, and against the mysterious malevolent Mailman on the other. The same loving elaboration applied to teleportation in *The Witling* is here put to a more plausible initial premise (the "magic" computer net), with brilliant results. As in previous novels, *True Names* features superhumans, but this time they attain that status largely by computer interface, rather than solely on the basis of their inborn talents. The love affair, within the "magical" realm where youth can be eternal, between the young hero and the old heroine (so ancient she had actually worked as a keypunch operator!) recalls, probably intentionally, a similar relationship in Heinlein's "Magic Incorporated." The technological innovation put to scrutiny in *The Peace War* is the stasis field, described in a few throw-away lines in Heinlein's *Beyond This Horizon* and perhaps best used before *The Peace War* in Niven's Known Space series. Vinge finds a variety of new applications for the idea, using it as an offensive weapon, a shield, a prison, and a time machine. In a combination of previous superman notions *The Peace War's* main viewpoint character is a genius even unassisted, and something unprecedented when interfaced with computers. Like *Grimm's World*, *The Peace War* depicts an elaborate sociological situation growing out of its basic assumptions (chiefly use of the stasis field, progress in genetic engineering and electronics, and the deliberate suppression of high-powered machinery). As in *True Names*, there is a romance blighted by age disparity—this time between a woman Air Force captain, newly emerged from stasis, and her onetime lover, who has aged throughout the fifty years since she was entrapped.

Both *True Names* and *The Peace War* show a considerable mellowing in tone over Vinge's previous work, which had been powerful and effective, but generally so bleak in outlook that it was made bearable only by the sparsity of the author's production. True, most of the human race is wiped out offstage in *The Peace War*, and the threat of bureaucracy is not entirely gone by the end of *True Names*, but life does now seem to be dealing Vinge viewpoint characters somewhat better cards. At the very least, the author is demonstrating his control of a wider range of approaches. Vernor Vinge has one of the most enviable "batting averages" in SF; any work under his name must be assumed to be a serious award contender, not so much because of name recognition (lessened by his slow rate of production) as by its consistent quality. It would be pleasant if Vinge could learn to write just as well more quickly, but even failing this, the steady accumulation of solid work will indeed earn him a major reputation with the passing of years.

\* \* \*

What is Kurt Vonnegut's relationship of SF? It would not only be too simple to say that he began as a SF writer and later drifted away from the "lodge"—it would also be misleading. For one thing, Vonnegut never identified with the "lodge"; for another, he has continued to use SF as a mine of metaphors for his sad, zany fictions chronicling the decline and dissolution of Middle American culture. The bizarre holocaustal scenario of *Cat's Cradle* has shrunk in *Deadeye Dick* to the depopulation of Midland City by a neutron bomb, but the weirdness that every reader perceives as the dominant mode of Vonnegut's fiction (whether it be diagnosed as black humor or absurdist fantasy) is nothing more or less than that of SF.

There are at least two ways to go wrong. One is to take straight Eliot Rosewater's much-quoted drunken speech to a SF writers' convention ("I love you sons of bitches. . . . You're all I read any more. . . . You're the only ones with guts enough to really care about the future. . . .") which appears in *God Bless You, Mr. Rosewater*. Eliot is a compassionate and humane drunken lunatic, to be sure, but all the same he is a drunken lunatic. Even

so he admits that SF writers "can't write for sour apples," while claiming that Kilgore Trout, the dean of hacks, is "the greatest writer alive today."

Another is to focus on Vonnegut's remark (in a *New York Times Book Review* essay on "Science Fiction") that since writing *Player Piano* he has "been a soreheaded occupant of a file drawer labeled 'science fiction,'" and that he wants out, "particularly since so many serious critics regularly mistake the drawer for a urinal." The urinal mistake is not Vonnegut's: he attributes it to critics who didn't study enough science in college, and he goes on to provide a clear-headed and sympathetic account of the SF writer's "lodge" and the SF branch of the publishing industry.

So unravelling Vonnegut's SF connection is not easy, nor should it be. Perhaps the best approach is to consider Donald L. Lawler's analysis of *The Sirens of Titan*. Lawler claims that the "narrative shell" of *Sirens* is "space opera," and that it serves Vonnegut as "an enabling form of satire." Lawler is right to see the satirical punch of the novel as arising from its SF form and content; he errs only in identifying the relevant SF type as space opera, for the SF form that is the opposite of the "shaggy dog story" Lawler finds in the novel is the apocalypse, the kind of SF story that portrays a catastrophic transformation of the human scene in order to reveal the purpose of human history. One of the most ambitious of SF's apocalyptic fictions is Arthur C. Clarke's *Childhood's End*, published five years before *The Sirens of Titan*. In 1978 Vonnegut called Clarke's novel one of SF's few masterpieces ("All of the others were written by me"). *Childhood's End* portrays the end of human evolution on earth, revealing that the latent destiny of humankind is to transform its last generation into a collective immaterial entity that will soar away from its planetary home and join the Overmind, a godlike union of similar "racial" consciousnesses which is gradually taking over the universe. The apocalyptic revelation of *Sirens* is a shaggy dog indeed, for its plot discloses that fifty thousand years of human history have had one trivial purpose: to ensure the delivery of a repair part for the spacecraft of an alien courier stranded on Titan. Not only that, the courier discovers that the message he has spent his being to carry from one end of the galaxy to the other is the merest ejaculation: *Greetings*.

The foregoing illustrates one way in which Vonnegut utilizes SF conventions—by writing against them, even to the point of parody. SF stories, whether they end well or badly for their protagonists, generally embody a romantic concept of human purpose: whether immanent or extrinsic, whether foreordained or created by human striving against nature, the destiny of humankind is noble and important. It is a struggle to dominate and to make sense of the universe. *The Sirens of Titan* uses its SF motifs to counter this tradition. Its "hero," Malachi Constant ("the eternal pilgrim") learns, along with Winston Niles Rumfoord and the rest of mankind, that the "outward push" is pointless, that there is no meaning to the universe, and there is no god but "God the Utterly Indifferent."

Another indicator of Vonnegut's relationship to SF is of course the feckless SF writer Kilgore Trout, who appears regularly in much of Vonnegut's fiction. He was promised his freedom in *Breakfast of Champions* (which was also supposed to be Vonnegut's final novel), but was pressed into service again for *Jailbird*. Trout knows and cares little about science, writes terribly, and has earned neither critical nor popular acclaim: his books can be found, remaindered and misleadingly titled, only in pornographic bookstores. His fate as a SF writer is far worse than that of the late Theodore Sturgeon, but his name is almost certainly a wicked parody of Sturgeon's. Kilgore Trout, however, is clearly also an *alter ego* of Vonnegut. His novel

*2BRO2B*, so admired by Eliot Rosewater, appears to involve the situation of *Player Piano*, Vonnegut's first novel, with the addition of Ethical Suicide Parlors for population control, themselves an appurtenance of the *Playboy* story "Welcome to the Monkey House" (written about the same time as *God Bless You, Mr. Rosewater*). Trout may be partly an execrable old hack who smells bad, but he is also a loveable fellow whose fictions are based on big, imaginative concepts like that of Sturgeon's *The Cosmic Rape*, the title of which is parodied and the plot of which is inverted in Vonnegut's notorious "The Big Space Fuck," published in *Again, Dangerous Visions*.

Kilgore Trout represents Vonnegut's interface with SF; he is no more a portrait of Sturgeon than he is of Vonnegut. He is perhaps Vonnegut's chief SF metaphor—the writer whose vision outstrips his knowledge and his craft. In that his condition is Sturgeon's—but also Vonnegut's, and any writer's. Perhaps he also represents any writer's (and any reader's) fear of becoming an old, derelict failure—or of actually being one already. Perhaps, more specifically, he embodies some nagging fear of his author that what he has created might just possibly be a bunch of worthless, second-rate SF.

Vonnegut's SF (many of the early stories, *Player Piano*, *The Sirens of Titan*, *Cat's Cradle*, and *Slaughterhouse-Five*), is not second-rate. *Player Piano*, perhaps, has suffered unfair competition from the major dystopian novels of its time: *Nineteen Eighty-Four*, *Fahrenheit 451*, and *The Space Merchants*, all of which have similar plots involving the rebellion of an insider against an oppressive social order. But like the others the story of Paul Proteus has a unique target—in its case automated production—and like the others it presents a plausible vision of one of our possible futures. In fact, in the details of its extrapolation it misses on only a couple of points: the virtual elimination of vacuum tubes by solid state devices and the failure of US government and industry to merge fully in management of the economy. *The Sirens of Titan* is not only the parody of apocalyptic SF discussed above: published at the beginning of the age of space, it is a satirical critique of a society obsessed with technological accomplishments that lead to little more than "empty heroics, low comedy, and pointless death." *Cat's Cradle*, with its story that counterpoints the careless disposal of a doomsday weapon with the history of a harmless cult religion, is perhaps even stronger in its denunciation of the follies of technological society. The discoverer of Ice-Nine, the substance that destroys the planet by freezing all its water, irresponsibly leaves the fatal chunk to his three less than normal offspring. Dr. Felix Hoenikker was already the "father of the A-Bomb," a scientist who would play with any dangerous research idea suggested by the military sources of his funding. Contrasted with him is the playful Bokonon, creator of a religion he realized was lies and illusions (a fiction), but knew would relieve the miserable lives of the inhabitants of his poor Caribbean island. Bokonon is a holy fool who has created a warm extended family; Hoenikker is a man of reason who has neglected his children. The dreams of reason prove more fatal than the illusions of religion.

*Slaughterhouse-Five* is the perfect marriage of Vonnegut's SF with his more "mundane" themes. "Billy Pilgrim has come unstuck in time"; but unlike the purposeful time travelers of SF convention (but much like the Winston Niles Rumfoord of *The Sirens of Titan*, jerked around by the chrono-synclastic infundibulum), this unlikely hero lives all the moments of his life simultaneously, including his POW captivity in Dresden during the firebombing and his captivity in an exhibit on the planet Tralfamadore. From this perspective, optometrist Billy sees that the universe is mechanically preordained, and that the solution is to try living only the happy moments. Billy, of course,

is regarded as a harmless lunatic (especially since he is a devoted fan of SF writer Kilgore Trout). Again, however, it is not the holy fools and lunatic dreamers who run the death camps and firebomb Dresden—it is a different kind of madman, who has polluted the stream of reason that trickles so weakly in a Billy, a Bokonon, and an Eliot Rosewater.

With *Slaughterhouse-Five* Vonnegut's fiction becomes more personal, and the line begins to blur between fictional narrative and autobiographical essay. The auctorial voice becomes more direct, and hard to distinguish from those of first-person narrators who are clearly, like Trout, avatars of Kurt Vonnegut, Jr. In the much-maligned *Breakfast of Champions*, the author-narrator actually appears in a cocktail lounge occupied by several of the novel's characters, and at its conclusion he confronts a pathetic Kilgore Trout. But though he tries to dismiss Trout, Vonnegut's SF roots will not disappear so easily. In *Slapstick* he employs a Troutian conceit (telepathic intelligence-boosting between twins) and a vague post-holocaust setting to articulate the idea of artificial extended families as an antidote for the rootlessness and minimal selfhood of contemporary Americans. In *Deadeye Dick* a freak neutron bomb accident (the stuff of a low-budget 1950's SF film, one would think) is a metaphor for the demolition of the rich cultural matrix of a place like the Indianapolis of Vonnegut's forebears.

Looking back, we can see that Vonnegut has been writing about two things since the beginning—the loss of Indianapolis Union Station and the way of life it stood for (noble despite its racism, its pretentiousness, and its abuse and neglect of the poor), and what we seem to be replacing it with (a racist, pretentious, exploitative vulgarity). Kurt Vonnegut, Jr. may not be a bonafide SF writer—by his own admission he is not a member of the "lodge" and did not read SF pulps as a kid. If he is not, he remains an ornament to SF, for without the SF devices that give shape to his fiction, he would have been unable to say most of what he wanted to say. If his chronicle of the never-ending Great Depression—of contemporary American life—has any enduring value, that is due in large measure to the fact that Vonnegut cut his literary teeth on SF.

—John P. Brennan

"Flying Saucer Rock and Roll," in *Omni* (New York), January 1985.

"Heirs of the Perisphere," in *Playboy* (Chicago), July 1985.

\* \* \*

It is necessary to know something about Howard Waldrop the person in order to understand something vital about Howard Waldrop the writer. Waldrop the person loves to reenact bits, pieces, and whole chunks of everything from Three Stooges comedies to *Casablanca*. It is his best party trick. He sets the scene with a few words and a gesture, he makes the faces, he does the voices. The result is neither impersonation nor interpretation, but something in between. Approximation. Pastiche. Onlooking film purists have been known to complain that he misses the letter of his model. But the spirit is always there, and often it is enhanced. The Waldrop version can be better than the original.

Everything that goes into the warehouse of information that is Waldrop's memory does not simply come back out but comes out skewed. He claims Thomas Wolfe, R. A. Lafferty, and Philip José Farmer as seminal literary influences and credits a Lin Carter novel with his deciding to become a writer. ("If *The Wizard of Lemuria* could be published, I knew anything I wrote could be published.") What seems to have given Waldrop's fiction its particular bent, however, was a remark made by Farmer at a long-ago science-fiction convention: "Mine your Childhood." Childhood for Waldrop is the 1950's, and, like his favorite moments in old films, that decade has been warped out of true by immersion in his brain chemicals.

So every bad brain-transplant and worse ape-on-the-loose movie he ever saw re-emerges, complete with Mad Scientist, Evil Assistant, and Beautiful Woman, in "Dr. Hudson's Secret Gorilla"; the title itself is a twisted homage to an old soap opera called *Dr. Hudson's Secret Journal*. Every comedian who ever made him laugh returns in "Save a Place in the Lifeboat for Me," on a mission to save the lives of three rock 'n' roll stars who bear more than passing resemblance to Buddy Holly, Richie Valens, and the Big Bopper—all killed in the same airplane crash in 1959, all as beloved of Waldrop as Buster Keaton, Abbott and Costello, and the Marx Brothers. Waldrop especially loves the science-fiction films of the 1950's; inevitably, in "All About Strange Monsters of the Recent Past" (another title that pays tribute, this time to Roy Chapman Andrews, whose *All About Strange Beasts of the Past* enriched many a 1950's childhood besides Waldrop's), those films' giant arthropods, marauding Martian invaders, and revived prehistoric animals enter our reality. Civilization As We Know It is destroyed. "God," muses the story's hero. "Japan must have gone first." And in "Ike at the Mike" Waldrop offers his most skewed vision of the decade: a promising young politician named E. Aaron Presley attends a farewell performance by jazz-great Dwight Eisenhower, on clarinet. George S. Patton sits in on drums.

Sometimes, of course, these whacko conceptions founder in faulty execution. Sometimes, the ideas themselves simply are not strong enough to support much wordage. The notion of importing Israeli mercenaries to a Lone Star State defending its oil against the other forty-nine is clever enough to sustain Waldrop and Jake Saunders's "A Voice and Bitter Weeping" but bogs down in a dreary and interminable combat yarn in their subsequent novel-length expansion, plokingly titled *The Texas-Israeli War: 1999*, almost as soon as the original material is left behind.

Still, Waldrop's level of competence has risen sharply in recent years. He hit his stride with "The Ugly Chickens," which won the Nebula Award in 1980. This tragicomic journal of a young ornithologist's search for the last surviving dodoes in, of all places, Mississippi contains a perfectly charming episode in

which the narrator daydreams of those hapless fowl dancing to Pachelbel's *Canon in D* before the King and Queen of Holland.

In Waldrop's first solo novel, *Them Bones*, an archeological team working in Louisiana in the late 1920's digs into a pre-Columbian burial mound and discovers first the remains of horses and then other, even more disturbing anachronisms. "Meanwhile," in the past but not far from the future site of the mound, Madison Yazoo Leake, a time-traveler from the 21st century, finds Greek-speaking Amerindians and meets traders from the Old World—an Islamic empire, heir to mighty Carthage, which crushed Rome in the Punic Wars. Oddity piles upon oddity and the very structure of time seems to fray as the novel cuts back and forth from the bewildered archeologists to Leake. *Them Bones* is a thoroughly engaging work, part mystery story, part action-adventure romp, and, like "The Ugly Chickens," amply demonstrates that Waldrop's technical skills have at last caught up with his non-stop imagination.

Waldrop's strengths as a writer are considerable. He is a tireless, meticulous researcher. He writes fine, pared-down prose and has a knack for the startling turn of phrase. He possesses humor, compassion, and a vast curiosity, and he loves to tinker with reality. Buster Keaton may have evoked guffaws in quite the way that Waldrop says he did, Rome may not have defeated Carthage and gone on to conquer most of the known world, Eisenhower may have become not a general and a president but the world's greatest jazz clarinetist instead. Waldrop can tell you that a thing was so or was not so, and while he is telling you, you are absolutely convinced.

—Steven Utley

---

**WALLACE, (Richard Horatio) Edgar.** British. Born in Greenwich, London, 1 April 1875. Educated at St. Peter's School, London; Board School, Camberwell, London, to age 12. Served in the Royal West Kent Regiment in England, 1893-96, and in the Medical Staff Corps in South Africa, 1896-99; bought his discharge, 1899; served in the Lincoln's Inn branch of the Special Constabulary, and as a special interrogator for the War Office, during World War I. Married 1) Ivy Caldecott in 1901 (divorced, 1919), two daughters and two sons; 2) Violet King in 1921, one daughter. Worked in a printing firm, shoe shop, rubber factory, and as a merchant seaman, plasterer, and milk delivery boy, in London, 1886-91; South African Correspondent for Reuter's 1899-1902, and the London *Daily Mail*, 1900-02; Editor, *Rand Daily News*, Johannesburg, 1902-03; returned to London: Reporter, *Daily Mail*, 1903-07, and *Standard*, 1910; Racing Editor, and later Editor, *The Week-End*, later *The Week-End Racing Supplement*, 1910-12; Racing Editor and Special Writer, *Evening News*, 1910-12; founded *Bilbury's Weekly* and *R. E. Walton's Weekly*, both racing papers; Editor, *Ideas* and *The Story Journal*, 1913; Writer, and later Editor, *Town Topics*, 1913-16; regular contributor to the *Birmingham Post*, and *Thomson's Weekly News*, Dundee; Racing Columnist, *The Star*, 1927-32, and *Daily Mail*, 1930-32; Drama Critic, *Morning Post*, 1928; Founder, *The Bucks Mail*, 1930; Editor, *Sunday News*, 1931. Chairman of the Board of Directors, and film writer/director, British Lion Film Corporation. President, Press Club, London, 1923-24. Died 10 February 1932.

Edgar Wallace is not a name which comes to mind as a writer

of science fiction. Were it not for the integral part which the fantastic plays in some of his plots they might be classed among his other thrillers. Even his stories of high adventure about Sanders of the River have skirmishes with the fantastic if witch doctors can be so classified. The difficulty in discussing Wallace's science fiction arises from its dual nature. The mystery critic's convention of not revealing the ending of the story has to be discarded in discussing Wallace. To explain what makes the science fiction is to give away the solutions to their mysteries.

Apart from the Sanders stories, Wallace's earliest use of a science-fiction theme is 1925: *The Story of a Fatal Peace* which deals with the consequences for Britain if Germany is not totally beaten in World War I. During the Festival of Schleswig-Holstein in 1925 the Germans attempt to invade Britain in the very transport which had brought British veterans to the German Festival. An interesting device in the story is the submarine detector activated by the sound of propellers, invented by Sir John Venniman. The preface frankly proclaims the story's propagandistic purpose. *The Green Rust* involves a scheme by a German scientist to infest the rest of the world's grain crops with a bacteria, thus putting Germany in a position of power. A layman's view of science and of scientists dominated both *Planetoid 127* and *The Day of Uniting*. The second work recalls a traditional theme in early science fiction, the impending destruction of the world and the effect the knowledge of this has on the characters. The humorous view of science by the non-scientist is combined with the moral dilemma over whether to protect the population from panic by keeping the disaster a secret against the objective view of their need to know. The impending disaster itself is the explanation for the mysterious incidents in the first half of the story, but the conclusion may still come as a surprise to all but the most alert reader. The title refers to the officially proclaimed day for families to be reunited before the end of the world. Professor Colson's "sound strainer" in *Planetoid 127* by which he talks to his alter ego on the planet Vulcan is a thing of "instruments, of wires that spun across the room like the web of a spider, of strange machines which seemed to be endowed with perpetual motion." Events on the other world often being in advance of those on earth, Colson is able to predict the future. This knowledge enables him to manipulate the stock market to his advantage until an unscrupulous gentleman kills him for his secret. The planet Vulcan is on the opposite side of the Sun from the Earth and thus the story has been called the earliest example of the "twin world" theme. It is obvious that the dominant theme in the story itself is the mis-use of scientific knowledge. *Captains of Souls* is a tour de force for Wallace. The transfer of the souls of the two men, Ambrose Sault and Robert Morelle, is an intriguing device which allows the author to explore his characters in depth and also results in a happy ending with retribution for all.

\* \* \*

Still a hazy figure in the history of science fiction, F. L. Wallace was one of the field's most outstanding and least appreciated writers during the 1950's. His only SF novel, *Address: Centauri*, is a minor work that was an expansion of his very good story "Accidental Flight" (*Galaxy*, 1952). Wallace's

other SF stories are of high quality, characterized by a depth and a thoroughness uncommon to the field in the 1950's. Among his most noteworthy stories are "Delay in Transit"; "Big Ancestor," a powerful commentary on the human race and its future direction; "Student Body," which features one of the very best descriptions and development of an alien life form in all of science fiction; "Bolden's Pets," wherein Wallace brilliantly employs the unique concept of *positive* parasitism; "Mezzerow Loves Company"; "Tangle Hold"; and "The Impossible Voyage Home."

\*

Ian Wallace comments:

I aim my books at well-educated or self-educated minds. For them, I try to write pleasurable, frequently startling, coherently designed stories, taking advantage of fantasy to enlarge their scope, but disciplining the tales with logic and with scientific and philosophic theory. I try to portray humans living at the highest levels of their humanity, entailing many-sided intelligence, emotion intelligently guided and expressed, and human fellow-feeling for all the different kinds of humans (including some weird-bodied instances on other planets); that, for me, is both a moral issue and a taste preference.

\* \* \*

Ian Wallace is a modern SF writer who, like many authors who developed during the 1960's, shows more concern for the "soft sciences" of psychology and history than for the "hard sciences" of physics and biology that preoccupied the SF milieu from the 1930's through the 1950's. Wallace's novels tend toward great complexity, a factor which proves an advantage in some works, and a detriment in others.

Wallace's most famous novels are his earliest—*Croyd* and *Dr. Orpheus*. These deal with the adventures of Croyd, a humanoid being possessed of great psychic powers, with special emphasis on the ability to move himself through time. The complexity of the subject matter is well balanced, especially in *Dr. Orpheus*, in which a madman attempts to subjugate humanity with a drug called Anagonon, which robs a subject of the inclination to question orders. Behind him, however, stands the additional threat of a race of arthropodal aliens, whose motive for disseminating the drug involves rendering humanity into a docile herd of mammalian food-sources in which to implant their eggs. Croyd must combat this threat by travelling through time to research the problem's beginnings, which necessitates a journey to ancient Greece at the time of Heraclitus, whose philosophy figures into the novel in a significant manner. Despite the apparent irrelevance of some plot-threads, Wallace draws them together in an engaging tour de force.

In later novels, however, the complexities come too thick and fast for the reader to catch his breath. *A Voyage to Dari* is an exceptionally diffuse novel in which a wide variety of plot complexities fail to gell, including: (1) a political situation between two planets roughly parallel to India and colonial Britain, (2) an alien marriage rite that requires three genetic donors to spawn a child, (3) Croyd losing his powers, and (4) a space-dwelling, brainlike organism that reproduces Earth-mediæval imagery as its mental "universe" and favors feudalism over democracy. Another Croyd novel, *Z-Sting*, is little more than *Fail-Safe* with SF trappings, but this simpler structure is undermined by another Wallace weakness, a penchant for unrealistic, mechanically detached dialogue. When in *Z-Sting* a female character suggests to Croyd the possibility of their having a liaison, he responds that it is "not long-range probable." A non-Croyd novel, *The World Asunder*, also strains credulity in that its protagonists, who must grapple with a madman called Kali out either to control or to destroy Earth (the motives are never clear), are all incredibly well-versed in the psychology necessary to analyze the madman—so well-versed that they often seem to speaking in the same voice. Yet here and there Wallace voices some interesting, if didactic insights, as

when one character says, "I suppose you know that you must never totally reject your dark side; it is where you get your depth".

In some ways, Wallace is more successful dealing with less involved plots. More readable than the save-the-world opuses are the St. Cyr SF-detective genre-pieces, which include the novels *The Purloined Prince*, *The Sign of the Mute Medusa*, and *Deathstar Voyage*. *Deathstar Voyage*, with its colorful settings and rigorously pursued logic-problems, is probably the best of these, in which the policeman Claudine St. Cyr must identify a madman aboard a space-vessel by analyzing his psychic powers and psychological proclivities.

In recent years, Wallace's novels continue to show the same fluctuations of quality. *The Rape of the Sun*, all about aliens who steal Earth's solar system to make of it a present to their princess, is, like *The World Asunder*, heavy on talk and slim in motivations (at the end, when the alien leader is shamed by circumstances that prompt him to desert his mission, he curiously decides that he wants to go back to Earth in the body of one of the protagonists—an action which makes no sense in light of the alien's character, but certainly makes for an emotional finish.) However, *The Lucifer Comet*, also a late work, may well be his second-best work, after *Dr. Orpheus*. Taking his cue from the popular myth of the struggle of angels and devils for the soul of man, Wallace posits two superhuman aliens who both desire to bring into being a planetary race of humans who follow their respective philosophies. However, rather than "good" and "evil," Wallace's "Quarfar" and "Narfar" symbolize something closer to "progress" and "antiprogess." Quarfar is the Prometheus of the real world, who brought it into scientific development; Narfar is a nature-loving, Neanderthal-like savage who prefers the simple life. In addition to giving the reader an interesting view of what life on Earth might have become under the sway of Narfar, Wallace succeeds in making the character of the "devil" quite likeable—which proves tragically affecting when he is unintentionally betrayed by the Earth-woman he loves. There are still some questionable plot-devices in *Lucifer Comet*, but overall, it shows that Wallace's innate creativity is high, and that he only requires a substantial idea in which to develop that propensity.

## Novel

*Taquita the Pearl*. London, Stockwell, 1924.

\* \* \*

The writing career of G. C. Wallis started at the turn of the last century, when the stories of Wells, Shiel, and Griffith were delighting the readers of the *Strand* and *Pearson's*. A list of his published tales, delicately printed by the Sheffield firm in which he was a partner, contains almost a hundred titles, including *The Children of the Sphinx*, a novel which the *Literary World* found "full of swing and interest." By then he had published half a dozen magazine serials, such as "The Last King of Atlantis" and "World Wreckers," and 40-odd short stories which appeared in a variety of publications from the *Penny Magazine* to *Tit-Bits*.

Only some of these tales were science fiction, which was often to be found in juvenile papers like the *Boy's Friend*, *Union Jack*, and *Lot-o'-Fun*. To such as these he contributed another 40-odd stories and serials, some under the name of John Stanton and a few in collaboration with a certain A. Anthony. Though most of his heroes were "Fighting the Spaniards," "In Peril in Persia," or "In the Grip of the Mafia," there were others who ventured to the "City at the South Pole," who voyaged "In Trackless Space," or joined in the "Wireless War."

Like several of his contemporaries who were the real pioneers of science fiction, Wallis played with ideas of cosmic proportions long before they became the stock-in-trade of the pulp magazines of a more advanced period. In "The Great Sacrifice" he anticipated writers like John Russell Fearn by destroying the outer planets (excepting Pluto, yet undiscovered) with the aid of the Martians, who finally exploded their own world so that Earth might escape the meteor stream invading the solar system. The notion that the Martians might not be the monsters that Wells made them was fairly well established among the writers who followed in the wake of Flammarion. Another early Wallis story, "The Last Days of Earth," shows all too obviously the influence of the French astronomer's *Omega: The Last Days of the World*.

In acknowledgment of a Canadian cousin's help in placing his manuscripts in America, many of Wallis's stories were by-lined B. & Geo. C. Wallis, Bruce & G. C. Wallis, or simply B. Wallis. He made several appearances in *Weird Tales*, where a four-part serial, "The Star Shell," typified the kind of science-fantasy with which the editor Farnsworth Wright sought to offset the competition of *Amazing Stories* when it appeared in 1926. Within two years the writer had made his bow in Hugo Gernsback's magazine with "The World at Bay," dealing with an invasion of the surface world by a subterranean race (a tale simple and exciting enough to be serialised also in London *Daily Herald*). Though just as simply told, with his usual touches of romantic interest, "The Mother World" contained some of Wallis's most thoughtful speculations upon the origin and destiny of the human species. An unlikely party of space-travellers is lured to a distant world whose godlike inhabitants have the power to expunge all life on other planets where they have planted their seed, should it fail to reach maturity—and man's fate is in the balance.

A pedestrian thriller, "The Voyage of the Neutralia," depicting lesser forms of life on Mars and Venus, marked his last appearance in *Weird Tales* in 1937. His sole contribution to the *British Fantasy*, "Invaders from the Void," was equally conventional; and when *Tales of Wonder* became established it featured several stories which, though fresh from his still brisk pen, mostly stemmed from ideas he had developed years earlier. His last novel, *The Call of Peter Gaskell*, concerned a mysterious Inca queen in a lost city in the Amazon jungle, and proved so close to Rider Haggard, yet so difficult to read, that a devastating critique in *Fantasy Review* was headed "She-Who-Must-Be-Avoided."

\*

Hugh Walters comments:

All my books are for young people in the 9-11 and 11-16 age groups. I believe that books for this readership should 1) entertain, which is the primary object; 2) educate painlessly (astronomy, mathematics, geology, etc.); 3) inspire the young people of today to become the scientists and technicians of tomorrow.

\* \* \*

Hugh Walters has devoted his entire writing career to children's SF, and the results have been mixed. At first, his novels were welcomed as filling a void in SF publishing, being praised as the way SF should be written for children. Gradually critical opinion shifted as Walter's fiction came to be seen as repetitive, formula-bound, and even carelessly written; and the

attention it received from the review media in both SF and children's literature virtually ceased. In the face of critical neglect and sometimes even open scorn, the wonder is, then, that Walter's novels continue to be published and have retained popularity for as long as they have. Obviously, his publishers are satisfied that the young audience Walters writes for does read and enjoy his novels and, ignoring adult disapproval, even puts pressure upon librarians to keep his books in circulation and order new titles as they appear. This phenomenon is readily understood once it is perceived that Walter's fiction is the result of his attempt to wed the formulas and expectations of boy's series books and SF. In other words, Walter's SF manifests both the strengths and weaknesses of children's series fiction writing.

On one hand, Walters's SF celebrates the exploits of youthful, dashing, and resourceful protagonists that boys chaffing under the dullness of their routine-filled lives enthusiastically identify with. In *Operation Columbus* Chris Godfrey, hero of Walters's SF, is the first person on the moon and he also magnanimously saves the life of his young Russian rival, Serge Smyslov, who had previously disabled Chris's space craft. Chris then pilots the Russian space ship safely to earth in spite of not being familiar with the controls. In *Terror by Satellite* Tony Hale, who appears in some of the Godfrey books, is the remaining link between earth and the Observatory, the space satellite taken over by its crazed commander, Hendriks, who threatens to destroy earth; through his skill in electronics Tony proves indispensable as Chris successfully retakes control of the Observatory. Of more than passing interest is that Walters is clearly a knowledgeable author of children's books, and is careful to balance Chris, the public-school boy born to privilege and noblesse oblige, with Tony, the son of lower-class shop-keeping parents. In this way, many different kinds of young readers may be able to identify with Walter's protagonists. Further, although he does emphasize action and the various dangers of space exploration—emphases obviously intended to capture the attention of young readers—Walters does not neglect space technology and weaponry. Described in detail, these are usually up-to-date or plausibly extrapolated so that youngsters looking for “nuts and bolts SF” are readily satisfied.

On the other hand, Walters's SF exhibits the weaknesses characteristic of most series fiction: conventional, two-dimensional characterization, repetitive and predictable plotting, and dull, pedestrian writing. As a result of these weaknesses, Walters has rightfully been denied major status. At the same time, however, it would be unfair to dismiss Walters as just another author of series SF, another Victor Appleton II or John Blaine. For, in view of his strengths it is clear that Walter's work is definitely a cut or two above typical series SF.

\* \* \*

Donald Wandrei's short SF appeared in a variety of pulp, slick, and academic outlets from 1926 to 1953. Wandrei was a frequent contributor to *Weird Tales*, but most of his appearances there were SF, not fantasy; his novel, *The Web of Easter Island*, is SF despite its close connection to H. P. Lovecraft's Cthulhu Mythos. Throughout the body of Wandrei's work runs a fascination with science, scientists, and the scientific attitude. Despite their scientific form, however, the stories are almost invariably horror stories. Considered as such, many of them work very well indeed. An ill-conceived experiment may bloodily destroy the experimenter in front of his wife—or may release atomic bonds, allowing the Earth to slump into a formless mass. Aliens invade across space or dimensional boundaries, doing enormous, graphically described damage. Human warfare sets into motion events which destroy the universe, the Earth, or simply civilization. Natural processes bring the universe to a quiet end or sterilize all life on Earth.

The unity of the stories is deeper than the horrifying nature of the events alone: there is also the coldness with which the events are perpetrated. A well-written illustration of this tendency is "The Witch-Makers." An adventurer trying to escape with the jeweled idol he stole from an African tribe stumbles into the camp of a pair of scientists. They have chosen to camp in an uncivilized area so that no one will interfere with their experiments in mind-transfer among animals. They experiment on the unwilling adventurer until they kill him, feeling neither compassion nor dislike for their human guinea pig. The effect is chilling.

Regrettably, Wandrei had little scientific background, a factor which severely weakens some of his best-known stories and most of the minor ones. "Colossus" and "Colossus Eternal," in effect the two halves of a novella, have a truly cosmic conclusion, but they are riddled with—and indeed built upon—repeated misunderstandings of basic concepts such as the periodic table and the difference between mass and volume.

Likewise, the universe of "The Red Brain" is being choked with dust which glues all the stars to blackness, a notion, whatever its validity in 1927, which has not aged well but which is crucial to the plot.

However, when Wandrei wrote of characters and settings with which he was personally familiar, he consistently created stories of great reality and impact. The Upper Minnesota Farmer and his wife in "The Crystal Bullet" are tersely and ably described. They are bewildered by the object which falls in their woodlot; and while they react to the object, they do not halt the story to explain the event as Wandrei's scientists would have felt compelled to do. Similarly, the overworked reporter of "Infinity Zero" is wholly real. He is so wrapped up in the everyday horrors of war-time news-gathering that it is some time before he realizes that he has witnessed the beginning of the process which will end the world in a few weeks.

*The Web of Easter Island* adds a level of compassion and, perhaps, hope to the horror it shares with the shorter fiction. A statuette turns up in a British cemetery amid buried structures built in the prehuman past. The statuette proceeds westward from one doomed carrier to another. It is studied and finally pursued by an archeologist who realizes that it is only a portion of a living being which will open our dimension to its own and the creatures thereof—unless stopped. The confrontation on Easter Island is not a final confrontation: there can be no final victory over such an opponent. But Mankind has found a champion, and at whatever cost to that individual there will be someone to protect the Earth beyond the foreseeable future.

The bulk of Wandrei's work is flawed, but there is some merit in the worst of it. At his best, Wandrei wrote fiction that was the equal of anything of its type.

\* \* \*

In discussing Stanley Waterloo's novels it is necessary to differentiate between the conception and the execution of the works. *The Story of Ab* is an early realistic novel of prehistoric man. Jack London admitted plagiarizing it for his *Before Adam*, and Waterloo's novel predated even H. G. Wells's splendid "A Story of the Stone Age" by some months. (Lang's still earlier "The Romance of the First Radical" differs from both works in being based in anthropology, not archeology, and being primarily a vehicle for social comment.) Similarly, *Armageddon* was probably the first of the fictional attempts to presage World War I with its weaponry and fabric of alliances. Writers as fine as Wells and Shiel (and many of lesser note) again followed in Waterloo's footsteps. On the other hand, Waterloo's execution (with a few brief exceptions) ranged from poor to worse. Both these novels as well as mainstream novels by Waterloo show signs of hasty construction and a basic lack of writing talent.

*The Story of Ab* is a serious attempt at the biography of a Stone Age (perhaps Neanderthal) man, told through significant incidents. Ab does many of the things that prehistoric heroes have done in more recent fiction: he hunts mammoths, domesticates dogs, slays a sabre-toothed tiger, invents the bow, and wages the first war. He does *not* tame fire. Waterloo claims to have based his novel on the best contemporary scientific opinion. Fire had been used by men long before the rise of Ab's subspecies, and Waterloo refused to take artistic license with scientific fact. While our knowledge of prehistory has greatly increased in the years since the book was published, Waterloo's obvious care keeps the novel from being badly dated. Indeed, Waterloo's picture of the Clam People combing tide flats for food and scuttling deeper in the water when danger threatens anticipates that drawn by Elaine Morgan in her 1972 treatise

*The Descent of Woman*. However, the incidents of Ab's life are only incidents. Some of them are spun into short skeins, but there is no connected purpose controlling the action of the novel. In general, chapters stand or fall on their own merits. There is little preparation for later events and almost no character development.

*Armageddon* is also rich in exciting material: the creation of the first airship, the building of a sea-level canal through Nicaragua, the greatest sea battle of all time, and, for that matter, a romance between parties of widely differing social positions. Waterloo's failure to make any of this material interesting results from a combination of flaws. First, there are not realized characters. Second, matters of large moment are trivialized by their handling. For instance, the novel's description of the international political situation descends beneath the level of national stereotype to the anthropomorphization of nations as national stereotypes. Third, the gritty details which could create the illusion of reality in a fictional world are absent. From the evidence of the novel, Waterloo simply did not know enough about the gadgetry of the present to be able to describe realistically the gadgetry of his future.

In sum, Waterloo was imaginative and was capable of good research. His writing, however, was generally pedestrian and invariably hasty. *The Story of Ab* remains readable, especially for younger people; *Armageddon* is at most of historical interest.

\* \* \*

William Jon Watkins's novels, two of which were written with Gene Snyder, show man as a corrupt evil-doer who creates his own doomsday crises in which he barely avoids the total extinction of human life on Earth.

In *Ecodeath* Earth is about to die from water pollution. Two characters, Watkins and Snyder, start out as opponents but soon pool forces in order to rescue mankind. They use teleportation and finally link their mindpower to transport a small group of survivors to a pollution-free parallel earth of the future by telekinesis. Mankind survives because Watkins realizes that time implies parallel worlds existing simultaneously in infinity.

In *Clickwhistle* extraterrestrial beings take possession of the minds of killer whales to send computerized commands to atomic missiles stored in submarines. Dr. Pearson, a dolphin authority, defeats the aliens with the help of dolphins but other human beings are either evil-doers or slaves of dark political powers. Intrigue and betrayal run rampant while Orcas and dolphins battle. Earth is saved when dolphins triumph but men

will forever live in fear of political bosses.

*The God Machine* shows perpetual and total warfare between a totalitarian worldwide state machine of Orwell's *Nineteen Eighty-Four* type and a highly technological underground opponent. Sophisticated weapons and tactics improve with the need to accelerate extermination. A reduction machine, the "micronizer," is central to several plot twists. Ecological negligence is the trademark of the status quo. An unbreathable atmosphere makes the use of masks and air filters universal. Neither side is a definite winner in the end.

In *The Litany of Sh'reev* Sh'reev uses mental powers to heal and save lives while a chronic state of revolutionary wars wrecks civilization. Empire is run by the will of an absolute and totalitarian ruler who destroys extant royal families to seize their wealth. The revolutionaries are ESPers who reject the increase of oppression. Sh'reev gets his spiritual power from Tao techniques. His mind fuses with those of the sick and dying in a state called Sh'aela. Eternal Return in its Eastern version provides further existences for Sh'reev.

The central action of *What Rough Beast* is the hunt for one huge, extraterrestrial, telekinetic, furry humanoid female who lands on Earth in order to help humans acquire her talents. Corporation mentality as the villainous hunter is aided by an almost sentient computer, Slic 1000, and his offspring Tad. There is an ironical twist when corporational man, dominated by a rigid mentality, becomes a dehumanized animal backbiting other corporate members in the struggle for power and rewards while the computers become humanized. The hero and savior is Lth, the alien furry female whose telepathic abilities merge with Tad in order to confer superhuman status upon man. Mankind is saved when sentient microcomputers become an implanted standard stabilizing device in human brains.

Although Watkins's novels are simply constructed and appropriate for juvenile audiences they deal with the vital issue of man's chances of survival. In each instance, man brings a catastrophic end upon himself and an environment he can neither preserve nor duplicate, and avoids self-annihilation by the slightest margin. Watkins implies that mankind, part angel but mostly beast, is on a cyclical course and will probably repeat its past mistakes. In *What Rough Beast*, Watkins introduces two new solutions to the "scorpion syndrome," man against himself. One is Lth's Superwoman mentality; the other is brain microcomputer implantation. In both cases, Watkins suggests that man can not be his own master.

—Eric A. Fontaine

**WATSON, Ian.** British. Born in North Shields, Northumberland, 20 April 1943. Educated at Tynemouth School, 1948-59; Balliol College, Oxford, 1960-65, B. A. (honours) in English 1963, B. Litt. 1965, M. A. 1966. Married Judith Jackson in 1962; one daughter. ## Ian Watson comments:

My books are all primarily about the relationship between reality and consciousness (testing out this theme variously by way of linguistics, speculation about cetacean intelligence, evolution, novel life forms, the UFO mythos, etc.) and whether any kind of ultimate understanding of the nature of reality and the reason for life and the universe may or may not be arrived at. Intersecting this is frequently—particularly in my earlier books—a strong socio-political underpinning to events. A dialectic of history and transcendence is at work. I regard my fiction as a research programme, in fictional form, into the nature of existence and the nature of knowledge.

\* \* \*

"SF is founded upon the exploration of ideas, rather than stylistics. It is a community of ideas; in its sum, it composes what one might call an 'idea-myth,' the idea-myth of man in the universe," Ian Watson wrote in "The Crudities of Science Fiction." That Watson should define science fiction in terms of its speculative content, with particular emphasis on myth and ontology, provides a telling gloss on both the form and the substance of his novels and stories. A former academic whose work displays not only a serious metaphysical bent but also an engaging internationalism in his choice of settings and characters, Ian Watson vaulted to prominence with the publication of *The Embedding*. Few novel-length debuts are so

dazzling, either for their structural brilliance or for the multifaceted complexity of their intellectual speculations, and reviewers responded with laudatory comparisons to the works of Arthur C. Clarke and Stanislaw Lem. Later J. G. Ballard emphatically styled Ian Watson "the most interesting British SF writer of ideas—or, more accurately, the *only* British SF writer of ideas" (*New Statesman*). Christopher Priest, likewise commenting on Watson's talent for launching cerebral flights of fancy within the expansive parameters of science fiction, has described his novels as having "a Wagnerian quality to them, with immense clashing of intellectual bravura and cosmic event" (Introduction to *Anticipations*, 1978).

One idea exploited in different guises or subtle variations from novel to novel is Watson's strategically held "belief" that consensus reality, or the world of everyday experience, is ripe for transcendence. The means of transcending our human limitations or the prison of the physical universe may differ from one fictional foray to the next, but the fact that there does exist a transcendent mental set or cosmic continuum to which we may or should aspire remains a conspicuous constant. Although Watson usually embeds this idea in a scrupulously rational context (often it is a research project or a scientific mission), a strong element of the primordial or the mystical (from metalinguistics to Sufism) lends his several restatements of the concept a rich and endlessly ramifying ambiguity. Indeed, Watson is especially adept at legitimizing the paranormal with the argot of technological discourse. Good examples of this technique include not only the recent stories "The Very Slow Time Machine" and "The Rooms of Paradise," but the mind-bogglingly open-ended novel *Miracle Visitors*, whose concluding sentence, rendered almost after the fashion of a haiku or a koan, points directly to the metaphysical beyond with which Watson is so obsessed: "Somewhere else, / Khidr smiled."

The structural complexity of Watson's work, as a matter of fact, almost certainly stems from his preoccupation with ideas. In *The Embedding*, for instance, the agency for arriving at the freedom and omnipotence of "Other-Reality" is a language, a distilled grammar of perception permitting its speakers to encompass "This-Reality" physco-biologically and so to transcend it. Language, then, is the unifying element of the complicated, threefold plot. First, in an English hospital a group of Pakistani orphans are learning artificial languages as "probes at the frontiers of mind." Second, a French anthropologist in the Amazon is studying a tribe of Indians whose use of a local drug enables them to alter their day-to-day language into an otherwise incomprehensible embedded language of transcendent perception and control. Finally, an alien race called the Sp'thra, whose name means "Signal Traders," arrive on Earth and as part of their ongoing "Language inventory" of the galaxy ask for six living human brains programmed with six different terrestrial grammars. By this inventory the Sp'thra hope to escape "This-Reality" for the ineffable "Other-Reality" now inhabited by a transcendent alien species called the "Change Speakers." Watson's ending, however, is both apocalyptic and enigmatic.

His next two novels follow a somewhat similar pattern. In *The Jonah Kit* escape from this illusory universe lies within the grasp only of the world's whales. By forming a "Thought Star"—a cetacean computer whose living components reach out with their minds to an alternate continuum—and by later committing mass suicide, these self-aware sea breasts abstract themselves from the homocentric madnesses of man. In *The Martian Inca*, on the other hand, transcendence derives from a viral activator in the soil of Mars. This mysterious catalyst triggers a

dormant genetic program in our DNA for releasing the superhuman in every adult representative of the species—but humanity, in the person of a bourgeois American astronaut, resists the transformation and the novel ends on a decidedly downbeat note. Although as complex and inventive as *The Embedding*, these books cast a dark and somewhat fatalistic spell. (*The Martian Inca*, incidentally, contains the seminal idea for Watson's story "The Very Slow Time Machine.")

Between *The Martian Inca* and *Alien Embassy* an interesting change apparently took place in Watson's thinking. His fourth novel—besides boasting his most appealing protagonist, Lila Makindi, who also narrates her own story—is noteworthy for framing the moral dilemma of a young African woman who sees the conscious formulation of humanity's next evolutionary step as a betrayal of the species *as it exists at present*. Watson cannily dramatizes the poignancy of Lila's dilemma even as he establishes forceful arguments for the necessity of society's taking the step that so appalls her. Although beyond is better, getting there may entail fearful hardships and the cruelty of institutionalized deceit. A departure from as well as a recognizable sequel to his previous work, *Alien Embassy* shows Watson opting for a hard-nosed humanistic compassion for his characters. For just that reason, it may be his most moving novel to date.

*Miracle Visitors*, perhaps an even more structurally complex novel than *The Embedding*, partakes of this same auctorial generosity and openmindedness. Here Watson's presiding metaphor for transcendence is the phenomenon of the UFO experience, which, because it manifests itself to different characters in different ways, establishes at least three separate subjective "realities" within the novel's conceptual framework. Imagine a Philip K. Dick novel sustained by undiluted intellectual rigor, and you have some idea of the tone and the narrative effects of *Miracle Visitors*. Its most striking bravura passage details a trip to the moon in a Ford Thunderbird. Although an intrinsically wacky, if not downright duncish, concept, Watson handles it with admirable pokerfaced dexterity—just as he does the psychological portraiture of his principal characters, even if the major part of his own sympathy seems to lie with the consciousness research, John Deacon. The book's final lines, "Somewhere else, / Khidr smiled," are therefore a kind of password phrase hinting at both the reality and the benevolence of Watson's hoped-for beyond. They also provide a clue to his own aesthetic orientation to the problem of demonstrable human limitations; the desire to know what some have labeled unknowable, Watson implies, is precisely what makes us human.

*The Very Slow Time Machine*, although lacking the eerily brilliant story "The Rooms of Paradise," contains a full-course feast of Watson's short fiction—from the title story to the early and nightmarish "Thy Blood Like Milk" to the playful and admonitory "Programmed Love Story" to the concluding complex mini-novel "The Event Horizon." In addition, Watson has written *God's World*, which he describes as "a kind of companion novel to *Miracle Visitors*," although neither a sequel nor a blatant parallel, and *The Gardens of Delight*, in which Watson creates a world based on the famous triptych by Hieronymus Bosch.

A fascinating *intermezzo* in Watson's career is *Under Heaven's Bridge*, co-authored with Michael Bishop without the two writers ever having met. That Watson is hardly a typical British SF writer—an "odd duck" according to Cy Chauvin in *Foundation*, "the most madcap, daring major figure" writes Gregory Benford in the same journal—is pointed up by this transatlantic co-creation which seamlessly fuses preoccup-

ations (numinous, human, and exotic) common to both Bishop and Watson. British authors typically also write at least one disaster novel; but Watson has not done so.

His next novel *Deathhunter* took as theme a peaceful, apparently utopian near-future society founded upon euthanasia and the denial of an afterlife; but all is not quite as it seems. *Locus* hailed *Deathhunter* as "a watershed, bringing a new lightness to his metaphysical concerns"—humor, irony, sprightliness of touch. These new elements—broadening Watson's scope and writerly repertoire—were even more evident in his next novel, *Chekhov's Journey*, concerning a scheme hatched up by a Soviet film unit to improve the performance of their lead actor (an Anton Chekhov look-alike) by means of "reincarnation by hypnosis," a scheme which goes awry in a delightful counterpointing of time present, timeship future, and the past where Chekhov's genuine historic journey across Siberia mutates into an investigation by him of the Tunguska explosion. As well as being a loving, convincing reconstruction of 19th-century Russia, the novel combines "comedy and thought-provoking inventiveness with a sophistication rare in SF" (*Locus*). American readers, alas, were to be deprived of their own editions of these two richly rewarding breakthrough novels due to the lack of perspicacity of U.S. editors.

The comic tendency climaxed in Watson's next novel, *Converts*, a fantastic slapstick tale about the pitfalls and pratfalls of taking evolution into one's own hands with a viral DNA drug which enables people to become the creatures of their own secret dreams. A witty homage to Ovid's *Metamorphoses*, *Converts* is also deeply satirical of the new fundamentalist "born-again" Christianity, showing how Watson remains an astute political and social commentator even while at his most outrageously, and hilariously, fantastic.

In the meantime Watson's second story collection, *Sunstroke*, appeared, confirming his position as one of the more prolific of short-fiction writers—as well as one with the most varied of tone, from the dark irony of "Nightmares," through the politically committed satire of "Returning Home," to the parodic comedy of "The Call of the Wild: The Dog-Flea Version" and the haunting, adventurous metaphysical domain of "The Milk of Knowledge."

Next, to the surprise of some readers, but to the pleasure of others who had seen the signposts of the new "light touch," Watson wrote an exotic adventure trilogy set on a distant world: *The Book of the River*, *The Book of the Stars*, and *The Book of Being*. Metaphysical concerns are still present, but even more noteworthy are the exuberance and informality of style, the vivid characterization and the memorable inventiveness of Watson's world divided by a great river, on one side of which a repressive male-dominated society rules, while on the other side is a female-led river-faring civilization—and in the midst, preventing intercourse between the two, a giant enigmatic alien creature, whose nature is gradually revealed. The first-person heroine of all three volumes is riverwoman Yaleen; and it's worth remarking how many of Watson's books have had heroines rather than heroes: *Alien Embassy*, *God's World*, and now the Yaleen cycle of novels told in her own lively irreverent voice. Few male SF authors have so frequently, so successfully, or so naturally developed female characters as their principals.

In the time since his *Sunstroke* collection Watson has already published enough short fiction, mainly in American magazines and anthologies, to fill at least two more collections. A whole range of voices is present in these: the playful ("Ghost Lecturer," a tale about the world-view of Roman philosopher Lucretius), the comic ("On the Dream Channel Panel"), the

parodic ("The Bloomsday Revolution"), the political ("Cruising": Watson is a convinced nuclear disarmament), the horrific ("The Flesh of Her Hair" and "White Socks"), the wittily fantastic as in "In the Mirror of the Earth," the emotionally moving (the Nebula- and Hugo-nominated "Slow Birds"), the satiric, and the experimental.

Just over forty, Watson has already produced a formidable oeuvre. The breadth of his intellectual interests, along with the nimbleness of his imagination and his wholehearted commitment to the possibilities of the field, ensures that no attempt to assess either the direction or the quality of 20th-Century science fiction can ignore his remarkable contribution.

## Sharon Webb comments:

The sciences I studied in nursing school gave me the confidence to write something that I had loved since childhood: science fiction. Thirty stories and three sf books later, I can look back and see that this "tool" of science, while useful to the genre, is not essential to the writing of it. The real tool of sf is the use of metaphor to describe the human condition, and it is this, I believe, that explains the seductiveness of science fiction for the reader.

\* \* \*

Sharon Webb has only been writing for the last few years, but she has been impressive. Following a non-fiction book about nursing school and the humorous *Terra Tarkington*, R. N., stories in *Asimov's Science Fiction Magazine*, Webb began work on the novelette "Variation on a Theme from Beethoven," an early version of part of *Earth Song*, the second volume of the *Earth Song Triad*, her most significant work so far. The trilogy explores how human beings respond to immortality either thrust unwillingly upon them, denied them, chosen by them, or denied by them. The Mouat-Gari immortality process, given to the children of earth at first without their consent, only works for children whose growth has not been completed. It tends to freeze people in a youthful maturity, allowing them to live forever. While the triad moves to events a few hundred years beyond our times and includes some of the usual science-fiction hardware, such as the Ram, a space ship similar to Clarke's Rama, and Utopian thinking similar to Asimov's in the Foundation series, there is an even greater conservatism in Webb—she stays close to what she knows: medicine, music,

writing, and locations in the southeast such as Tampa, Atlanta, Chattanooga, and the Blue Ridge Mountains. In many respects, particularly in her concern for people's motivations and reactions, Webb is a realistic social novelist doing "What if?" experiments with her characters much like Ursula K. Le Guin. Although immortality for human beings may seem an undeniable good, Webb sees a trade-off much as we might see in Homer or the Greek tragedians: her thesis is that creativity is dependent upon mortality which immortals consequently do not share—creative work thus becomes for mortals a substitute for immortality, a way to live on after death.

*Earthchild* traces the beginning of the effects of immortality on human beings and moves to the establishment of an immortal solar government with headquarters on earth, WorldCo. The initial effect of immortality on the children of earth is hatred, as the immortal children are hunted and killed by groups of mortals, sometimes their own relatives. So much butchery occurs that the children have to be taken from their parents and raised in a fortified, protected environment where they are forced into training for government work in a plan similar to Plato's. Two immortals have special significance, Kurt Kraus, a man who loses his art, music, to the Mouat-Gari immortality process, as well as his family, and Silvio Tarantino, a cherubic looking immortal whose lust for power and manipulation of people is as sinister as Hitler's or Asimov's Mule. After a generation, it becomes clear that immortality and creativity are at odds; consequently, Kurt Kraus, who has become the Minister of Culture, designs a planned environment, Renaissance, where gifted children may study their art or science and then choose to live through their work and die or to live eternally.

*Earth Song* continues the cultural developments of Renaissance nearly 200 years after Mouat-Gari. Two children of Renaissance must choose between mortality and art, Liss McNabb and David Defour, while Silvio Tarantino, through control of the propaganda apparatus in WorldCo. Communication, plots a revolution of earth's solar colonies. The villain is foiled through David's art, Kurt's courage, and the skills of a child with Down's Syndrome. This plot, though skillful, only provides the suspense of the novel. The book's real fascination, just as in *Earthchild*, is in human motivation. What does it feel like to be alienated from a father dying of cancer who wishes to kill his immortal son? To know that one will outlive his parents and brothers and know that they know this will happen? To choose between immortality and the prospects of immortality through one's own creativity?

Sharon Webb's writing is extremely sensitive. Though she uses symbolic narrative, her chief ploy aids narrative compression and characterization, situational irony. Kurt Kraus, for instance, who tells his dying father, "I'm going to watch you die," soon finds that he institutes death to save earth's creativity at Renaissance; he triumphs but grieves. David Defour and Liss are caught in equally powerful ironic situations through their choices involving immortality and their love. The *Earth Song Triad* is a powerful beginning by a writer with great potential.

Critical Studies: *After Ten Years: A Tribute to Stanley G. Weinbaum* edited by Gerry de la Ree and Sam Moskowitz, Westwood, New Jersey, de la Ree, 1945.

\* \* \*

It is now formulaic to include the term "tragic death" with each mention of the name Stanley G. Weinbaum. His total career as a writer lasted from the publication of "A Martian Odyssey" in the July 1934 issue of *Wonder Stories* to his death in December 1935. Almost every critic who discusses the early years of pulp science fiction singles out Weinbaum as a unique voice who never had the chance to develop fully his powers as a writer. While one can never know just how far these powers would have in fact developed, a number of conclusions can be drawn, based on the short stories published during Weinbaum's career and a number of stories published after his death.

With his very first story Weinbaum managed to break a number of standard formulae in pulp fiction. "A Martian Odyssey" not only attempted to portray aliens as creatures unlike man but went so far as to present one such creature in a highly sympathetic light. Weinbaum seems to have been one of the first, if not the first, to realize that aliens may differ from humans in not only their outer appearance but their inner thought processes as well. His invention of the bib-bird-like creature Tweel in "A Martian Odyssey" stands as a major step in the genre because it undertakes the difficult task of describing the actions of a creature that clearly thinks differently. Given its non-human nature, Weinbaum uses a human character's interaction with Tweel to bring out the alien's basic nature. While both the human character and the reader begin the story amused at the weird actions of Tweel, this amusement is changed to admiration and respect by the end of the story. Tweel first grasps the possibility of communication between alien and human, and is able to make use of the human language while the human character gives up any chance of comprehending Tweel's. Tweel shows the greater understanding of the other aliens on Mars, and looks more at home on Mars, even though

he too is an explorer from another planet. In other words, with Tweel readers were given an alternative to the murderous aliens of H. G. Wells, and many writers were soon imitating Weinbaum.

But Weinbaum's stories were not successful simply because he had invented a new attitude toward aliens. In the stories that followed (all in *Wonder Stories*) Weinbaum continued to emphasize the fact that his aliens lived by systems of logic that were different from man's, and it is the fact that these different systems were both strange and internally consistent that won him a wide audience. The care with which Weinbaum created new aliens and described their alienness was unique to the pulp fiction of its time. Thus, even in a story such as "Paradise Planet" in which alien forms on Venus do menace humans, the threat originates in the nature of life on Venus and not in some anthropomorphic desire to rape and pillage humanity.

As *Wonder Stories* continued to publish stories by Weinbaum almost monthly, a second reason for his popularity became apparent: his stories contained a good deal of humor. This humor was often achieved at the expense of human character and human science. Thus in a series of stories based on a delightfully "mad" scientist named Professor Haskel van Manderpootz ("The Worlds of If," "The Ideal," and "The Point of View"), inventions constantly appear that seem to have no other reason for existence than the fact that they constantly complicate the life of Dixon Wells, a young and somewhat love-sick romantic.

Weinbaum's treatment of aliens and his use of humor, however, did not free him from all of the pulp formulas. In "Pygmalion's Spectacles," for example, Weinbaum refuses to bring the story to its logical, tragic conclusion. A young man, while wearing spectacles that allow the wearer to take full part in an illusion, falls in love with a dream woman. When the dream ends and he must take off the glasses, he remains in love with the woman. Weinbaum, however, begs the whole issue of illusion and reality when at the end of the story a living counterpart of the dream woman is produced. Given the strength with which Weinbaum evokes the dream world and the sadness that the hero undergoes with its loss, one feels that "Pygmalion's Spectacles" could have been a better story. Weinbaum's ties to pulp fiction can also be seen in *The Black Flame*, which contains two versions of the same story. The first version, "Dawn of Flame" is a competent but uninspired story of the innocent young man who meets the exotic and erotic immortal woman. Reminiscent of H. Rider Haggard's *She*, the story contains some powerfully sexual scenes but basically remains a formula story. In the second version, "The Black Flame," however, Weinbaum rewrites the story and adds the paraphernalia of a pulp story complete with happy ending. The mixture of these two separate traditions was less than successful, and "The Black Flame" seems to be constantly struggling to make up its mind as to exactly what it wants to be.

On those occasions when Weinbaum does completely overcome his pulp environment, however, the fiction he produces is both sensitive and moving. In "The Adoptive Ultimate" he refuses to opt for the happy ending, and in the *The New Adam* Weinbaum takes the stock superman character and turns him into a sympathetic character who is alone in a world of mere humans. Because of the first-person narration the reader is able to see a side of such a character that rarely was portrayed before Weinbaum's treatment, and never so carefully or intimately. Lester del Rey calls the hero of *The New Adam* "a rather helpless failure," but such a characterization refuses to take into account what caused that failure, what it was in the nature of being a superman that led to it. And it is Weinbaum's

investigation of exactly these questions in a sympathetic and painstaking manner that makes the novel so readable.

Works like *The New Adam* are rare in science fiction. Too often they are ignored when they do appear, and such was particularly true during the great age of the pulps. Weinbaum is remembered best for his aliens and the strange worlds he created for his stories in *Wonder Stories*. Thus, "A Martian Odyssey" remains Stanley Weinbaum's best known work. While such stories have had a significant effect on the direction science fiction was to take in the 1940's, *The New Adam* deserves far more notice than it has received to date.

\*

Manly Wade Wellman comments:

I came to America from an African wilderness, but with strong family heritage and association in the American west and south. I began by wanting to write of the fantastic, the imaginative. I wrote in other fields, too, but now I've returned to that first love. A writer must find himself out all alone, must understand himself, use himself in all he writes. More than by years or ability or reputation, your life is measured by the work you do. You pave your road by your writing, and travel it always into new wonders and perils and joys and sorrows. You find and use things out of sight and sound of all others. It's part of you, like the blood in your veins, the breath in your nostrils.

I look back on more than half a century of writing, and hope to keep on until they say the last words over me.

\* \* \*

The bulk of Manly Wade Wellman's writing has been outside the science-fiction field. A popular writer during the heyday of the SF pulps, he is best known today as a fantasy author and for his fiction and nonfiction work in the field of Southern regionalism.

Wellman began selling SF as early as 1927 with "Back to the Beast" in *Weird Tales*. In 1930 he turned to writing as a full-time profession, and in 1934 moved to New York in order to be closer to his markets. After "Outlaws on Callisto" made the cover of the April 1936 *Astounding Stories*, Wellman became a client of the noted agent, Julius Schwartz, under whose direction he became part of the Better Publications stable. There Wellman became a regular contributor to *Thrilling Wonder Stories* and *Startling Stories*. These popular pulps, aimed at an adolescent readership, were well suited to Wellman's brisk, simple narrative style, and the bulk of his SF appeared in these and similar pulps. Most of his SF books are reprints of his earlier work, although recently he has begun to write fantasy.

Wellman's first book publication was *The Invading Asteroid*. It set the tone for the sort of space opera Wellman was to become known for. He created a consistent futuristic setting of the 30th century, and utilized this for some 16 of his stories. Wellman's 30th century was pretty much the same as the 20th, with the addition of interplanetary travel and extraterrestrials. Nonethe-

less, so well-liked was Wellman's future world that fans cried "plagiarism" when Nelson Bond utilized certain of these elements for a story of his own, and Wellman had to explain that Bond had done so with his permission.

*Sojarr of Titan* is a "Tarzan of outer space" pastiche written at editor Leo Margulies's request. *The Beasts from Beyond* made use of the idea of invasion at the intersection point of bubble universes that Wellman returned to in *The Beyonders*. *The Devil's Planet*, part of his 30th-century series, is a murder mystery set on Mars that teams a human and an android as detectives, and appears to be the archetype of Asimov's *Caves of Steel*. *Twice in Time* is a novel of a man who travels through time to become Leonardo da Vinci. It is Wellman's most important SF work and remains a superior time-travel novel. *The Dark Destroyers* has Earthmen throwing off the yoke of extraterrestrial conquest. In *Giants from Eternity*, Pasteur, Darwin, Newton, Edison, and Curie are brought back to life to combat an alien growth that threatens to engulf the Earth. In *Island in the Sky* a future gladiator rebels against a technological dictatorship that holds Earth in thrall. A final reprint from the pulp days, *The Solar Invasion* is Wellman's one fling at writing a Captain Future episode.

During the 1960's Wellman collaborated with his son, Wade Wellman, for a series of droll pastiches that placed Doyle's Sherlock Holmes and Watson alongside Professor Challenger in the London of Wells's *War of the Worlds*. These were expanded and collected as *Sherlock Holmes's War of the Worlds*, a book which ranks among the best of the Holmes pastiches. *The Beyonders* is a routine novel of invasion by creatures from another dimension, with the saving charm of its Southern mountain setting.

While even the best of Wellman's SF seems naive and badly dated to modern readers, the same is not true for his fantasy writing, which remains some of the finest in this genre. The best of his short fantasy fiction has been collected in *Who Fears the Devil?*, *Worse Things Waiting*, and *Lonely Vigils*. *Lonely Vigils* collects the cases of three occult investigators, Judge Pursuivant, Professor Enderby, and John Thunstone, whose separate series originally appeared in *Weird Tales* and *Strange Stories*. *Who Fears the Devil?* collects the adventures of a wandering balladeer, named simply "John," who confronts supernatural evil in the southern Appalachians. The stories originally appeared in *The Magazine of Fantasy and Science Fiction* during the 1950's.

Recently Wellman has revived these characters for a series of novels, that, although marketed as SF, definitely belong to the category of fantasy. *The Old Gods Waken*, *After Dark*, *The Lost and the Lurking*, *The Hanging Stones*, and *The Voice of the Mountain* all feature John. Judge Pursuivant makes a guest appearance in *The Hanging Stones*, while John Thunstone returns as the hero of *What Dreams May Come* and *The School of Darkness*.

—Karl Edward Wagner

**WELLS, H(erbert) G(eorge)**. Also wrote as Reginald Bliss. British. Born in Bromley, Kent, 21 September 1866. Educated at Mr. Morley's Bromley Academy until age 13: certificate in book-keeping; apprentice draper, Rodgers and Denyer, Windsor, 1880; pupil-teacher at a school in Wookey, Somerset, 1880; apprentice chemist in Midhurst, Sussex, 1880-81; apprentice draper, Hyde's Southsea Drapery Emporium, Hampshire,

1881-83; student/assistant, Midhurst Grammar School, 1883-84; studied at Normal School (now Imperial College) of Science, London (Editor, *Science School Journal*), 1884-87; taught at Holt Academy, Wrexham, Wales, 1887-88, and at Henley House School, Kilburn, London, 1889; B. Sc. (honours) in zoology 1890, and D. Sc. 1943, University of London. Married 1) his cousin Isabel Mary Wells in 1891 (separated, 1894; divorced, 1895); 2) Amy Catherine Robbins in 1895 (died, 1927), two sons; had one daughter by Amber Reeves, and one son by the writer Rebecca West, the writer Anthony West. Tutor, University Tutorial College, London, 1890-93. Full-time writer from 1893: theatre critic, *Pall Mall Gazette*, London, 1895. Member of the Fabian Society, 1903-08; Labour Candidate for Parliament, for the University of London, 1922, 1923; lived mainly in France, 1924-33. D. Lit.: University of London, 1936. Honorary Fellow, Imperial College of Science and Technology, London. *Died 13 August 1946*.

Bernard Bergonzi, in his monograph *The Early H. G. Wells*, notes somewhat caustically that if Wells had died in 1900, like his young American friend Stephen Crane, "he would be remembered primarily as a literary artist." The 45 years of ardent "pamphleteering" that followed would not have occurred, and Wells's place in the firmament of high culture would have been more secure, unshadowed by the embarrassment of his crusades for public enlightenment, or even by his sometimes awkward attempts after 1900 to write mainstream fiction. From the perspective of literary criticism as it is practiced in the second half of the 20th century, Bergonzi's judgment is hard to fault. What Wells produced between 1894 and 1901, from the earliest short stories in *The Pall Mall Budget* to *The First Men in the Moon*, was not only the most imaginative and artistically satisfying science fiction of any novelist of his generation, but also the best writing of his long career. None of the mainstream novels, sociological tracts, prophetic manifestos, collections of journalism, or encyclopedic surveys of science and history that Wells published after 1900 bears comparison, as art, with his early science fiction. Most of his later science fiction also suffers when measured against the standards he set for himself between 1894 and 1901.

Fortunately for his literary soul, Wells did more than enough in his salad days to win admission to the ranks of the immortals. From 1894 to 1901 his output of fantasy and science fiction (chiefly the latter) came to six novels and more than 30 short stories; most of these captured immediate public and critical acclaim. *The Time Machine*, the first of the novels, is a profound dystopian parable and the archetype of all time-travel stories in 20th-century science fiction. *The Island of Dr. Moreau* retells the Frankenstein tale, with dark satirical touches reminiscent of Swift. *The Invisible Man* furnishes the model for every later warning in science fiction of the Faustian potentiality for human self-destruction in the powers of science. *The War of the Worlds* is the first great story of interplanetary conflict, and *When the Sleeper Wakes* inspired Zamyatin's *We* and Huxley's *Brave New World*. In *The First Men in the Moon* Wells produced a masterful fantasia on the theme of biological engineering and one of the first credible accounts of space travel.

Several of the short stories have the same archetypal quality as the early novels. The deadliness of nature disclosed by modern science, which has supplied the raw material for a huge literature of disaster in our century, was a subject thoroughly exploited by Wells in his early stories, and in a few others written just after 1901. Apart from *The War of the Worlds*, which can also be read as a Darwinian fairy-tale, there were stories of man-eating orchids and cephalopods, giant birds and spiders, world-conquering ant hordes, and, in "The Star," an astrophysical disaster story of classical discipline, which seems almost to have been carved in ice. In "A Story of the Stone Age" Wells was among the first writers to make imaginative use of modern anthropology. "The New Accelerator" and "A Dream of Armageddon" carry further the admonitions in *The Invisible Man* on the perils of science and technology. "You know the silly way of the ingenious sort of men who make these things," the dreamer tells the narrator in "A Dream of Armageddon," recalling the weapons research in his nightmare of future life. "They turn 'em out as beavers build dams, and with no more sense of the rivers they're going to divert and the lands they're going to flood!"

The flow of science fiction from Wells's pen did not stop in 1901, but time sapped his creative powers and eroded his craftsmanship. He grew careless. Between 1902 and 1914 he wrote six fantasy and science-fiction novels and a dozen stories. From 1914 until his death another five science-fiction novels made their appearance, three filmscripts, and several works located in a literary no-man's-land halfway between speculative and mainstream fiction. In his later work some of the warnings and anxieties of the first novels emerge again, and new ground is broken as well. What chiefly distinguishes Wells's science fiction after 1901 is its heightened political consciousness. Scenarios of global war fought with diabolical weapons alternate with visions of a technocratic worldwide utopia. Wells foresaw tank warfare in 1903 ("The Land Ironclads"), massive bombardment of cities by aircraft in 1908 (*The War in the Air*), and atomic bombs in 1914 (*The World Set Free*). He satirized fascism in *The Autocracy of Mr. Parham* and turned it to his advantage in *The Holy Terror*. His three major utopian novels, *A Modern Utopia*, *Men Like Gods*, and *The Shape of Things to Come*, are landmarks in that extraordinarily difficult genre.

Writing in 1934, Wells took stock of the "incurable habit with literary critics to lament some lost artistry and innocence in my early work and to accuse me of having become polemical in my later years." In his defense, he observed—quite correctly—that his work had always been concerned with contemporary issues and with "life in the mass." So far, so true. But Wells could not bring himself to admit the decline of imagination and technique that overtook his later fiction. The success of such eminently polemical writers of science fiction as George Orwell and Walter M. Miller, Jr., who has as many axes to grind as Wells at his worst, suffices to show that Wells did not go wrong by abandoning "pure" literature for "pamphleteering." He merely let impatience and irritability diminish the effectiveness of his art. But the size of his achievement remains formidable. Wells's best work is superb, and grandly paradigmatic. No other early writer of science fiction opened so many pathways. He is also a singularly universal figure. One may wonder if even one significant writer in the genre anywhere in the world in this century has missed reading H. G. Wells. Quite simply, he is to science fiction what Albert Einstein is to modern physics, or Pablo Picasso to modern art.

\* \* \*

Shortly after the end of World War II, a number of science-fiction enthusiasts became small-time book publishers, dealing exclusively in fantasy and science fiction. Many of the oldtime favorite magazine authors found that they could rework their earlier short stories or novelettes into full-length novels for an appreciate audience. Wallace West was one of the "names" thus uncovered to the book-buying world, and his novels are such expansions and confluences. *Lords of Atlantis*, though, was originally published as a series of novelettes; it retells the Greek myths as the memories of an invasion from Mars in a combination of the author's ingenuity and ironic humor.

Wallace West was never a full-time writer. He wrote stories because he enjoyed reading science fiction and enjoyed writing it. He could tailor his plots to any magazine's requirements, and some of his stories are wildly melodramatic in the old "pulp" manner; but even those examples offer humor and speculation beyond the level of pulp entertainment. A number of the early stories were the first to present themes that are very familiar. The Feminist movement foreshadowed today's Women's Liberation, and there were those Feminists who felt that a truly decent society could exist only if males were completely subjugated to females—if not dispensed with altogether. In "The Last Man" (*Amazing*, February 1929) West draws an amusing yet grim portrait of a world where that "final solution" has been achieved. The last man is a museum exhibit; there are no more wars and sex conflict is a thing of the past. But is the world a utopia? The picture is not enticing.

West was concerned with air and water pollution decades before it became a public issue. In 1935, West wrote a short story, "Dust," which shows what happens when several elements of runaway pollution peak simultaneously. The story was rejected in 1935; he effectively rewrote and updated the tale for publication in 1967. "The Phantom Dictator," his best-remembered story, showed the possibilities of subliminal propagandizing some 20 years before Vance Packard's *The Hidden Persuaders*. (That story was subsumed, with other themes, in his novel *The Time-Lockers*.)

Wallace West was well-educated and widely read in many fields—literature, history, and the theater—as well as science. He used the entire range of his learning, in addition to his wry sense of humor, to write stories that stimulated thought as well as provided entertainment; that is why so many of them are still a pleasure to read and have not grown stale with time. He cared too much for the joys of science fiction to preach to or condescend to his readers, however seriously he himself might consider some of the themes, and would be the first to snort if some academic found his work "significant."

\* \* \*

In 40 years, Dennis Wheatley published some 60 books of detection, adventure, fantasy, and romance. While his plots may seem fantastic, his is not a name which comes to mind when science-fiction writers are mentioned. Many of those which may be classed in the genre are only marginally science fiction in theme. The fantasy is often only a framework for a story of romance and adventure. His stories of black magic may give him one claim to belong to the field.

The heroes of two of his major series of thrillers, the Duke de Richleau and Gregory Sallust, become involved with the occult in some of their adventures. *The Devil Rides Out*, which concerns a classic confrontation between the forces of good and evil (Richleau and a group of Satanists in contemporary London) is considered his best novel in the genre. In the sequel, *Strange Conflict*, the success of the Nazis in World War II is traced to their use of the supernatural. This fancy is also the theme of a later work, *They Used Dark Forces*, in which the occult is turned upon Hitler himself. Richleau's third black magic adventure is *Gateway to Hell*. Other black magic novels which do not involve recurring characters from the major series are *The Haunting of Toby Jugg*, *To the Devil a Daughter*, *The Ka of Gifford Hillary*, and *The Satanist*. While there is a definite attempt to make the reader believe in the occult in these novels (one is uncertain of the extent to which the author is being creative or reporting his own belief) it must be admitted that the supernatural is described in such detail that the reader is never really frightened. Actual malevolence is never as convincing as the suggestion of the possibility that ghosts exist. The diabolists could just as well have been gangsters. The ghost hunter stories in *Gunmen*, *Gallants*, and *Ghosts* and the lurking fears in *The Haunting of Toby Jugg* more successfully evoke the true shudder.

More traditional science-fiction motifs occur in some of his other novels. *Black August* is a Wellsian story of England in the future during a Communist revolution. In *The Fabulous Valley* the heirs to a diamond field in Africa have only a knobkerrie, a necklace of monkey skulls, and a leopard skin to tell them where to find the treasure, in a story of high adventure in the Haggard vein. A somewhat incongruously diverse group of adventurers find a lost race in *They Found Atlantis*; while the plot may not appear original to us there is a sound foundation of archeology and anthropology behind the telling of the story. *Uncharted Seas* is another lost-race story in which the shipwrecked protagonists are cast adrift on the open sea and discover a continent made of seaweed. A more conventional thriller, *The Secret War*, is a speculative fantasy about an anti-war league called the "Millers of God" who assassinate war profiteers. Also in the Wellsian vein is *Sixty Days to Live*, the story of the comet scheduled to strike the earth. The bulk of the novel concerns three men in love with the same woman and a world gone mad. A third lost-race story is *The Man Who Missed the War*: Philip Vaudell tries to float a raft across the Atlantic, is diverted to the Antarctic, and discovers a warm climate and a people cut off from the world. In *Star of Ill Omen* a British secret agent discovers the secret behind flying saucers and travels from Argentina to Mars. One of the novels often found on lists of Wheatley's fantasy, *Such Power is Dangerous*, has little to recommend it apart from a fascinating idea of motion picture studios combining to shape public opinion through the films they produce. It is more satiric than fantastic.

Even in fantasy, Wheatley's strength lies in his having discovered that what the readers wanted was what he enjoyed writing for them. His adventure stories are far better than the elements of fantasy with which he filled them. A study of Wheatley is a study of public taste.

#### James White comments:

I have always felt that the best stories are those in which ordinary people are faced with extraordinary situations, and my early attraction to science fiction, both as a very young reader and later as a writer, was that it was the only genre which allowed ordinary people to be faced with truly extraordinary situations. My favourite of these is the one in which Earth-human characters make first contact with an extraterrestrial species. The attempts to understand the behaviour and thought processes of the aliens frequently illuminate the human condition as well, and the problem of learning to understand and adapt to a totally alien viewpoint places in proper perspective the very minor differences of skin pigmentation and politics which bedevil our own culture.

\* \* \*

One of the most memorable of James White's many intriguing settings is to be found in *The Watch Below*: a colony survives for several generations trapped inside the hull of a tanker torpedoed during World War II. In their effort to keep themselves sane, one of the things the first generation does is to attempt to recall every story any of them has ever read. One survivor has read a few works in the relatively new genre of science fiction. He particularly remembers a Doc Smith novel with a character "who was a winged dragon with scales, claws, four extensible eyes, and a lot of other visually horrifying features and who was more human than some of the human characters." Now, since

*The Watch Below* is a "first contact" story, there are reasons of plot for this introduction of this tribute to the idea of interspecific brotherhood. But beyond this, the tradition of the fraternity of all intelligent life which first took firm hold in magazine SF in the mid-1930's is one which has had a marked impact on White himself as an author.

Most of White's stories involve extraterrestrials, and these beings are a varied lot indeed, including creatures indistinguishable from terrestrials in *The Secret Visitors*, aquatic lifeforms in *The Watch Below*, chlorine-breathers in *Open Prison*, and giant caterpillar-like tree-dwellers in *All Judgment Fled*. All these varieties together, and others besides, can be found at once in *Hospital Station* and the other books in White's series about Sector Twelve General Hospital, a multi-environmental hospital in deep space with staff and patients from a diverse galactic culture. Indeed, as an author White is quite fond of the field of medicine, perhaps seeing in it a paradigm of the cooperation and fellowship which should embrace all intelligent beings. Even outside the Sector General series, physicians are important characters in *The Secret Visitors*, *The Watch Below*, *All Judgment Fled*, and *Underkill*.

But soldiers figure almost as prominently as doctors in White's work. One section of *Hospital Station* is given over to the hero's realization that the Monitor Corps performs a necessary police function. White is not happy about this fact of life. Indeed, in at least three different books characters are relieved to have it turn out that the lifeforms they were forced to kill are only animals, and not intelligent beings after all. And beyond such justified violence, White's work also depicts some conflicts based on honest misunderstanding, and others stemming from deliberate selfishness and greed. But with one exception, the accent in White's work is not on the existence of such abominations but on the possibility of doing something about them. White's stories almost always close with harmony restored, or at least with such a restoration anticipated. This stubborn optimism has been one of White's trademarks.

A second trademark, already alluded to, is his inventiveness regarding environments. If his most brilliant achievement in this area is the sunken tanker in *The Watch Below*, other instances are almost equally imaginative—the prison planet of *Open Prison*, the alien starship overrun with laboratory animals in *All Judgment Fled*, the energy-poor world of the "powerdown" in *Underkill*, and others.

White's work does have its defects. His human characters are too much alike, and sometimes their actions are inadequately motivated. Often White's extra-terrestrials have incongruously human—indeed, Western—psychologies, whatever their external forms. White's fascinating environments are also sometimes a little too visibly contrived. Until fairly recently, the single most serious accusation that could be brought against White was his utopianism, his seeming belief that no group of intelligent beings could willfully persist in wrongdoing once they had had the right path pointed out to them. White, however, effectively countered any such accusation with *Underkill*, a novel presumably growing out of White's experience of the civil unrest in his home of Northern Ireland. In this novel, extra-terrestrials—playing as it were the part of an Old-Testament Yahweh—find mankind so depraved (particularly by the ethnic and sectarian hatreds that lead to terrorism) that they see no solution but to destroy all the Earth's population save for a chosen remnant of ten million, and to start over with those. Unlike other White books, *Underkill* is charged with a bitterness and forcefulness reminiscent of Jonathan Swift. However, after this aberration, White's next several books went back with no obvious difficulty to the seeming

utopianism of the Sector General series. This return to a familiar path could have been based on commercial considerations, since *Underkill* failed to find an American publisher. (Presumably its bitterness was judged to be unviable in an American market that was beginning to emerge from the gloom of much Vietnam-era sf.) In any case, *Underkill* makes it clear that in his other books, White is presenting a view of human relations as they ought to be, not as he actually takes them to be. White is not naive—merely hopeful.

—Patrick L. McGuire

**WHITE, Ted** (Theodore Edward White). Also writes as Ron Archer; Norman Edwards. American. Born in Washington, D.C., 4 February 1938. Educated in public schools in Falls Church, Virginia. Married 1) Sylvia Dees in 1958; 2) Robin Postal in 1966; one child. Head of foreign department, Scott Meredith Literary Agency, 1963; Assistant Editor, 1963-67, and Associate Editor, 1967-68, *Fantasy and Science Fiction*; Associate Editor, Lancer Books, 1966; Managing Editor, 1969, and Editor, 1970-78, *Amazing* and *Fantastic*; Co-Editor, *Void* fan magazine, 1959-68; Editor, *Heavy Metal*, New York, 1979-81. Recipient: Hugo Award, for criticism, 1968. Agent: Henry Morrison Inc., 320 McLain Street, Bedford Hills, New York 10705, U.S.A.

\* \* \*

Ted White, like many writers of his generation, first achieved prominence as a fan. He was responsible for what was recognised as the first fanzine devoted exclusively to comics in 1953; his fanzine *Void* helped advance both his career and that of Gregory Benford.

White's career as a novelist was relatively short. His novels tend to be all of a type, in that they usually deal with supermen with neuroses. Thus *The Spawn of the Death Machine*, a novel much better than its title suggests, concerns an android in a post-apocalyptic future who wanders about determining the limits of his powers. In *Phoenix Prime* the cab-driver Maximilian Quest learns that he is an incomplete superman and is rushed to another dimension to fight a cosmic war. White's novels are essentially imitative, at times reminding one of Heinlein, at other times of Van Vogt; while his work is competent, he has not achieved any writing of the first rank, save for certain sections of

the fascinating failure, *The Jewels of Elsewhen*, White's favorite among his own works.

White's distinction is as an editor, more than as a writer. White was editor of *Amazing Stories* and *Fantastic Science Fiction* for some ten years; he returned the magazines to a policy of publishing original fiction, and developed some of the talented young writers of the 1970's

\* \* \*

Leonard Wibberley's science fiction for adults is limited to two books of a series on the Duchy of Grand Fenwick, *The Mouse That Roared* and *The Mouse on the Moon*. The scientific element in them, and the others in the series, is quite thin, bordering upon the fantastic. The only element of *The Mouse That Roared* that seems at all science-fictional is Dr. Kokintz's "Quadium Bomb." It is supposedly based upon quadium, the unstable isotope of hydrogen that follows deuterium and tritium. The bomb itself is built in a lead shoebox and uses a hairpin as a triggering device (which ultimately doesn't work). The essence of the story, however, is the extolling of the presumed virtues of smallness. Wibberley seems to assume that there is some sort of Rousseau-like principle at work in nations, that size and density of population virtually force immoral behavior upon the inhabitants of large countries. This is apparent when the rulers of Grand Fenwick realize that large nations cannot be trusted to handle a "doomsday device" but a coalition of little nations can. *The Mouse on the Moon* is a virtual repeat of *The Mouse That Roared*. The now-famous Dr. Kokintz discovers that an extract of the Duchy's wine, Pinot

Grand Fenwick, is the basis for the world's most powerful rocket fuel. The Prime Minister has obtained a \$50,000,000 grant from the US (under the guise of starting a space program, but really to improve the castle's plumbing), so the Duchy enters the space race. As in *The Mouse That Roared* Grand Fenwick succeeds in besting the world's "Great Powers." When the Russian and American spacemen arrive on the moon, they find Grand Fenwickians already in possession of it. Of course, again, the little countries accept their responsibilities, where the big ones hadn't, and agree to keep the moon free for all humanity.

Wibberley's science fiction for children seems only slightly more juvenile in plot and thesis. *Encounter Near Venus* tells of four children who, almost despite the aid of their child-hating uncle, save an Edenic Venusian moon from the deadly clutches of Ka the Smiler. On a simplified basis it is quite reminiscent of C. S. Lewis's Narnia chronicles. In *Journey to Untor* the message is again that the big and/or mature lack flexibility and sensitivity to the world around them, while the small and/or immature, when given the opportunity, have those properties and the will to use them in the most responsible manner possible.

In general, Wibberley's supposed science-fiction writings are so categorized only as a recognition that they employ gimmicks which nominally belong to that realm. In actuality they are fairly simple-minded morality stories written in a clever and entertaining fashion.

—Richard W. Miller

**WILDER, Cherry.** Pseudonym for Cherry Barbara Grimm, née Lockett. New Zealander. Born in Auckland, 3 September 1930. Educated at Canterbury University College, Christchurch, B. A. 1952. Cherry Wilder's first published SF short story, "The Ark of James Carlyle," launched a bountiful career in the field. The story displays her considerable narrative skill and the gently evocative style characteristic of her work. Wilder creates highly original landscapes, people with unique aliens—far removed from the classic little green men and bug-eyed monsters of pulp SF. She attributes this inventiveness to the influence of the Australian bush, in which she lived for a number of years. Human contact with aliens, a theme common to the rest of her work, is the subject of "The Ark of James Carlyle." Carlyle is serving on a weather station, on an island of a newly explored planet which is inhabited by baboon-like mammals called Quogs, child-like aliens who are described with affectionate humour. Carlyle's relationship with the Quogs is revolutionised when the island is flooded by torrential seasonal rains. The humans have recklessly chopped down the single tree of the island, a giant mee-haw tree, which the Quogs used as a refuge from the rapidly rising waters. Carlyle saves them, by improvising the raft and it is on this that his relationship with the Quogs undergoes a delicate transformation, with the Quogs using telepathic dreams to communicate with Carlyle and help

him contact the rest of the explorative team. A subtly ecological message is mixed with the idea of empathising with alien species.

In "The Phobos Transcripts" Wilder uses alternating narrative styles to describe three different perspectives of the same event: a vast transcendental alien's possession of an astronaut's body. One of the themes of this story is the effect of loneliness—in particular the loneliness of isolation, which results in the alien breaking its covenant and the madness of one of the crew of a survey ship. The three crew members are changed by the contact with the alien—the madness healed and transformed into religious zeal.

First contact is dealt with in a unique way in "Double Summer Time." A basic SF theme—an invasion of aliens who can mimic other lifeforms—is transformed into a charming, unusual, and complex story in Wilder's hands. Human characters include a radical "greenie," her scientist uncle, and a security robot, indistinguishable from human beings. Various perspectives are explored: the cynical contempt of the professor, the patronising amusement of the secret service man, the passionate involvement of the environmentalist, who falls in love with a "tree" which later becomes a man. The aliens can tamper with the flow of time, and the last part of the story is an intricately woven pattern of different time streams. Andrew Marvell's "The Garden" and "To His Coy Mistress" act as a kind of referential symbolism throughout the story. It is a complex story which demands re-reading.

"Point of Departure" begins an alien-human contact saga, continued in *The Luck of Brin's Five* and *The Nearest Fire*. In these works Wilder details the world of a marsupial race, called Moruians, who live in a society whose strength is in its tradition of tightly knit families, known as "Fives." The old ways are seen threatened by new ideas, and new technologies such as electricity (fire-metal-magic) and photography (silk-beam copy) are looked on with fear and suspicion. Into this world comes Scott Gale, a member of a survey team, when his small ship crashes near some bush-weavers. He is adopted by Brin's Five as their "Luck"—an abnormal or disabled person who brings good luck to a family, acting as a kind of living talisman or familiar. The story is told through the young eyes of Dorn Brinroyan. One sees the growth of Dorn, from the naive member of a family, to a wise individualistic character (from Dorn Brinroyan, to Dorn-U-Dorn). Ideas of turning misfortune into luck, of encompassing the disabled within society without the need for patronising charity, of aliens learning and changing and growing from intimate contact are developed in this story. Technology, as opposed the craft, is discussed at length.

The story is continued in *The Nearest Fire*, this time told from the perspective of Yolo Harn, a female miner sent to a prison settlement for assault. It details the story of the other members of the bio-survey team and their reunion with Scott Gale. Although immensely pleased to be reunited with his fellow humans, he has developed attachments to his new family (a transition from Scott Gale to Escott Garl Brinroyan). The great strength of these stories is Wilder's ability to create a convincing and engrossing alien culture, encompassing conventional SF themes (such as telepathy) and injecting them with a refreshing original approach. *The Nearest Fire* ends with a promise of new adventures, told from yet another perspective. (A minor problem is reading these stories recalls James Carlyle's difficulty in recognising the gender of the cryptorchidian Quogs—it is very difficult keeping track of the character's names and sex. The list of character's names at the front is very useful but a glossary of Moruian terms might also prove worthwhile.)

Wilder's work is optimistic and hopeful. She presents contact with aliens, so often a violent and ugly event is SF, as a gradual

learning process, in which all concerned grow and change. This can perhaps be best summed up with a quote from "The Ark of James Carlyle" describing the effects of his contact with the Quogs: "The distance between Carlyle and the landing party could not be taken up in a few small steps. They saw tomorrow's man, who by some chance operation of good-will, some accident of understanding, reached forward into new modes of being." Wilder's effortless prose, her charming characters, her moving plots and beautiful descriptions make her books a joy to read, and they are a positive and exciting contribution to the genre.

\* \* \*

Kate Wilhelm has said that about half of her published work is science fiction, though much of the rest contains elements of fantasy. Her first novel was a mystery; later works such as *Margaret and I* and *Fault Lines* are novels of contemporary life, though *Margaret and I* makes use of a speculative element by portraying the protagonist's subconscious as a separate character. Wilhelm is primarily a writer who skillfully uses genre elements—suspenseful plots, scientific or technological notions, and slick prose—to produce fiction as satisfying and as well-rounded as any being written today.

Wilhelm's technique, in most of her work, is to introduce a character or set of characters in a commonplace setting, then to reveal the unusual or uncommon elements of the story through the thoughts and actions of the people in it. Her characters are some of the most fully realized people to be found in science fiction. Her style is the smooth, almost slick manner of so much "women's magazine" fiction, complete with the details of domestic and everyday life; this manner of telling her stories

makes the contrast and tension between the usual and the unusual even more striking. This technique can be seen in Wilhelm's first novel, *More Bitter Than Death*. A young couple, Eve and Grant, return to Grant's home, where the body of Grant's murdered mother has been found. Eve must come to terms with her husband, who is one of those suspected of the murder, and Grant must deal with long-suppressed feelings about his home and family. The problems raised here are resolved by the book's conclusion, though in her later work Wilhelm's characters find answers more difficult to come by, life more complex, and reconcillations more problematic. The problem Eve and Grant face, that of having to understand the past and to reconcile it with their future hopes in the midst of unusual events, is present in Wilhelm's later work, and is especially prominent in her science fiction. These same problems are depicted movingly in the novella "Somerset Dreams," ostensibly a story about dream research in a dying town.

In two early science-fiction novels, Wilhelm writes about standard science-fiction themes. In *The Killer Thing* a computerized robot which is trying to kill all life must be destroyed; in *Let the Fire Fall* an alien landing on Earth and the rise of a new religion are shown. *The Killer Thing* shows Wilhelm's mastery of the technique of suspense. Though it is set in the familiar future of colonized planets so common in SF, the book shows the author's concern with the moral issues raised by space travel and human greed. *Let the Fire Fall* begins in the familiar, almost cozy, environs of a small American city. This novel is written in an uncharacteristically breezy style; the author's strong opinions about organized religion and cults are not concealed, and the new religion is much like some rather disturbing present-day cults. These books, and early pieces such as "The Mile-Long Spaceship" and "Stranger in the House," are better than average stories, but it is in later works that Wilhelm shows her real strengths.

Wilhelm, unlike many writers, is a master of both the novel and shorter forms of fiction. Her short story "Baby, You Were Great" shows a world where it is possible, through brain-implanted electrodes, to live a celebrity's life vicariously and to feel all her emotions as well. Her Nebula Award-winning "The Planners" concerns biological research, and "The Funeral" depicts a rigid future society. But these stories are not simply intellectual adventures comfortably removed from us in time. "The Planners" shows a scientist who does not fully comprehend the moral and ethical implications of his research, "The Funeral" reveals the crippling constraints in which adults often place children, and "Baby, You Were Great" takes place in a world uncomfortably like our own.

Wilhelm's work gains much of its strength by showing us life as it is lived, as so many works of science fiction do not. Her stories are easily accessible, but they are not escapist entertainments which one can read and then put aside; the issues she raises are present in our lives. She is a concerned writer, but she does not moralize and she does not lapse into despair. Many of her works, notably *City of Cain*, a novel about a plot to build an underground city where experiments will be conducted on survivors of atomic and environmental disasters, show the dangers of excessive power thoughtlessly used. One especially strong novella, "The Infinity Box," shows the corrupting influence of power from the inside; the story is made more disturbing by the fact that the protagonist is a likeable, intelligent, and sympathetic man who is altered and changed simply by having the power to enter another person's mind. *Where Late the Sweet Birds Sang* (Hugo Award) has been called the best treatment of cloning in science fiction by many critics.

But the novel is also about the often destructive strategies human beings can employ in order to survive, and it shows the author's concern with the damage we have done to the earth, a common theme in her work.

Wilhelm's abilities are at their height in *The Clewiston Test* and *Juniper Time*. *The Clewiston Test* is both a feminist novel and a psychological thriller which presents issues in the context of a suspenseful story. The isolation of the protagonist, Anne Clewiston, who is recovering from a serious accident, is symbolic of the isolation felt by so many women; the scientific project in the novel is used as a plot device to illuminate the personal conflicts of the characters, as well as to present issues about human experimentation. *Juniper Time* tells the story of two people, Jean Brighton and Arthur Cluny, who are the children of astronauts. The two grow up in a drought-plagued world in which the dream of space exploration, the goal to which their fathers had devoted themselves, has died. The conflicts in the book reflect our own predicament; we must live with our technology, however uneasily, and cannot turn back, but we must conserve what is valuable of the past, and keep future hopes from being perverted to unworthy and short-sighted ends.

A recent novel, *Welcome, Chaos*, also unites many of Wilhelm's concerns and techniques, and deals with the dilemmas that immortality might raise. In an earlier novella, "April Fool's Day Forever," the author also dealt with immortality; there, the price of endless life turned out to be the loss of the bond with the collective unconscious and all creative forces. In *Welcome, Chaos* Wilhelm, in the context of a thriller, asks difficult questions: What if the serum that makes immortality possible kills half of those people who are exposed to it? Should such a serum be limited to only a few? How will its protection against the effects of radiation affect the nuclear balance of terror? It is to Wilhelm's credit that she attempts to give answers, however tentative, to these questions.

In her science fiction, Kate Wilhelm holds a mirror to our world, and in her work we can see the dilemmas present in our uneasy, late-20th-century lives.

Critical Study: *The Evolution of a Black Writer: John A. Williams* by Earl Cash, New York, Third Press, 1974.

\* \* \*

As a sensitive black writer, John A. Williams is alert to discriminatory literary restrictions and chafes against them. His article "The Literary Ghetto" contends that the critical practice of comparing black writers only to black writers denies them the rights to compete with whites and to be taken seriously when they examine issues and emotions common to all men. Although his fiction concentrates on the manifold ways in which blacks have been oppressed and have reacted to that oppression, he also depicts similar maltreatment accorded to Jews and others, the need for man to transcend his progenitor, the killer ape, the differences between casual affairs and emotional commitments. Moreover, he welcomes—and merits—comparison with such contemporaries as Mailer and Styron.

Williams's novels *The Man Who Cried I Am*, *Sons of Darkness*, *Sons of Light*, and *Captain Blackman* demonstrate that he also rejects the critical practice of placing future-oriented fiction in a literary ghetto. These novels blend mainstream, experimental, thriller, and speculative fiction techniques into artistic wholes that confound many critics. Like Doris Lessing's Martha Quest series, *The Man Who Cried I Am* starts with a realistic delineation of social and political forces at work in the modern era as experienced by a protagonist and ends with a vision of the future those forces have shaped. The protagonist, Max Reddick, is a black man whose advances from job-seeker to journalist to presidential speechwriter reveal increasingly subtle refusals by whites to share power. Thus, he is not surprised to confront the King Alfred plan, the American government's proposal to put all blacks into concentration camps and gas them if some blacks move from rioting to rebellion over unfilled promises. The more extensively speculative *Sons of Darkness*, *Sons of Light* show how a racial war could develop in the United States from one black man's decision to initiate the assassination of whites who kill blacks as an alternative to the random violence of riots. Both blacks and whites readily comprehend the "eye for an eye" philosophy behind such assassinations and both escalate the number of eyes to be exchanged. However, Williams never repudiates retaliatory violence by blacks but raises unresolved moral and practical questions about it. *Captain Blackman* also combines realism and extrapolation but examines the distant past before considering the future. Like Twain's Connecticut Yankee, Captain Blackman receives a wound that jolts him back in time while leaving his present knowledge intact. Blackman then experiences life as a typical black soldier from the Revolutionary War to Vietnam. Since he has thus encountered two hundred years of white callousness, his decision not to accept intergration into a white army that countenances My Lai massacres and contemplates nuclear holocausts gains added meaning. His achieved goal of infiltrating light-skinned blacks into key positions to take over the nuclear strike and dismantle it is not only a blow for black power but also an attempt to substitute decency for destructiveness. All three novels reflect Williams's belief that man must comprehend his personal, racial, national, and evolutionary history to alter himself and his society. He also feels that in an oppressive society manhood depends on the willingness to strive for change. It is his longing for change that leads him to link mainstream and speculative fiction.

Williams also refuses to segregate fiction from fact and the personal from political. His background as journalist and poet makes him aware of the fictive in much so-called fact and the reality behind fantasy. Both *The Man Who Cried I Am* and *Captain Blackman* intermingle historical persons with fictional characters and actual occurrences with invented ones to

illuminate his view of history. Both works also analyze the interrelationships between the social and the individual. In *The Man Who Cried I Am*, for example, the social impinges on the personal when Max's white-imposed joblessness prompts his girlfriend to undergo an abortion. And the personal impinges on the social when Max's "friend" Harry Ames risks leaving the King Alfred plan unexposed by giving it to Max because he is jealous of Max and expects him to die for possessing it. Such insightful juxtapositions, plus that of the realistic with the speculative, place Williams among the best contemporary writers.

—Steven R. Carter

\* \* \*

The Pelbar cycles consists of six novels based on the hypothesis that a nuclear war occurred in the late 20th/early 21st century. Focusing on the land area of Urstadge (the United States and southwestern Canada), Paul O. Williams surmises that despite the devastation, isolated groups of people survived. His series, set about 1000 years after the devastation, explores these groups of people when they are large and stable enough to be expanding beyond their borders.

The cycle is rich in detail about political systems, languages,

games, architecture, dress, food, weaponry, technology, music, art, education. William's societies are influenced by his knowledge of Native Americans, especially in the Mississippi River valley; his scholarship in 19th-century American romanticism, especially Thoreau; his Christian Science religion which offers strong female models; his reading of western expeditions, particularly that of Lewis and Clark; and his clear love for the immensity of the land, the endurance of nature and its patterns, and the symbolism and power of the Mississippi River, a feature he has watched from the limestone cliffs just north of St. Louis where he has lived for many years.

The cycle depicts humankind moving toward unity as the individual societies realize the advantages of open trade, exchange of knowledge and skills, and their common historical and religious foundations. The impetus for the move toward unification comes from the Pelbar, people living in three elaborately designed stone cities along the Heart River (Mississippi). Individual novels echo the cycle's movement from fragmentation to federation by depicting journeys by psychological and physical discovery by young protagonists. Each protagonist's search culminates not only in a return home and a new or renewed marriage but also in a treaty or agreement with other societies.

The cyclic nature of these novels is evident in a number of ways but most clearly in its open-endedness; although certain individuals or social groups reach agreements about the sharing of responsibilities, land, or resources, there is always the potential for separation and renewed isolation. Underneath the movement toward unity is the potential for injustice, tyranny, and destruction. How these conflicting desires for unity and for power are handled by individuals is the real focus of the series. The solutions affect the married couple (William's ideal for human fulfillment and social unity) and the nature of individual societies. Unification in the cycle requires the combined skills of different heroes—the visionary, the inventor/technician, the diplomat, the social leader, the rebel, the explorer, the military strategist, the warrior.

*The Breaking of Northwall*, besides providing background, recounts the influences that lead the people of Northwall, the northernmost Pelbar city, to share knowledge and to intermarry with the other two valley tribes of the valley, the Sentani and the Shumai. The external tribes are hunters and nomads; the Pelbar offer these intelligent, honorable peoples a high level of culture and a settled existence. *The Ends of the Circle* tells of the personal quest of Ahroe, a young Pelbar wife, for Stel, her husband who has fled West to escape the severe domination of Ahroe's family. In Pelbar society, women are the administrators and men are laborers. The adventures of both Ahroe and Stel lead them to an increased understanding of human love and hate, men and women, social order and change. *The Dome in the Forest* is an account of the emergence of a small group of "the ancients" from a sealed dome where they have perpetuated themselves through several generations for over 1000 years. Even more isolated than the Pelbar, they bring with them advanced technology and reason but lack the social skills, emotions, and intuitions of their rescue party composed of Pelbar, Sentani, and Shumai.

*The Fall of the Shell* turns to the third and most conservative Pelbar city where twin adolescent boys defy the harsh rule and are punished severely. One twin is imprisoned in the city and contemplates the architectural and social structure of his society; the other escapes to journey south on the river and return with great knowledge of new societies. By different routes, the twins learn the basic human virtues of love, forbearance, kindness, and goodwill. *An Ambush of Shadows*

depicts the strained marriage of Ahroe and Stel as she goes to the Heart River Federation Convention as a diplomat and he travels north to seek contact with new societies. *The Song of the Axe*, the only novel to use non-Pelbars as protagonists, recounts a journey that began at the end of *The Dome in the Forest*. Tor, a Shumai axeman, and his nephew, Tristal, travel far into the northwest. Although Tor, a man of intuition and vision, chooses not to return to the Heart, he helps shape his nephew so that he does return with the combined skill of the diplomat and the explorer.

*The Fall of the Shell* best exemplifies the themes and structure of the cycle. The concept that each society is in artifact and that its design determines its strengths and weaknesses is universal in the cycle. Williams uses the nautilus shell and the Mississippi River as symbols of the beauty, limitations, and potentiality of human society. The river/highway gives access to a variety of human societies and greater knowledge of the single religion that underlies all of the Urstadge societies. The shell is rich in ambiguity for a shell can house mature life as a society shelters its citizens, but it may also inhibit life and have to be cracked open.

—Elizabeth Cummins Cogell

\* \* \*

During the editorship of Ray Palmer in the 1940's, *Amazing Stories* and *Fantastic Adventures* were juvenile action pulps principally written by a stable of writers under their own bylines and an assortment of house names. Robert Moore Williams was part of this stable, producing scores of stories including a few under the name Russell Storm. (It is not clear which stories he wrote under house names, but it's probable that most of the stories published prior to 1951 under the name E. K. Jarvis are his.) Even today, Williams is largely associated with these magazines and their juvenile policy, but the truth is he was one of only a handful of writers of those years who were able to cut across policy boundaries and sell stories to almost all the existing science-fiction magazines. He appeared often, for example, in both *Thrilling Wonder* and *Startling*, and also in John Campbell's *Astounding* (Campbell thought enough of his talents to mention him in his essay for Lloyd Eshbach's *Of Worlds Beyond*). In fact, of these writers, Williams is unique in sustaining a continuous career as an SF writer through to the 1970's.

Although Williams wrote almost 200 stories, it is possible from one of his collections to get a good feel for his approaches and talent. The stories in *When Two Worlds Meet* are linked through a common background of Earthman conflict although the background details of Mars and the Martians are inconsistent. The title story tells of an Earthman who tries to learn the secret behind a "god weapon" that allows one race to subjugate another. "Aurochs Came Walking" concerns a shaman's crystal ball that turns out to be a control device for a machine built by ancient Martians. In "The Sound of Bugles" Martians show an Earthman the secret of creating such resources as food and housing from pure thought. The weakest story in the book is probably "When the Spoilers Came," marred by an unconvincing and rather sentimental resolution, something not especially common in the fiction of Williams whose romantic streak more often manifested itself as a mildly ironic cynicism. "The Final Frontier," in which a dying Marian wields strange powers to thwart exploitative Earthman, is only technically better. The best story in the book is "On Pain of Death," a suspense story about a group of Earthman trapped in a strange prison that may be either a particularly efficient machine or a test of their worthiness to live.

Again and again, Williams's fiction deals with machines that bestow godlike powers, or ordinary humans who possess a special rapport with machines or elemental energies. In "The Night the General Left Us" a mathematician's love of machines

is returned by a model rocket that attacks a general who orders the man arrested. "The Smallness Beyond Thought" deals with an eccentric hermit whose ability to grow food without water is related to his ability to sense the flow of electromagnetic and less familiar forms of energy.

It should not be assumed that William is playing with the traditional science-fiction theme of the superman. Rather, his work expresses a basically mystical view of the world. This is borne out by "The Grove of God" (*Other Worlds*, 1956), whose editor described it as too taboo-breaking for other magazines. An expedition of space explorers from Earth lands on a planet where they discover god-like humans living in a primitive paradise. They discover that the planet is actually Earth, to which they have returned through some sort of application of Lorenz-Fitzgerald principle that none of the scientists seem to have been aware of. The narrative is as awkward and downright clumsy as the idea, something surprising in the work of a professional as experienced as Williams. Ironically, another story by him in that issue ("The Steogar" as by Russell Storm) deals more effectively with similar material: a research scientist at a government installation acquires godlike abilities through the agency of a miraculous invention.

Williams turned to novels for the growing paperback markets in 1955 with *The Chaos Fighter*. During the next decade and a half Williams produced almost 30 books. By and large they were not too different from the mass of his magazine fiction and they abound with such concepts as aliens trying to control human destiny, Earthman exploiting alien planets, and humans with miraculous powers. Williams did manage, in *The Day They H-Bombed Los Angeles* and *The Second Atlantis*, to find interesting ways to destroy Southern California. The Jongor series consist of Burroughs-like lost-land stories, and the Zanthar series are about a super scientist who seems as interested in the occult as in physics. The last, appropriately called *Zanthar at Trip's End*, has him coping with a machine that blows the souls out of people's bodies.

The strangest of Williams's books, however, is a slim volume titled *Love Is Forever, We Are for Tonight*. Although its called science fiction on one cover and a "strange and fantastic novel of a man trapped in an inner world of fear and evil" on the other, the book is autobiography with no pretense of being fiction. It begins with some fairly evocative description of his childhood and youth but soon focuses on Williams's interest in and experiences with such things as dianetics, hallucinogenic gases, and communes (in the 1950's). The style reminds one of Ray Palmer's in his editorials for *Other Worlds*, but Palmer's delightful flamboyance and self-directed humor are missing and missed. The book is often vague and evasive, but some facts about the man crop up and the portions dealing with dianetics, while not particularly revealing, might hold interest for anyone curious about the impact of that cult on the SF field.

Williams doesn't seem to have very often probed deeply into any of his ideas or themes, and this makes some of his work, while perfectly readable on the surface, seem disturbingly incomplete. His best work tends to be stories of adventure and suspense, such as "On Pain of Death," and stories about determined human beings trying to survive, such as "Last Ship Out" where two disfigured survivors of atomic war try to battle their way on board a spaceship bound for Mars. The story is slight but compact and straightforward and very readable. It satisfies more than the ponderous "Grove of God," reminding us that Williams is more likely to be at his best writing about people and situations than about ideas.

**WILLIAMSON, Jack** (John Stewart Williamson). Also wrote as Will Stewart. American. Born in Bisbee, Arizona, 29 April 1908. Educated at Richland High School, New Mexico; West Texas State University, Canyon, 1928-30; University of New Mexico, Albuquerque, 1931-32; Eastern New Mexico University, Portales, B. A. (summa cum laude), M. A. 1957; University of Colorado, Boulder, Ph. D. 1964. Weather forecaster in the United States Army, 1942-45; Staff Sergeant. Married Blanche Slaten Harp in 1947; two step-children. Writer from 1928; wire editor, *Portales News Tribune*, 1947; created comic strip *Beyond Mars* *New York Sunday News*, 1952-55; Instructor in English, New Mexico Military Institute, Roswell, 1958-60, and University of Colorado, 1960; Professor of English, Eastern New Mexico University, 1960-77, now retired. President, Science Fiction Writers of America, 1978-80. Recipient: Pilgrim Award, 1973; Grand Master Nebula Award, 1975. Guest of Honor, 35th World Science Fiction Convention, 1977. Agent: Scott Meredith Literary Agency, 845 Third Avenue, New York, New York 10022. Address: Box 761, Portales, New Mexico 88130, U.S.A.

#### SCIENCE-FICTION PUBLICATIONS

Novels (series: Cuckoo's Saga; Jim Eden; Legion of Space; Seetee; Starchild)

*The Girl from Mars*, with Miles J. Breuer. New York, Stellar, 1929.

*The Legion of Space*. Reading, Pennsylvania, Fantasy Press, 1947; London, Sphere, 1977.

*The Humanoids*. New York, Simon and Schuster, 1949; London, Museum Press, 1953.

*The Green Girl*. New York, Avon, 1950.

*The Cometeers* (Legion). Reading, Pennsylvania, Fantasy Press, 1950; London, Sphere, 1977; expanded section published as *One Against the Legion*, New York, Pyramid, 1967; London, Sphere, 1977.

*Seetee Shock* (as Will Stewart). New York, Simon and Schuster, 1950; Kingswood, Surrey, World's Work, 1954.

*Seetee Ship* (as Will Stewart). New York, Gnome Press, 1951.

*Dragon's Island*. New York, Simon and Schuster, 1951; London, Museum Press, 1954; as *The Not-Men*, New York, Belmont, 1968.

*The Legend of Time*. Reading, Pennsylvania, Fantasy Press, 1952; as *The Legion of Time* and *After World's End*, London, Digit, 2 vols., 1961.

*Undersea Quest* (Eden), with Frederik Pohl. New York, Gnome Press, 1954; London, Dobson, 1966.

Manuscript Collection: Special Collections, Eastern New Mexico University Library, Portales.

Jack Williamson comments:

I began writing at 20, hardly half-educated but dazzled with visions of science and intoxicated with science-fiction as a device for exploring the possible. In the 50 years since, the known universe has vastly expanded and science fiction has grown as fast. Now at 70 I'm still held by the unfolding of science and still excited about science fiction. As a career, it has been rewarding. Though in the first few decades the pay in money was meager, there were always rich compensations in the satisfactions of creating, in the fine friendships, in the opportunities to observe the explosions of scientific knowledge and the human impacts of science and technology. The writers and readers of science fiction form a special community, still tiny when I first discovered it, inhabited by the most able and interesting people I have known. Belonging to it has been a privilege.

\* \* \*

Jack Williamson occupies the same place in the history of science fiction that Richard Strauss occupies in the history of music. Both men were artistic prodigies who first achieved recognition in their early twenties; both represented, as they grew older, a dynamic conservative branch of their art that used the techniques of their heirs to refine their own skills. Thus Strauss tended, as he aged, towards a neo-classic style that was late Romanticism freed of ostentation; thus Williamson, in the past decade, has returned to the characters of his early novels, echoing Strauss's return to the forms of his youth.

Williamson's early life was spent in a covered wagon on one of the last frontiers, that of rural New Mexico. His first story resulted from reading one of the first numbers of *Amazing Stories*; it was "The Metal Man" (1928). In a crude but enthusiastic way, it established one of Williamson's *leitmotifs*: the interface between man and machine, as the hero becomes a technological object, a "person-machine." After several early novels that have never been published in book form (e. g. "The Stone from the Green Star") Williamson first earned a reputation as a master of space opera with *The Legion of Space* (1934). This novel put Williamson in the same rank with such galaxy-conquerors as John W. Campbell and E. E. "Doc" Smith; but the novel resembles those of his contemporaries only in its exuberance. Unlike Campbell and Smith, Williamson was not espousing either technocracy, as Campbell did, or the joys of physics unchecked by any intellectual bound, as Smith did. Williamson is neither pro- nor anti-technology; while there is a great deal of gimcrack physics scattered throughout the text, the central device that allows the heroes to conquer their foes, AKKA, can be activated only by a few scraps and an act of will; its operation is never explained. *The Legion of Space* is important because it is the first sign that SF was moving away from the epic of technocracy; although it is what Alexei Panshin

would call a lost-race novel of space (much of the action is standard lost-race adventure transported to the jungle-covered moon of Jupiter, Titan), it is still an advance over other, duller works of the time and can still be read with pleasure. Its sequels are better written but less entertaining. Williamson was one of the few writers of the 1930's who could write with equal facility for the *Astounding* of F. Orlin Tremaine and the *Astounding* of John Campbell. It is generally forgotten that *One Against the Legion* was published in Campbell's *Astounding*. Campbell prodded Williamson to excellence in much the same way as he prodded other writers; Williamson's best work dates from this period, and the only novel that Williamson produced after 1948 that achieves excellence is a result of a Campbell-inspired fragment of 1941.

Williamson's three great works deal with the same theme: the eternal tension of society. Man, Aristotle teaches, is a social animal; it is the degree to which an individual must participate in society without abandoning free will that Williamson seeks to find in *Darker Than You Think*, *The Humanoids*, and *Star Bridge*.

*Darker Than You Think* is a result of the two years Williamson spent in psychoanalysis in the late 1930's. Ostensibly it concerns a war between lycanthropy and humanity for dominance; but the werewolves are seen as agents of freedom, creatures that put the lie to scientific and psychoanalytic explanations with mystical truth that transcends attempts at rationalization. But freedom, in this novel, requires a price, a sum of dependence, of eternal vigilance. It is as if the werewolves were organized anarchists, determined to preserve absolute liberty with a new order. Added to this, Williamson has produced what is the best explanation of lycanthropy extent (it depends on probabilistic physics, a theme deepened in *The Humanoids*). *Darker Than You Think* is an excellent thriller as well, being the finest novel of the occult produced by a science-fiction writer.

Williamson continued his search for controlling agents in his best work, *The Humanoids*. In two ancillary works designed to match each other as thesis and antithesis, "With Folded Hands" and "The Equalizer," Williamson ruminated on the use and abuse of technology. The former introduces a classic dystopian theme, that of robots following a categorical imperative to its logical limit; the latter shows that technology can preserve as well as destroy free will. But these two novellas are two halves of a larger whole; they can not be read apart, and consequently they lose some of their artistic impact. Only in *The Humanoids* does Williamson attempt a synthesis; and he does this by relying on the old Campbellian warhorse, that of psionic power, as Williamson combines metaphysics with particle physics and the laws of probability to produce a new unified field theory. It is hard for the modern reader to accept psionics with the willingness of those in the late 1940's; but Williamson transcends mere reciting of psionic power to examine the epistemological foundations behind that power. Williamson also examines the fate of those who have accepted the humanoid categorical imperative, producing an examination of the middle ground between the two cultures of pure technocracy and pure mysticism that still retains its impact. *The Humanoids* is Williamson's best novel, a classic dystopia and the single best work on robot instrumentalities outside the work of Isaac Asimov.

Williamson began a rapid decline after *The Humanoids*; for the next dozen years, he produced works only in collaboration. These collaborations with Frederik Pohl are minor entertainments, the earlier novels such as *Undersea City* being competent juveniles, but rapidly declining to reach a nadir with *Starchild*, the worst novel of either author. Williamson's other "collabor-

ation" is not that at all, but is instead the completion of a Williamson fragment by James Gunn. This novel, *Star Bridge*, is Williamson's last important work, an examination of the processes of political change no less searching than his examination of psychoanalysis in *Darker Than You Think* and of technology in *The Humanoids*. The dialectic between individual and society here is less distinct; the chief representative of individualism is an assassin who does not know what he stands for, the society a corporate state whose internal dynamic has been spent.

After *Star Bridge*, Williamson began a creative drought which lasted 27 years. During this period Williamson's only important work was non-fiction; he began an academic career in the late 1950's, his dissertation forming part of *H. G. Wells, Critic of Progress*. Williamson's novels during this period returned to stories that would have achieved minor billing in *Planet Stories*; such a work as *The Power of Blackness* suffers from a black hero so characterless that Williamson can find no other descriptive qualities for him than the color of his skin. By the 1980's, Williamson was reduced to writing unneeded sequels to his major works; *The Humanoid Touch* is a minor, darker pastiche of *The Humanoids*, while *The Queen of the Legion* is a frothy conceit lacking in the force of its predecessors.

*Manseed* marked a new phase in Williamson's career. This tale of a latent superman struggling to discover the limits of his powers, while seriously flawed, marked a new seriousness in Williamson's career. Williamson followed *Manseed* with a collaboration with Frederik Pohl, *Wall Around a Star*, one of the few novels to use linguistics as the scientific base for its intricate plot.

Williamson's most recent novel, *Lifeburst*, is his most important since *The Humanoids*. In *Lifeburst* Williamson returns to his eternal theme—in relations between man and the world. *Lifeburst* is a surprisingly dark exploration of galactic power politics, with the power struggles between clans used as a metaphor for sexual and social tension. Gritty and imaginative, *Lifeburst* is to Williamson what *Capriccio* was to Richard Strauss: an autumnal masterpiece that ensures that Williamson, unlike most writers of his generation, remains a major force in science fiction in his fifth decade as a professional writer.

—Martin Morse Wooster

**WILLIS, Connie** (Constance E. Willis). American. Born in Denver, Colorado, 31 December 1945. Educated at the University of Northern Colorado, Greeley, B. A. in English and elementary education 1967. Married Courtney W. Willis in 1967; one daughter. Teacher in elementary and junior high schools, Branford, Connecticut, 1967-69; substitute teacher, Woodland Park, Colorado, 1974-81. Since 1982, full-time writer. ##### Connie Willis comments:

I love the short story. People are constantly telling me how the short story is dying and how it is economically impossible to make a career out of writing short stories, but I still love the short story, and I've been writing them for 20 years. I think I like the variety of moods, styles, and themes I can explore in the short story, which I have always felt was the most successful form of science fiction. It is necessary to work with only a few characters, to create worlds with only a few words and hints of background, and to make everything in the story do double duty. It's an exciting challenge. I have written everything from screwball comedies to mysteries to fairy tales and have found to my delight that science fiction welcomes them all.

I have always been fascinated by the problem of time and our place in it, and science fiction has allowed me to explore that theme in a variety of ways. I have written stories that involve the impact of the past on the present and on the future and on the far-reaching and sometimes devastating effects time travel would have on us. My story "Fire Watch" concerns a history department at Oxford that has time travel at its disposal. It can make a wonderful teaching tool, but the lessons to be learned are not always the simple ones of discovering the past. I plan to do several stories using the Oxford history department and a novel in which a young woman living in Washington, D. C., begins to dream Robert E. Lee's dreams. The theme of time is one of endless possibilities and I find the stories unfolding one after the other as if I hadn't even begun.

\* \* \*

Connie Willis has very quietly become one of the most interesting writers of short fiction of recent years, despite a relatively small body of work, and despite the fact that it is spread among science fiction, fantasy, and supernatural fiction. It is in science fiction, however, that she particularly stands out, as recent Hugo and Nebula awards attest. Her sole novel to date, *Water Witch*, written with Cynthia Felice, was an interesting but not outstanding story of a shrewd and not particularly honest con artist on a planet where water is in short supply. It was entertaining, but nothing upon which to base a reputation. The recent publication of *Fire Watch*, her first short-story collection, should go a long way toward correcting that situation.

The title story of the collection concerns a man who travels back through time to the London Blitz as part of his training in the study of history. He becomes involved with the efforts to save an historic cathedral from destruction, waiting on the roof during each air raid to extinguish incendiary bombs before they can do any great damage. He becomes involved emotionally with his fellow defenders and ultimately learns more about himself than he does about the Blitz. In "A Letter from the Clearys" Willis illustrates the strongest point of her fiction, her ability to create entirely convincing characters, in this case, a young woman struggling for mental equilibrium in the paranoid, near-primitive aftermath of a nuclear war.

"All My Darling Daughters" is set in an orbiting finishing school for rich, but probably not particularly loved adolescents. The protagonist is a feisty, opinionated young woman who uses unorthodox methods to combat a new vice among the male students, an alien pet that completely sublimates their sexual

drives. Willis maturely and deftly handles a very controversial theme.

"The Sidon in the Mirror" is an even more complex story. The setting this time is a small mining colony on the surface of a burnt-out star. The main characters are the staff and clientele of a bordello catering to the miners, and the story centers on the sado-masochistic relationships among them. Once again, Willis avoids sensationalism and grotesquerie and concentrates on the personalities of her characters and the destructive and self-destructive forces that impinge upon them. This is perhaps her most successful single work.

Another outstanding story, this time with a more conventional plot, is "The Curse of Kings." An archaeological expedition on a primitive world uncovers a fabulous treasure, but most of their complement are immediately struck down by a bizarre and fatal ailment. Is it in fact a curse of some sort, a virus held in the burial chamber perhaps? Or is it a plot by a native chieftain jealous of the treasure and equally concerned to conceal the sordid facts of his race's earlier exploits? A reporter finds himself a bit too intimately involved in the unravelling of events as he learns that the planet's past history was not quite what he had expected.

A number of other short stories bear mention. "Daisy, in the Sun" is another of those stories where the finely developed character of the protagonist is the main focus and the plot, which involves survival of consciousness following the death of our sun. "Blued Moon" is typical of her work, a quite funny tale of what happens when the disposal of industrial wastes works to affect the laws of probability. It is genuinely humorous, a rarity in the science-fiction genre.

"Samaritan" is another of her best stories, set in a future where most of the organized churches have combined into one ecumenical body to resist a host of new beliefs. A minister and his assistant differ when their orangutan servant apparently requests that he be baptized into the faith. Predictably, some church members are aghast at the possibility of their church accepting an "animal" as a member, and the minister himself is torn between two conflicting urges. The resolution is inevitable, given the context and tone of the story, but nonetheless satisfying for all that.

Willis has also written some unusually good ghost stories, notably "The Service for the Burial of the Dead", "Distress Call", and "Substitution Trick." Her writing in general shows great versatility and a real talent for fine characterization that should make her one of the leaders in the field for the foreseeable future.

—Don D'Amassa

**WILSON, Colin (Henry).** British. Born in Leicester, 26 June 1931. Educated at Gateway Secondary Technical School, Leicester, 1942-47. Served in the Royal Air Force, 1949-50. Colin Wilson is an enormously energetic and eclectic writer whose works include non-fiction and fiction of many classes. For his world view he acknowledges a seminal and continuing influence of Bernard Shaw, whose long science-fantasy play *Back to Methuselah* is a sort of mainspring for Wilson's science-fiction novels.

In the Preface to *The Mind Parasites* Wilson remarks that the work is his first attempt at fantasy and likely his last. It was not. At least two more have followed. In *The Mind Parasites* Professor Gilbert Austin discovers a counter-life entity competing with humanity for life energy from the wellspring of creation. Throughout history the parasites have masked from men mankind's own true powers—which are enormous, even godlike. Austin and his cohorts turn the tide of battle in favor of man, after themselves becoming considerably advanced in this "natural" power. Similarly, in *The Philosopher's Stone* Howard Lester seeks and finds the answer to the problem of death. The power of the will to live has been blocked by the "Old Ones," a superspecies millions of years old that caused and then intercepted the evolution of man. Long asleep, the Old Ones may soon awaken. Lester hopes to lead men to confront them as "Masters" where they once served the Old Ones as slaves. *The Space Vampires* streamlines in style and strategy a similar tale. Spaceship Commander Carlsen discovers a gigantic interstellar craft to perverted aliens from the star-system Rigel. These creatures cheat death by absorbing life energy from host species such as humanity. Fortunately for mankind, sane Rigelians catch up with the vampire Rigelians just in time. Carlsen acts as the medium of the saviours, and in the process learns wholesome means by which mankind can be "immortal".

There are an enthusiasm and bright-eyed bombast about these tales that make it not unrewarding to read them as parodies of science fiction. This may account for a number of the elements common in the three works, though one need not forego taking them seriously as well. Each is furnished with a preface acknowledging a debt to H. P. Lovecraft or August Derleth. Each manifests considerable erudition exhibiting Wilson's encyclopaedic knowledge of the occult as well as the arts and history: ancient mythologies are found to have considerable basis in fact. Each story presents an intellectual power fantasy. The hero, in whom a panoply of parapsychological abilities is emerging, seems torn between visions of mankind as mean, gullible, and cowardly and man with a destiny of vaulting grandeur. These heroes, after lifting the yoke of mental slavery from humanity, win a form of personal transcendence, a step in the direction of joining the advanced intelligent life that lives throughout the universe.

Of the three *The Space Vampires* is the shortest and slickest. *The Philosopher's Stone* bogs us down and seems precisely repetitive of *The Mind Parasites* whose patient narrative, nicely deployed scenic hyperboles, and wonderful message were Wilson's first, best attempt after all.

—John R. Pfeiffer

**WILSON, F(rancis) Paul.** American. Born in Jersey City, New Jersey, 17 May 1946. Married Mary Murphy in 1969; two

daughters. Since 1974, physician, Cedar Bridge Medical Group, Bricktown, New Jersey. Recipient: Prometheus Award, 1979. Agent: Albert Zuckerman, Writers House, 21 West 26th Street, New York, New York 10010, U.S.A.

F. Paul Wilson comments:

Frankly, I'm hesitant about making a statement about my work. I have no long-range goals, no grand theme I'm pursuing (at least not consciously). My prime personal interests are achieving personal autonomy and living an honorable life while remaining a participant in modern civilization (oxymoronic as that may sound). Surely my work reflects that, but to what degree I don't know. In my writing, I'm most interested in telling a good story, in writing the kind of book I would wish to plunk down money for. Anything beyond that is gravy.

\* \* \*

F. Paul Wilson is undoubtedly one of the most interesting of the younger science-fiction authors. He is a practicing physician, plays musical instruments and composes music, a physical-fitness advocate, the father of two daughters, recipient of the first annual Prometheus Award (for *Wheels Within Wheels*), and was encouraged and developed by editor-writer John Campbell. Wilson's erudite background in literature, science, and medicine slip unobtrusively into his writings in a manner that fascinates and intrigues the reader.

To understand some of the major themes in Wilson's work, it is important to look at one of the major early influences on his writing, Albert Camus. If struggle gives meaning to life, then that struggle must of necessity have a valid cause worth fighting and dying for. This is evident in Wilson's novel *An Enemy of the State*, which is concerned with the LaNague Federation. The central character, Peter LaNague, is a true existential hero, and in some philosophical aspects is beyond good and evil as Friedrich Nietzsche might envision.

All Wilson characters are involved to one degree or another in conflict and struggle to establish a meaningful existence. (Generally speaking, this is true of all fiction writing since World War One.) Through commitment to struggle, the Wilson characters have made the choice to have the courage to be, and by so doing, establish meaning in a void of nothingness. Courage to be means to struggle for essence, among other things, and in Wilson's fiction, the characters make this choice no matter what the outcome may be. Each character seeks to be realized in his or her existence; otherwise, reality rapidly gives way to illusion and illusion gives way to nothingness.

Another major theme that runs through Wilson's writing like a gossamer spider web is the conflict between good and evil at every level of existence and action. To seek either means the character must have the courage to be one or the other; yet, there is no such thing as pure good or pure evil, for each contains mirror fragments of the other to function rationally in an existential universe. To defend either requires that the situational ethics through which each exists and functions must be examined in depth before definition of the situation can become known. Consequently, justification of each character's definition must be analyzed in those terms. In whatever genre Wilson works in, the conflict between good and evil is an intricate part of the structure. Other themes in Wilson's writing include equality, individuality, fear, loneliness, and sexuality.

Wilson's fiction clearly reveals his careful attention to plot construction for character development. Character development is interwoven into the plot in a subtle manner so that every character action reflects attributes necessary for the character's existence and moral code. Every Wilson character has a moral code, and Wilson's prose style is reminiscent at times of William Faulkner.

The continued importance of Wilson to scholars, sociologists, and readers of science fiction rests on his unique skill at presenting complex philosophical themes in a clear, direct manner that instructs as it entertains. F. Paul Wilson's contribution to science fiction is his philosophical insights into social themes and social trends, and his concern over the struggle between good and evil for superiority.

—Harold Lee Prosser

\* \* \*

Richard Wilson's career as a writer breaks quite nicely into two stages. In his early years, Wilson was a satirical humorist in the mode of Henry Kuttner and Robert Sheekley, whose stories were frequently infused with a grim humor and a sharp eye for humanity's foibles. The three novels written at this time are cases in point. *The Girls from Planet 5* takes a pair of old standby plots and fuses them, with delighted results. America has become a matriarchy, where only one state still upholds the macho ideal—Texas, naturally. Into this strife-ridden world come invaders from another world, but invaders who are actually beautiful women. Frustrated by their loss of pre-eminence, the Texan patriarchs are not willing to become a minor backwater in an increasingly female universe. Aliens appear again in *And Then the Town Took Off*, a shorter novel that details the effect upon the citizens of Superior, Ohio, when their city uproots itself from Earth and rises into space to become a separate planet. This rollicking escapade pokes amusing if unconscious fun at James Blish's famous "Cities in Flight" series. The third and best of the novels is *30-Day Wonder* which takes what should be an ideal situation and turns it

completely around. The Monolithians are alien visitors who express their determination to obey scrupulously all human laws and regulations, and ensure that all humans in their vicinity will do the same. The effect on rush-hour traffic of several automobiles sedately travelling well within the speed limit is just the beginning of an increasingly taxing month of the human race.

Although most of Wilson's early short stories such as "Those Idiots from Earth," were satirical or actively funny, his most well-known story of that period was very serious. The heroine of "Love" is a blind human girl living on Mars, who is in love with one of the despised Martian natives. When her father forbids her to have anything further to do with him, she runs off for one last meeting, and together they discover an ancient artifact that may well cure her sight. It is a touching tale told somewhat awkwardly, but effective.

The awkwardness left during the years that followed, and several of Wilson's more recent works are outstanding. "Mother to the World" won a Nebula award for its tender, effective portrayal of the last man on Earth and the last woman, a gentle but retarded individual whose tolerance and flexibility overcome the horrors of their situation. Wilson returned to the last man theme in "A Man Speckith" in which a disc jockey and a computer remain in orbit, looking down over the corpse of the Earth. "See Me Not" is one of the few recent treatments of invisibility that contains any novelty. "The Carson Effect" portrays a wave of philanthropy on the eve of the last day of the world, an ending that is miscalculated and never happens, much to the consternation of those who have given away their fortunes. "The Story Writer" is a complex, engrossing story that contains enough complexity for a brace of novels. An aging successful pulp writer sits in flea markets, writing stories for people as a whim, until he finds himself a character in one of his own stories, the tale of the meeting of our own race and another that has reached us through another plane of existence in their flight from a ravaged homeworld. In this as in the other later stories, Wilson employs a rich, witty style that is a delight in itself; the expertly handled plots and characters are almost superfluous.

—Don D'Amassa

**WILSON, Robert Anton.** American. Born in Brooklyn, New York, 18 January 1932. Educated at Brooklyn Polytechnic Institute; New York University, Paideia University, B. S., M.A. 1978, Ph. D. 1981. \*

Robert Anton Wilson comments:

I define my writing as guerilla ontology—that is, a literary expression of the discoveries of physical relativity (Einstein), cultural relativity (anthropology), neurological relativity (Korzybski, Leary) and the new head-spaces opened to us by psychedelics, bio-feedback, scientific study of yoga, etc. Each of my books presents not one map of reality, but several; the humor, the suspense, and the philosophical meaning (if any) derive from the search for the one reality, never quite found, which will synthesize or include all the alternative reality-tunnels presented. As in quantum physics, the isolated observer or omniscient narrator does not exist in my world; it is a participatory universe in which each entity projects/creates its own surrounding experiential continuum.

\* \* \*

George, you're too serious.  
Don't you know how to play?  
Did you ever think that life is  
maybe a game? There is no  
difference between life and a  
game, you know.

Games of all sorts and at all levels abound throughout Robert Anton Wilson's books. Those most typical in this respect are perhaps *Masks of the Illuminati*, whose overall structure is that of a detective story (the most formal sort of literary game, and here played with strict attention to the rules) and whose subject is the mind-game played on an innocent seeking occult knowledge. And Wilson would solemnly assure us that the book is part of the mind-game he is playing with his readers, Operation Mindfuck, to lead them to some level of further awareness.

Some readers will find that last level, Wilson's philosophical pretensions, spoils the books for them. But insofar as he's serious about anything, Wilson is serious about bringing home to people the limits that their own viewpoints impose on them and the possibility of transcending those limits. To this end Wilson makes a mockery of all political viewpoints (including the anarchism he himself espouses) and in *Prometheus Rising* tries to give some structure to a course of self-liberation. Perhaps the "Trancendental Agnosticism" that has come to Wilson from drinking too deep of too many springs of ultimate wisdom, from hearing too many Ultimate Truths, contradict each other; perhaps it's too much a product of the late 1960's to appeal to the True Believers who infest more recent decades. But happily Wilson doesn't seem to have noticed and continues to pillory our "normal primate behaviour."

And if you want to just sit back, forget the message and look at the scenery, Wilson will keep you happily entertained, stealing from any source that pleases him, Joyce, Lovecraft, Tolkien, or "Elephant Doody Comix" and throwing up the lunatic touches of characterisation that make the patchwork structures of his novels shine.

Drake let out a small fart, an incredible thing, it seemed to George, for the leader of all organised crime in America to do.

Wildeblood was by no means a simple or uncomplicated WoMan. The sex-change operation had only been stage one in a plan to totally transform himself. After that she intended to become a nun.

George decided . . . to grow his hair long, smoke dope and become a musician. He succeeded in two of these ambitions.

Wilson's viewpoint is determinedly optimistic, as his essays on Buckminster Fuller and on the conquest of stupidity show. Yet there is in his novels alongside the jugglers and buffoons a sense of pain and tragedy that isn't diminished by its futility. To quote Wilson's own motto: "It isn't true unless it makes you laugh, but you don't understand it until it makes you cry."

The author solemnly warrants and guarantees that there are no flat lies and only one hidden joke in the above . . . paragraphs.

\* \* \*

It is well known that science fiction tends to emphasis content at the expense of style, but the positive influence this has had on narrative techniques is not always appreciated. Writers have been encouraged to create methods better adapted to its needs than traditional story-telling procedures. Jack Wodhams is one such writer. The way his stories are constructed could have been evolved in tradition short story writing. Smooth, effortless, controlled, a typical Wodhams story moves irresistibly ahead, mostly carried by dialog with a minimum of description and explanation. Indeed, when the author intrudes to fill in background or discuss principles, the pace slows or falters. There may be a firm single viewpoint, or a focus of action on a continuing situation if it is required. Often there are frequent scene changes as the action unfolds through related events. Characters tend to be no more than voices whose conversation shows what is happening, details of motivation unknown and

irrelevant. The effect at its best is of the story happening, not being reported. It has much in common with modern film scripts, but it emerged naturally in science fiction as the field matured and a sophisticated readership developed.

Wodham's stories usually grow out of an original scientific premise, often a revaluation of a familiar speculation. They may bring out new objects or snags or turn a familiar argument around, often for a surprise ending. Some are in the venerable "dangerous invention" tradition. Thus "Stormy Bellwether" devastatingly sets out the bad news about person-to-person television. "The Fuglemen of Recall" has criminal exploitation of a memory recording and transfer process. "The Empty Balloon" looks at a "mind-reading" device working on sub-vocalised verbal thinking, an uncomfortable possibility, with a spy plot. In "Androtomy and the Scion" a cloned duplicate brain, in rapport with the original, gives the forces of evil new powers for coercion. "Split Personality" has an even more macabre atrocity, a felon physically dissected into living left and right halves for use as a better form of radio for an interstellar expedition.

The author's awareness of the social implications of radical new techniques, their value for oppression by ever-ready authority or for private anti-social acts, shows in many other stories. Thus "Whosa Whatsa" explores the utter ruin of traditional legal assumptions and conventions implicit in human sex reversal, and its impact on adultery, divorce, custody, and inheritance. "The Form Master" brings out the weakness of the coming world data bank, including its use for fraud by selective use of false input. In "Sprog" the inventor of a system of predicting future events cannot get a hearing and ends up exploiting the gullible as an ordinary fortune-teller. In "The Cure-All Merchant" behavior modification drugs have been refined into effective specifics for all problems, but a practitioner treats patients just as well by suggestion. One group of stories deals with the hazards and misuses of matter-transmission systems. "There Is a Crooked Man" shows future crime and detection in action. In "Wrong Rabbit" communication is accidentally opened with another world. "Top Billing" looks at duplication of people transmitted. "Hey but No Presto" shows a future form of hijacking. Among the stories of the interstellar future, "Star Hunger" is an excellent look at the need to reach the stars, the drive for habitable new worlds, and the danger of failure.

Wodham's first two novels are similar, though episodic and with more complexity of detail. *The Authentic Touch* uses the setting of a planet settled with re-creations of past epochs for jaded tourists of an opulent future, which tends to get out of control through too much realism. *Looking for Blücher* has a thin framing device to link up a series of shared hallucinatory adventures—easy stuff to write no doubt but not very satisfactory reading. It is really a disappointing waste of effort. *Ryn* does not seem to qualify as science fiction despite a vague gesture at rationalising its theme of reincarnation of metempsychosis. But it is a strongly unified work, strictly following the logic of its premises, and a compelling study of a victim of circumstances trying to cope with his narrowly restricted situation: as an infant with full consciousness and memory of a previous adult life in another milieu.

An interesting recent group of stories looks with loathing at some ideas about the possibilities of war in the distant future which are commonly found and accepted in science fiction, bringing out their absurdity as well as obscenity. In "Pet" the dehumanised military caste isolated from its sponsoring society is seen: the fighter accidentally acquiring a civilian captive insists on keeping the creature as a pet. One innovation in

"Butcher Mackerson" is the custom of drafting the handicapped to carry on a permanent ritual conflict, clearly an inverted form of eugenics. All the characters in these stories have a total ethical vacuity and no sense of any meaning underlying the fighting, but we may draw our own conclusions.

Perhaps Wodham's writing is so typical of *Analog*, where most of his stories have been published, that he does not seem distinctive, despite his considerable originality and individuality.

##### Uncollected Short Stories

- "Love Story," in *Worlds of Tomorrow* (New York), Winter 1970.  
 "Dissolve," in *Orbit 11*, edited by Damon Knight. New York, Putnam, 1973.  
 "Therapy," in *Orbit 13*, edited by Damon Knight. New York, Putnam, 1974.  
 "The Bridge Builder," in *Orbit 14*, edited by Damon Knight. New York, Harper, 1974.  
 "Slammer," in *Fantasy and Science Fiction* (New York), March 1974.  
 "Dr. Rivet and Supercon Sal," in *Fantasy and Science Fiction* (New York), January 1976.

\* \* \*

Gary K. Wolf's "Love Story" opens with a marriage ceremony during which the couple involved are required to relive briefly their pasts. Their civilization at first seems typically dystopian—conception occurs artificially, each fetus is properly programmed, children are raised in state facilities—yet Wolf cleverly reverses the situation, making it clear that the children are both well cared for and happy. We briefly tour a culture where there is no excess population, where everyone is content and virtually immortal. Our protagonists grow to adulthood, fall in love, and live together. Eventually they decide to have children and, their twin babies born artificially, they prepare for marriage. "Love Story" ends with a jolt. The priest at the ceremony hands them each a wafer. Eucharist-like, symbolic of

their love, poisoned. They give up immortality to provide space for their babies.

"Dissolve" argues that television, because of its documentary-like quality and its oversimplification of moral problems, is drastically distorting our view of reality. The story jumps montage-like between a TV talk-show discussion of this problem, a number of typical television programs, and a young couple living in a bombed out TV studio after an atomic war. The girl is dying from radiation sickness but the boy, immersed in the simplistic television mind set, seems to think that he can save her by making a video-tape in which she is cured. A grim story, it is very effective.

"Therapy" is a slight, funny piece about a computer marriage counselor, one of its less successful cases, and a robot elevator which thinks it's the computer's mother. "The Bridge Builder" is a gripping story set in a world where the main transportation system is the Bridge, a matter transmitter. The protagonist builds bridges, repairs them, and is, in fact, fatally addicted to their use. "Slammer" and "Dr. Rivet and Supercon Sal" are both wildly comic tales reminiscent of Ron Goulart. The first concerns a prissy momma's boy who, mistakenly arrested for breaking into his own car and interred in a city reserved entirely for criminals, decides to stay there and become one. The second details the adventures of two shysters out to make a fast buck. He's a failure with people, but can do anything with machines. She's just the reverse. Their partner in crime is a rogue robot kitchenette. The story ends with one of the most hilarious chase scenes in recent fiction.

Wolf's novels, as a rule, are not of the same quality as his short fiction. *Killerbowl*, the best of them, is set in the world of street football, a cross between our current sport and guerilla warfare. The playing field covers several square city blocks, knives, clubs, and rifles are routinely issued, and the millions of fans keep statistics not only on touchdowns but on kills. T. R. Mann, a veteran quarterback, has been marked for assassination because he isn't bloody enough. The novel is very effective, but seems derivative of William Harrison's well-known story "Roller Ball Murder" (1973). Less successful are *A Generation Removed*, which involves a near-future America where only those under 20 can hold political office and where those over 55 are "euthed," and *The Resurrectionist*, which details the adventures of a Bridge (see "The Bridge Builder") who must rescue a defector lost in the lines during transmission. Both novels suffer from weaknesses of plot, characterization, and style. All three books involve basically the same character motivation; a competent middle-aged protagonist, while working for the System, discovers it to be corrupt, and, finding himself in jeopardy, sets out vigilante-style to destroy it.

In summary, Wolf is a talented but uneven writer who seems most at home with short fiction. His best work is found in such slightly avant-garde stories as "Dissolve" and "The Bridge Builder," and in the broad comedy of "Slammer" and "Dr. Rivet."

Critical Study: *Bernard Wolfe* by Carolyn Geduld, New York, Twayne, 1972.

\* \* \*

A lifelong enemy of science fiction, to judge from his comments in Harlan Ellison's *Again, Dangerous Visions*, Bernard Wolfe has written a few science fiction stories and a celebrated dystopian novel. The stories are tightly written, but *Limbo* is a masterpiece.

Zany, action-packed, Joycean in style, *Limbo* is formally and conceptually complex and unremittingly analytical, both politically and psychologically. Most effectively of Wolfe's novels, it argues Dr. Edmund Bergler's acceptance of ambivalence opposition to "pseudo-aggression." Alongside Korzybskian semantics, cybernetics, and various technological fantasies (van Vogt is cited by name in the Afterword), Bergler's neo-Freudian theories are entertained in an entertaining manner. Besides its Dantesque associations, the novel's title signifies voluntary amputation, the absurdist idea for literal "disarmament" Dr. Martine left behind in a journal when he deserted World War III's automated carnage. Self-exiled among the relatively primitive Mandunji for 18 years, he has perfected their traditional cure for evil spirits, lobotomy. When civilization invades his island in 1990, Martine feels compelled to return to the mainland, where he finds the postwar "Inland Strip" and its great power rival, the "East Union," have taken his gallows humor seriously.

As in Plato's *Republic*, the state is the individual writ large; only Martine, as its unwitting begueter, can end this travesty, after he comes to know himself. Others are little more than extensions of him, for or against the prosthetic limbs that are more dangerous than their originals. Tom, son of his loins, is the ultimate pacifist, a basket case, and a spokesman for the Anti-Pros. Children of Martine's thought are his former colleague, now President Helder (hero) and the charismatic Theo (god) whose wartime amputation by Martine started the whole chain of ideas. performing a social lobotomy, Martine removes both party "heads," returning with Theo to his tropical island. There, his healthy native son, Rambo (for Arthur Rimbaud), is leading a similar revolution against single-minded solutions.

Not a prediction of 1990, *Limbo* is a metaphorical extension of a literal malaise, most dangerous among the technologically sophisticated whose dependence on their tools blinds them to their own responsibility. Self-amputation is no answer to the human dilemma, rather a symptom of it. This central absurdity is the most important of many estranging devices integrated into a thoroughly modernist novel; its vision of wholeness and balance is both its form and its substance. Wolfe does not simply arouse anxiety about the uncontrollable, or appease it with an appeal to contemplate the artwork. *Limbo* locates the trouble's source in the individual, whose recognition of the problem is the necessary first step toward its solution.

This therapy may not have worked for Wolfe, whose subsequent novels belabored Berglerian analysis without winning much of an audience. Nor has post-1952 American society been self-evidently more able to laugh at and accept its ambivalence. The book's acceptance in SF circles is marginal; reviewed at arm's length, it has often been ignored in historical studies of the genre. Though its direct influence is questionable,

*Limbo* is still a harbinger of more stylish, sexy, complex novels to come. On its literary merits, *Limbo* is the "great American dystopia."

—David N. Samuelson

## Gene Wolfe comments

I am frequently called an *Orbit* writer, by which the callers appear to mean an obscurantist. I do not feel the term is justified. I try to bring pleasure to my readers on more than one level; but that, I think, is a characteristic of virtually all good fiction. I avoid private symbolism, and usually provide more than enough clues for such small puzzles as I set. If I show a man lying when it is to his advantage to lie, I assume that my reader is intelligent enough to see that the man in question is a liar—and so on.

My heroes are often boys or young men trying to find a place in the world (Tacky Babcock in "The Island of Doctor Death and Other Stories," Mark in *The Devil in a Forest*, Number Five in *The Fifth Head of Cerberus* and so on); perhaps despite a conscious conviction to the contrary, I feel that the most

adventurous years are between 10 and 30. But I have written about old women too, and young ones, aliens, and middle-aged men. Recently I wrote a story—"The War Beneath the Tree"—in which the chief character was an automated teddy bear.

I think I am still at least as much a reader as a writer. I like Proust, Chesterton, Dickens (I've done a Dickens story: "Our Neighbor by David Copperfield"), Washington Irving, Lewis Carroll (not just *Alice*), Kipling, Maugham, Wells, John Fowles, R. A. Lafferty, Ursula K. Le Guin, Kate Wilhelm, Jorge Luis Borges, Tolkein, and C. S. Lewis. If you like half or more of those writers (for example, Maugham as far as the 'h') you should probably try me. Trembling, I throw myself on the mercy of the court.

\* \* \*

With the publication of his tetralogy *The Book of the New Sun*, Gene Wolfe has entered the ranks of the major contemporary writers of science fiction. The far-future world of Urth through which Wolfe's characters move is a world of beauty and horror, one in which humanity's great accomplishments are not only past, but also nearly forgotten, and in which the lack of resources makes the knowledge that remains nearly useless.

In this work's first volume, *The Shadow of the Torturer*, we follow Wolfe's hero, Severian, through his apprenticeship among the Seekers for Truth and Penitence, a guild of torturers who administer the punishments meted out by the authorities of the Commonwealth Severian serves. When Severian helps the prisoner Thecla, whom he has grown to love, commit suicide, he is expelled from the Citadel where his guild resides, and must leave the great walled city of Nessus to become an executioner in distant Thrax. During his journey out of Nessus, he joins a troupe of players, meets the mysterious young woman Dorcas, who cannot recall her past, and accidentally acquires a gem, the Claw of the Conciliator, which has the power to heal. In *The Claw of the Conciliator*, Severian continues on his journey as he is pursued by the woman Agia, who seeks revenge for the death of her brother, whom Severian has executed. Severian participates in a bizarre feast with the rebel leader Vodalus and rejoins Dr. Talos's troupe, who are to perform at the House Absolute, a residence of the Autarch who rules the Commonwealth. In *The Sword of the Lictor*, Severian reaches Thrax, spares a woman he was supposed to execute, learns that the Claw may have raised Dorcas from the dead, and then flees Thrax, still pursued by the vengeful Agia; he eventually loses his sword, *Terminus Est*, in a battle with the giant Baldanders. In *The Citadel of the Autarch*, Severian comes to the battlefield where his commonwealth is waging war against the Ascians, once again meets Agia, the rebel Voladus, and the Autarch, and discovers his own destiny.

This all-too-brief summary might make *The Book of the New Sun* seem yet another series of novels about a fantastic quest in a fantasy world, but Wolfe's work is much more than that. Wolfe is mindful of Arthur C. Clarke's dictum that a sufficiently advanced technology would be indistinguishable from magic (through it would not *be* magic), and the fantastic elements in this work are solidly grounded in science-fictional traditions and in the carefully developed technology of this future society. The tower in which the torturers live is clearly an old spaceship. The Claw's healing powers may be the result of its ability to twist time, to return an ailing or dead person to a time when he was healthy or alive. The Hall of Mirrors in the House Absolute, where Severian loses his friend Jonas, is actually a room of portals leading to other worlds, while Jonas is himself a cyborg and spacefarer from the past. The house where the anchorite Ash resides has windows that reveal both the past and future

possibilities. Various unusual creatures populate the wilder areas of Urth; some are the products of past genetic alterations, but others are alien in origin. One of the most terrifying of these is the alzado, which can lure its victims by speaking to them in the voice of someone it has already killed.

Even those elements in these books which might otherwise seem merely throwbacks to a past society are not simply the past grafted onto the future, but are logical developments. The cavalry used by the Commonwealth in its war makes use of genetically altered beasts and various sophisticated weapons. Severian's own guild of torturers and executioners might be a distant offshoot of those who once manipulated and altered the human body. All of the developments we look toward in our own future—space travel, the settling of other worlds, advances in biology—are in Urth's distant past, and its people live out their lives on a depleted planet under a dying sun. *The Book of the New Sun* can be grouped with such far-future narratives as William Hope Hodgson's *The Nightland*, Arthur C. Clarke's *The City and the Stars*, and some of the novels of Jack Vance, but Wolfe's skillful use of obscure and unusual words lends much to his atmospheric depiction of a world quite unlike our own.

Most of Wolfe's earlier work is extremely atmospheric. Though many of its props are familiar to science fiction readers, the author's oblique manner forces us to see these devices with fresh eyes. An early Wolfe story, "Trip, Trap," has a standard plot, that of a man landing on an alien world and trying to communicate with its inhabitants. The author, however, tells the story through a message sent by the man to his superior and a letter dictated by one of the aliens, alternating between the two points of view so that we see how differently the two perceive the same events.

Wolfe's first science-fiction novel, *Operation Ares*, is ostensibly about a Martian attempt to invade the earth, but the author plays with this old theme. The "Martians" are Earthpeople who were sent to Mars by NASA, only to be abandoned by a United States that has given up science and technology. The novel's plot has apparently been modeled on a game of chess, and *Operation Ares* is not up to the standards of the author's later work. Its pace is too rapid toward the end, since the original manuscript was cut before publication; the protagonist, John Castle, is one of the few characters who stand out clearly. But in several scenes, particularly those at the beginning of the novel and those in which we see John pressed into service as a welfare worker in New York, Wolfe's ability to write suspenseful and frightening narratives is displayed.

Wolfe's short fiction is especially noteworthy, and he is a prolific master of this form. Three stories deserve special attention, since they are related and are among Wolfe's best work. "The Island of Doctor Death and Other Stories," written in the second person, tells of a young boy who begins to see the people and events around him mirror those in a pulp magazine he is reading. "The Death of Doctor Island" is, according to the author, the first story reversed, a mirror image of it; Doctor Island is an artificial world in which disturbed people needing treatment dwell, and again a boy is the central character. "The Doctor of Death Island" is the same story turned inside out; a prisoner is serving a life sentence, but the catch here is that he, and everyone else, is immortal. Each story shows a character imprisoned or confined in some way, each ends in violence and the character's understanding of what has happened to him. Two protagonists are boys, one is an older man; two female characters are threatened by death in the first two stories, while the man in the third is himself threatened by a woman. The stories conclude when the main characters are, in different ways, freed from the circumstances around them. A fourth story,

"Death of the Island Doctor," in which a young couple takes a seminar with a professor named Dr. Insula, is a coda to this series and follows the pattern of the first three stories.

*The Devil in a Forest*, a fantasy novel published for younger readers, demonstrates Wolfe's concern in much of his work for the young boy finding his place in the world. This book tells the story of a medieval peasant boy whose village is involved with a highwayman. The boy, trying to sort out good from evil, finds that the world is a good deal more ambiguous than it once seemed. Another novel, *Peace*, was published as a "serious" novel, but this remarkable work deserves mention here. *Peace* reveals the inner life of a man who is apparently reflecting on his life after his own death; we are shown the man's memories and associations so vividly and subtly that, by the novel's end, we feel we know this other mind as well as our own. The book's manner is at times reminiscent of Marcel Proust, at other times of Thomas Wolfe, but it is Gene Wolfe's style that prevails. *Peace* is, in its own way, a novel of "speculative" fiction and a major American novel that has been neglected.

One of Wolfe's most important works is *The Fifth Head of Cerberus*, a group of three novellas that forms a novel. The second novella, "'A Story' by John V. Marsch," is supposedly a tale written by a character who appears briefly in the first novella and is the main character of the third; it is an imaginative depiction of an alien culture. The first novella, "The Fifth Head of Cerberus," is considered to be one of the most intriguing treatments of cloning in science fiction. The background of the book includes many traditional science-fictional elements; an alien culture, the settling of other planets, biological experimentation, and space travel are among them. Yet *The Fifth Head of Cerberus* raises a great many questions about its characters and its world that it never fully answers; it reflects the ambiguity of life rather than the clarity of a dramatic paradigm. It is a quality this book shares with that rich and varied work, *The Book of the New Sun*.

The last volume of *The Book of the New Sun* ends with Severian, now the Autarch and the representative of Urth, embarking on another quest as he travels into space, where, if he passes a certain test, his race may be judged ready to enter space once again, and a new sun may be created in the embers of the old. Much could be written about the symbols, particularly those of the rose and the sun, that Wolfe uses in his tetralogy, but the spiritual nature of Severian's quest should also be mentioned. He begins as a torturer, one who inflicts pain, and ends as one who wants to reform his old guild, not because of what it has inflicted on its victims, but because, as Severian puts it, "it is intolerable that good men should spend a lifetime dispensing pain."

In an essay about how he came to write his tetralogy, "Helioscape" (in *The Castle of the Otter*), Wolfe has said that the existence of pain, contrary to what some might argue, might tend to prove God's reality, for through pain it is possible to learn compassion. Wolfe writes:

It has been remarked thousands of times that Christ died under torture. . . . But no one ever seems to notice that the instruments of torture were wood, nails, and a hammer; that the man who built the cross was undoubtedly a carpenter too; that the man who hammered in the nails was as much a carpenter as a soldier. . . . Very few seem even to have noticed that although Christ was a "humble carpenter," the only object we are specifically told he made was not a table or a chair, but a whip.

And if Christ knew not only the pain of torture but the pain of being a torturer (as it seems certain to me that he

did), then the dark figure is also capable of being a heroic and even holy figure. . . .

Severian, who has acquired the memories of the previous Autarchs and now carries them inside himself, may bring the rebirth of the dying Urth.

Gene Wolfe is a writer for the thinking reader; he will reward anyone searching for intelligence, crafted prose, involving stories, and atmospheric detail. He is the heir of many literary traditions—pulp stories, fantasy, adventurer stories of all kinds, and serious literature—and he makes use of all of them. His work can be read with pleasure many times; new discoveries are made with each reading, and the stories linger in one's mind.

Although Donald A. Wollheim made his first sale while still in his teens ("The Man from Ariel," *Wonder Stories*, January 1934) and has written about 20 volumes of a science fiction, his greatest impact on science fiction has been in capacities other than that of author. Wollheim was one of the pioneering fan publishers in the 1930's, founded the influential Fantasy Amateur Press Association (which still exists), and was a founding member of the original Futurian Society. The Futurians, founded in New York in 1938, were an odd combination of science-fiction club, radical political movement, communal residential society, and literary mutual aid association. At one point Futurians controlled no fewer than seven science-fiction pulp magazines—*Stirring Science Stories* and *Cosmic Stories* edited by Wollheim, *Super Science Stories* and *Astonishing* edited by Frederik Pohl, and *Future, Science Fiction*, and *Science Fiction Quarterly* edited by Robert A. W. Lowndes.

Since the Futurians numbered among their membership such young talents as James Blish, Damon Knight, Isaac Asimov, Judith Merril, and Richard Wilson, in addition to the three editors, there was a constant flow of material into the magazines. Wollheim's *Stirring* was the most interesting of the seven, divided into science-fiction and fantasy sections. Wollheim later edited *The Pocket Book of Science Fiction* (1943), generally regarded as the first significant science-fiction anthology, and helped A. A. Wyn in the creation of Ace Books in 1952. At Ace, Wollheim was known for his keen choices and successful mixture of commercially popular and artistically valid works. Besides publishing many important new SF writers, he was responsible for publication of the first mass-market editions of Tolkien's *The Lord of the Rings* and of many of the science-fiction works of Edgar Rice Burroughs. In 1972 Wollheim left Ace to create DAW Books, the first mass publisher devoted entirely to science fiction. At DAW, Wollheim has continued his formula of mixing pulp-style adventure series with significant works.

Notwithstanding the greater importance of Wollheim's work as editor and publisher, his own production of fiction has been substantial. In the 1950's he wrote three juvenile novels in the

"Secret of. . . ." series; all are set in the intermediate-near future and deal with the exploration of the solar system. In the 1960's Wollheim produced eight novels featuring the juvenile hero Mike Mars; these are set even closer in the future than the previous series. Among Wollheim's other novels, many readers have found amusement in *Destiny's Orbit* and its sequel *Destination: Saturn*. These amusing space opera-comedies feature Ajax Calkins, introduced in a series of short stories written by Wollheim under the pseudonym Martin Pearson. Also of interest is the novel *Edge of Time*, regarded by many as the definitive (although far from the first) treatment of the macro/micro-universe theme.

A good collection of Wollheim's shorter fiction is *Two Dozen Dragon Eggs*. The short stories tend toward extreme simplicity of plot and minimal characterization, concentrating on a mix of atmosphere and "idea." "The Rag Thing" and "Mimic," probably Wollheim's two best stories, are both included in this collection. Wollheim's short critical volume, *The Universe Makers*, is one of the most cohesive and convincing statements of philosophy to date in the context of science fiction.

##### Novel

*Islandia*. New York, Farrar and Rinehart, 1942.

\*

Critical Studies: *An Introduction to Islandia* by Basil Davenport, New York Farrar and Rinehart, 1942; *The Islandian World of Austin Wright* by Lawrence Clark Powell, privately printed, 1957.

\* \* \*

The reputation of Austin Tappan Wright rests on only one work, but it is safe to say there is nothing quite like *Islandia* in all of literature. If one can make a fine semantic distinction between science fiction and speculative fiction, Wright's novel is more the latter than the former. His "speculation" is in the area of geography and, spinning off that, sociology and cultural anthropology.

Islandia is a nation located on the southern half of the Karain subcontinent in the southern hemisphere. It is civilized but isolationist, and for it Wright has created the most detailed and in-depth of all fictional cultures. There are discernible elements of Japan, Madagascar, Indonesia, and India, but the sum total is curiously more Western than Eastern, more homely than exotic. Islandia is revealed to the reader in all its richness by the action of the novel, which takes place in the early part of this century. The country has decided to end its isolation from the rest of the world, and a few representatives of other governments are allowed in. One of these is a young American diplomat, John Lang; we learn about Islandia through his eyes as he travels the country and becomes acquainted and involved with her people.

The novel is peripherally a remarkable portrait of the nationalistic power plays that were occurring at the turn of the century, and a fine character sketch of an intelligent, moral young American confronted with values different from his own. But it is Islandia and the wonderful cast of characters with which it is peopled that is Wright's most notable achievement.

\* \* \*

S. Fowler Wright escaped being an accountant and poetry magazine editor with tales of fantasy, adventure, detection, and disaster. This prolific and versatile author began writing fantasy at 50.

His early novels reflect the influence of H. G. Wells. Wright, however, had such a pessimistic view of man's devolution that

most human beings and their social customs vanish with dramatic flourishes. *The World Below* features a time-machine trip 500,000 years ahead to encounter Amphibians, delicate, web-footed, and cerebral, and Dwellers, gigantic seekers of knowledge through scientific investigation. The hero is most like the lizard-like Killers, who boil and eat victims. Much of the conversation between him and his amphibian companion reveals man's mistreatment of other living things, while many of the adventures show how close he is to bestiality when he throws reason aside in panic.

In *Beyond the Rim* descendants of British Puritans live in an Antarctic theocracy, raided occasionally by the Anabaptist horde from the volcanic hell nearby. The explorers include two strong women, one of whom remains while the other and her lover return home, but never to tell the real story. Similarly, in *The Island of Captain Sparrow* Charlton Fogle is shipwrecked where a pirate established a kingdom for his men and their women. Already present were a race of satyrs, providing meat, and a tribe of handsome natives decimated by disease brought by the outsiders. Charlton and Marcelle, intended for Sparrow's ugly, vicious heir, fall in love. At the book's spectacular climax the giant rokas, birds used for agricultural work, turn on the pirates, leaving the young lovers and the last native child to start over.

*Deluge* narrates a cataclysmic flood in which a hero and two heroines survive the barbarity to which most civilized people descend and found a new order. Martin Webster and Claire Arlington are among the few who adapt to living with nature. Because she is the kind of woman men put on a pedestal, Helen Webster also survives with her children. Some men—a murderer among them—become humane while others degenerate into ravaging, rapacious beasts who must be exterminated. At the end of this engrossing novel, Wright surprises his readers by allowing Martin to have both women. What's more—with noble psychological struggles—the women love each other. In *Dawn*, its sequel, Wright goes back in time to introduce new characters and repeat the flood's horrors. Defeat of the threatening gang and escape from another flood promise a future.

In *Dream* and its sequel, *Spiders' War*, Marguerite Leinster enjoys dangerous adventures with the help of a psychologist-magician. In the first she dreams of an ape-girl fighting off the river rats that challenge human supremacy. In *Spiders' War* she goes into a future where the threat to divided humanity stalks in the form of giant spiders. Her man, a scholar of 20th-century history, is also a warrior-leader. Together they organize three hostile groups against the intelligent monsters. *The Vengeance of Gwa* contrasts similar groups, ranging from starving barbarism to bored perfection, in a tale of an evil queen and her well-deserved end.

*Prelude in Prague*, *Four Days War*, and *Megiddo's Ridge* form a trilogy dealing with an ugly near-future in which Germany conquers Europe, by the use of a freezing gas, air raids, and political terrorism. In this apocalyptic disaster culminating in the destruction of the powerful forces of Von Teufel, Wright creates and kills a large cast of interesting characters, including a double agent and a woman pilot. He also vents anger at British underestimation of Germany, lack of preparation for war, and callousness about highway moralities. As in *Deluge* he warns readers that, while they vegetate, their neighbors hover a step from savagery.

In addition, Wright produced numerous short stories—light fantasy, medieval romance, mystery, and satire. Among the best are "Justice" and "Original Sin," a short version of *The Adventure of Wyndham Smith*. Society can be so perfect that

only mass suicide can abolish boredom. So often does Wright annihilate mankind that it is not surprising that the heroine of his last story, "The Better Choice," prefers to remain a cat.

Critical Study: *Philip Wylie* by Truman Frederick Keefer, Boston, Twayne, 1977.

\* \* \*

Philip Wylie's science fiction represents only a small portion of his profile output of magazine stories, novels, polemics, and screenplays. Wylie consciously and carefully placed himself in the "popular" market where his strongly moralistic and iconoclastic eye could not only observe and criticise but where his work would be read by large numbers. For, unlike the satirist, Wylie passionately believed that his pen could contribute to the sweeping away of cant and the creation of a modern and sane society.

*Gladiator* was accepted for publication in 1928 but Wylie's publishers held it for two years until he had produced two non-science fictions works. In it and in *The Murderer Invisible* he set the pattern for his ventures in the science-fiction idiom. In both novels the scientific projections (a genetically produced superman and an invisible man) are put in place quickly and without fuss as in H. G. Wells's novels, and the real stress lies on what the innovation can reveal about human nature and human society. Hugo Danner, the superman in *Gladiator*, observes the futility of human greed and of things like fraternity parties, football games, and the stock market. Through Hugo Wylie poses the problem of what could be done to improve the lot of man even by a superman if the masses would not change themselves. In *The Murderer Invisible* moral issues emerge because a scientist, William Carpenter, seriously wronged in a previous career on the commodities market, develops invisibility with intentions of a fair revenge and further use for the good of mankind. But he becomes a megalomaniac and attempts to take over the world for its own good. In these novels Wylie keeps calling his characters back to reckonings of conscience and analyses of the society which they are trying to change. These real and central concerns of his work were continued in *The Savage Gentleman*, a novel about a child educated away from mankind which offers a Tarzan-like variation on the single-man-against-society theme of the earlier novels.

Wylie's most optimistic venture into SF comes in two novels written in collaboration with Edwin Balmer, *When Worlds Collide* and *After Worlds Collide*. In these cosmic disaster stories two planets, a gas giant with an Earthlike planet in orbit about it, enter the solar system and destroy the Earth when the gas giant brushes against it. *When Worlds Collide* chronicles the discovery of the threat and the desperate efforts of a group of scientists to build rockets to get them onto Bronson Beta, the smaller of the invaders. Several parties succeed and the second novel deals with their survival on Bronson Beta, their discovery of a high civilisation there, and the conflicts between the American party and a Japanese-Chinese-Soviet party which has also survived. These novels contain a good deal of Wylie's most careful scientific prognostication in astronomy, earth physics, and in the prediction of human behaviour in times of extreme crisis, although the extrapolations about rocketry and inter-planetary travel are considerably flawed.

Time spent in Hollywood, war work, and the pursuit of other kinds of writing leave a gap in Wylie's SF output until the publication of *The Disappearance*. The simple but very elegant premise of this novel is a world in which all of the women disappear in an instant from the world of the men and all of the men disappear from the world of the women. Although no real

explanation is offered for this split in the stream of reality, the device is a perfect instrument for some very carefully considered opinions on the roles of the sexes, particularly in modern America. Wylie cleverly sets a great deal of the novel in a family unit very much like his own which lives in Miami and has all the domestic complications that society tends to produce. On one level the novel is fascinating because chapters taking place in exactly the same surroundings trace the varied collapse of the two worlds, the men having an all-out atomic war and a return to savagery while the women struggle with technological collapse. But in addition to the outward struggle there runs through the book some very serious contemplation of the double standard and the fragility of male-female relationships.

Wylie's next three SF works deal in various ways with his deep concern for the dangers of nuclear war, a phenomenon about which he was particularly well informed because of his activities in civil defence organisation. *Tomorrow!* is a detailed portrait of a nuclear attack on an American city and the civil defence response. He is heavily critical of the failure of face and prepare for this inevitability, and his realistically detailed picture of the carnage is both blunt and sobering. *The Answer* is a brief allegory in which both the Americans and the Russians bring down an angel in their bomb tests. The angel was carrying the message "Love one another" to mankind. *Triumph* paints the most horrible picture of holocaust, in which virtually the only survivors in the northern hemisphere are 14 people in a supershelter prepared by a farsighted millionaire.

Wylie's posthumous legacy to mankind, *The End of the Dream*, is his prediction of the pollution death of the world. Like John Brunner's novel of the same year, *The Sheep Look Up*, *The End of the Dream* ties together projections of man's mistreatment of the environment to foresee mass deaths from air pollution in the cities, a rice blight which leaves most of the world starving, and a particularly horrible mutation of an ocean leech which sucks the life from millions. *The End of the Dream* is a fitting culmination of Wylie's career, for it combines his anger against human foolishness with his obvious desire to warn and thus influence the future positively. From *Gladiator* to *The End of the Dream* Philip Wylie has used the science-fiction mode and the style of the popular writer to reach and caution the widest possible audience in his life-long crusade to save man from his own foolishness and blinkered views.

##### Verse

'*Melia Ann: A Fantasy of the W. I.* Taunton, Somerset, Wessex Press, 1953.

\* \* \*

J. B. Harris had been writing long before the reading public first heard of John Wyndham. Beginning in 1930, he published—primarily in the US and under several pseudonyms—a great many short stories and several novels. Eventually it was the novel *The Day of the Triffids* which in 1951 brought Harris wide public recognition and permanently affixed to him the pseudonym under which he had published it: John Wyndham. Wyndham is justifiably considered to be the truest disciple of H. G. Wells in English literature. He himself said that of all science fiction he was most influenced by two of Wells's novels, *The Time Machine* and *War of the Worlds*. Indeed, Wyndham more than once dealt with themes raised in those novels, such as displacement in time and invasion from outerspace, though Wells's influence on Wyndham was not restricted to thematic borrowing.

Wyndham loves to write about perfectly familiar things, some everyday occurrence, and let the fantastic element help him uncover unprecedented and unforeseen possibilities in that daily routine. Only one of his novels, *The Outward Urge*, deals

with other worlds. In his other novels and stories the action is set on Earth and in time frames not all that distant from ours. Nor does he burden us with technical minutiae. Being a firm opponent of the Jules Verne school of science fiction, resurrected and modernized in the US by Hugo Gernsback, Wyndham uses technical—and other—detail only insofar as he or any other writer needs it: for the sake of credibility, realism, authenticity. In addition Wyndham has the ability—decidedly not within any other writer's reach—to compel us to suspend disbelief by being true to human character. Damon Knight correctly observed that Wyndham achieved his objective with down-to-earth means, that is, making us believe the most unbelievable things simply because they happened to people whom we all knew well. Wyndham's imagination is very tactile, sequential, logical. He follows the Wellsian method of the "single premise." In each of his books there is, then, one fantastic assumption; something in the world has changed and all subsequent changes follow as a consequence. Wyndham has the inventiveness to illustrate with many examples the impact of an event on all realms of life. All this causes Wyndham's fantasy novels to be part of the basic current of literature. He has no use for space opera; instead he practices a special kind of "realism in fantasy." One of his tasks has been the exploration of possibilities created by application of science-fiction motifs to various types of short stories. That is the guiding principle behind the collection *Seeds of Time*. Here again there can be no doubt about the influence of H. G. Wells.

The influence of Wells also determined the basic theme of Wyndham's writings. He is usually concerned with some catastrophe, cosmic or social, which results in the discovery of hitherto hidden dangers in daily life, in the revelation of character under novel circumstances, in the disclosure of defects in the society. In searching for his "single fantastic premise" Wyndham displays a degree of imagination which belies his ostensibly traditional manner. In *The Day of the Triffids*, which remains Wyndham's best-known novel, he showed his greatest originality. The novel deals with the disintegration of the social order under the impact of two events—a rain of meteors which has blinded most of the human race, and the appearance of mobile carnivorous plants. In two other novels Wyndham writes about the invasion of Earth by beings from other planets. In the first of these, *The Kraken Wakes*, invaders from space who can exist only under conditions of enormous pressure, establish a bridgehead deep under the ocean. In an attempt to wipe out the human race, they melt down the polar ice caps; the resulting flooding of the continents almost brings about the desired end. All this occurs under Cold War conditions, with mutual suspicion between the great powers preventing them from joining forces against the invaders. In the final analysis the catastrophe is caused by human divisiveness. In *The Midwich Cuckoos* the subject matter is not so much invasion as a kind of "penetration" from space. Here the non-earthlings isolate the village of Midwich and a few other places on Earth from their surroundings and put their inhabitants to sleep. Nine months later there appear in those localities children of non-earthly origin who are evidently destined to become the rulers of all mankind. Their intellectual and spiritual superiority is such that the earthlings submit without protest, even to the point of taking actions clearly detrimental to themselves. What makes these children from outer space so superior is their capacity to communicate constantly with each other by telepathy. Thus, while remaining individual beings, they form at the same time a formidable collective force. Anything learned by one becomes immediately part of everyone's knowledge. And the group also has the ability to channel everyone's will in one direction.

Eventually the extra-planetary colony becomes so dangerous to Earth that it must be destroyed.

Telepathy is a rather common theme in Wyndham's fiction. It serves as a means of demonstrating its relationship to various forms of collectivism. The collectivism of the non-earthlings in *The Midwich Cuckoos*, for instance, reminds one of a fascist order. *The Chrysalids* provides an example of another sort of collectivist order. *The Chrysalids* takes place many centuries after a devastating nuclear war. Enclaves of life are cut off from one another by vast areas of radioactive contamination. Random mutations are occurring. As a result people, animals, and plants become so grotesquely disfigured that their hideousness exceeds even that which Wells anticipated in *The Island of Doctor Moreau*. These circumstances have given rise to puritanical communities seeking salvation by suppressing anything "different." Should anything new turn out to be superior to the old, these puritans are all the more eager to suppress it. They are convinced that they themselves represent the only kind of perfection possible, and at the very thought that elsewhere there might live people of a different color they fly into a rage. Nevertheless, life, movement, progress win out even here. These horrible, monstrous families produce children similar to those who tried to control Midwich. They differ in one respect, though: they hate cruelty. According to Wyndham these children who feel themselves to be members of one single family will not merely rebuild the old world: they will build a new and better one. *Trouble with Lichen* is the least interesting of Wyndham's novels. Taking the theme of Shaw's *Back to Methuselah*, he discusses the possibilities a vastly extended life expectancy could open for mankind.

Chelsea Quinn Yarbro comments:

My work, for the most part, has to do with some aspect of love and survival, though that should be interpreted in its broadest sense. Music has very much influenced me, not only as subject matter, but structurally as well. Since I make my living as a writer, I do, in a pragmatic sense, write for money. However, I regard writing as an art, and feel that within certain realistic limitations a part of my responsibility is to maintain and protect the integrity of my work.

\* \* \*

Chelsea Quinn Yarbro's first collection of short fiction is appropriately called *Cautionary Tales*, a title which fits a lot of work in the genre of SF. Although she loves opera and has based at least three stories on operas, and although she creates strong characters and likes to put them in moments of confrontation which feel like grand opera duets (as James Tiptree, Jr., points out in the introduction to *Cautionary Tales*), Yarbro is most easily characterized as a dystopian SF writer whose horrible speculations on the future are meant as dire warnings, predictions she hopes will *not* come true. But all categories, even useful ones, tend to be too narrow and simplistic. Yarbro is not simply a prophet of hard times to come; it just happens that a lot of her stories occur in rather harsh and unfriendly worlds. This makes for very stark conflict, and lots of passion, pain, romance, violence, terror, adventure, and love, all of them marshalled into evocative form by a strong and vivid talent.

What is most obvious once you read the stories is that Yarbro finds the very starkness of ultimate situations aesthetically exciting. In *Time of the Fourth Horseman*, *False Dawn*, "Allies," "The Generalissimo's Butterfly," "Dead in Irons," and *Hyacinths* (as well as in the cycle of historical fantasies about le Comte de Saint-Germain), her protagonists must continually battle for physical, psychological, and moral balance against the final enemy in whatever form: plague, ecological breakdown and the descent to barbarism, an alien death-force, the corruption of political power, slavery in the hold of a giant FTL cargo ship, the degeneration of art in the service of greed, or the various dogmas enlightened people have fought throughout history. Their heroism is not the easy kind found in escapist adventures; it is, rather, hard won and often of little value to anyone except the protagonist, and then only as a psychological talisman with which to face oncoming destruction. But Yarbro's morality is fiercely held to, in both her characters and her style of presenting them. As well (remember the opera), love can light up portions of a grim life if like Thea, of *False Dawn*, you're especially lucky. But if, like Jehanne Bliss, of *Hyacinths*, you throw away love for power, you may lose both power and the power to love. Moreover, love will not solve any problems, really, though its presence helps a person carry on. Certainly the act of loving, even when that love may not be returned, is presented as a positive virtue, something to hold on to in the midst of destructive chaos.

If many of the stories and the three novels are extremely dark, there are some lighter moments, especially in the short stories. "Frog Pond," whose protagonist later becomes Thea of *False Dawn*, is, despite its post-apocalyptic setting, a social comedy. "Disturb Not My Slumbering Fair" is a kind of Hitchcockian black comedy thriller about the trials and tribulations of a young ghoul, while "Lammas Night" is a historical sketch revealing the kind of wit Yarbro brings to the series of five novels and five stories concerning the ageless, charming, and essentially good vampire, le Comte de Saint-Germain. Interestingly, these tales are full of the operatic colour and larger-than-life

romance which Yarbro tends to eschew in the bleak spaces of her pure SF works. Nevertheless, these narratives, too, point to the inherent cruelty and power hunger of so much of humanity throughout the ages, and, in every one of the novels, Saint-Germain, and the readers, must face the dark side of the human heart.

But there are ways to introduce such colour into SF worlds. "Un Bel Di" is a story of a confrontation between two alien races that is also a variation on the structure of *Madame Butterfly*. "The Fellini Beggar," surely one of Yarbro's finest stories, gathers together a number of significant motifs in her work: her ability to suggest through telling details the lineaments of a whole world, in this case another post-apocalyptic Earth; her delight in the beauty to be found even in the midst of rubble; and her recognition that emotion and the absolute need to satisfy it are continually changing with personal circumstances—this beggar allowed Fellini to "use" him brutally in his final film because it was a worthy exchange for his personal grail, the manuscript which allowed him to *know* exactly how Puccini had planned to finish *Turandot*. This, like all Yarbro's fiction, is 160 proof, and meant to satisfy a discriminating palate.

—Douglas Barbour

**YEP, Laurence (Michael).** American. Born in San Francisco, California, 14 June 1948. Educated at Marquette University, Milwaukee (Dretzka Award, 1966-68; University of California, Santa Cruz, B. ## Laurence Yep comments:

Growing up as a Chinese in America, I felt much like Ralph Ellison's "invisible man": without form and without shape. In my studies and in my teaching, I pursued the psychological figure of the Stranger, both in the American classics and in the works of popular culture. In writing science-fiction stories about aliens and alienated heroes, I was also unconsciously seeking my own identity. I've used the results to good effect in my children's books on Chinese-Americans. When I'm having problems with a historical novel, I still find it useful to do a science-fiction story on a similar theme.

\* \* \*

Laurence Yep is making his mark as a writer of realism as well as SF fantasy for adults and children. In his children's novels depicting Chinese-American experience in San Francisco, *Dragonwings*, *Child of the Owl*, and *Sea Glass*, Yep, himself Chinese-American, has deliberately and effectively sought to combat racial stereotyping, and these novels have been praised because they have repaired some of the harm inflicted by racist persistence in describing Chinese or Chinese-Americans as characters resembling Charlie Chan or Fu Manchu, or playing the seemingly omnipresent houseboy, gardener, or launderer. The impact of these novels largely derives from the author's frank, sympathetic rendering of the painful clash between an old generation of Chinese in America who, while mindful of the opportunities their new home provides, still cherish the folkways of their mother country, and a young generation, convinced of the importance of change and the necessity of becoming American, who are tempted to deny the value of their ancestral past. It is surely not coincidental that a similar clash is the thematic center of *Sweetwater*, a most distinguished children's SF novel.

Set on Harmony some centuries in the future, *Sweetwater* describes the efforts of the Silkies, descendants of the Anglie starship crew who had brought the first colonists and then been forced to remain, to maintain their own distinctive society—one lived in harmony with the sea which dominates their lives—and resist the blandishments of the descendants of the first colonists, who are enamored of the latest technology. The Silkies are led by Captain Inigo Priest whose son, Tyree, is both the narrator and moral center of the novel. His several ethical choices, making up a great part of the plot, encapsulate the novel's focus upon the

conflict between tradition and the necessity of change and growth. The most prominent element is the setting created for Harmony, in particular, its ecology. Not knowing that the planet is subject to cyclic flooding, the settlers, aided by the Argans, an indigenous race resembling spiders, built on the flood plain. When the waters rise, the settlement, Old Sion, is abandoned by all except the Silkies who struggle to wrest a livelihood from the sea. *Sweetwater* also concerns the development of an artist, a relatively rare topic in children's fiction of any kind, as Tyree senses within himself a gift for music which his parents disdain. Secretly abetted by Amadeus, an old Argan (the many references to music and the Old Testament contribute to the allusive richness of the novel), Tyree gradually internalizes the expressive nature of music and its centrality in any life that aspires for wholeness. Both thematic complexity and verbal richness, then, make *Sweetwater* superior SF.

A subsequent SF novel, *Seademons*, describes Fancyfree, a world colonized by the Folk, other descendants of the Anglies. Unlike the Silkies, the Folk do not live in harmony with the Seademons, intelligent life forms native to Fancyfree, until catastrophe forces them to. Like *Sweetwater*, *Seademons* dramatizes a clash between tradition and change, and its most prominent element too is the sea-dominant setting. Also *Seademons*, a densely written and poetically evocative novel like *Sweetwater*, effectively incorporates Celtic lore into its plot. Recently Yep seems to be aiming for versatility. He has written *Shadow Lord*, a volume in the Star Trek series; two young adult novels; and *Dragon of the Lost Sea*, a retelling of a Chinese legend. The merit of the last, in particular its witty interplay between a young boy and the ancient dragon, suggests that Yep, in spite of his desire for versatility, writes most distinctively whenever he focuses on the clash between generations and their conflicting values and draws upon his Chinese-American heritage.

## Nicholas Yermakov comments:

I approach my writing with a musician's sensibilities, which is to say that I enjoy "playing different kinds of music." I practice hard, I play often, and I continually seek to improve, but the driving force is the sheer joy of playing and the appreciation of the listener, or in this case, the reader. Writing is not so much a profession or an art as it is a lifestyle. Writers are fringe people. We deal in dreams. We shape them, hone them, polish them, nurture them lovingly, then share them. It's a craft, perhaps more ethereal than most, but no less demanding. Its special attraction is that it can never be truly mastered. But I'll keep on trying, just the same.

\* \* \*

A member of what might be called the post-New Wave generation in American science fiction, Nicholas Yermakov is nothing if not eclectic. An admirer of literary radicals in the genre like Harlan Ellison, Norman Spinrad, and Samuel R. Delany, he is nevertheless quite traditional in plotting and style—as Simon Hawke, he is even responsible for the Time Wars series, and he has also written a couple of Battlestar Galactica novelizations.

Yermakov's serious works are full of allusions to both literary classics (Oscar Wilde and Samuel Taylor Coleridge are among his heroes) and such modern authors and gurus as Tom Wolfe, Marshall McLuhan, and Robert Anton Wilson. From all of them, he takes a sense of personal moral responsibility and a distrust of false values and manipulation of whatever kind.

His philosophy perhaps emerges most explicitly in *Clique*, where Ross Cleary, one of those most responsible for the fashion in holographic "auras" behind which people hide their true selves, breaks with the System to lead a movement against their use. But the movement's ideal of being true to one's self, of becoming "clean" of all deception and hypocrisy, later degenerates into an ideology—with Cleary turning into a guru as domineering as his earlier advertising-executive persona.

Yermakov sympathizes with the libertarian movement, but doesn't seem to have enough faith in it to write utopian works. The Boomerang trilogy (*Last Communion*, *Epiphany*, *Jehad*) is set in an authoritarian future in which a few decent people try to defend the native culture of a newly discovered world against the ruthlessly amoral designs of the Directorate.

The Shades, as the natives of Boomerang are called, are a unique species. They can absorb the minds and memories of dying members of their kind, so that all their "dead" live on as entities which form gestalts like Jungian archetypes. For the Directorate, after the failure of a drug that promised immortality, the Shades are a godsend. Unknown to present-day explorers, colonists are sent into the *past*—in what turns out to be a successful experiment to acquire the Shades' form of "immortality" for humanity through calculated genocide.

Although full of plot complications involving time travel and conspiracy, the real tension of the series is a *moral* one. The colonists are as much victims as the Shades, all knowledge of their true origin and purpose having been suppressed—and, ironically, they do create a viable hybrid culture by absorbing the Shades (who had never had a *society*, nor the need for one). And the heroes like Paul Tabarde, who had hoped to save the Shades, end up as the defenders of the colonists against the Directorate's obscene plan to "harvest" them like a crop.

Yermakov became known for taking strange turns even in his first novel, *Journey from Flesh*, expanded from a short story: the same alien reptile that at first seems to be a parasite, draining the life from the host that is addicted to it, turns out also to hold out the hope of immortality—at the cost of turning the seeming parasites into the victims themselves.

Having held almost every kind of job imaginable (rock musician, security guard, factory worker, book store clerk, motorcycle salesman), Yermakov can write authoritatively from many viewpoints. But for all that, and the moral-philosophical issues in his SF, he insists that "the primary aim of my work is to be a good storyteller."

\* \* \*

With doctorates in sociology and economics, Michael Young is dominantly an academic. It is difficult, in fact, to tell if *The Rise of the Meritocracy* is literature or sociology. Young uses the handy and familiar future perspective in order to persuade the reader that the world has evolved into a complete meritocracy by the year 2034.

The form of the book is a historical-sociological analysis of the present (2034 AD) social situation in Great Britain. Young takes us step by step up the rungs of educational reform that rendered a system of happy justice on the basis of education to fit the intelligence of the individual. This transformation from "an aristocracy of wealth to an aristocracy of merit" produces a smooth and durable social order. It becomes evident through the book that Young may be more infatuated with the aristocracy than the merit. The villains of this fantasy are the socialists who stupidly support equal and uniform education for all, therefore enslaving the gifted to mediocrity. In fact, some of the more cogent points in the book are made on the subject of education as "social leveling" on one hand, and the potentiality wasted by a system that excludes talented lower-class children from educational opportunity on the other. Part of the scenario Young builds is Britain surging ahead in productivity "thanks mainly to the scientific management of talent." In the meritorious future students do not have to wash dishes, and in fact are paid a 60% higher wage than industrial workers.

*The Rise of the Meritocracy* is surely unique in form, as it has no characters and no plot, and is footnoted as an academic work would be. In fact Young may be accused of dressing up his bizarre political notions in literary garb and selling it on the basis of its being a bi-genre novelty. But this would be too harsh; Young deserves credit for his inventiveness and believable scenario construction.

—Peter Lynch

\*

#### Robert F. Young comments:

My books and stories deal with a variety of subjects. My motive in writing most of them stems in part from a fascination for science fiction dating from the long-ago years when I discovered Edgar Rice Burroughs and H. G. Wells, and in part from the genre's capability of providing a writer with the opportunity to make the impossible seem possible.

\* \* \*

In an introductory essay to Robert F. Young's *A Glass of Stars*, Fritz Leiber remarks: "And I say that the field to which Robert F. Young has many times proven his claim is that of romantic love. The magic potion of which he is master creator is the love philter." It could be further noted that the potion is not meant merely for the characters in his stories, but to captivate the audience that reads them. Robert F. Young's realm is the realm of boy meets girl, not in some bygone era but on other worlds or in a future mired in the sins of our own time, crass commercialism and the violation of the environment. Almost always Young surveys his domain with the force of his sense of

humor, inserting it at the proper junctures so as not to allow "boy meets girl" to become soap opera. Young skillfully weaves his plots in such a manner that the reader can only smile at the fact that the man and woman are together, living happily ever after, in the end.

An especially fine example of Young's plot-twisting talent is the story "L'Arc de Jeanne," which takes place on the planet Ceil Bleu, near the key city of Fleur du Sud. This is a planet committed to the Psycho-Phenomenalist Church. We find it under attack by the forces of the evil tyrant O'Riordan. All that stands in the way of conquest is a young maiden who rides a "magnificent black stallion" and is armed with what appears to be a magic bow and arrow. O'Riordan wants the maiden captured, and sends a computer-selected young man guaranteed to be irresistible to the maiden, to win her affection. The story evolves in such a manner that Young's Joan of Arc must burn at the stake, yet Young manages the plot so that the story ends happily.

Young's conservations concerns show forth in "To Fell a Tree." A young treeman has the task of felling a glorious 1000-foot tree, a job his company has been hired to do by a rather greedy village. The tree is so enormous that he must live in the tree for a number of days in order to bring it down. While in the tree he meets a dryad, the spirit of the tree, who is seen slowly dying as the tree is cut down, a tree the sap of which looks just like blood. Young's talent as a weaver of words is revealed in this story, along with his passionate concern for nature's living forms.

Young, a shrewd commentator on the crassness of commercialism, has a special fondness for the crudities of the automotive world. In "Romance in a Twenty-First-Century Used-Car-Lot" the auto industry has managed to miniaturize cars sufficiently so that they can be worn as clothing, and then convinced the public that not wearing them is obscene. Those who don't wear cars are called nudists and consigned to a nudist colony. "It wasn't hard to do," Howard Highways tells Arabella Grille, "because people had been wearing their cars unconsciously all along." Then there is Emily ("Emily and the Bards Sublime"), an assistant curator of a museum. She is extremely fond of the android poets, especially Lord Tennyson. One day she is told that the poets must go to make room for a display of 20th-century art, cars, that is. Mr. Brandon tells her she will be taking over the new exhibit; "Mr. Brandon handed her the big book he was carrying. 'An Analysis of the Chrome Motif in Twentieth Century Art. Read it religiously, Miss Meredith. It's the most important book of our century.'"

However, Young's first love is romance, and he is willing to go to, or to manipulate, the ends of time to bring his loved ones together. "The Dandelion Girl," "The Girl Who Made Time Stop," and "Mine Eyes Have Seen The Glory" are all examples of first-rate stories that entail clever use of the intricacies of time as the fourth dimension. Robert Young's gift as a story teller is brought out in these tales, for by the end of each story the reader has been moved to believe in the possibility of romantic love even when it entails bending the known laws of physics.

In a recent novel, *Starfinder*, Young also makes much use of the intricacies of time travel. The book deals with giant creatures—space whales—who can dive into the past, space-ships constructed from the carcasses of these creatures, and one man's relationship to both the spacecraft and one of the creatures. Young takes full advantage of the paradoxes of time travel as he spins yet another story of romance across the eons. The reader should be forewarned, however, that Young's romanticism takes something of a rather sexist turn in its portrayal of one of the most important female characters and

the planet she helps rule. The reader might also wish to know that several segments of *Starfinder* were first published in short story versions over a number of years.

\* \* \*

Arthur Leo Zagat is essentially an early 1930's figure, to be seen in the context of science fiction broadening, diversifying, and acquiring a definite character as more magazines emerged.

His relatively small science-fiction output reflected a personal interest in futuristic ideas; as with many others of the time whose overall output was trivial hack work, he showed originality and vision in science fiction. Every cliché began as an inspiration. Though his stories ranged over a variety of themes, his main contribution was to space flight. This was then something predicted for the indefinite future, but it was a vision that excited that generation as no other. The spectacular progress of aviation had made a profound impression, clearly made obvious the pace of technological change, and raised imagination from the ground.

Interplanetary travel had a long literary tradition, but, aside from its use as a springboard to introduce a Utopia or a reflection on man's follies, its emphasis had always been on the initial problems to be solved. By the time SF was firmly established, readers had gone over that ground many times and were ready to go beyond it. Early 1930's science fiction tried to imagine regular traffic between worlds, and settled into a picture analogous to ocean shipping as it had been in earlier times when it was more hazardous and maritime countries more remote and diverse. Zagat helped build up the image of a dangerous yet established trade, of interplanetary shipping lines and business rivalries, of a rough spaceport district analogous to the traditional waterfront, of a rough frontier class of spacemen, with occasional piracy and clashes with natives, or a well-disciplined space service to keep order.

Inevitably this led to the repetitive action stories Tucker aptly tagged space opera. It tended to trivialise space flight by glossing over the problems, though it popularised the concept. Its rather optimistic view had a strong appeal in its time. Zagat's stories such as "The Great Dome on Mercury," "Spoon of the Bat," and "The Cavern of the Shining Pool" were good entertainment, and added to the movement's repertory of expectations. World-scale conflict of East and West, another standard theme, was exploited in "The Death-Cloud," "The Green Ray," and "Flight of the Silver Eagle," dated, but showing what then seemed good probabilities: a world shrunk by better communications, conflict mainly airborne, death-rays and other devices.

And there are many other themes, all fairly new and treated originally—unearthlike life, the amorphous "Menace from Andromeda," logically evolved; a nonhuman intelligent race in "The Emperor of the Stars" sympathetically treated without humanising it; invisible subterranean beings in "Beyond the Spectrum"; machine intelligence in "The Revolt of the Machines"; the world depopulated and left to a few chance survivors in "When the Sleepers Woke"; big business replacing traditional state power in "Exiles of the Moon" and "Lost in Time"; glimpses of future custom and folklore, even sport, in "Sunward Flight"; dangerous inventions in "The Lanson Screen," the defensive shield that became a deadly prison.

Zagat's only book, *Seven Out of Time*, drew on elements he had used before and clearly suffers from spinning out the suspense in a six-part serial. The early chapters with their missing-person plot and eery touches contrast with the strange remote world of millions of years hence, where the group of dehumanised monsters evolved from us try to recover the insights and motivations they have lost by studying their kidnapped people of our own and earlier times. Dated and plausible only as symbolic fantasy even in 1939, it has merit for the message it presents even today.

The volume of science fiction still appearing in the general fiction magazines through the 1930's is generally overlooked, but it was considerable and, though mostly less original, it has interest. *Seven Out of Time* first ran in *Argosy* which had a long history of including science fiction on its merits. Perhaps a better novel serialised there, never made a book, is "Drink We Deep," though hampered by its use of the primitive diary-letter form. This mystery with seemingly supernatural elements developed into a wild extravaganza of early science-fiction fancies, with size-change to bring the leading characters from everyday America into a miniature people's realm under a lake, with scientific marvels and a possible menace to the human world, plot elements reminiscent of Burroughs or Merritt, and some memorable scenes. The 1939-41 series of six tales beginning with "Tomorrow" was discontinued without resolution, perhaps because its background of a future America enslaved by the Yellow Peril came to be less a stock theme than an uncomfortable possibility. But its treatment with a group of children growing into Noble Savages in a wilderness retreat to lead revolt was an unusual concept.

Zagat's first works were written with Nat Schachner, whose role cannot be distinguished. The writing is conventional, the human interest elementary, with characterisation going little beyond stock figures. But it is competent, good of its kind in its time, and it has conviction.

##### Timothy Zahn comments

There are as many definitions of "science fiction" as there are writers, readers, and critics; but to me the important word here is "fiction," and fiction means telling a story. I enjoy speculating in my stories—playing the "if-then" game—and when I can make a point about humanity or society as well I feel I am helping, in a small way, to fulfill the promise of depth and richness that science fiction has always offered its readers. But the basic story *must* be worth reading; must hold the readers' attention and firmly draw them into the world the writer has created. Otherwise any message is likely to be lost, or never read at all.

The number-one goal in my writing, therefore, is to entertain my audience—to entertain with high adventure, as in *The Blackcollar*; to entertain with details of an unusual society, as in *A Coming of Age*; to entertain with scientific-puzzle stories, as in many of my shorter stories. But the entertainment must be there. Always. It's part of the job.

\* \* \*

Timothy Zahn is one of the newest holders of the reputation of "an *Astounding/Analog* writer". During the five years of his career to date, most of his work has appeared as novelettes in that magazine. His stories emphasize an intellectual challenge in a context of the growth of mankind, astronomically and metaphysically. His characters are intelligent and likeable, although due to the brevity of the stories they are seldom more than stereotypes of technicians: stick figures to present and solve the problem. This has begun to change with the recent publication of two novels which have given Zahn more room for character development.

A common theme is the expansion of humanity into space, often involving conflict with an alien civilization. In "Hollow Victory" two biomedics must deduce the cause of the critical illness of an alien ambassador, using clues about the Thrulmodi physiology and the nature of the planet on which the first human-Thrulmodi conference is taking place. "Unitive Factor" is set on an exploratory ship manned by a team of humans and aliens who find each other sociologically dislikeable. The story, involving a space rescue utilizing an incomprehensible deep-space life form, emphasizes the need of the two cultures to work together. A sequel, "Bête Noire," goes deeper into the ecology of the fascinating space life forms. "Cascade Point" (Hugo winner) is the point in space at which a ship makes its transition to another stellar system. An unexplained phenomenon is the appearance surrounding each person aboard ship of multiple images of himself, from alternate time-lines. The story relates how an experiment to use this phenomenon for psycho-

therapeutic purposes ends up revealing more about the phenomenon itself, and how the embittered narrator comes to prefer his actual career to that shown by his more glamorous cascade-point images. *The Blackcollar*, Zahn's first novel, is a military-combat thriller in which a commando unit with chemically-augmented physical abilities fights the alien conquerors of Earth. Zahn sets up the question, if the entire human space civilization was unable to defeat the aliens thirty years earlier, what chance does a single Resistance unit have today? He answers it in a melodramatic yet plausible manner.

Another common theme is the elevation of society to a higher mental plane, and the psychological stresses that this creates. In "Dark Thoughts at Noon" two telepaths are kidnapped by a technician who wants mechanically to duplicate their talents for his own benefit. The methods that the unscrupulous Green uses to stymie Ted's and Colleen's natural powers, and the manner by which Green is finally thwarted, are cleverly worked out. "The Final Report on the Lifeline Experiment" tells how an intellectual experiment to find out by telepathy at what point a human fetus becomes a "real person" is converted into a political crisis by pro- and anti-abortion activists. "The Cassandra" starts with a mutation that enables the humans of a colony planet to foretell death, and ends with a speculation that the death of any sentient being may affect the structure of the universe.

Zahn's second novel, *A Coming of Age*, is set on a planet where a mutation two hundred years earlier resulted in all children developing telekinetic powers at the age of five, which they lose at puberty. Several strong characters are developed, notably a 13-year-old girl who fears the coming loss of her ability, an adult detective and his preteen assistant who are investigating a kidnapping, a scientist doing research on the biology of the telekinetic phenomenon, and a criminal plotting to take advantage of it. Zahn slowly reveals one facet at a time of this unique society, and ties each one in as an important element of his mystery. *A Coming of Age* is Zahn's most ambitious and his best-developed work, and indicates that he will become an increasingly important SF author during the next few years.

Bibliography: *The Work of George Zebrowski: An Annotated Bibliography and Guide* by Jeffrey M. Elliot, San Bernardino, California, Borgo Press, 1985.

Manuscript Collection: Paskow Science Fiction Collection, Temple University, Philadelphia.

\* \* \*

There is, contends George Zebrowski, an aspect to writing that is akin to prayer, to pleading with the nameless fact of existence, on behalf of one's characters. Superficially, a fiction writer tells lies, fabricating events and characters; but on a deeper level, a writer tells the truth about his characters and events, finding what is meaningful about these things for the reader and himself. Some writers never get past the point of telling lies, of fabricating events and characters in a facile

simulation of what literature, at its best, is about. However technically skilled such work is, it has one feature which betrays it: the inauthentic work fades in the reader's mind, however dazzling the initial reading might have seemed. This is not true of George Zebrowski.

*Macrolife*, Zebrowski's most ambitious work, depicts with Stapledonian scope the evolution of artificial space colonies (or macrolife). Jack Bulero, a 21st-century businessman in charge of the world's largest corporation, inadvertently precipitates a disaster that threatens to destroy earth. Blamed for the catastrophe, his family is forced to seek asylum in a space colony where Richard Bulero, the visionary younger son, realizes that macrolife has the potentiality to become the next logical step in man's evolutionary development. Freed from the drawbacks of natural planets, with their scarcity of resources and other limitations, macroworlds offer man the opportunity for almost limitless expansion and social experimentation. This dream is tested in the second section of the novel when a descendant of the Bulero clan becomes sentimentally attracted to the savage inhabitants of a decayed natural world, only to find that his primitivistic yearnings are not only impossible but deadly. The novel concludes on an apocalyptic note: as the last remnants of macrolife huddle around a few dying dwarf stars, a reconstructed descendant of the Buleros is called on to aid in an apparent miracle: the rebirth of the cosmos.

Imaginative rebirth, with its philosophic and religious implications, is the dominant motif of *The Monadic Universe*, a collection of stories. "Monadic Universe" charts the nightmarish voyage of the last survivors of earth's destruction. Hurtling through deep space, they must confront the terrible truth that they cannot return to their normal space-time continuum without unleashing forces that would destroy the entire cosmos. Their only hope lies in a leap of faith so unimaginable that it drives the rigidly rationalistic captain to his death. Self-enclosed space systems as a metaphor for human isolation and regeneration also appear in the Christian Praeger series. A struggling city youth in "Assassins of Air," Praeger decides to quit the "recycling gangs" roaming the polluted city and trafficking in bootleg automobile parts. Sensitive and idealistic, he seeks to obtain an education that will help him to combat pollution, but his former cohorts drive him from the city with murderous fury. In "Parks of Rest and Culture" he becomes so disillusioned with the seemingly insoluble problems of earth that he enlists as a space colonist, dreaming of an idyllic new life "filled with elegant people, full-leaved trees casting broad shadows." Several years later Praeger, now a seasoned space colonist, encounters his old friend Julian, "The Water Sculptor," a reclusive artist in an orbiting studio. When Julian commits suicide rather than return to the crass and corrupt earth, Praeger not only learns a poignant lesson about the human condition but also has a deeper insight into the transformative power of art and the imagination.

Other stories in this collection, such as "Starcrossed" and "First Love, First Fear," explore the paradoxes of eroticism in an utterly alien context. In "Heathen God" a priest of a proudly "enlightened" interstellar empire is shocked to discover that a gnome-like alien is actually the worship-starved "father" of the human race. The religious implications of an "alien god" are also taken up in "Interpose," a story whose account of the Jesus-as-alien theme is as subtle as its punning title.

Major stories of the late 1970's and early 1980's include "The Word Sweep," "The Eichmann Variations" (a Nebula Award finalist), and "Gödel's Doom." This last work is overtly based on the philosophy of mathematics, and is one of the few science fiction stories in which mathematics is treated accurately. The

story was reprinted in the Bertrand Russell Society quarterly, the only story to be so honored by that journal.

Zebrowski's science fiction is a way of grasping and communicating human experience, past, present, and future; it is a form of phenomenological description in areas too complex for quantification. This is the grist with which serious writers deal, witnessing their times, refining language, transmitting feelings, thoughts, and a sense of beauty. The critical possibilities of Zebrowski's work suggest that the creation of genuine future alternatives may, when it is combined with the tools of literary expression, become a supremely affecting art form.

Writers, argues Zebrowski, must be prepared to risk being demolished, psychologically, by the "facts" of their careers, by how they are perceived. "Artistic failure" is a curious process; there is no way to prove it is happening, since some of the best writers often receive the most vehement condemnation (and no money), and the worst the highest praise (while the money teems). Beware the voices of *both* praise and condemnation; both speak from shifting positions, and can be very damaging in how they affect a writer's new work.

Arriving in the United States as a displaced person while still a child (his parents were captured by the Nazis), Zebrowski is preoccupied with exile, loss, and the need to find meaning and identity in a strange environment. Thomas N. Scortia has compared Zebrowski's style and background to that of another deracinated Polish writer, Joseph Conrad, whose "prose . . . is alternatively complex and leanly descriptive" and whose "themes reflect the intellectual heritage of Middle Europe." Michael Bishop has written: "Together with his metaphysical imagination, his hard-earned understanding of science and technology, and his maturing skills as a delineator of character, his mastery of a distinctive prose style makes it impossible to regard Zebrowski as just another journeyman yarnspinner. . . . The strides he has made on a stylistic level—the increases in metaphorical aptness, in the beauty and simplicity of his images—cry out for applause." Serious and original as well as stimulating and entertaining, Zebrowski has proven a promising new voice whose work deserves a wider readership.

Critical Study: *A Reader's Guide to Roger Zelazny* by Carl B. Yoke, West Linn, Oregon, Starmon House, 1979.

#### Roger Zelazny comments:

My earlier writing involved considerable use of mythological materials. I have, however, attempted to diversify over the years. I write both fantasy and science fiction, as well as mixtures of the two. My objectives vary from book to book, but in general I begin with character in mind rather than plot. Among my personal favorites are the *Lord of Light* and *Doorways in the Sand*.

\* \* \*

A writer who constantly challenges himself, Roger Zelazny is difficult to categorize. He has successfully written both fantasy and "hardcore" science fiction, his work has been both light and serious in tone, he is adept at all lengths, he has tackled most of the standard science-fiction themes. Even his style has changed since he published his first short story in 1962—from one that was highly mythic and richly poetic to one that is more controlled, economical, and precise. Yet despite the wide variation in tone, content, and style of his work, there are definite and consistent characteristics in his writing. Certain themes recur; certain kinds of character reappear. Perhaps it is in his characterization that the threads which link his works are most easily seen.

Zelazny's ability to create believable characters is probably

his single most important contribution to science fiction. Even though his protagonists usually possess some ability or talent which makes them "larger-than-life," they remain entirely credible. They prize their self-reliance, personal integrity, and individualism. They must develop their own unique abilities and talents. And, since growth is a result of experience, the psychological growth of the characters is directly linked to their adventures. Frequently, Zelazny's stories begin with his protagonist disillusioned, alienated, or geographically isolated, and, whatever the circumstances, the specific conditions of his situation set him off on some kind of quest. In addition to attaining some physical objective, however, Zelazny's heroes are also set off unconsciously on a psychological quest—which is to achieve a metamorphosis of a personality, to raise their level of consciousness. If successful, this new maturity brings the disparate elements of their personalities into harmony, gives them a broader and deeper knowledge of themselves and the worlds in which they live, and creates the possibility for love. Of Zelazny's best works, the Amber novels, "A Rose for Ecclesiastes," and "The Doors of His Face, The Lamps of His Mouth" use protagonists who achieve metamorphosis in the course of the story, while *Lord of Light* and *This Immortal* tells stories which could not happen until after their protagonists have achieved this growth.

Zelazny's recurrent themes are integrally related to the psychological quests of his heroes. Vanity, greed, power, guilt, and revenge block metamorphosis and must be overcome before it can occur. Immortality permits a character to achieve a fuller realization of his capabilities. Zelazny recognizes that as long as a healthy person lives, psychological growth will continue. Love and fertility, in all their possible forms, are the positive benefits of metamorphosis. Self-reliance, personal integrity, and individualism are the keys to achieving it. Renewal, or restoration, which appears so frequently in Zelazny's stories, is an encompassing theme which signals both physical and psychological success.

Zelazny's most important works are the stories "A Rose for Ecclesiastes," "The Doors of His Face, The Lamps of His Mouth," and "Home Is the Hangman" and the novels *This Immortal*, *The Dream Master*, *Lord of Light*, and the five Amber books. "A Rose for Ecclesiastes" and "The Doors of His Face, The Lamps of His Mouth" are renewal stories, and both Gallinger, the conceited Earth poet, and Carlton Davits, the bankrupt baitman, must overcome their vanity in order to achieve personality metamorphosis. Each does, and in the process Gallinger saves the Martians from racial suicide and restores fertility to the planet, whilst Davits brings both his and his ex-wife's personalities into harmony and creates a healthy relationship. "Home Is the Hangman," one of Zelazny's "no-name detective" stories, presents a unique twist on the metamorphosis motif. In it, the Hangman, a combination telefactor and computer, returns to Earth after many years in space to show its teachers that it has overcome the neurosis they created for it. The anthropomorphic machine has successfully integrated the elements of its personality, while, ironically, one of its teachers, Jessie Brockden, is so overpowered by guilt that he believes that the machine has returned to kill him.

This immortal presents a protagonist, Conrad Nomikos, who has already achieved maturity by the time the story begins, so the focus of the story shifts from achieving metamorphosis to the role of the hero in restoring the irradiated Earth. A revolutionary group believes that the Vegans, a superior alien culture, are about to begin a wholesale exploitation of the planet, when in truth they are testing Conrad's worth to inherit and subsequently restore it.

*The Dream Master* presents the only instance in Zelazny's writing where a protagonist fails to achieve metamorphosis. Because his particular personality fault, once again pride, continues to dominate, Dr. Charles Render, a neuroparticipation therapist, is ultimately drawn into the madness of one of his patients. His vanity has prevented him from seeing the limits of his abilities. In one of Zelazny's more interesting attempts to expand a novel through the use of myth, he links Render to the Scandinavian *ragnarok* and Eileen, his patient, to Arthurian legend. The *ragnarok* represents Render's view of the world and signifies the psychologically deterministic course of his life. The Arthurian material characterizes Eileen's chivalric and highly idealized view of the world. Though the concept is ingenious, the use of symbolic mythic sequences tends to confuse meaning for the perceptive reader rather than clarify it. In addition to illustrating the dangers inherent in allusion, it also illustrates the danger of assuming that Zelazny is attempting to translate whole bodies of myth into science fiction.

*Lord of Light*, undoubtedly Zelazny's best novel, also treats renewal—in this case the renewal of a society. By the time the story begins, Sam, the Protagonist, has long since passed on to a higher state of consciousness. The world of Urath is ruled by colonists who have virtually become gods. They patterned the new after the Hindu culture that they left behind on Earth, and they have achieved virtual immortality because they have the technology for body transfer. Unfortunately, their power has corrupted them. They exploit the masses, their own descendants, and refuse to let them share their technological benefits. Society is repressive and stagnant, and Sam sets out to change it. Of course, he accomplishes his reform mission.

The Amber novels treat both the physical and psychological sides of renewal—the restoration of the land and the metamorphosis of personality. Corwin, the protagonist, journeys from youthful and romantic idealism to pragmatism in the course of his adventures to keep his universe from being absorbed back into chaos. In the process, he learns that the most important reason for living is psychologically healthy human relationships. A dramatization of Zelazny's form and chaos philosophy, the Amber novels also show how man should relate to the basic forces of the universe.

The Amber novels are not only a major fantasy work, they are also an excellent window on Zelazny's capabilities. Criticized by some who feel that he has not achieved the stature projected for him when he broke into science fiction more than 15 years ago, Zelazny has perhaps more than any other writer brought the techniques, style, and language of serious literature to the field. There can be no question of his stature, for he has written several major works, but his greatest contribution may in the end prove to be that he has brought characters who are psychologically credible, who are sympathetic, who have depth and scope, to a literature famous for its cardboard figures.

Zelazny's most recent stories display two interesting lines of development. First, in *Changeling*, *Madwand*, and *Eye of Cat*, he consciously uses Jungian images and concepts to shape his stories, much as he did in "The Doors of His Face, The Lamps of His Mouth." Such usage reinforces the renewal theme, which pervades his work and which is evident in these stories, especially in terms of the personality growth of his characters. This technique is very similar to what he did in his early writing with mythology.

Second, his most recent work clearly leans toward fantasy, but it is fantasy that has been hedged. By that I mean that he takes great care to treat the worlds of these new stories as if they were simply governed by physical laws different from our own. Magic, supernatural events, and other motifs and devices

usually unexplained in fantasy are handled as if they were a normal part of some other reality in these worlds. In *Changeling* and *Madwand*, for instance, magic is a skill. There are different forms of it, there are rules to govern its use, and there are various degrees of adeptness in its practice. In short, Zelazny provides means for his characters to tap into and use the basic forces that govern their story worlds. Though these forces are different from our own, he implies that lying beneath both sets is something common. In this work, Zelazny is probing the question of reality and offering up different scenarios as possibilities. I suspect that his concern for verisimilitude is prompted by his reading about the chaotic, illogical, and irrational world of sub-atomic physics and his longtime interest in the Quabalah.

The questions of different realities is one with which he has flirted in the past. The Amber novels end, for example, with Corwin inscribing a new universe, one which may incorporate entirely new physical laws. *The Changing Land*, too, ends with a

castle passing through the end of time to a new creation. And while *Trumps of Doom*, which re-opens the Amber series with a new story line focusing on Merlin, is too busy charting a course to map out how this second set of novels will probe the question of reality, it does provide a perfect opportunity to deal with it by raising the issue of Corwin's whereabouts.

While Zelazny's ultimate intention may be nothing more than providing us with a series of imagined alternatives, evidence indicates that he will continue to probe the question of reality in his future work.

ZETFORD, Tully. See BULMER, Kenneth.

FOREIGN-LANGUAGE  
WRITERS

ABE, Kobo (1924—). Japanese. *Inter Ice Age 4*, 1970.

\* \* \*

Science fiction is but a small part of Kobo Abe's work, though his creations in other genres have tinges of science-fiction character. He is, however, regarded in Japan as a major literary figure mainly because of his plays.

As a medical school graduate, Abe has the technical knowledge for outstanding work in science fiction. Also relevant is his creation of psychological novels in the 1960's, as well as his propensity for experimental literary work, combining his familiarity with European 20th-century trends with the characteristic Japanese mindfulness of indigenous cultural tradition. One important example of this is the mask, for centuries a major resource of Japanese drama. His novel *Tanin no kao* (The Face of Another) is scarcely science fiction, but has technological content, the methods by which a realistic mask is substituted for a horribly disfigured face. Here the hero compares himself to the monsters of television, and the film is replete with the organ-filled laboratories of the Frankenstein tradition.

The greatest science-fiction work of Abe is *Inter Ice Age 4* in which the forthcoming inundation of the Earth by melting polar ice caps is to be dealt with by modifying human embryos to produce gill-breathers. Very important in predicting the disaster here is computer technology, and we are told that the computers have also discerned Communism as the shape of things to come. However, says a leading character, Communism would fit the predictions of a machine; it neglects free will. The computers are also described as scanning a human mind completely, then engaging in dialogue with the "individual" stored in their data banks. When this dialogue with the "data bank ghost" is extended even to the mind of a newly dead person, one sees an old Japanese concept in action (the 11th-century novel *Tale of Genji*, as well as the modern film *Rashomon*). Abe's philosophy of present-future relationships is especially significant. *Inter Ice Age 4* comments that "The future is not to be judged by us," but rather it "sits in judgment on the present." It gives a verdict of guilty, says Abe, and the people of the present, confident in the continuity of their microcosm, are to be scorned. This author's vision may have been enhanced by a sense of alienation from his immediate present. Also monumental in his work is an eager confrontation with the great borderlines between life and death, between illusion and reality, and between the inner and outer worlds of human beings.

—Frank H. Tucker

ANDREVON, Jean-Pierre (1937—). French. "Observation of Quadragnes," in *View from Another Shore*, edited by Franz Rottensteiner, 1973; "The Time of the Big Sleep," in *A Shocking Thing*, edited by Damon Knight, 1974.

\* \* \*

Jean-Pierre Andreon is perhaps the best-known French SF writer, though he became a professional fairly late (31). He quickly became the most prolific contributor to the main Parisian SF monthly, *Fiction*, both as a critic and short-story writer, introducing political views in both fields, to the delight of progressive readers and the (very vocal) fury of the more conventional ones. He was one of the first to explode the taboos of sex ("Observation of Quadragnes") as well as death (*Le*

*Reflux de la Nuit*), to strip the glamour from war on the earth ("Retour à Broux") as well as in space (*La Guerre des Gruulls*), and to denounce the excesses of technology. In his anthologies—the 3 volumes of *Retour à la Terre* (whose title clearly express the intention of re-focussing SF on the problems of our world), the 2 volumes of *Compagnons en Terre Etrangère*—he rallied round him a whole school of young writers who shared his preoccupation with imminent perils (pollution, overpopulation, the misuse of nuclear energy, social and international conflicts).

Andrevon should not, however, be considered as a pure son of the protest movement of 1968: contrary to many of his followers who tended to reduce their SF to ideological tracts, and whose readership consequently dwindled very fast, he never forgot that he was expected to tell stories, and to tell them well. In his first novel, *Les Hommes-Machines contre Gandahar*—a sort of *Great Dictator* of the future, with a strange time-controlling creature thrown in as game-master—the libertarian message and the appeal of mystery and adventure were already cleverly blended. Putting to use both his sense of everyday dialogue (to the inclusion of slang and vulgarisms) and the eye of the painter that he also is, he unites truly poetic visions with the most implacable realism, which he sometimes tempers with fantasy and humour, as in *L'Immeuble d'en face* and *Hôpital Nord* (both recently published in collaboration with Philippe Cousin, a disciple with a strong personality of his own).

Though he has kept exploring his main obsessions (death and sex in *Il Faudra Bien Se Résoudre à Mourir Seul*) and concerns (the follies of mankind and the endangered future of the planet in *Paysages de Mort* and *Dans les Décors Truqués*; more particularly the nuclear peril in *Neutron*), Andreon has achieved a great diversity of themes and approaches: his latest anthology, *L'Oreille contre les Murs*, is an attempt to launch a modern fantastic school; *Le Travail du Furet à l'Intérieur du Pouliailler*, though about overpopulation, is in the form a thriller; *Le Désert du Monde* and *Cauchemar . . . Cauchemars* have something of Philip K. Dick's interplay of reality and Illusion; *La Fée et le Géomètre* shows that writing for young people does not entail self-censorship of one's convictions.

The latter book is indeed one of Andreon's finest expressions of his ideology, which has shifted from Trotskyist marxism to ecology—harmony between various social groups being now subject in his opinion to saner relationships between man and his environment. The main short-coming that he has been reproached with is that, because of the huge gap between his views of the ideal future and the present evils he denounces, he has failed to imagine any acceptable transition: in his novel *Le Temps des Grandes Chasses* an idyllic society emerges only after world-wide disaster; and in *Le Monde Enfin* our planet finds beauty and balance again at the cost of . . . the disappearance of humanity!

Yet, by the abundance and variety of his production, his rich characterization, and the wide resources of his style as well as by the warning function he often gives his fiction, Andreon's stature in French SF can be compared to John Brunner's in Britain.

—George W. Barlow

BARJAVEL, René (1911—). French. *Ashes, Ashes*, 1967; *Future Times Three*, 1970; *The Ice People*, 1970; *The Immortals*, 1974.

\* \* \*

René Barjavel's science-fiction work contrasts pastoral utopias full of love with war-torn dystopias full of distrust. Although *Le Diable l'Emporte*, *Colomb de la Lune*, and *L'Homme Forte* have not been translated, *Ashes, Ashes*, *Future Times Three*, *The Ice People*, and *The Immortals*, available in English, are passionately anti-war, erotic, and satiric, relating vividly penned horrors and sentimental romance.

Although Barjavel is a screenwriter, journalist, and writer of romantic novels, *Future Times Three* is typical science fiction, dealing with the paradoxes and dangers of time travel. Playful escapades in the near future and malicious forays into the 19th century echo Wells's *Invisible Man*, and the specialized races of 100,000 A.D. follow Stapledon. Exploring the future, mathematician and physicist brood over questions of God and causality. This episodic novel declares—like Faust—that man cannot safely extend beyond God.

In traveling to 2052, St. Menoux learns the fate of the survivors of *Ashes, Ashes*, in which some inexplicable sunspot phenomenon cuts off electricity and the world goes mad. Fire and bloodshed purge a decadent technological society on the verge of all-out war. As in the earlier novel, the pure love of two young people provides hope. The heroes, however, are ruthless killers who fight their way into the country to found a pastoral society where books and inventions are forbidden.

One of the numerous Swiftian sallies of *Ashes, Ashes* explains the system of freezing ancestors. In *The Ice People* South Pole explorers find two gorgeous bodies from 900,000 years earlier, obviously remnants of a vastly advanced society destroyed by atomicholocaust. Unfrozen, Elea transmits her memories of her perfect love with Paikan and her selection as the mate to be preserved for the mastermind, Coban. This Romeo and Juliet tale is set against political turmoil of past and present. Only a coalition of scientists and students might save the world, though Elea and Paikan are destroyed.

Using the actual backdrop and leaders of his own time, *The Immortals* examines the frightening long-range political effects of a drug that defeat death and disease. Since immortality is contagious, all those involved in research have been isolated on an Aleutian paradise. They are, however, human time bombs doomed to annihilation by world powers when scientists learn there is nowhere for man in space. Although pessimistic, Barjavel didactically asserts the values of love and peace.

—Mary S. Weinkauff

---

**BELYAEV, Aleksandr** (1884-1942). Russian. *The Amphibian*, n.d.; *The Struggle in Space*, 1965; *Professor Dowell's Head*, 1980.

\* \* \*

Aleksandr Belyaev's first SF stories were published in adventure journals in 1925 and his first book in 1926. He wrote about 30 SF stories, about 20 novels, and a dozen articles or prefaces (e.g., to Jack London's novels) which make of him the first penetrating Russian SF critic. He used the breathtaking Vernean adventure plot or the current detective-thriller-SF (from Wells, London, Renard, Burroughs or A. Tolstoy) with an isolated and romantically alienated hero, either a scientist with humanistic ideals, a biologically modified man who is a naive child of nature (Ichthyander in his most popular novel, *The Amphibian Man*, or Ariel in the novel of the same title), or quite openly an artist (such as Presto in the two variant novels

*The Man Who Lost His Face* and *The Man Who Found His Face*). This bearer of the novum and of the desire for freedom is opposed to and hounded by the cruel power of wicked scientists and financiers; most interestingly, he is at the center of an extreme situation or novum validated by a bold scientific technique. This is usually biological adaptation, including the changing use of the senses, and, most prominently, a sundering of brain from body as in *Professor Dowell's Head* (much superior to Renard's *New Bodies for Old*) or various, often humorous and folktale-like, scientific inventions in the "Professor Wagner" cycle. Such works are imbued with an aching lyricism and a vibrant humanistic vehemence. But often Belyaev's hero triumphs thanks to an essentially fairytale metamorphosis that allows him to vanquish physical gravity and social injustice. The black-and-white opposition of his threatened hero to a grotesque capitalist environment becomes then a form of escapism into a wicked Ruritania.

In the late 1920's and early 1930's Belyaev's SF was interrupted by a campaign against the genre. From 1934 he largely shifted his focus to short-range technological anticipation and (more interestingly) to interplanetary work and struggles, domesticating the notions of Tsiolkovsky and early Soviet rocket experimenters. For all his shortcomings, Belyaev's basic concern with human metamorphosis striving for freedom and the external resistance and inner anxieties it provokes have not only made of him at least the equal of any interwar German, French, or US SF writer, and a lasting influence in Russia, but also an author who remains of interest today.

---

**BORGES, Jorge Luis** (1899— ). Argentine. *Ficciones*, 1962; *Labyrinths*, 1962; *The Aleph and Other Stories 1933-1969*, 1970; *The Book of Sand*, 1977.

\* \* \*

Jorge Luis Borges has been called "the greatest living writer in the Spanish language today." His literary achievements secured him a post as director of the Argentine National Library in 1955, though blindness obliged him to retire in 1973.

Primarily a miniaturist and poet, Borges has been attracted throughout his long career by themes which transcend our normal reality, and many of his short stories are frankly science-fictional. In "Tlön, Uqbar, Orbis Tertius" he describes how our Earth is gradually being taken over by another, invented version of the world. His pitiable title character in "Funes the Memorioso" is endowed with a memory which will not permit him to forget anything, yet this talent cripples him as a person. "Dr. Brodie's Report" gives an account of a visit to an imaginary African tribe halfway between apes and humans, who possess a religion, the concept of poetry, and a rudimentary ability to foretell the future. "The Aleph" is a point within which the whole world, past and future, can be seen. "The Zahir" is a satirical variation on a similar motif: an object which obsesses its beholder, sometimes a man or a tiger, but at present a common coin. Paradoxes connected with infinity abound in Borges's work, for instance, in *The Library of Babel*, which is an endless store of incomprehensible books, and *The Book of Sand*, which appears to be a sort of scripture, but contains literally countless leaves. He has also long been fascinated by fabulous animals, and indeed devoted an entire volume to the subject, a sort of

bestiary of the nonexistent: *The Book of Imaginary Beings* (with Margarita Guerrero).

It is known that Borges has occasionally been influenced by authors of SF or near-SF, including Poe and Lovecraft; in turn his elegant economy of style and his ability to compress long complex arguments into a few pages have earned him the admiration of many younger SF writers, who not infrequently imitate him, though with scant success.

—John Brunner

---

**BOULLE, Pierre** (1912—). French. *Planet of the Apes*, 1963 (as *The Monkey Planet*, 1964); *Garden on the Moon*, 1964; *Time Out of Mind and Other Stories*, 1966; *Because It Is Absurd* (stories), 1971; *Desperate Games*, 1973; *The Marvellous Palace and Other Stories*, 1977; *The Good Leviathan*, 1979; *The Whale of the Victoria Cross*, 1983.

\* \* \*

Like the venerable minister-priest of the Religion of Doubt who is the narrator of the six “*histoires perides*” that make up *The Marvelous Palace and Other Stories*, Pierre Boulle has viewed his main function throughout his prolific and varied career as his duty “to arouse curiosity by the prospect of an enigma.” In Boulle’s wryly laconic fables, the enigmatic takes many forms: in *The Good Leviathan*, an oil supertanker capable of miraculous cures; in *The Whale of the Victoria Cross*, another kind of good leviathan, one that sacrifices itself to save its friends on the British fleet during the Falklands conflict; in “The Heart of the Galaxy” (*Because It Is Absurd*), a message from the stars, engendered by an immense expenditure of energy, which—much to the consternation of the scientists on earth who decipher it—turns out to be an advertising slogan; in *Desperate Games* a world government of Nobel Prize-winning scientists who cure all of mankind’s social ills but must devise destructive war games to prevent the universal ennui that sets in when man is left with nothing to struggle against. Boulle’s style is too arch and his stance too knowing for his science-fiction tales to be called cautionary, just as his espionage stories set in the Far East are too coolly ironic to be labeled merely escapist thrillers: even a casual reader must have anticipated that the astronaut escaping from *Planet of the Apes*—undoubtedly Boulle’s best-known SF work and the basis for the popular film series—was returning to an Earth in which a similar evolutionary movement had taken its inevitable course.

Most recently, Boulle’s double-edged, deadpan observance of man’s social and political foibles has even taken him to the Throne of Heaven itself. When Boulle, in *Trouble in Paradise*, has the Virgin Mary coming back to Earth to help patch up a quarrel between the bickering members of the Holy Trinity, only to become a media celebrity and prime minister of France, her eventual triumphant ascension back to Paradise as Supreme Goddess could be construed as either a pro- or anti-feminist statement. In all of Boulle’s work, however, the tone may be cynical or obscure but it is rarely morose, since Boulle remains detached from the delusions, vanities, and follies of technocratic man confronting the remorselessness of an implacable Nature and the unchangingness of his own proud and enigmatic heart.

—Kenneth Jurkiewicz

**BOYE, Karin** (1900–41). Swedish. *Kalloccain*, 1966.

\* \* \*

Karin Boye was a distinguished Swedish poet and a disciple of the radical French pacifist Henri Barbusse. She committed suicide a year after the publication of *Kalloccain* in 1940. She was one of those intellectuals horrified by the rise of Nazism, and she returned disappointed from a journey to the Soviet Union, a country she had considered a hope for the future. Her anxieties and her experiences with Nazism and Stalinism are clearly reflected in her novel, one of the few dystopias written by a woman. Her work uncannily anticipates many of the black features that Orwell made known in *Nineteen Eighty-Four*, in particular the total surveillance of citizens by spy-lenses in their private homes, the concept of a thought police and thought crime, and the thoroughgoing division of the world into (two) big states which are so antagonistic to each other that they deny their enemy the common human ancestry. Leo Kall, a chemist and inventor of the eponymous truth serum *Kalloccain*, is a citizen of the “world state” in the 21st century—a “fellow soldier,” for the country’s organization is thoroughly militaristic. The police are omnipresent, and citizens are urged to denounce their friends and relatives and to join in communal “hate sessions.” The fear of spies is so great that even simple geographical data are treated as secrets of state. Leo Kall is deeply distrustful of his immediate superior Edo Rissen, one of the few human beings who have kept their individualism, and he suspects that his wife is unfaithful to him. Knowing very well that under the influence of his new drug all are equally guilty, Kall decides to attack and to denounce Rissen, who is promptly sentenced. In the end the “world state” is invaded by the “universal state,” which is, we may assume, different only by name, and Kall serves his new masters with equal zeal. The psychological conflicts of the hero are depicted powerfully, and the novel reflects a deep fear of the rise of totalitarianism and an all-powerful state that inexorably crushes the individual.

—Franz Rottensteiner

---

**BRAUN, Johanna** (1929—), and **Günter** (1928—). East German. *The Great Magician’s Error*, 1972; *Uncanny Phenomena on Omega 11*, 1974; *The Mistake Factor* (stories), 1975; *Conviva Ludibundus*, 1978; *The Utofant: A Periodical from the Third Millennium Found in the Future*, 1981; *The Spherico-Transcendental Design*, 1983; *The Inaudible Sounds*, 1984.

\* \* \*

Johanna and Günter Braun, a married couple, were newspaper reporters and editors before they turned free-lance writers. They published 9 juvenile adventures, historical novels, TV plays, and experimental prose such as *Eve and the New Adam* touching on equal rights for women and sparking off much public discussion. At the beginning of the 1960’s they entered into full possession of their narrative voice—ironical, lyrically oriented toward characterization rather than plot, and strongly concerned with the integrity of people enmeshed into politics and economics. *An Objective Angel*, for instance, deals with the societal and personal implications of modern technology in contemporary East Germany. In the 1970’s they published four SF books.

*The Great Magician's Error*, a juvenile novel, is a folktale-like parable on a country ruled by a Magician whose power is founded on the soporific effects of a special pear, in its natural state both inebriating and stimulating. Helped by a snake-like girl, the young hero, drawn to pranks and interesting knowledge rather than obedience, manages to defeat the despotic rule, in an analogy to Stalinism's rule and fall. In their collection of stories, *The Mistake Factor*, the central conflict is between critical socialist humanism and technocratic self-satisfaction. The collection contains at least three small masterpieces. In "Choosing Astronauts" the earthy and quirky independence of Merkur and Elektra (heroes of the second novel) amounts to an *exemplum* not only for the fitness of astronauts but of people in general to cohabit. "The Jingling of Caesar's Cowbells," told by an involved narrator changing her opinion, is a tour de force of economy and clarity, successfully blending the East European "production tale" with understated sexiness and graceful wit. Best of all is the title story: in a utopian future the narrator is sent to investigate the malfunctioning of the central computer. The setting is an inertia-inducing centre near the Bertolt Brecht Lake with rejuvenating qualities, and the story opposes the rejuvenation associated with a critical and anti-bureaucratic marxism to the huge but tired technocracy which concealed the malfunctioning because the machine had become a soothing idol.

In the second novel, *Uncanny Phenomena on Omega 11*, the erotic and cognitive interplay between the playful Merkur and the serious Elektra, from grudging mutual acceptance through connubial bliss and the ups and downs of team-work to final growing apart, possesses a gentle power. The adventure-puzzle on a foreign planet with a treacherous exploiting race, whom our heroes circumvent by brain not brawn, suggests the uses of playfulness fused with work as antidote to class isolation and specialization. *Conviva Ludibundus* is named after a marine bio-electronic life-form which is the indispensable link in the production of a mussel containing all the nutrients necessary for a future humanity. Instead of the gardener-like encouragement by the narrator, the *Conviva* is subjected to rationalization and enclosures by his successor, a typical hardworking, unimaginative, upwardly mobile, pompous scientist. His hunt for the *Conviva* in a super-technological Vernean vehicle manages, by misusing scraps of knowledge, to turn it for a time into the producer of uneatable giant mussels and of unnecessary data from the seabed. A global catastrophe is only averted by the narrator's girlfriend who unwittingly deprograms the *Conviva* (a one-celled being which can come together in many shapes) by leading it into mobile self-constructs and aquatic ballet. This key scene of the novel is not unworthy of comparison with some of Lem's *Solaris*. The upshot is that art is the only antidote to elitist power and technocratic breakdown: a darker and weightier conclusion in a text with a more powerful antagonist, putting up stronger obstacles to utopian ethics. But the satire remains accompanied by comedy and wit, by the constant disrespectful and funny inversion of received authority.

In the 1980's, the Brauns have, keeping to their constant horizons, become more embattled, faced with what they perceive as a stronger bureaucratic or "cold current" in the GDR (East Germany). Among other things, they have left the official GDR Union of Writers. This attitude, and the attendant pragmatic pressures on them as free-lance writers, has resulted in a genre diversification of their writings. Outside of SF this has led to some brilliant works of travelog, Hoffmannesque fantasy, essays, a fictional biography of Socrates as parable on the difficulties of an independent and disrespectful thinker, and even a book of witty culinary recipes crossbred with erotics. In

SF, the result has been a number of short stories published in various East and West German anthologies, and the books *The Utofant: A Periodical from the Third Millennium Found in the Future* (1981), *The Spherico-Transcendental Design* (1983), and *The Inaudible Sounds* (1984)—the two latter, just as the Socrates book, published only in West Germany. These are more fragmentary and as a rule briefer than their earlier writings, but just as elegant and ironical. Thus, increasingly dark and forlorn, the Brauns' playful cognizing is part of the "warm current" in socialism, colliding with the cold one. Their artful manipulation of narrative voices, their commitment to the feminine principle amusingly associated with sexual emotions, productive self-management, and critical intelligence place them at the pivot of East German SF, and on the map of the best world SF.

**BRYUSOV, Valery** (1873-1924). Russian. *The Republic of the Southern Cross and Other Stories*, 1918.

\* \* \*

Valery Bryusov, from a rich merchant family, became a leader of Russian Symbolist poetry, publishing a dozen books of formidably erudite and polished verse, as well as stories, plays, brilliant verse translations from many languages (including the complete poetry of Poe), and interesting criticism of poetry. His esoteric disdain for the multitude changed after the 1904-05 revolution into a growing acceptance of social responsibility and sympathy for the revolutionary destruction of the "ugly and shameful" capitalist order. He thus became one of the few prominent non-Marxists to take an active part in Soviet cultural life, and in 1920 even joined the communist party.

Bryusov had a long-standing interest in a "scientific poetry" akin to SF. Two of his major preoccupations were more obviously SF. From the 1890's he was haunted by the fall of world civilization, envisioned as a giant symbolic city. In his play *Youth* (1904) a revolt of youth shatters the glass dome that bars the city from sunshine and open space; the revolt both seeks liberation and exposes the city to the risk of death (see also his story "The Last Martyrs"). Written after the defeat of the 1905 revolution, his Poesque story "The Republic of the Southern Cross" is frankly dystopian: an enclosed industrial city on the South Pole falls prey to an epidemic leading the afflicted to do the opposite from what they wish to do; a resolute bourgeois minority fighting for order is overwhelmed by the brutalized inhabitants. Raskolnikov's dream at the end of *Crime and Punishment* blends here with a parable on the great social convulsions of our century. Bryusov's second SF theme is one of cosmic contacts, treated both in his poetry and in a number of unfinished stories and plays, and influenced by the utopian philosopher Fyodorov and his disciple Tsiolkovsky, by Poe, Wells, and most of all Flammarion; as in this last writer such contacts often involved a cometary world. His old theme of catastrophe and a distant presentiment of a possible new world lent themselves well to the widespread post-1917 equation of the social revolution with man's leap into interplanetary space. Bryusov thus became the link between, on the one hand, the tradition of Russian utopianism, 19th-century European SF, and philosophic speculation leading from Leibniz to Spengler, and, on the other, early Soviet "Cosmist" poetry and SF. Bryusov's peculiar double horizon, embracing both dystopia

and utopia is his greatest strength: he clearly managed to influence both Zamyatin and Mayakovsky, and, through them as well as directly, most prewar Russian SF.

---

**BULGAKOV, Mikhail** (1891-1940). Russian. *Heart of a Dog*, 1968; *Diaboliad and Other Stories*, 1972.

\* \* \*

"The stars will remain when the shadows of our presence and our deeds have vanished from the earth. There is no man who does not know that. Why, then, will we not turn our eyes towards the stars?" This is the leitmotiv of Mikhail Bulgakov's science fiction: the nature of a true relationship between a Kantian universe and a human existence of thought and action.

Bulgakov's early science-fiction stories established an allegoric parallel between scientific discovery and social revolution, using every technique from slapstick comedy to black humor and horror, to show the absurdity and danger of trying to impose human purposes on reality. In "The Fatal Eggs" (*Diaboliad*), based on H.G. Wells's *The Food of the Gods*, mammoth artificially hatched serpents almost devour Moscow. In "The Crimson Island"—"Jules Verne translated into Aesopian"—an involuted rebellion results in nothing but a drunken revel and a telegram to the West: "Go (indecipherable) your (indecipherable) mother."

The novella *Heart of a Dog* exhibits Bulgakov's characteristic literary method: a fantastic realism that is a combination of grotesque action and a naturalistic background, with a satiric intent, serving a philosophical idea. It concerns a Moscow professor who transforms a dog into a man in a rejuvenation experiment. The identification of professor and Lenin, rejuvenation and revolution is implicit. Within a week, the new creation has a vocabulary of "every known Russian swearword"; he can't button his fly, eats toothpaste, and has fleas: he is immediately made a Commissar. His mature virtues include greed, viciousness, and "cosmic stupidity." Disgusted, the professor curses the attempt to substitute the artificial for the authentic, whether dog for man or dogma for life, and reverses the experiment.

Bulgakov's science-fiction plays range from burlesque to near-tragedy, but all deal with the ontological theme. In *Bliss* a wondrous future utopia is revealed to be inadequate and boring compared to the mystery of reality and the adventure of living. In *Ivan Vasilievich Ivan the Terrible's* farcical misadventures in modern Moscow revolve around a confusion of definitions and roles with actualities. The best of the type, however, both in character development and seriousness of thought, is the tragicomedy *Adam and Eve*. In a war-devastated Leningrad, a few surviving men and one woman must choose between reality and ideology, represented by the pacifist Yefrosimov, whose anti-gas invention saved them, and Adam Krasovsky, who wants to risk annihilation for the sake of Communism. In the end, Eve chooses Yefrosimov for her mate because, as she tells Adam, "the forest and the singing of the birds, and the rainbow, this is real, but you with your frenzied cries are unreal."

*The Master and Margarita* is Bulgakov's masterpiece of indefinable genre and indeterminate meaning, wherein Satan visits Moscow, punishing evil, driving rationalists insane, and "putting the fear of God" into atheists. In it, the science-fiction

theme converges with all of Bulgakov's other themes, styles, and techniques, and is fully realized. In *The Master and Margarita* reality is infinite, eternal, and transcendent; time and space are relative; man is immortal. Living according to the demands of universal truth is a moral duty for which man is held accountable. "Cowardice is the worst sin of all" for a character like Pontius Pilate whose "mind is too closed" and whose life is too cramped." Yet man's denial and betrayal of reality cannot alter it. "All will be as it should," the devil promises; "that is how the world is made."

By his science-fiction model of a surreal method to present a multi-dimensional universe, and by the example of his artistic courage, Bulgakov obliged Russian writers to contemplate "the shadows of man's presence" from the perspective of the stars and therefore "to a complete truth of thought and word."

—Jana I. Tuzar

---

**BUZZATI, Dino** (1906-72). Italian. *Larger Than Life*, 1962; *Catastrophe* (stories), 1965.

\* \* \*

Although Dino Buzzati became first widely known with his novel *The Tartar Steppe* (1940), his real strength is in his short stories, concise, absurd, wonderful fables and parables of modern existence, often fantasies. Buzzati has frequently been compared to Kafka, and although there is a certain similarity in the mysteries both writers touch upon, their differences are quite marked, both in style and rhythm and their manner of storytelling.

Actually, Buzzati is much more a fantasist than Kafka, showing the influences of E.T.A. Hoffmann and Gogol, as well as of fairy and folk tales. Often his stories are allegorical. This is marked in his brief novel *The Secret of the Old Forest* which revolves around the conflict between nature and civilization; the spirits of an old forest, untouched by human hands for centuries, wage a war against the greedy owner who starts exploiting the old trees. The absurdity of existence and the vanity of human ambitions is the subject of Buzzati's best novel, *The Tartar Steppe*. Isolated in a lonely fortress at the border of a big desert, engaging in senseless military drill, the commander of the small forces garrisoned in the fort spends his whole life waiting for an invasion that never comes, and when rumors seem to indicate that the dreaded onslaught of the Tartars may come, he is already an old man, falls ill and dies. An obsessive concern with military duties and a senseless waiting for an event that may never come, is turned into parable of the futility of human existence when all aspirations for transcendent meaning are destroyed by accidental death. Compared to this puzzling and disturbing novel, Buzzati's only SF novel proper, *Larger Than Life*, is an uninspired computer story; a big computer is programmed with the personality of a woman, and this mawkish story is not better than countless other SF novels of big computers.

Generally, Buzzati's few genuine SF stories tend to be weak and unoriginal, lacking the power of his fantastic stories. There are a few tales of time travel, the atomic bomb, the end of the world, and flying saucers. Much more impressive are his stories that blend the everyday and the fantastic in an intricate, inseparable manner, and are told with the economy and eye for factual details of the journalist that Buzzati was. Buzzati

declared: "...fantasy should be as close as possible to journalism. The right word is not 'banalising,' although in fact a little of this is involved. Rather, I mean that the effectiveness of a fantastic story will depend on its being told in the most simple and practical terms." Something that would have been applauded by Edmund Wilson. By quite simple means, in elegantly turned stories, Buzzati manages to convey alternatively a sense of wonder, horror, the absurdity of existence, the bewildering complexity of modern society, and the inexplicable workings of fate. Strive as they might, his characters have a particular destiny waiting for them from which they cannot escape. Often their whole efforts prove to be in vain, and a long wait or a long search turns out ultimately to be a waste of their lives, as in "The Colomber" or "The Walls of Anagoor." Buzzati's most impressive story is probably "The Slaying of the Dragon"—the story of a hunt for a murderous monster, turned upside down. There the human hunters show only base motives, vanity and greed, while the dragon alone exhibits courage, compassion, and dignity. "Seven Floors" is another parable of modern existence, the story of a hospital, which the patients enter in perfectly good health at the seventh floor, and are gradually moved down to the basement where they arrive terminally ill.

Buzzati's stories are characterized by a search for meaning; they express the existential fears of modern man and interpret the anxieties of modern civilization, explore the labyrinthine existence of cities and the threats of machinery. Their dreamlike mood is often underpinned by an ironical sense of humor and they exhibit a deep feeling for his fellow-sufferers. They show the absurdity of existence, but the hope for salvation is nevertheless a redeeming feature in them; for all their sometimes ferocious criticism of human beings they do not condemn but leave open an avenue of hope.

—Franz Rottensteiner

---

**CALVINO, Italo** (1923-1985). Italian. *Cosmicomics* (stories), 1968; *T Zero*, 1969 (as *Time and the Hunter*, 1970); *The Watchers and Other Stories*, 1971; *Invisible Cities*, 1974; *The Castle of Crossed Destinies*, 1977.

\* \* \*

Italo Calvino is perhaps better known as a writer of fantasy/surreal/experimental fiction than as the creator of science fiction. Yet at some points these two branches of fiction intersect with interesting results. His first science-fiction work, *Cosmicomics*, considers the origin of the universe, the development of life, and the advance of human consciousness and technology—all from the perspective of the "cell/narrator," Qfwfq, who has been present as an observer in one form or another from the beginning of time. This collection of vignettes pre-dates Douglas Adams's *Hitchhiker's Guide to the Galaxy* by many years and takes the same wry perspective on the struggle to survive on the planet Earth and in the universe. Calvino uses the science-fiction format as his vehicle for observing human foibles, in much the same way that any writer of science fiction places "human" protagonists in alternate universes and times to explore how any creature, human or otherwise, handles challenges.

*T Zero* considers the meaning of time, space, motion, and values. In this episodic series Calvino investigates such

polarities as unity and multiplicity, past and present, chaos and order, probability and certainty. As in most of his work, Calvino experiments as much with narrative form as an expression of observed "reality" as he does with creating entertaining characters and plots.

Calvino also makes use of arcane subjects in order to explore the nature of the universe. For example, he patterns the events in *The Castle of Crossed Destinies* on the array of cards in the Tarot pack. The cards and the things they stand for shift meaning as he sets them in different time frames: one grouping shows us such figures as Faust, Parsifal, and Oedipus from the perspective of a medieval castle; another examines them as they would manifest themselves in a more modern setting.

Stylistically similar is *Invisible Cities* in which an imaginary Marco Polo meets with an improbable Kublai Khan to describe the cities of his empire. Each chapter explores a different city in this imaginary world and provides accompanying dialogues between Polo and the Khan.

Calvino is rewarding to read, for his work not only challenges our assumptions about time, ethics, and perception but also forces us to re-examine the comfortable methods we generally employ to avoid dealing with paradox. He explores these topics thematically at the same time that he makes conscious efforts to extend and distort the boundaries of conventional fiction. His fiction has as much to do with the structure and nature of fiction itself as it does with characters and plot. For this reason, Calvino can be grouped with such writers of fantasy as Jorge Luis Borges, Umberto Eco, Donald Barthelme, and Robert Coover, all of whom want their readers to be aware of what it means to be a reader, a participant in their fictions.

—Melissa E. Barth

---

**CAPEK, Karel** (1890-1938). Czech. Fiction—*Krakatit*, 1925 (as *An Atomic Fantasy*, 1948); *The Absolute at Large*, 1927; *War with the Newts*, 1937. Plays—*R.U.R.* (*Rossum's Universal Robots*), 1923; *And So Ad Infinitum* (*The Life of the Insects*), 1923 (as *The Insect Play*, 1923; as *The World We Live In*, 1933); *The Macropulos Secret*, 1925; *Adam the Creator*, 1929; *Power and Glory*, 1937.

\* \* \*

Karel Capek was a prolific author of stories, essays, novels, travelogues, plays, and newspaper articles. The word "robot" was coined by his brother Josef (his collaborator in some works), but its blend of psycho-physiology and politics expresses precisely Karel's preoccupation with contemporary inhumanity, opposing Natural Man to Unnatural Pseudo-Man, a manlike, reasoning, but unfeeling being associated with capitalist technology and the social extremes of upper-class tycoon and working-class multitude. Capek's heroes range from small employees and craftsmen to doctors and deviant scientists, and his most stubborn values arise from peasant confidence in traditional things and relationships. In the plays, this is openly expressed by his small people and ideological arbiters, such as Nana in *R.U.R.* or Kristina in *The Makropoulos Secret*, while in the novels it is implied by key actions such as the final return to normality in *Krakatit* and *The Absolute at Large*. Yet Capek was also spellbound and terrified by the workers' world of factories and the power of capitalists (e.g., Bondy from both the latter novel and *War with the Newts*).

In Capek's first SF phase, after World War I, the tension between the little people (the audience he was writing for) and the catastrophic forces of technology and violence is largely vitiated by the ambiguity between a menace to man and to the middle class: does it arise from aliens created by the large industry, its capitalists and engineers, or from the workers? The robots of *R.U.R.*, synthetic androids outwardly like men, are mass-produced to be "workers with the minimum amount of requirements," i.e. without the non-exploitable emotions. In their first story, "System" (1908), the Capeks had shown a workers' revolt in such circumstances; the machine-men of *R.U.R.* are technological stand-ins for workers (and for Wells's Morlocks) but also, simultaneously, inhuman aliens "without history." Their creation doesn't lead to Domin's engineering utopia with Nietzschean supermen but to genocidal revolt. Yet during the play they grow more like a new human order than like inhuman aliens, more workers than machines; reacquiring feelings, they usher in a new cycle of creation. This oscillation, parallel to one between psychological and collective drama, has dated *R.U.R.* This holds even more strongly for *Adam the Creator* and *The Makropoulos Secret* (about the elixir of longevity). In *And So Ad Infinitum* the flighty erotics of upper-class "golden youth," the acquisitive sentimentalities of the petty bourgeoisie, and the militarism and deathlust racism of incipient fascism are personified as insects in a bitter satire, Capek's best stage play.

Capek's SF strength lies in his novels. *The Absolute at Large* presents another supposedly utopian but destructive invention: the Absolute or God, mass-produced as a by-product of atomic fission in "karburators" that supply cheap energy. The novel passes in sarcastic review its abuses by church and state, corporations and individuals, academics and journalists: both the economy and personal relations collapse. Absolutized sectarian and national fanaticism leads to the "Greatest War," which peters out only when all "atomotors" have been destroyed along with most people. Yet it isn't clear why the Absolute, a "mystical Communism," must bend itself to capitalist economy and competitive psychology, or work disparately in things (overpopulation of industrial goods only) and in people (destructiveness matching the overpopulation). The power unleashed is simply a chaotic magnification of acquisitive economics and psychology. This makes for brilliant if spotty social satire, in which the little people outlast the highminded idea, but hardly for consistent SF.

In *Krakatit* the naive genius who pierces the secret of atomic fission finds a parallel "destructive chemistry" in Dostoevskian fevered nightmares, dissociations of memory, and explosive human encounters, and develops from "value-free" science to painful recognition of the primacy and dangers of human relationships. Capek integrated here popular literature—detection mystery and epic adventure from Homer through the folktale to pulp thrillers—into poetic and committed modern SF. The love and heroism of sensational melodrama and the counter-creation of the mad-scientist tradition are balanced by a sympathetic, suffering, and relatively complex hero, who rejects a series of erotic-cum-political temptations—not only the established class and new personal power but also the idyllic retreat. He is left with a resolve to achieve useful warmth instead of destructive explosions, and emerges from the fog of yearning into the clarity of moderation. Though the novel doesn't quite fuse realism and allegory, ethical moderation and folktale certainties, it largely succeeds in transcending the opposition between scientific progress and human happiness. For the first and last time in Capek's SF, a believable hero fights back successfully at destructive forces within himself and society.

Capek's second phase comprises some minor, marginally SF stories, *War with the Newts*, and one play. The rise of Nazism dispelled his illusions of the little man's instinctual rightness and the relativity of truth. Instead of satirizing the intellect, he wrote sharply against irrationalism, "be it the cult of will, of the soil, of the subconscious, of the mass instincts, or of the violence of the powerful." The pseudo-human becomes clearly evil when the Salamanders become analogous to the Nazi aggressors. Their rise is interwoven with a satire on the illusion industries which screen biological and social reality from mankind—the exotic and juvenile adventure romance, sensational tabloid newspaper, Hollywood movies, pseudo-scientific polls and interviews in newspapers. Scientists and academics are as timid and ideologically limited as the public at large, but the real villains are the capitalists who finance the menace through the Salamander Syndicate—an industrial utopianism satirized in the minutes of its meeting. The Salamanders, who began as exotic pets, become an "extremely cheap labor force" parallel to the transformation of competitive merchant-buccaneering into a global exploitative corporation aiming at a new Atlantis—which will end as Atlantis did. An appendix on the Salamander's sexual life shows that their "Collective Male" horde is capable of politics and technics but not of real sociability: the Syndicate is the greatest illusion of them all. Progressing to a powerful alternate society, learning well mankind's combination of slavery and stock-market, aggression and ideological propaganda, they begin their assault. Capek's satire is here most bitter, topical, and precise. Startlingly, even his beloved small people are found guilty of complacency as continents crumble around them.

The satire of literary, journalistic, and essayistic forms in this novel is also a critique of SF. The history of the Salamanders echoes Wells's *Island of Dr. Moreau*, Conan Doyle's *Lost World*, and the animal fable; the global overview latches onto Wells's later SF and France's *Penguin Island*; it ends with Wellsian havoc-wreaking aliens—but also with an open question, much superior to ordinary SF: "No cosmic catastrophes, nothing but state, official, economic, and other causes . . ." The menace could have been stopped—if people had organized to fight it, if "All the industries. All the banks. All the different states" had not financed "this End of the World." Such writing makes of Capek not only the pioneer of all anti-fascist and anti-militarist SF but also (together with Zamyatin) the most significant SF writer between the World Wars. True, *War with the Newts* didn't quite manage to overcome this ambiguity: the Salamanders are at the beginning a wronged inferior race and yet grow into an embodiment of both the Nazis and robotized masses. Russia, moreover, is presented as a Tsarist state: Capek couldn't deal with socialism or any positive radical novelty. He dealt in catastrophes, and concentrated his fire almost entirely on bourgeois society. Conversely, such a love-hate relationship led the communist bureaucracy in Czechoslovakia to neglect him in the early 1950's, though he has since been rehabilitated.

Capek's evolution is not simple. One of his best works, *Krakatit*, is early, and his final SF play, *Power and Glory*—a critique of fascism, militarism, and subservient medicine—is second rate. But in a few works he left a precious heritage. He—rather than Burroughs or Gernsback—is the missing link between Wells and a literature which will be both entertaining (which means popular) and cognitively (which means also formally) avant garde. He infused the legacy of the adventure novel and melodramatic thriller, French and British SF, and German fantasy with the prospects of modern poetry, painting, and movies as well as with an eager and constant interest in societal relationships, in natural and physical sciences, and

above all in the richly humorous and idiomatic language of the street and the little people. In that way, he is the most "American" of the often elitist European SF writers. And yet he is also not only intensely Czech, but a "European local patriot" for whom Europe meant culture and humanism; when they were betrayed, the Salamanders—read fascists—had arrived.

—Darko Suvin

---

**FRANKE, Herbert W.** (1927—). Austrian. *The Orchid Cage*, 1973; *Zone Null*, 1974.

\* \* \*

Writer, scientist, spelunker, computer expert, and academic, Herbert W. Franke writes novels, short stories, and works on science for laymen which revolve around computers, information science, and the potentialities of psychological manipulation through electronic sensory stimulation. His earlier novels emphasized dominant military-industrial systems allied to conformist drug cultures, radioactive desolations, the decadent games of satiated mass cultures, entrapment in plastic environments, and the definition of enforced "superiority" as conformity to one man's monomaniacal obsessions. Some of the novels of the late 1970's and early 1980's portray superman-obsessed leaders who use electronic simulations to test and delude their trainees (*Schule für Übermenschen*). From *Glasfalle* to *Kälte des Weltraums* tyrants are a continuing thread, but the later novels allow their heroes more freedom. Although Franke's portrayal of enforced "superiority" remains harsh, a hero may submit voluntarily to the training school rigors in the beginning and survive the tyrant in the end (*Schule für Übermenschen*). Franke continues his analysis of scientists' responsibility for the state of affairs in *Keine Spur vom Leben* and *Todeines Unsterblichen*. Most striking is the development of the entertainment theme from *The Orchid Cage* through *Zone Null* and *Sirius Transit* (1979) with its ultimate amusement parks. There the dominant personality is a "Star" who manipulates the masses by faking the conquest of a distant planet. Though some of his characters show a modest development, the novels are ironic in outline and analytical in the disclosure of unifying social, political, and psychological systems. With the enduring themes of heroes who question and survive, critical encounters with "superiority," and analyses of the psychological potentialities of advanced technology, Franke continues to plumb the long-term problems of survival for the individual and the species.

—Alice Carol Gaar

---

**GAIL, Otto** (1896-1956). German. "The Stone from the Moon," in *Science Wonder Quarterly*, Spring 1930; *By Rocket to the Moon* (for children), 1931; *The Shot into Infinity*, 1975.

\* \* \*

Otto Gail, the German popular science and science-fiction writer, was closely associated with rocketry pioneers such as Hermann Oberth, and influential in development of realistic

depiction of space travel in Anglo-American and even Soviet SF. All three of Gail's science fiction novels were translated into English.

Until the appearance of *The Shot into Infinity* in *Wonder Stories Quarterly* in 1929 there was little technical realism in Anglo-American SF devoted to the conquest of space. Victorian devices like anti-gravity were still common, and even when rockets were used they tended to be built by precocious inventors right in their back yards. Gail, also the author of a 1928 non-fiction work of popularization, *With Rocket Ships into Space*, was familiar with the work of Oberth and other theorists. And if he did not fully realize the logistical problems of the Space Age, he was certainly aware space travel would be a massive undertaking. *The Shot into Infinity* mixes Vernean SF with romantic melodrama. August Korf, the hero, has been working on a multi-stage liquid-fuel rocket—a project that has languished for lack of funding (partly due to his own stubbornness: he is too proud to appeal to the world for help). A rival has stolen his earlier plans for a solid-fuel craft, and sent an astronaut to the Moon. Alas, solid fuel proves inadequate, and the luckless pilot is trapped in lunar orbit. So naturally Korf speeds completion of his *Geryon* to attempt a rescue, and of course the dying pilot turns out to be his former true love, who was impatient with his caution and wanted to go herself. Amid the melodrama, there remain realistic scenes of acceleration, stage separation, space walks, and the like. Too, there is the sense that reality is unforgiving, as in Tom Godwin's later "The Cold Equations," and, above all, a sense of *mission*: space travel as a cause. *The Shot into Infinity* is ancestor to such later works as Robert A. Heinlein's "The Man Who Sold the Moon" and Arthur C. Clarke's *Prelude to Space*.

"The Stone from the Moon" is less interesting; although it features a space station, the plot centers on an occult Lost Atlantis theme. *By Rocket to the Moon* is strictly juvenile. Despite the earlier influence of Konstantin Tsiolkovsky, Gail's work seems to have had some impact on Soviet SF through translations. Aleksandr Belyaev tries to go *The Shot into Infinity* one better with *A Leap into Nothingness* (1933), with even more attention to logistics and outdoes "The Stone from the Moon" with the space station in *KETStar* (1936).

—John J. Pierce

---

**JESCHKE, Wolfgang** (1936—). German. "A Little More Than Twelve Minutes," in *New Writings in SF*, edited by Kenneth Bulmer, 1975; "The King and the Dollmaker," in *The Best from the Rest of the World: European Science Fiction*, edited by Donald A. Wollheim, 1976; *The Last Day of Creation*, 1982; "The Land of Osiris," in *Isaac Asimov's Science Fiction Magazine*, March 1985.

\* \* \*

Although Wolfgang Jeschke's output is small—so far one novel, 13 short stories, several poems, and a number of radio dramas—he ranks among Germany's most important writers. Yet he is much better known as editor (since 1972) of Wilhelm Heyne's successful SF line—the largest in Europe.

As a writer, he is almost the exact opposite of somebody like H. W. Franke (generally considered to be the most important SF writer in Germany), who is more interested in content than in the manner of expressing it, and who has turned a style severe and

austere into a virtue. Jeschke is a more natural writer, interested in a tale well told, rich in background, narrative turns, and incident. Mood and stylistic qualities are often more important than plot, subject matter, or theme. Consequently, many of his stories are variations on well-known SF themes or build upon previous SF. His first professionally published story, "Der Türmer," is typical of this: a sentient and telepathic plant on a far planet comes into contact with a lonely human being, striving like the humans to conquer space and to spread its seeds on other planets. One of Jeschke's favorite topics is time-travel and its paradoxes, as in one of his earliest stories, "Supernova," later revised as "The Gap in the Mountain"—an earthman is caught in a time-loop. Similarly in "A Little More Than Twelve Minutes" time travelers from the future wait for the building of the first time machine so that they can return home. Sometimes Jeschke's stories contain mythical allusions or provide SF versions of classical tales, as in "Sirens on the Shore." His imminent death is made bearable for a dying spaceman by aliens that project his inmost longings into his mind. This character of wish-fulfillment is also evident in "The Gate of Night," in which the after-effects of an atomic war are undone by mutants who create another reality track, thus giving mankind another chance. Other early stories feature a horrible new disease, the transplantation of human memories into robot bodies or the long voyage to the stars by human beings who have forgotten their origins and purpose. These are well-written but not terribly original, old-fashioned and slight stories. Of quite a different order is the long story "The King and the Dollmaker," another time-travel tale, but this time a virtuoso performance, so complex and well-constructed a story that it can stand besides the best time-travel stories, a tour de force that turns artifice into a high art, although this was recognized (upon its appearance in Donald A. Wollheim's *The Best from the Rest of World*) only by perceptive critics like Michael Bishop.

Jeschke's newer stories are both more substantial in content, and more experimental in form. "Heike the Heretic's Writings" is a skilful arrangement of real and fictitious newspaper reports, essays, speeches of politicians, news, and quotations from books, all relating to the current political state of the world, while "The Land of Osiris" offers a journey through a post-atomic Africa, and a contact with an alien visitor.

Jeschke's first novel, *The Last Day of Creation*, again turns back to time-travel. The book starts with the discovery of a series of mysterious artifacts that are both a spoof on Erich von Däniken's ancient astronauts theories and the saintly traditions of the Roman Catholic Church. The discoveries are taken by the American authorities to mean that their project is viable: to travel back into the past in order to change the present, to steal the Arab oil from under the noses of the sheikhs. But from the beginning, everything goes wrong, the time troops arrive in little groups, spaced years apart, and are already awaited by superior and better-equipped enemy forces. They are not even all from the same future but from alternate futures, and they are soon stranded in the past, for no return is possible, and all that is left to them is fighting for their bare survival in the jungles of the Mediterranean (then not yet a sea), with only dim prospects of a golden Atlantis in the Bermudas ahead. Jeschke's novel is both an engaging fast-paced adventure story, and a narrative with deeper meanings, satiric both of the current situation of the world and other SF stories depicting attempts to improve history by time-travel.

—Franz Rottensteiner

JEURY, Michel (1934—). French. *Chronolysis*, 1980.

\* \* \*

When *Le Temps Incertain* (*Chronolysis*) appeared in 1973, a new author arrived in French science fiction and established himself immediately at his peak. Michel Jeury was neither a young writer nor a newcomer. Born in 1934, he had already published in 1960 (under the pseudonym of Albert Higon) *Aux Etoiles du Destin* and *La Machine du Pouvoir*, which attempted a synthesis between the French tradition of the *roman d'anticipation* and recent American science fiction. Then for more than ten years Jeury was silent. Of humble, peasant background, which had already placed him apart in the social universe of science fiction, he spent many difficult years and had nearly ceased writing entirely. This origin, these difficulties, these uncertainties on the order of the world, are essential to the understanding of his work.

In *Chronolysis* two futures, the one dominated by a multinational fascist HKH, the other more human and asserted by intelligent computers, the Phords, dispute our present, which will decide their existence. Both futures have use of the weapon *chronolyse*, which permits sending agents into the past, or rather projecting their personality there. But the chronolitic drug is not as certain as a machine, because it acts upon the mind. Robert Holzach thus enters into a universe of uncertainty where the past, the present, the future, and the possible encounter each other and are superimposed, alternatively. He's a man hunted to the depths of his own psyche. So well is this done that the novel has the characteristics of a realistic nightmare, without becoming hallucinatory.

Jeury is so remarkable for creating the social fabric of a period that he specializes both in economic problems and the hesitations of the real, as well as an anguish that is sometimes precise, other times diffuse. Therefore, certain commentators relate Jeury to Philip K. Dick. But one can also discern in the *principe d'incertitude* the influence of Robbe-Grillet. If this is the case, Jeury brings to the *nouveau roman* a simplicity of writing and an almost prophetic content which it ordinarily lacks. In reality, Jeury invents—and does not cease to explore in his major works—a personal world that is somber, even pessimistic, controlled by vast social machines, by informational networks, by the omnipresence of tyranny, by the image, the falsification of the real for the benefit of the dominant groups.

In this universe where nothing is ever exactly as it seems, the central character, a little man, flees, tries to survive and even bring about a better world, a utopia like that in *La Fête du changement*, perhaps Jeury's most brilliant novel but a utopia without rules.

The result defies all analytic description. If *Chronolysis* and its successors have known an instant success, it is in the dissolution of the framework of the real and in joining the philosophic themes then developed by Lyotard, Deleuze, and Guttari, whom Jeury probably hadn't yet read.

The little man hunted is evidently Jeury himself, perceiving the crushing of his social group by the great forces fighting among themselves for absolute supremacy.

One finds again these preoccupations, this obsession, in his later works, notably in *Soleil chaud, poisson des profondeurs* and in *Les Animaux de Justice*. But with *Les Yeux Geants* the writer was to go further yet, describing the encounter between a society in crisis in the beginning of the 21st century and an absolute strangeness, an extra-terrestrial who manifests himself always in an elusive manner. The novel is a long progression towards

the discovery of the other as indicated by the last sentence: "the ending of this story can never be written with human words." In this terrain, Jeury has surpassed, in my judgment, Stapledon, Clarke, and Lem. He borders on the frontier of mysticism without ever letting himself be taken into its pitfalls, and shows that it is a question at the same time of a mediated perception and a social phenomenon. He has thus profoundly renewed science fiction; too much perhaps for its habitual public.

The other side of the coin is that the narrowness of the French quest for science fiction works of high quality limits Jeury to producing more commercial work, where he is less comfortable. His skill even in describing problematic unknown universes in dissolution prevents him from producing simple and manichean works which please the larger public. And that is precisely because his characters, without being anti-heroes, cannot and will not dominate the conflicts that confront them. If science fiction is a literature obsessed by theory, Jeury introduces to it, exaggerated by the taste of the majority, doubt.

The drama, and I weigh my words, is that Jeury, as with so many other writers of breadth, might find himself prevented from writing what he is and obliged to turn away from and devalue his talent. This would be an immense loss for French literature and for world-wide science fiction. The reader will profit from consulting my preface to the *Livre d'or de Michel Jeury* (Presses-Pocket, 1982) where I develop the ideas briefly sketched here on the sense, the importance, and the genesis of Jeury's work.

—Gérard Klein (translated by Ann K. Smith)

---

**KELLERMANN, Bernhard** (1879-1951). German. *The Tunnel*, 1915.

\* \* \*

Bernhard Kellermann's only science fiction novel, *The Tunnel*, was influential in development of a school of SF better known in the Soviet Union than in the West. "Industrial science fiction," as it was later christened by Soviet critics, goes beyond the strict invention-adventure format of Jules Verne as represented in both the *voyages extraordinaires* and the juvenile SF (dime novels, Tom Swift, etc.) which imitated them: vast engineering projects change both the face of the world and ordinary people's lives. But no more than in straight Vernean SF is there any *fundamental* change in society. Early examples include André Laurie's *New York to Brest in Seven Hours* (1888, France), involving construction of a transatlantic oil pipeline, and Luigi Motta's *The Submarine Tunnel* (1912, Italy), which anticipates the project in Kellermann's novel.

*The Tunnel* was undoubtedly the most popular of these; it was translated into English within a year, and was still remembered fondly enough two decades later to inspire three movie versions, *The Tunnel* (1933, in simultaneous French and German versions) and *Transatlantic Tunnel* (1935, Britain). Even the novel reads like a cross between Verne and Cecil B. DeMille. Mac Allan, the hero, is an idealistic engineering genius typical of invention SF. But realization of his dream requires billions of dollars and entire armies of workers—and costs thousands of lives. Kellermann realizes the scale of logistics for such a project, from an artificial Niagara to provide electric power to a new city to house workers. Although gigantic boring machines do the basic tunneling work, the toll on human life is great—and the

project is nearly doomed by an explosion that kills nearly 3,000 and leads to strikes and riots. Despite being made a scapegoat for the disaster and being sent to jail (his wife and child already having been killed by rioters), Allan eventually redeems himself and completes the tunnel. Through it all, there are no basic moral or social questions: Western civilization is united by the ideals of science and engineering; there are no wars or serious international disputes. Even the scientific imagination is short-sighted: the possibility of *air* travel across the Atlantic is curtly dismissed.

Kellermann's collected works were translated in 1930 in the Soviet Union, where his sympathy for the Bolshevik Revolution struck a responsive chord. *The Tunnel* undoubtedly helped inspire Aleksandr Kazantsev's *Arctic Bridge* (1946), involving a similar project across the Arctic Ocean, as well as such industrial sf novels as Aleksandr Belyaev's *Under the Arctic Sky* (1938), Grigori Adamov's *The Banishment of the Lord* (1946), Vladimir Nemtsov's *Golden Bottom* (1948) and Kazantsev's *Northern Jetty* (1952), devoted to Siberian development and similar projects.

—John J. Pierce

---

**KLEIN, Gérard** (1937—). French. *The Day Before Tomorrow*, 1972; *Star Masters' Gambit*, 1973; *The Overlords of War*, 1973.

\* \* \*

Gérard Klein has been a prolific writer of science fiction as well as an important editor, publisher, and critic. He has produced considerable critical writing about American science fiction, and the influence of such writers as Silverberg, Dick, and Brunner can be seen frequently in his work. His first novel, *Star Masters' Gambit*, falls into the pulp tradition of adventure action narrative and space opera. One French critic argues that Klein wished to revive the Romantic tradition of the *bildungsroman*; and a later novel, *The Overlords of War*, is drawn from Klein's own personal experience with the French Algerian crisis. His more than 60 science-fiction short stories show a wide literary influence as well as a preciousness and polish in style at times that seems peculiarly French. The reader can move from space opera set on Uranus and told straight to first-person monologues suggestive of Malzberg's *Beyond Apollo* to Swiftian irony set like an 18th-century *conte philosophique* to fantastic aliens such as Snarks in his most widely known story, "Jonah." Without doubt Klein is important and influential in the current science-fiction scene in Europe.

—Donald M. Hassler

---

**KOMATSU, Sakyo** (1931—). Japanese. *Japan Sinks*, 1976 (*The Death of the Dragon*, 1978).

\* \* \*

Sakyo Komatsu has written widely in science fiction, other types of fiction, and non-fiction. He was characterized in the early 1970's, when a number of his major works were published and his fame spread, as one of the "Big Five" of Japanese science

fiction writers, the others being Tsutsui Yasutaka, Hoshi Shin'ichi, Mitsuse Ryū, and Mayumura Taku. That grouping left aside Abe Kobo, who may have exceeded the "Big Five" in fame, but is by no means an SF specialist, having produced much mainstream literature.

Komatsu himself is not at all a tightly specialized SF writer. He is sometimes called the Robert Heinlein of Japan, while Hoshi is contrastingly referred to as Japan's Ray Bradbury. Like Heinlein, Komatsu gives much thought to political and international problems, and both writers have had a diversified cultural, technical, and occupational background. For Komatsu, this diversified experience contributes to his ability to present natural and realistic narratives, and contributed particularly to his great success with *Japan Sinks*.

One may also say that Komatsu resembles Isaac Asimov in his continuing output of non-fiction and fiction other than SF. His non-fiction often gets into futurology, as in *Mirai Gijutsu to Ningen Shakai* (Future Technology and Human Society, co-authored with Kato Hidetoshi, 1983), which explores the way in which our dreams of today may be realized in the future. His *Nihon Bunka no Shikaku* (The Dead Space of Japanese Civilization, 1977) is a critical examination of Japanese culture. Komatsu's critical writings include a piece of SF criticism in English, "H. G. Wells and Japanese Science Fiction," found in a book he wrote with Judith Merrill, Tetsu Yano, and Robert Philmus, *H. G. Wells and Modern Science Fiction* (1977). Komatsu has also written mysteries, detective stories, and travel books—these last help to account for his impressive physical descriptions.

His story "Fukurokoji" (Blind Alley) is a summary of his futurology, and is included in his book, *Hoshi Koroshi* (Star Killer)—a title drawn from another very original story in that volume. In the same book are his skilled narratives of the birth and death of our moon, "Kaigo" (Conjunction) and "Wareta Kagami" (The Broken Mirror). The title story of another collection, *Chini wa Heiwa* (Peace on Earth) was nominated for the Naoki Prize, while a short-story therein, "Koppu Ippai no Senso" (A Full Cup of War) deals with the development and hazards of nuclear war. The story "Hokusai no Sekai" (The World of Hokusai) was one of the first Japanese SF stories to appear in Russian for Soviet readers.

*Japan Sinks* enlarged his status greatly, selling over four million copies in Japan, appearing in translation in the United States and other countries, and leading to a motion picture which has been widely exhibited in Japan and abroad. By the 1980's he was referred to in publications as "Mr. Chimbotsu" (Mr. Submersion) and as "the man who sank Japan." In this novel he makes plausible, with abundant data from geology and physics, what would otherwise be regarded as highly fantastic, the submergence of virtually the entire Japanese archipelago as the result of sliding plates, earthquakes, and terrific volcanic action. The loss of Japan in a mere year or so of time is the fantastic element here. The same process extending over millions of years would not be so questionable—nor might it make much of a narrative.

Komatsu has called this novel a fable, and it surely can be read as a caution against insularity in Japan or any nation. On the question of the surviving Japanese people and their culture after their land disappears, Komatsu says that beyond ethnocentric and insular nationalism is a better, enriched identity, that one's own language and customs can be kept, while enhanced by a global blending. He also considers the often problematic question of how peoples in distress may interact with the nations to which they call for help.

*Japan Sinks* and its forthcoming sequel are to be rated against

a number of other SF stories of cataclysms—and inevitably to be compared even with those novels which treat the end of the Mother Earth or of the entire human race. Such themes, of course, offer the SF writer a fine chance to deal with the essence of humanity and human destiny. Komatsu's variegated preparation enables him to deal superbly with this challenge.

—Frank H. Tucker

---

LASSWITZ, Kurd (1848-1910). German. *Two Planets*, 1971.

\* \* \*

In the literature of space travel Kurd Lasswitz's *Two Planets* merits notice, particularly for its acknowledged impact upon a generation of German scientist-engineers. After the initial 1897 publication translations fostered audiences throughout Europe. Lasswitz's thousand-page novel (abridged in the English translation) focuses on the conflict of values when intellectually and ethically superior but physically similar Martians ("Nume") invade Earth ("Ba").

Three explorers accidentally discover the Martian land station at Earth's North Pole. Their balloon runs afoul of the "abaric" or anti-gravity field used to propel craft to a solar-powered, ring-shaped satellite. Despite this peaceful contact a subsequent misunderstanding between Martians and the crew of an English warship precipitates military reactions from Earth, soon nullified by superior Martian weapons utilizing repulsion rather than destruction. Ensuing events admit no victory for Earth. The Martians reduce Earth to protectorate status and institute a stringent system of education. Ironically they in turn suffer a re-awakening of the corrupting urge to power. Only through such efforts as those of La, a Nume, and the explorer Saltner does compromise occur. Offering a microcosmic solution for the macrocosmic problem, these two fulfill destiny, or "reason within timeless will," by becoming one with love: "To follow destiny is freedom; to satisfy it is dignity."

Even as the novel gains philosophical complexity, it suffers weak plotting and characterization. Its great strength lies in description and exposition. In detail Lasswitz describes the Martian utopia as a society accommodating freedom of the individual moral will. His scientific and technological exposition of establishment of space stations, utilization of solar energy, synthetic food, and the healthy balance of scientific and humanitarian concerns prophetically foreshadows contemporary interests.

—Hazel Pierce

---

LEM, Stanislaw (1921— ). Polish. *Solaris*, 1971; *Memoirs Found in a Bathtub*, 1973; *The Invincible*, 1973; *The Investigation*, 1974; *The Cyberiad*, 1974; *The Futurological Congress*, 1974; *The Star Diaries*, 1976 (as *Memoirs of a Space Traveller*, 1982); *Mortal Engines*, 1977; *The Chain of Chance*, 1978; *Tales of Pirx the Pilot*, 1979 (*More Tales*, 1982); *A Perfect Vacuum*, 1979; *Return from the Stars*, 1980; *The Cosmic Carnival*, 1981; *Imaginary Magnitude*, 1984; *His Master's Voice*, 1984.

\* \* \*

One of the most respected and innovative of modern science fiction writers, Stanislaw Lem can pride himself on the linguistic versatility, the humanism, the scientific accuracy, and the intellectual virtuosity of his creations. He takes the genre seriously, and has used it to explore man's limits and man's potentials, to satirize his governments, his pretensions, his militancy, his delusions, his failure of imagination. His attack encompasses East and West, man the tourist and man the bureaucrat, man the technician and man the theoretician. In *Microworlds: Writings on Science Fiction and Fantasy* (1985) Lem criticizes writers for squandering the potential of science fiction, resorting to clichéd patterns and devices and rehashing old tales instead of initiating experiments and evolving processes of discovery to heighten human awareness and to challenge the intellect. These last mentioned goals he has made his own. He has been compared to both Swift and Voltaire for the wit and seriousness of his vision, and the controversy of his ideas. His cynicism, his sense of man's alienation and Sisyphean dilemma, his understanding of the limits of theories and interpretations, his willingness to face the human condition, explore and criticize it, his unique geopolitical vantage point lend his works significance and distinction.

Lem's treatment of the alien is intriguing and intelligent, for, unlike those writers whose anthropomorphism he attacks as banal and absurd, he focuses on the truly unknown and unknowable, with man limited by nature and experience and the alien beyond human reason and human understanding. In *Solaris* scientists, confronted with a possibly sentient, colloidal ocean capable of materializing their deepest obsessions, collect reams of data and even develop an anti-field to exorcize their psychic mirrors, but are "dumbfounded" by alien phenomena whose essence remains forever mysterious. Their observations, theories, and methodology ultimately serve only to reveal themselves and their needs; yet they deny even these (as in Kelvin's rejection of Rhexa, an innocent ocean creation, an exact duplicate of his lost love). In *The Invincible* man measures his limits against the alien, whose nature remains elusive. The probing and measuring of a new planet reveals "undefinable formations," an inexplicable black cloud, and puzzling signs of the mayhem that eventually force the human observers to recognize their vincibility; their specialists can study and their destructive machines attack, but man remains stymied, more in tune with a befuddled robot than with the dark, inscrutable configuration that defies interpretation. The main character, Rohan, stands in "numbed awe," and concludes that "not everywhere has everything been intended for us." In *Return from the Stars* the central figure, Hal Bregg, tells his girlfriend about an inexplicable incident on a dusty planetoid, one "like nothing. We have no referents. No analogies," while Doctor Digóras in *Memoirs of a Space Traveller* finds himself the subject of an experiment he thought he was conducting, and stands helpless, "without a chance of understanding" before two amorphous fungoids. "Eden" and the stories of Ijon Tichy and Pilot Pirx continue this theme. Man stands alone, alienated from his universe, misunderstanding his fellow creatures, redeemed only when he shows respect for other life forms and gains insights into his own nature.

Related to Lem's image of man projecting the familiar onto the alien is his focus on man's obsession with theorizing and hypothesizing, seeking a pattern amid the random chance of myriad realities. *Philosophy of Chand* and *Summa technologiae* (philosophical essays which provide keys to his views) establish his absurdist attitudes toward man's search for meaning amid meaninglessness. In both *The Investigation* and *The Chain of Chance* private investigators try to unravel bizarre mysteries, in

the former resurrection of corpses, in the latter a series of deaths and disappearances at an Italian seaside resort. A chain of coincidences is countered with deductive reasoning, causal arguments, and the laws of probability seemingly to explain the inexplicable. *His Master's Voice* delineates man's attempts to interpret a pulsating stream of neutrino radiation as some sort of stellar code. 25,000 specialists advance divergent hypotheses to decode the so-called message, with explanations ranging from a technological gift from a dying civilization to a formula for the ultimate weapon; all are convincingly detailed, but reveal more about the theorists than the reality. The penetrating description of the formulation of scientific theories and their social impact, the controversy and the conspiracies are the heart of the novel, but the role of chance and the problem of communication (between worlds, societies, and individuals) are also central.

*Memoirs Found in a Bathtub* continues the focus on militarism and global destruction first introduced in Lem's early "social realism," *Astronauts*, *The Magellan Nebula*, and "Sesame." The record of what happened in the "Third Pentagon" after an American revolution, the memoirs expose a bureaucratic hell in which intelligence gathering and surveillance are turned inward as the Pentagon invents functions, and nameless characters are caught in a senseless maze filled with double agents, secret codes, loyalty tests, polygraph mittens, and "Seminars on Applied Agony." The reminiscences of Ijon Tichy, tourist of the universe and protagonist of *The Star Diaries*, *The Futurological Congress*, and *Memoirs of a Space Traveller*, point up the ridiculousness of human institutions and doctrines in a more comic vein. Tichy is average and mundane, yet his outrageous adventures, recorded in a free-wheeling, episodic diary, tilts at scientists and scientific laws, concepts of progress and nature, repression, jargon, and even "unaccommodated man" with delightful informality and gusto. In the 7th Voyage Tichy gets caught in a time warp and splits into multiple selves, while in the 4th he finds his cultural assumptions about personal identity challenged. In *The Futurological Congress* he encounters revolution and chemical warfare, drug therapy and psychemization, and a "pitifully empty" world which changes grass to cheese without the cow. In *Space Traveller* "Phools" consent to their own destruction, a scientist discovers that the mechanical beings he has created are as real as he, and Tichy realizes that eternal life without body or social contact is eternal hell.

*Mortal Engines* and *The Cyberiad* are fables, robot legends, at times comic, at times nearly tragic, satiric parodies of human avarice, cruelty, and stupidity. They include stories of a pirate drowned in a paper sea of trivial information, soldiers plugged together for greater efficiency, and a tyrant ironically saved by his greed and suspicion, but ultimately trapped in a dream about dreaming. Despite the fairy tale quality of many of these stories, "Dragons of Probability" is scientifically sound, and "The Mask," the powerful story of a robot programmed to kill the man she has come to love, verge on pathos. Here and elsewhere Lem tackles the question of artificial intelligence, suggesting that consciousness brings pain, but deserves respect.

*Tales of Pirx the Pilot* also deals with man vs. machines. Pirx is tough and courageous in his own way, prosaic and bumbling but irresistible. His training mission teaches him the inadequacy of textbook knowledge and the importance of sheer guts, and his first mission the limits of technology and the need for close observation; his last adventure involves deciphering the final acts of a long dead crew from the encoded memories of a psychically wounded robot. In contrast, Hal Bregg of *Return from the Stars* is a worn-out astronaut, returning home after harrowing adventures only to find himself overpowered by

changes on earth which make it alien and intimidating. He finds aggressions medically neutralized, sophisticated robots in charge, social customs incomprehensible, and risk and challenge lost concepts; yet he learns to assert his humanity and to find love and meaning and a new life.

Clearly Lem enjoys variety and experimentation. His *Imaginary Magnitude* consists of introductions to nonexistent books, while *A Perfect Vacuum* has clever reviews of nonexistent books, including a review of Lem's reviews. His science fiction ranges from realism to fantasy, from comedy to tragedy, from the technological to the poetic. Lem is fond of situations that lend themselves to multiple interpretations and that leave the final reality ambiguous. Mirrors, masks, and multiple levels add to the confusion and to the depth of his message. Double and triple puns, intentional ambiguities, codes, neologisms, cybernetic and futuristic jargon, and carefully selected proper names add to the fun and the potential possible interpretations. *The Cosmic Carnival* provides a good panoramic selection of Lem's best.

**MAUROIS, André** (1885-1967). French. *The Next Chapter: The War Against the Moon*, 1927; *Voyage to the Island of the Articoles*, 1928; *A Private Universe* (stories), 1932; *The Thought-Reading Machine*, 1938; *The Weigher of Souls*, and *The Earth Dwellers*, 1963.

\* \* \*

The scores of diverse books published by André Maurois show the varied experience and interests of the man. His family business of cloth manufacturing claimed his attention in early life and the first World War also delayed his full-time devotion to writing, thus helping to carry out the advice of his mentor, Emile Chartier, that he should experience the real world amply before turning to a life of literary creativity. Certainly his novels and short stories evince a mastery of human nature and profound understanding of the French and English character. His careful analysis and biographies of Percy and Mary Shelley, Charles Dickens, Honoré de Balzac, and other authors contributed further to this, as did his many works of history and commentary on modern affairs.

Maurois gave only a fraction of his literary attention to science fiction, and his typical works in this genre are novellas. In these, as always with Maurois, we see reflections of the universal curiosity to which he himself gives major credit for his successes. Always also there is the readiness to interpret discerningly. In *The Thought-Reading Machine* a professor makes a machine to detect the passing thoughts of the targeted persons, but Maurois discerns that transient thoughts are of quite limited value. In *Voyage to the Island of the Articoles* the author imagines a South Sea island society, but he is also satirizing the purblindness of his European contemporaries. Maurois's close acquaintance with H.G. Wells and with even more innovation-minded Frenchmen of his time did not prevent him from warning against rapid changes in society. He also warned of the destructiveness of then undeveloped "ray" and atomic weapons. *The Next Chapter* contemplates wars of genocidal scope—with 30 million deaths in 1947 alone. Equally imaginative, for 1927, is his description of the marshalling of the media to shape and control public opinion on a grand scale. The author's historical works show that he knew how this opinion-

moulding had worked in the propaganda for the wars before 1927. The ambitious re-casting of national opinion is shown as the benevolent but arbitrary project of the powerful magnates who control the media of the world, and Maurois envisions unforeseen, even catastrophic, effects from this tampering with the outlook of the masses.

In quality, the science fiction of Maurois can be ranked among the early classics, with impressive insights into human affairs.

—Frank H. Tucker

---

**MAYAKOVSKY, Vladimir** (1893-1930). Russian. *The Bedbug* (play), 1960; *The Bathhouse*, in *Complete Plays*, 1968.

\* \* \*

Vladimir Mayakovsky, the Futurist poet and playwright, is one of the brightest stars in the great constellation of modern Russian literature. His paradoxical fusion of lyrical tenderness and oratorical violence marks a decisive change and renewal in it. Some of his works—even though, or perhaps because, only partly SF—are most representative of the embattled utopianism of the Soviet structure of feeling 1917-30. In poems such as "About It," "150,000,000," and "The Fifth International," in short propagandist pieces such as *Before and Now*, in film scenarios, and most clearly in his three post-revolutionary plays, the mainspring of Mayakovsky's creation was the tension between anticipatory utopianism and recalcitrant reality. An admirer of Wells and London, Mayakovsky wrote his witty masterpiece *Mystery Buffo* to celebrate the first anniversary of the October revolution, envisaging it as a second cleansing Flood in which the working classes, inspired by a poetic vision from the future, get successively rid of their masters, devils, heaven, and (in the 1921 version) economic chaos, and finally achieve a Terrestrial Paradise of reconciliation with Things around them. The revolution is thus both political and cosmic, it is an irreversible and eschatological, irreverent and mysterious, earthy and tender return to direct relationships of men with a no longer alien universe. No wonder that Mayakovsky's two later plays become satirical protests against the threatening separation of the classless heavens from the Earth. The future heavens of the sun-lit Commune remain the constant horizon of Mayakovsky's imaginative experiments, and it is by its values that the grotesque tendencies of petty-bourgeois restoration in *The Bedbug* or of bureaucratic degeneration in *The Bathhouse* are savaged. Indeed, in the second part of both plays, the future—though too vaguely imagined from scenic purposes—irrupts into the play. In *The Bedbug* it absorbs and quarantines the petty "bedbugus normalis" in its bestiary. In *The Bathhouse* the newly proclaimed Soviet Five-Year-Plan slogan of "Time forward!" materializes into the invention of a time machine that communicates with and leaps into the future, sweeping along the productive and the downtrodden characters but spewing out the bureaucrats. The victory over time was for Mayakovsky a matter of central political, cosmic, and personal importance: intrigued by Fyodorov and by Einstein's theory of relativity, he firmly expected it to make immortality possible for men. His suicide in 1930 cut him off in the middle of a fierce fight against the bureaucrats whom he envisaged as holding time back and who engineered the failure of Meyerhold's production of *The Bathhouse*.

—Darko Suvin

**NESVADBA, Josef** (1926—). Czech. "The Last Secret Weapon of the Third Reich," in *The Year's Best S-F 10*, edited by Judith Merrill, 1965; "Mordair," in *Czech and Slovak Short Stories*, 1967; "The Planet Círcè," in *New Writing from Czechoslovakia*, edited by George Theiner, 1969; "Vampire Ltd.," in *Other Worlds, Other Seas*, edited by Darko Suvin, 1970; *In the Footsteps of the Abominable Snowman* (stories), 1970 (as *The Lost Face*, 1971); "Captain Nemo's Last Adventure," in *View from Another Shore*, edited by Franz Rottensteiner, 1973.

\* \* \*

Josef Nesvadba is a practicing psychiatrist. Almost all of his stories are introverted, brooding, and hauntingly effective probings of humanist morality and the "small people" that inhabit the real world of modern, Soviet-dominated Czechoslovakia. Those stories which have appeared in English show his penchant for intellectual and psychological questions; Nesvadba's tales are rarely "upbeat" as they dig beneath appearances, peel away affectations, and discover a universality in man that transcends the hated memories of the Nazis, the heavy presence of Soviet power, and the occasionally wistful reflections about Britons and somewhat distant Americans.

One major collection has appeared in translation, *In the Footsteps of the Abominable Snowman*. The best in this assortment is "The Death of an Apeman," a wry retelling of the Tarzan story with a typical twist: the nobleman (German, not English) must commit suicide once he has learned what "civilized" men are like. "Expedition in the Opposite Direction" tells of time travel gone afoul, especially when one's sense of *déjà vu* cannot prevent the inevitable; "The Trial Nobody Ever Heard Of" focuses on petty scientists and their academic wars extrapolated by analogy into the Nazi murderers and their callous inhumanity; "The Lost Face" suggests that even plastic surgery cannot change essentials; "The Chemical Formula of Destiny" examines the uniqueness of genius; "Inventor of His Own Undoing" asks what would happen if everyone worked for fun; "Doctor Moreau's Other Island" grumpily predicts man's inevitable degeneracy; and the title story is a moving tale of wanderlust, perhaps indicative of Nesvadba's sense of isolation.

Other stories which have appeared in English include "Mordair," that suggests a cheap and inhumane solution to fuel costs; "Vampire Ltd.," a beautifully crafted tale of the soul-sucking qualities of the modern automobile; "Captain Nemo's Last Adventure," one of Nesvadba's best, showing the wanderlust and the eternal search for "The Fundamental Question of Life" and its "Final Answer"; "The Planet Círcè" which examines the dangers of total indolence and complete satisfaction of childhood desires; and "The Last Secret Weapon of the Third Reich" which recalls the nightmare of the Nazi ability to pit Czech against Czech.

Nesvadba writes with great dexterity, and his stories deserve wider attention in the West. He represents a brand of science fiction quite distinct from either the Russian variety, which sometimes smothers good writing in the cocoon of socialistic theorizing, or from the American-British science fiction, which tends to focus on disasters (man-made or natural) or how heroes with mechanical know-how can undo cosmic evils. Nesvadba is a clear descendent in Czech literature of Hasek and perhaps Polacek, but not Capek. The zest of Capek's furious and ironic humor does not appear in Nesvadba's writing. The vision is narrowed, and Capek's wide-ranging internationalism has been replaced by a poignant sadness, an inner reflection of the fate of the Czech nation.

—John Scarborough

**RENARD, Maurice** (1875-1939). French. *New Bodies for Old*, 1923; *Blind Circle*, with Albert Jean, 1928; *The Hands of Orlac*, 1929; *The Flight of the Aerofix*, 1932.

\* \* \*

Maurice Renard is considered a pioneer of French SF and one of the most important SF writers of the period 1910-30. His first novel, a wildly impressionist fantasy akin to Wells's *The Island of Dr. Moreau*, albeit with more overt sexuality that sometimes rises to strange ecstasies, was *New Bodies for Old*, in which the brain of the hero is transplanted into a bull by one of the proverbial mad scientists of science fiction; the novel ends with an even more fantastic identity change that brings to mind demonic possession. A similar grafting experiment on a more modest scale (a pianist is given the hands of a criminal), but with hardly less gruesome consequences, appears in the more glib and weaker *The Hands of Orlac*, which is probably better known since it was filmed twice. In *L'Homme Truqué*, finally, a giant is given a pair of electric eyes which turns the world into a nightmarish vision. *Un Homme Chez les Microbes* is an elegant and sophisticated treatment of the journey into a microscopic world, a theme often mishandled in American SF by Ray Cummings. Renard's most ambitious novel, however, is *Le Péril Bleu*, an almost surrealist work with strong Fortean overtones. It introduces a strange civilization of etheric lifeforms, the Oniweig, living on top of our atmosphere and fishing for objects in the air as we might fish the deep seas. They abduct humans and experiment with them, returning them to the surface of Earth only as a rain of picked bones and skeletons. Another SF novel is *Le Maître de la Lumière*, a fantastic mystery novel about duplicated bodies. His short stories tend towards the mystical and fantastic; a common theme is the relativity of perception, and their favorite device a distortion of perspective: time and space, other dimensions, mirrors, and changed sense organs figure prominently in them, and he is fond of joining together opposites, cold reason as well as feverish dreams.

—Franz Rottensteiner

**STRUGATSKY, Boris** (1933—), and **Arkady** (1925—). Soviet. *Far Rainbow*, 1967; *Hard to Be a God*, 1973; *The Final Circle of Paradise*, 1976; *Monday Begins on Saturday*, 1977; *Roadside Picnic*, 1977; *Prisoners of Power*, 1977; *Tale of the Troika*, 1977; *Definitely Maybe*, 1978; *Noon: 22nd Century* (stories), 1978; *The Ugly Swans*, 1978; *Far Rainbow and The Second Invasion from Mars*, 1979; *The Snail on the Slope*, 1980; *Beetle in the Anthill*, 1980; *Space Apprentice*, 1981; *Escape Attempt*, 1982; *Aliens, Travelers and Other Strangers*, 1984.

\* \* \*

Boris and Arkady Strugatsky's early cycle—the trilogy *The Country of Crimson Clouds*, *A Voyage to Amaltheia*, *The Space Apprentice*, and the short stories in *Six Matches* and *Noon: 22nd Century*—is an optimistic "future history" on or near Earth, a not quite systematic series with interlocking characters progressing through the next two centuries. The young explorers and scientists, and their vivid and variegated surroundings, are

shown in adventure-packed action leading to ethical choice. In this first idyllic cycle, except for some surviving egotism and capitalism, conflicts take place "between the good and the better," basically between man and nature. The societies depicted, based on friendship, community, equality, shared property, and shared values, have overcome modern worries about overpopulation, pollution, and mechanical dehumanization, but still face human problems of man's limitations and failures, torments of conscience, boredom, and unhappiness. Some of these early tales, only recently published in English, focus on human frailty: the short stories of *Aliens*, *Travelers* and *Other Strangers* which spoof the complications caused by a greedy time-travelling art collector or make wry comments on the space hero cult, and *Space Apprentice* which focuses on the adventures of a galactic hitch-hiker who sees greed, ambition, and jealousy dividing workers and threatening the security of communities, and who finally sacrifices his life for knowledge. It is such failures that darken the somewhat aseptically bright horizons.

The dialectics of innocence and experience, of utopian ethics and historical destructiveness provide the Strugatskys' main tension in their second phase (1962-65). In *Escape Attempt* a holiday jaunt leads to a brutal planet where barbaric masters force enslaved masses, made subhuman by cruel abuse, to test out alien weaponry that moves endlessly across a frozen wasteland. Communication and assistance prove impossible due to divergent *a priori* premises, and even attack proves futile. This interest in utopian ethics tested by inhuman and apparently irresistible destruction continues in the Strugatskys' first masterpieces, *Far Rainbow* and *Hard to Be a God*. All three books involve a theme the Strugatskys explore throughout their canon, that of interference in the history of an alien planet, and of the moral, logical, and social problems arising therefrom. On the small planet Far Rainbow a physical Black Wave, unintentionally produced by a joyous community of experimenting creators, destroys them in a clear historical parable. The novel focuses on the decisions involved in the final 24 hours before destruction: whether to rely on logic and preserve the knowledge stored on the planet or to act humanely and save the children, the biological future. Almost all remaining heroes of the first cycle die here; only the children, and the mysterious deathless man-robot Kamill (a lonely and powerless Reason), survive. In *Hard to Be a God*, a very successful domestication of a historical novel, the conflict of militant philistinism, stupidity, and social entropy with utopia is faced without natural science disguises—and therefore the richer and subtler consequences. The hero is an emissary from classless Earth to a feudal planet, instructed to observe without interfering. However, the Earth historians' projection of progress turns out to be wrong; organized obscurantism is killing off intellectuals and destroying all human values. The planet triggers readers' memories of human history as the worst excesses of the medieval and the fascistic merge (ignorance, superstitious hatred of intelligence, violence, and oppression), and revolt simply leads to more calamity. Outside interference would introduce a new benevolent dictatorship, but the Earthling "gods" are trapped in a dilemma—their humanism and ethical sense compel them to reduce suffering, to save those they love and respect, yet in so doing they will introduce weapons that will be misused, and will push the planet's progress forward so rapidly that its inhabitants will be deprived of their own history, a history that would humanize them and that would form the dark base for their brighter future. *The Final Circle of Paradise* (originally *Predatory Things of Our Age!*) returns to the anticipatory universe of the first cycle. An apparent utopia, democratic,

peaceful, unified, and abundantly wealthy, proves spiritually regressive, endangered by too much ease and a new hedonism, summed up in "slug," a mysterious addictive substance that provides instant pleasures, but that destroys thought and binds man in a dehumanizing cycle of self-gratification. The protagonist, a Soviet cosmonaut turned UN agent, flushes out the demoralizing pleasure centers and seeks to overcome them through education and conflict. The ending is left open, the outcome uncertain, the warning clear.

Running into increasing pressures, the Strugatskys opted in their third phase (1965-68) for parables with increasingly satirical overtones, joining formal mastery to sociological bewilderment. The protagonists provide the privileged point of view, often a naive glance at a disharmonious world with monopolized information channels. In *The Second Invasion from Mars* the philistine protagonist, keeping a diary of the Martian invasion, happily conforms to the new bosses, who use local traitors, economic corruption, misinformation, and modern business practices, instead of heat rays and gases, to enslave and conquer. Renewable body fluids become big business, and only the active opposition of the strongly independent can possibly keep the human race from becoming the Martians' dumb, complacent sheep. The work is infused with details that relate the action directly to Soviet society: farmers celebrated for productivity, long shopping lines, ill-will towards POWs, alcoholism, persecution of the press, incomprehensible news reports of new wheat deals.

In the two interlocked stories of *The Snail on the Slope* a fantastic and symbolic forecast is seen indistinctly from inside and outside by protagonists painfully struggling to understand. The "Kandid" narrator juxtaposes his stream of consciousness with rural idioms, infuriatingly repetitive and monotonous as the life whose flavor they convey: the dearth of information and this impossibility of generalizing, the "vegetable way of life" bereft of history and subject to unknown destructive forces. The "Pepper" narrator views the forest from the bureaucracy supposedly managing it. The two protagonists come to stand for the alternatives of modern intellectuals faced with power: accommodation versus refusal. Though a culmination of the Strugatskys' escape from politics into ethics, the novel is among their most interesting creations, and the Kandid part a gem of contemporary Russian literature. The work has not been published as a single volume in Russian. The English edition, following the authors' guidelines, alternates between chapters belonging to the two parts.

*The Ugly Swans* was published abroad in an edition repudiated by the authors. In a Shchedrinian satiric city, persistent rainfall signifies the end of a morally corrupt society; the children evolve to higher intelligence and justice with the help of mutant "Wetters," midwives of the New. Boundaries between past and future blur, the fantastic (multiplying "rain-men," sudden metamorphoses) and the realistic (quarreling police factions, paramilitary Fascists) merge. The setting is the West, but the capital is Moscow, and unrelenting fog inundates all. Lepers, harbingers of the future, are pied-pipers, leading children from the past. Contradictions and metamorphoses are the essence of this novel, whose title is a counterproject to H.C. Andersen's optimistic fairy tale. As in the former novel, the puzzles are left unsolved: all we can infer from the final exodus of the children, through the ambiguous protagonist—a politically suspect writer—and the hardboiled, polemical vernacular, is that our species is doomed.

The novels *Monday Begins on Saturday* and *Tale of the Troika* are linked by the main character. The updating of folktale to embody the "magic" of modern alienated sciences and society

results in a loose picaresque work ranging from fun to the Goyaesque horrors of charlatanism and bureaucratic power. *Monday* deals primarily with the use and abuse of science. The director of the Scientific Institute for Magic, studying human happiness, has split into scientist and administrator who lives backward; the demagogic charlatan Vybegallo plans a happy Universal Consumer and his homunculus is destroyed just short of consuming the universe. *Troika* shows a bureaucratic triumvirate "rationalizing" a country of unexplained phenomena. The Troika's semiliterate jargon and fossilized pseudo-democratic slogans, its incompetent quid pro quos and malapropisms, make for wildly hilarious black humour. Somewhat uneven, this is perhaps the Strugatskys' weightiest experiment.

The post-1968 novels can be thought of as their fourth phase, somber and uneven, often of juvenile heroics amid increasing alienation and desperation. *Prisoners of Power* is a very good adventure wherein the utopian protagonist, a Terran explorer marooned on a planet wasted by nuclear holocaust, fights a military dictatorship and its new persuasion technologies. But to change this world he too must change, experience its cruelties and ignorance, unravel its mysteries. The masterly depiction of various social strata bereft of history, the insights into both oligarchy and underground politics, contrast with the superhero and the happy ending. In *Beetle in the Anthill* the choice is again between ethics and survival; a space explorer is suspected of being programmed by aliens to destroy the human race. The racy mystery, told by a confused Terran security officer, ends with the security chief, ex-space hero, murdering the suspect—just in case. *Hotel "To the Lost Climber"*, *Kid from Hell*, and *Space Mowgli* are entertaining lightweights. The first is a mystery with a SF twist. In the second, humane interference in a grotesque war between equally violent societies produces a limited peace, but failure to truly change a trained killer from one of the societies, after prolonged intellectual and emotional contact, suggests conflict is inevitable, people cannot be changed, peace is doomed. In the third, a "wolfchild" tale, contact with a humanoid—modified for survival and raised to manhood by an incomprehensible alien life form—raises false hopes of bridging the gulf between human and alien. The weightiest work is *Roadside Picnic*, simultaneously a folktale, utopian quest, and straight psychological novel, with a rich array of standpoints and vernaculars. In it Earthlings seek meaning amid the strange and dangerous discarded leavings of unknown cosmic travelers. The story centers around one of the blackmarketeers who penetrates the alien Zones to steal artifacts and to perhaps find knowledge/salvation. The alien influence is catalytic, showing up man as greedy and ignorant, ingenious and courageous. In *Definitely Maybe*, a chilling tale verging on the supernatural and a very dark parable, an unknown force disrupts the lives, work, and happiness of the world's leading scientists, whose groping hypotheses include a supercivilization threatening Earth's progress and the universal laws of nature asserting themselves to control destiny. The somber prevails, but the tough-minded clarity of relationships and a glimmer of utopian brightness persist.

The Strugatskys' work is at the heart of Soviet SF; its polemic acted as an aesthetic and ideological icebreaker. From static utopian brightness in a near future they have moved through a return to the complex dynamics of history to an unresolvable tension between the necessity of utopian ethics and the inhuman inscrutable powers of anti-utopian stasis. There are deficiencies in their vision: the junction of ethics with either politics and philosophy has remained unclear, the localization of events has oscillated somewhat erratically; the socio-philosophic criticism

has sometimes fitted only loosely into the SF framework. Their writing is at times obscure, at times consciously illogical. Nonetheless, half a dozen of their works approach major literature. Their later phases are a legitimate continuation of the Gogol vein and of the great Soviet tradition of Ilf and Petrov or Olesha, at the borders of SF and satirical fantasy, as in Mayakovsky's late plays, Lem, Kafka, or Carroll. The predatory bestiary into which people without cognitive ethics are transmuted, the strange countries and monsters becoming increasingly horrible suggest that *Gulliver's Travels* is their final source. The Strugatskys' work has some of Swift's fascination with language—a mimicry of bureaucratic and fanatic jargon, irony and parody, colloquialisms and neologisms. Their satire of official language, though alien to Westerners, is masterful, as is their control of conversational idiom. They are polemical at the deepest level of wordcraft and vision, making untenable what they termed the "fiery banalities" of the genre.

The Strugatskys' works are full of humor, irony, exciting action, and a clear sense of historical inevitability. They infuse scientific and technological elements with typically Russian ones, from dachas to central committees. They mix historical realities and future settings (and often seem careless about the precise motivation of their story's framework). In *Escape Attempt*, for example, a central character turns out to be an escapee from a Nazi concentration camp flung into a better future by sheer will power. The Strugatskys introduce characters *in medias res* and leave readers gradually to work out relationships. The main characters are complex—at times contradictory—in nature; they are changed by events, and grow and evolve with experience.

Within the Russian tradition, the best of the later Strugatskys reads like an updating of Shchedrin's fables and chronicle of Foolsville. However, the hero and ideal reader is no longer Shchedrin's *muzhik*, but the contemporary scientific and cultural intellectual, the reader of Voznesensky and Voltaire, Wiener and Wells. Many Strugatsky passages read as a hymn to young scientists who are also citizen-activists, inner-directed by and toward "constant cognition of the unknown." The central source of the Strugatskys is an ethics of cognition, sprung from a confluence of utopianism and modern philosophy of science. With all its oscillations from bright to somber horizons, such a confluence transcends Russian borders and marks their rightful place in world SF and literature.

**TENDRYAKOV, Vladimir** (1923—). Soviet. *Three, Seven, Ace, and Other Stories*, 1973; *A Topsy-Turvy Spring* (stories), 1978.

\* \* \*

"A Lifelong Journey" is a departure from Vladimir Tendryakov's usual realistic stories of rural life and moral decision into a "scientific-fantastic" metaphor of human existence. Told in a matter-of-fact linear style, it is the story of the scientist Bartenyev whose disembodied mind is sent on an interstellar voyage while the rest of him works, loves, and dies on earth. The central conflict is Cartesian. The rational mind may hold all of time and space in itself and "be greater than all the universe," yet, isolated in space, it is inhumanly unhappy and "the most meaningless thing" in creation. Similarly, "it is

necessary simply to live," but the body alone is purposeless, and "there is no more terrible unhappiness than the happiness of comfort."

Aside from the unifying potentiality of artistic experience and of natural beauty, Tendryakov offers no solution for the contradictions in humanity. His world is constructed to move always in a dual pattern, exclusive and complementary, of good-evil, life-death, thought-being. He warns that any attempt at one-sided reduction leads to falsification of reality and loss of movement; and "to crave motionlessness is just as unnatural as for a healthy individual to think of the grave." "The future disturbs me," Tendryakov writes, because the "tormenting puzzles" of the human situation will not only obtain in the future, but will become more urgent with increasing knowledge and power. "To describe the future as a rosy Eden populated with the blessed, means to deceive oneself." His hope is that as science once discovered the laws governing matter and the processes of life, so now it will uncover the essential nature and laws of "thinking life," that mankind may learn to cope with the perennial problems of its existence. "Our future is real," Tendryakov says; "we have to take it seriously."

—Jana I. Tuzar

---

**TERTZ, Abram.** Pseudonym for Andrey Sinyavsky (1925—). Soviet. *The Icicle and Other Stories*, 1963 (as *Fantastic Stories*, 1963); *The Makepeace Experiment*, 1965; "Pkhentz," in *Soviet Short Stories 2*, 1968.

\* \* \*

Abram Tertz, a literary critic who, after six years in Soviet prison camps, now lives in Paris, can be only marginally claimed for SF, though he has written on the subject. *The Makepeace Experiment* has strong SF aspects, both in its use of thought-reading and thought-control powers by means of which the hero Makepeace becomes for a while ruler of the town of Lyubimov, and as a satirical parable in the vein of Gogol, Shchedrin, and Dostoevsky on Russian messianic utopianism. However, the psi powers are ultimately shown to be a gift from a historical ghost who is exorcised at the same time as the robot tanks break through, and the whole narrative system of the story leads one to call it a fantastic parable. Similarly inconclusive is the clairvoyance in "The Icicle," which the government tries to use but which is lost with the death of the hero's beloved. But the short story "Pkhentz" is brilliant SF, a simultaneously sad, grotesque, and terrible parable on an individual Alien isolated in a claustrophobic, menacing, and repugnant everyday life. Though grounded in the banalities and pettinesses of Soviet reality, it has implications for all situations where stifling social pressures pervade the most intimate strivings of alienated exceptions, who see it with a foreign and estranging eye yet slowly lose their original insight.

—Darko Suvin

**TOLSTOY, Alexey** (1882-1945). Russian. *The Deathbox*, 1934 (as *The Garin Death Ray*, 1955); *Aelita*, 1957.

\* \* \*

Alexey Tolstoy published two collections of poetry before he turned away from both verse and Symbolism to stories and novels in the tradition of 19th-century realism. He emigrated to Germany after the Bolshevik revolution, but returned to Russia in 1923 and became a leading and privileged exponent of the official Socialist Realism, especially in a number of historical novels.

Tolstoy became the first classic writer of Russian SF by giving the fast-developing genre the accolade of literary quality and respectability, much as his model Wells did. In *Aelita* this blend is enriched with a lyrical component, the love of Los, the inventor of the rocketship, for the Martian princess Aelita. Los, the creative intellectual, with his vacillations and individualist concerns, is contrasted to but also allied with Gusev, a shrewd man of the people and fearless fighter who leads the revolt of Martian workers (the Martians are descendants of the Atlantans) against the decadent dictatorship of the Engineers' Council. If the standard adventure and romance were taken over from Wells and pulp SF (e.g., Benoit's *Atlantis* and Burroughs's *A Princess of the Moon*) or indeed from theosophy, the politics are diametrically opposed to Lasswitz's and Bogdanov's idea of a Martian benevolent technocracy. Yet if the workers' uprising led by a Red Army man was a clear parable for the times, such as could have been shared by all Soviet SF from Mayakovsky to Zamyatin, the dejected and somewhat hasty return which has Los listening at the end to the desperate wireless calls of his beloved is clearly of a Wellsian gloom (*The First Men in the Moon*). But this ambiguity, which sometimes strains the plot mechanics, makes also for an encompassing of differing attitudes and levels that follows Bogdanov by envisaging the price as well as the necessity of an activist happiness. This is achieved by plastic characterization, differentiated language, and consistent verisimilitude. Tolstoy's second novel, *The Deathbox* (four versions from 1926 to 1937), is a retreat to the "catastrophe" novel: Vernean adventures and Chestertonian detections and conspiracies center around a well-drawn amoral scientist who beats the capitalist industry kings at their own game but comes to grief when faced with popular revolt. It moves fast if jerkily; as Tolstoy had training in engineering, its science is believable (atomic disintegration of a transuranium element is posited as well as something resembling lasers), and it remains a prototype of the anti-imperialist and antifascist satire-thriller melodrama, always a vigorous strand in Russian SF. The two novels, as well as the stories "Blue Cities" and "The League of the Five" and several plays (including an adaptation of Capek's *R.U.R.*), blended SF adventures (interplanetary flight, the revolt of machines, or global struggle for a new scientific invention) with a utopian pathos arising from revolutionary social perspectives in a way calculated to please almost all segments of the reading public. This blend was to remain the basic Soviet SF tradition till Yefremov, and indeed to the end of the 1960's.

—Darko Suvin

---

**TSIOLKOVSKY, Konstantin** (1857-1935). Russian. *Beyond the Planet Earth*, 1960; *The Call of the Cosmos* (miscellany), 1963.

\* \* \*

Konstantin Tsiolkovsky lost most of his hearing as a boy, and grew up a lonely eccentric. He became a provincial teacher,

writing scientific papers all the while— particularly on aeronautics (from balloons to jet aircraft) and interplanetary travel. A self-made mathematician, he often rediscovered already known hypotheses; yet he also created the theory of rocket flight for interplanetary space (formula for attaining cosmic velocities). Disregarded before the revolution, he was elected to the Socialist Academy in 1918 and given a pension in 1921, when he devoted himself entirely to writing. His SF tales *On the Moon* and *Beyond the Planet Earth* and his anticipatory fictionalized essays bordering on SF, *Dreams of Earth and Heaven: The Effects of Universal Gravitation*, as well as some other anticipatory essays, are collected in *The Call of the Cosmos*, while other essays are collected in *Life in Interstellar Environment*; a number of utopian visions, notably *Sorrow and Genius*, have been relatively sighted.

The deep-seated obsession in all of Tsiolkovsky's writings is liberation from earthly and indeed universal gravity. The cosmic alternative— on rocket spaceships, satellite stations, asteroids, or space colonies— is accompanied by diverse aspects of bliss: perpetual Spring, physical ease and health, utopian-socialist democracy, unheard-of technological achievements, "heavenly life without sorrow," and finally immortality— possibly for individuals and certainly for the human species moving from sun to sun through billions of years. When touching on such a cluster of beatific desires Tsiolkovsky's clear but very pedestrian style rises to passages of a naive poetry, e.g., in descriptions of life-forms on the low-gravity Moon. This is also what makes for the peculiar hybrid genre of these writings, oscillating between fantastic idea and scientific (or popularizing) prose, with the stories just on this and the essays just on that side of an imaginary halfway house. Visionary essays seem the primary form of his expression, while the tales are primarily an attempt at reaching a wider readership. Thus even their clumsy plots and non-existent characterization are an interesting testimonial to the genesis of one kind of SF, the "literature of ideas" (in Tsiolkovsky this embraces also speculations on "etheric" beings, on a photonic phase of mankind and universe, on reversing entropy).

The main literary influences on Tsiolkovsky seem to have been the eccentric Russian philosopher of cosmic utopianism and this-worldly resurrection N.F. Fyodorov, Verne, and Flammarion. In his turn, he stands behind all Soviet writings on cosmic travel, in fiction from Tolstoy and Belyaev to Yefremov and Altov, and in science from Oberth and others down to the Sputnik and Yostok constructors. He remains one of the great pioneers of modern SF, particularly important for his refusal to discriminate between utopia and science.

—Darko Suvin

**VARSHAVSKY, Ilya** (1909— ). Russian. "In Man's Own Image," in *Russian Science Fiction 1968*, edited by Robert Magidoff, 1968; "Out in Space," in *Last Door to Aiya*, edited by Mirra Ginsburg, 1968; "A Raid Takes Place at Midnight," in *Russian Science Fiction 1969*, edited by Robert Magidoff, 1969; "Preliminary Research," in *The Ultimate Threshold*, edited by Mirra Ginsburg, 1970; "Biocurrents, Biocurrents," "Lectures on Parapsychology," "The Noneaters," and "Somp," in *Others Worlds, Other Seas*, edited by Darko Suvin, 1970; "Robby," in *Path into the Unknown*, 1973; "Escape," in *Best SF 1973*, edited by Harry Harrison and Brian Aldiss, 1974.

\* \* \*

Ilya Varshavsky's main interests are thinking machines, space travel, and advanced medical and mechanical technology. His attitude toward science is generally humorous or ironic, but at times bitingly satiric or questioning. He expresses nostalgia for the beauty and spirit of the 20th century.

Varshavsky's machines are subject not only to the laws of mathematical logic but to those of self-organization which demand that robots eventually develop the impulses and drives of humans. For example, when confronted with "death," they are impelled to reproduce themselves ("Homunculus"); rather than harm their robot children, they choose a life of frustration ("Conflict"); thoughts of soccer and redheads can subvert them ("The Duel"); like any vocabulary-gifted human, they can develop into pompous, abusive, tricky, intellectually perverse beings ("Robby"). Of interest to Varshavsky is the relationship between language and humanness, as well as the obstacles to a robot's thinking processes posed by connotation, non-objective reality, and accidental characteristics.

Varshavsky uses space travel to examine his ideas on closed-circuit systems (animal organisms in "The Noneaters"; time in "The Trap"); the effects of man on other life forms ("Lilac Planet"; "The Noneaters"); the continuity of human qualities, from petty to heroic ("The Return"). He twits simpleton-scientists ("Somp"; "Lectures on Parapsychology"; "A Raid Takes Place at Midnight"); castigates those who sell their minds to blind projects ("Preliminary Research"); and satirizes science-fiction writers who do anything for a plot. He questions both means and ends of psycho-scientists ("Escape") and ponders the human complications of organ transplants ("Plot for a Novel").

—Rosemary Coleman

**VERCORS.** Pseudonym for Jean Bruller (1902— ). French. *You Shall Know Them*, 1953 (as *Borderline*, 1954; as *The Murder of the Missing Link*, 1955); *The Insurgents*, 1956; *Sylva*, 1962.

\* \* \*

Although never really considered a genre writer, Vercors contributed two interesting and well-crafted novels to the field. *Sylva* is a poetic fantasy about a fox that changes magically into a human woman before the eyes of a hunter. The man falls in love with this wereperson, but the peculiarities of her origin provide rather unusual stresses in their married life. *Sylva* bears more than a passing resemblance to David Garnett's *Fantasy Lady into Fox*, though with a more coherent plot. There are traces of satire as well, much in the tradition of John Collier's *His Monkey Wife* or Mikhail Bulgakov's *Heart of a Dog*. But Vercors is less a humorist than a novelist, and his novel portrays a touching love story that transcends the gimmick that might otherwise seem central to the story.

At the same time, *Sylva* reflects the concerns mentioned in his more significant novel, *You Shall Know Them*. We are told in the latter that "all man's troubles arise from the fact that we do not know what we are and do not agree on what we want to be." The relevance to the lady into fox theme is obvious, but the statement has equal validity when applied to the latter novel. A thoughtful man becomes aware of the existence of a sub-human race on Earth, the legendary missing link in our own evolutionary climb. Concerned about their exploitation by the rest of

humanity, he embarks on a bizarre course to determine their legal humanity. He sires a child which he then kills, confessing himself a murderer and surrendering to the authorities. The stage is hereby set for a precedent-setting murder trial, for if the protagonist is indeed guilty of murder, then the sub-humans must be considered our equals and be protected by the law. If they are not to be considered as human, then he has not in fact committed anything worse than cruelty to animals. In conception, this is one of the finest novels in the genre, establishing and examining a genuine ethical question with ruthless realism. At the same time, it is a well-balanced, craftily written tale that should appeal to all readers. Indeed, the novel has been marketed as a mystery, which in at least one sense it is. But it is also that most rare of creations, a novel of science fiction that tells us something about ourselves and our society.

Only one other of Verne's novels can truly be said to be science fiction. *The Insurgents* chronicles one man's search for physical immortality, and the perils and prices inherent in both the search and the attainment. Thematically it is remarkably similar to Aldous Huxley's *After Many a Summer*, and in some ways is more effectively handled.

—Don D'Amassa

**VERNE, Jules** (1828-1905). French. *Five Weeks in a Balloon*, 1869; *From the Earth to the Moon*, 1869, complete version, 1873 (as *The American Gun Club*, 1874; as *The Baltimore Gun Club*, 1874) (sequels: *All Around the Moon*, 1876; *The Purchase of the North Pole*, 1890); *A Journey to the Centre of the Earth*, 1871; *Twenty Thousand Leagues under the Sea*, 1872; *Doctor Ox and Other Stories*, 1874; *A Floating City*, and *The Blockade Runners*, 1874; *From the Clouds to the Mountains*, 1874 (as *Dr. Ox's Experiment*, n.d.); *The Mysterious Island: Shipwrecked in the Air* (as *Dropped from the Clouds*), *Abandoned*, *The Secret of the Island*, 3 vols., 1874-75; *The Voyages and Adventures of Captain Hatteras: The English at the North Pole, The Field of Ice*, 2 vols., 1874-76; *Hector Servadoc*, 1877 (as *To the Sun*, 1878; as *Off on a Comet*, 1957; as *Homeward Bound*, 1965; as *Anomalous Phenomena*, 1965); *The Begum's Fortune*, 1879 (as *500 Millions of the Begum*, 1879); *The Steam House: The Demon of Cawnpore, Tigers and Traitors*, 2 vols., 1881; *The Clipper of the Clouds*, 1887 (as *Robur the Conqueror*, 1887; as *A Trip Around the World in a Flying Machine*, 1887) (sequel: *Master of the World*, n.d.); *Adventures of a Chinaman in China*, 1889; *The Winter amid the Ice and Other Stories*, 1890; *The Castle of the Carpathians*, 1893; *The Floating Island*, 1896 (as *Propeller Island*, 1961); *For the Flag*, 1897 (as *Facing the Flag*, 1897); *An Antarctic Mystery*, 1898 (as *The Mystery of Arthur Gordon Pym*, 1960); *The Chase of the Golden Meteor*, 1909 (as *Hunt for the Meteor*, 1965); *The Master of the World*, 1914; *The Lottery Ticket*, and *The Begum's Fortune*, 1919; *The Barsac Mission: The City in the Sahara, Into the Niger Bend*, 2 vols., 1960; *Village in the Treetops*, 1964.

\* \* \*

The key biographical fact in Jules Verne's life, for the understanding of his *voyages extraordinaires*, is his induction, at the height of his fame, into the French Legion of Honor by none other than Ferdinand de Lesseps, builder of the Suez Canal and a disciple of Henri Saint-Simon. Saint-Simon is the pre-Marxist patriarch of socialism, whose disciples coined the very word for "socialism," and who meant by it what we mean by the word

"technocracy." They worshipped industrial production as a world-wide process, not merely the international proletarian worker as in later Marxism, and their slogan was "The whole world belongs to mankind." Their romantic globalism is captured in Verne's most famous novel, *Around the World in Eighty Days*. The Saint-Simonians were apostles of world transport and a world-industrial civilization, to which the Suez Canal was a programmatic contribution.

Their view was that the industrial revolution would make for the socialist revolution, replacing the feudalistic love of war with peaceful production, and Catholic theology with science; thereby uniting mankind in universal association for the exploitation of nature, instead of being divided for the exploitation of man by man. Verne's great novelization of this doctrinal thesis is *From the Earth to the Moon*.

Verne wrote this novel during the fourth year of the American Civil War. As a Saint-Simonian socialist, he pondered on American wartime technology, wondering how it might be converted to peacetime industry. How redirect these destructive energies into a creative project? His answer, as the war concluded, was symbolically to melt down its entire arsenal of cannons in the casting of the *Columbiad* for the peaceful colonization of space and the development of interplanetary travel. But the moonshot is not America's project alone.

While a civilian spinoff of her military technology, the Baltimore Gun Club that initiated the project raises funds for it from a world-wide subscription. All humanity is drawn into it with a collective enthusiasm. The Gun Club itself is internationalized on the model of the Council of Newton—the name Saint-Simon gave the brain center of his technocratic council of world direction—as it calls upon scientific talent wherever it is to be found, including the world's astronomers to track the moon capsule in flight. Moreover, the Gun Club's council of directors wins to its purpose the happy collaboration of the American work force, organized on a gigantic scale as one national workshop of united interests. This is a harbinger of Saint-Simon's prophecy: "All men shall work; they will regard themselves as laborers attached to one workshop and whose efforts will be directed by the supreme Council of Newton."

In its exalted atmosphere of class collaboration between captains of industry and the proletarian workers, all this in the service of man's harmonious conquest of nature, the novel is a technocratic hymn to the partnership of knowledge and work, science and labor. The arts of war are again translated into peaceful production in Verne's model mining community, Coal City, in *Black Diamonds*. Coal City is a veritable military colony, where its miners live and work together inside the mine itself, a huge underground cavern lit by the promethian light of electricity. Here they live with and for their work, under the direction of their chief engineer, a former army engineer, together constituting "a peaceful army of labor" that toils in harmony and collective joy. With their division of labor modeled after that of the armed forces, they are able to realize the ideals of fraternity and equality. All are united in "one big family with the same interests."

So, too, in *The Mysterious Island*. The scientifically versatile army engineer, Capt. Cyrus Harding, leads the survivors of a balloon crash to salvation through endurance and their zeal for hard work, epitomizing the Saint-Simonian motto, "Down with idlers." The island is a microcosm of the socialist utopia, the well-regulated and fraternal cooperation of humanity in the exploitation of the globe in the light of scientific knowledge. At the end of the novel, Capt. Nemo appears, and gives them his blessing after they have proved themselves by their readiness for labor. "You love this island," he says on his deathbed in his

submarine. "You have changed it by your efforts and it is truly yours."

Capt. Nemo's all-electric submarine is itself a miniature Saint-Simonian world, with its crew of international sailors who speak a universal synthetic language. Observing their grim and robotlike round of tireless work under Capt. Nemo's direction, Ned Land in *Twenty Thousand Leagues Under the Sea* suspects that they, too, are "run by electricity." Their work, however, is not peaceful production; it is making war for peace, the business of sinking British ships, punishing them for their nation's world-dividing colonial wars. In this Capt. Nemo is like the hero of *Robur the Conqueror* and *The Master of the World*. He does his vengeance by smiting the world's warships from out of the sky in his airplane, *The Terror*, by way of enforcing the union of nations and a cooperative oneness in the "economic and political ways of the world." For the whole world belongs to mankind.

—Leon Stover

---

**WERFEL, Franz** (1890-1945). Austrian. *Star of the Unborn*, 1946.

\* \* \*

Franz Werfel fled from Nazi Germany, finding refuge in California, the setting of his single contribution to utopian science fiction, *Star of the Unborn*. His expressionism, poetic skill, love for the lush music and grand passions of the opera, religious mysticism, and experience in a society as surreal as fiction combine in a novel much like Olaf Stapledon's vast future panoramas, Dante's *Inferno*, and *Gulliver's Travels*.

*Star of the Unborn* envisions a huge underground city full of decadent, beautiful, ethereal souls who live over 200 years and avoid physical contact. Summoned from the past to be a wedding guest, F.W. is guided by his old friend, B.H. Unfortunately, since his glasses were left behind, F.W. never sees the world with complete sharpness. The novel tours a world 100,000 years in the future, vividly reporting social customs and chronicling long philosophical conversations. What little plot there is revolves around the atavistic bridegroom, Io-Do, and the lovely bride, Io-La, who develops a crush on F.W. More like a long poetic satire than a blueprint for an ideal world, it is full of brilliant scenes and paradoxes. "I am doing my utmost to avoid any invention in this narrative," Werfel insists.

*Star of the Unborn* is organized around the three days of F.W.'s visit. In "Irongray Turf" he encounters Mental Man and his society, which uses a "travel puzzle" to move destinations to individuals and prints its news in the stars. In "Djebel and Jungle" he meets the Jew, Idiot, and Worker of the Era, travels in space with an elementary chronosopher class, has three questions answered by the High Floater, and witnesses the first shot of a revolution. In "Flight from the Wintergarden" he visits the Jungle where people drink beer and remain earthy and the Wintergarden where Mental Man goes for Antiception, a sometimes horror-producing form of euthanasia. Finally, the Grand Bishop of the powerful Catholic Church returns him to April 1943.

—Mary S. Weinkauf

**WITKIEWICZ, Stanislaw** (1885-1939). Wrote as Witkacy. Polish. *Insatiability*, 1977; plays—*The Madman and the Nun and Other Plays*, 1968; *The Cuttlefish*, in *Treasury of the Theatre 2*, edited by Bernard F. Dukore and John Gassner, 1969; *Tropical Madness: Four Plays*, 1972.

\* \* \*

Labelled old-fashioned by his peers but *avant-garde* and prophetic by modern critics, a precursor of the Theater of the Absurd, a forewarner of Hitler-like aberrations and Red Chinese power, Stanislaw Witkiewicz defies categorization. At times parodying Shakespeare, Ibsen, Chekhov, Stendhal, or Strindberg, Witkacy combines the wit and urbanity of an Oscar Wilde with the dramatic sensitivity and the sense of the absurd of a Samuel Beckett, the artistic perception of unity in fragmentation of a Picasso with the Renaissance conception of individual discord, disintegration, lunacy, and crisis as micro-cosmic reflections of the world at large. In both novels and plays he paints horrifying images of anti-utopias, characterized by exploding violence, the destruction of the individual, and the emergence of a totalitarian state of insect-like automatons. These mechanized men in mass are summed up most graphically in "the mobile yellow wall," a solid block of completely depersonalized Chinese soldiers who encircle Poland in *Insatiability*. The way "THEY" destroy art, language, creativity, and individuality, and harness man's sexual energies to produce a neutral social machine, bland, boring, and bogged down in mindless bureaucratic red tape and senseless cruelty, is Orwellian in conception. So too is his emphasis on fear tactics and collective madness. He envisions the destruction of contemporary civilization by mechanization and egalitarian levelling, with clone-like technocrats the wave of the future, a "dusk of mechanized grayness," not physical dissolution only but psychological too. The title of one of his plays destroyed during World War II sums up his final vision: *The End of the World*.

In a childhood play, *Cockroaches*, a preview of his adult concerns, an army of identical gray insects from America invades a city, while in *The Cuttlefish* a Renaissance pope, a modern artist, and a potential dictator debate ethical, political, and artistic relativity. In *The Mother* the individuals are bloodsuckers, ultimately trapped in a room with no exits, dominated by a giant tube used by the mechanized workers of the State to suck out life. In *The Crazy Locomotive*, set against a hurtling cinematic backdrop, the machine that will supposedly carry man to higher knowledge ends up in a headlong collision, death and a pile of human and mechanical debris with "no help possible." *They* suggests a vast conspiracy, a dread and secret menace that bans art and crushes artists. In *The Madman and the Nun* the authorities, represented by a Freudian psychologist, imprison the artist, imposing physical and psychological restraints on his humanity, but at the end are forced to question their own sanity and the sanity of all systems which limit the individual. *The Water Hen* ends in revolution, with grenades exploding, heaps of corpses in the street, advocates of community property "banging away in fine style," and thinking man resigned to his fate, playing out a card hand amid chaos, the final call a "Pass." *The Shoemakers* envisions revolution after revolution—capitalism overturned by a fascist coup followed by a worker's rebellion in turn overthrown by nameless, identical technocrats who annihilate freedom and uniqueness and make boredom the ultimate reality.

Like his plays, Witkacy's novels are a kaleidoscopic mixture of the erotic, the philosophical, and the apocalyptic. They

follow the adventures and musings of an artist who struggles against domination, but who ultimately fails, partly due to his own weakness, partly due to the disintegration of society around him, partly due to historical inevitability. *Farewell to Autumn* (1927), set in an unspecified future world, concentrates on a period of change, with metaphorical winter coming, an old regime failing, and "the amorphous anthill" dominating. As a bourgeois democratic revolution is followed by the reign of "Levellers," the artist hero seeks escape in cocaine and sex and faraway places, but finally succumbs to the horror of the new system: petty regimentation, a drab daily routine, and futile, fatal boredom. In a number of his works, Witkacy focuses on the debilitating power of drugs that paralyze those individuals who might have stood against the State. In "Sluts and Butterflies" he portrays whites, in the face of the vitality of primitives; resorting to pills as substitutes for real feelings; "Mother" includes a cocaine party, a sign of social decadence and a refusal to face facts; *Insatiability* predicts the Chinese use of a very special pill (and accompanying mystic pseudo-philosophy) to pacify and lull the European enemy populace, and thereby to effect the takeover of Russia and then Poland. The latter, Witkacy's most famous novel, is a black comedy of chaos and loss, with the hero seeking personal identity in a world where identity is slowly but definitely being annihilated. Therein government has become a sport, news reporting false, women dominant, sexuality absurd, madness the norm. The Chinese, "flawless, fearless machines," threaten Poland and all of Western culture, first with painless palliatives, then with the possibility of crossbreeding to produce an Oriental-Occidental hybrid that is totally deindividualized. In this work, as is true throughout Witkacy's canon, sexual perversions, emasculated males and destructive, insatiable females are harbingers of totalitarian sterility, and images of the insect world sum up collective society. At their victory banquet the Chinese serve rat's tails in a bedbug sauce; Witkacy's childhood nightmare is realized; the world is in chains, and lunacy prevails. The fate of the individual and of society follow parallel courses; decapitation of victors and victims occurs after the human mind has already become extinct.

Witkacy's tone is mocking, irreverent, ironic. He depicts man baffled by an inexplicable universe, waging a hopeless battle for identity and control. Images of imprisonment, restraint, confinement are played off against those of stifled creativity. His characters are oversexed misfits, the lunatic fringe (the bastions of sanity in a world gone mad)—neurotic artists, criminals, demonic women, and mathematical geniuses, indulging in self-gratification, seeking thrills and oblivion, but sometimes making a last frenzied stand before being engulfed by historical inevitability. His works are full of fake deaths and resurrected corpses, as fantasy and psychological realism meet in a symbolic, metaphorical world of the grotesque. His style is an incredibly varied hodge-podge of forms: a new language of insults and obscenities, allusions, puns, jokes in mock Russian, parody, polemic, digression, political and philosophical argument, buffoonery, free-for-alls, cabaret routines, accelerated and decelerated tempos, anti-climaxes, sight gags, masks, and disclosures and exposures; although the triple puns, multiple connotations, and amazing manipulation of sound and meaning are lost in translation, his style remains impressively versatile. His future includes a Ministry of the Mechanization of Culture, a Department of Metaphysical Absurdity, a Commissariat of Sexual Nonsense, a Council for the Production of Handmade Crap, and an organization of Vigilant Youth. Characters split in two, corpses prove dummies or return unscathed, the aging process is eliminated, and time and space are confused.

His works are not science fiction as we generally envision it; but they are science fiction in the sense of fantastic creations that project political worlds that could well (and in some cases did) evolve in the very near future.

—Gina Macdonald

---

**YEFREMOV, Ivan** (1907-72). Russian. *A Meeting over Tuscara* (stories), 1946; *Stories*, 1954; *Andromeda*, 1959.

\* \* \*

Ivan Yefremov, with degrees in geology and biology, was Professor of Paleontology at the Paleontological Institute in Moscow. His first book of stories was *A Meeting over Tuscara*, hovering between folk legends, sea and historical romance, scientific popularization, and SF. His first "cosmic" novella was "Stellar Ships" (*Stories*), but it is *Andromeda* which is his breakthrough, the bearer of the post-Stalinist "thaw" in SF, and the supreme achievement of its first phase (1957-63). *Andromeda* achieved this position after a long and acrimonious public debate, unheard of in the USSR since the enthronement of dogmatic literary policy and the Stalinist purges of the 1930's. Against violent ideological opposition, this debate resulted in 1957-58 in the victory of the new wave, which wanted to build upon the pristine Soviet tradition, in abeyance since the Leninist 1920's. The opinion of "warm stream" critics, and of the thousands of readers who wrote to the author, newspapers, and periodicals, that this was a liberating turning-point in Soviet SF, finally prevailed.

*Andromeda* creatively revived the classical utopian and socialist vision, which looks forward to a unified, affluent, humanist, classless, and stateless world. The novel is situated in year 408 of the Era of the Great Ring, when mankind has established communicational contact with inhabitants of distant constellations who pass information to each other through a ring of inhabited systems. The Earth itself is administered—by analogy with the associative centers of the human brain—by an Astronautic Council and an Economic Council which tallies all plans with existing possibilities; their specialized research academies correspond to man's sensory centers. Within this framework of the body politic, Yefremov concentrates on new ethical relationships of disalienated men. For all the theatrical loftiness of his characters, whose emotions are rarely less than sublime, they can learn through painful mistakes and failures, as distinct from the desperado and superman clichés of "socialist realism" or much American SF after Gernsback.

The novel's strong narrative sweep full of action, from fistfights to encounters with electrical predators and a robot-spaceship from the Andromeda nebula, is imbued with the joy and romance of cognition. Yefremov's strong anthropocentric bent places the highest value on creativity, a simultaneous adventure of deed, thought, and feeling, resulting in physical and ethical beauty. Even his title indicates not only a constellation but also the chained Greek beauty rescued from a monster (here, class egotism and violence, personified in the novel as a bull, and often bearing hallmarks of Stalinism) by a flying hero endowed with superior science. Astronautics thus don't evolve into a new uncritical cult, but are claimed as a humanist discipline, in one of the most significant fusions of physical sciences, social sciences, ethics, and art established as

the norm for Yefremov's new people. Such a connection is embodied even in the compositional oscillation between cosmic and terrestrial chapters, where the "astronautic" Erg-Nisa subplot is finally integrated with the "earthly" Darr-Veda subplot by means of the creative beauty of science united to art (Mven-Chara and Renn-Evda). Furthermore, this future is not the arrested, pseudo-perfect end of history—that weak point of optimistic utopianism. Freed from economic and power worries, people must still redeem time through a dialectics of personal creativity and societal teamwork mediated by functional beauty, shown in Dar's listening to the "Cosmic Symphony in F-minor, Color Tone 4.75 u." Creativity is always countered by entropy, and self-realization paid for in effort and suffering. In fact, several very interesting approaches to a Marxist "optimistic tragedy" can be found in *Andromeda*, e.g., in Mven's "happy Fall": the failed and destructive "null-space" experiment finally leads to great advances. Significantly, the accent on beauty and responsible freedom places at the center of the novel female heroines, interacting with the heroes and contributing to the emotional motivation of new utopian ethics—in contrast to the US SF of those times.

True, *Andromeda* has somewhat dated. In a number of places its dialog, motivation, and rhythm flag, and it falls back on melodrama and preaching. Yefremov's characters tend to be plaster-of-Paris statuesque, and his incidents often exploit the quantitatively grandiose: Mven blows up a satellite and half a mountain, Veda loses the greatest anthropological find ever; Erg is manly, Nisa is pure. One feels in *Andromeda* the presence of an unsophisticated reader, who is, as Yefremov wrote, "still attracted to the externals, decorations, and theatrical effects of the genre," and the presence of the erotic, philosophic, and literary taboos of the cultural context. Yefremov's epistemology is a naive anthropocentrism: the 19th-century view of man as subject and the universe as object of a cognition that is ever expanding, if necessary through a basic social change yet without major existential consequences. Doubt and the menace of entropy are only external enemies—e.g., the electric predators of a far-off planet; if any epistemological opaqueness ever becomes internalized in a man, then he is a melodramatic villain, such as Pour Hyss.

Yefremov's ideology is thus receptive only to a certain romantically codified range of creativity. His limitations are more clearly manifested in his later works. In *The Heart of the Serpent* Terrans meeting a fluorine-based mankind put an end to its loneliness by promising to transmute fluorine into oxygen. This story—an avowed counterblast to Leinster's "First Contact" with its aggressive and acquisitive presuppositions—might be a legitimate pacifist-socialist allegory for changing US capitalist meritocrats into Russian socialist ones, yet it is curiously ethnocentric. Yefremov's last SF novel, *The Hour of the Bull*, demonstrates this even more clearly. Though he took from Lem and the Strugatskys the device of showing heroes (and heroines) facing anti-utopia, his old preachiness reaches monumental proportions; and the fascist regime of Tormans seems nearer to US pulp SF of the 1930's and 1940's, or indeed to the weirdnesses of Lindsay (from whom the planet's name is taken), than to either the reactionary capitalism or Maoism which Yefremov declared he wanted to hit in one fell swoop. Such parochial views preclude a full development of imaginative SF vistas.

Yet any discussion of such vistas in Soviet SF was made possible by Yefremov's pioneering effort. *Andromeda* has polyphonic scope and a large number of protagonists; it is Tolstoian rather than Flaubertian. Not limited to the consciousness of one central hero, it is one of the first utopias in world

literature which successfully shows new characters creating, and being created by, a new society, i.e., the personal working out of a collective utopia (analogous to what Scott did for the historical novel). Yefremov's unfolding the narration as if the anticipated future were already a normative present unites the classic "looking backward" of utopian anticipations with the modern Einsteinian conception of different coordinate systems with autonomous norms: 20th-century science and the age-old Russian folk dreams of a just and happy society meet in his novel. This meeting made it a nodal point of the Russian and socialist SF tradition, and enabled it to usher in the second Golden Age of Soviet SF—an age which closed with the 1960's.

ZAMYATIN, Yevgeny (1884-1937). Russian. *We*, 1924.

\* \* \*

Yevgeny Zamyatin wrote some 40 books of fiction, fables, plays, and essays. After the October Revolution he became a prominent figure in key literary groups, but from 1921 he incurred much critical disfavor, eventually culminating in a campaign of vilification, especially after *We* was published in an émigré journal. He died in Paris shunned both by Soviet officialdom and right-wing émigrés.

As all post-revolutionary Russian SF, *We* (written in 1920) deals with the relation of the new Heavens and the old Earth. It incorporates significant features of Zamyatin's novella satirizing life-crushing bourgeois respectability and clerical philistinism written in England during World War I (sex coupons, Taylorite "table of compulsory salvation" through minutely regulated daily occupations). In *We* the Revolution, unlike principle of life and movement, is opposed to Entropy, principle of dogmatic evil and death. Zamyatin thought of himself as a utopian, more revolutionary than the latter-day Bolsheviks. He is thus not primarily anti-Soviet—even though the increasingly dogmatic high priests of Soviet letters thought so. Extrapolating the repressive possibilities of every strong state and technocratic set-up, including the socialist ones, Zamyatin describes a Unique State 12 centuries hence having for its leader "the Benefactor" (a prototype for Orwell), where art is a public utilitarian service, and science a guide for linear, undeviating happiness. Zamyatin's sarcasm against abstract utopian prescriptions takes on Dostoevskian and Shchedrinian overtones against the totally rationalized city. The only irrational element left is people, like the narrator, the mathematician and rocketship builder D-503, and the temptress from the underground movement who for a moment makes of him a deviant. But man has a built-in instinct for slavery, the rebellion fails, and all the citizen "Numbers" are subjected to brain surgery removing the possibility of harmful imagination.

A practicing scientist, committed to the scientific method, Zamyatin could not seriously blame it for the deformation of life. How was it then that a certain rationalism, claiming to be scientific, became harmful? Zamyatin could answer this only in mythical terms: the victory of any lofty ideal causes it to turn repressive. To the extent that *We* equates Leninist Communism with institutionalized Christianity and models its fable on an inevitable Fall from Eden ending in ironical crucifixion, it has a strong anti-utopian streak. Instead of motivations, it advances through powerful recurring images, unable to reconcile

rationalism and irrationalism, science and art (including the art of love). Zamyatin's political ideology conflicts here with his experimental approach: a meaningful exploration would have to be conducted in terms of the least alienating utopia imaginable—one in which there is no misuse of natural sciences by a dogmatic science of man.

Yet the basic values of *We* imply a stubborn vision of a classless new moral world free from all social alienations, a vision common to Anarchism and libertarian Marxism. Zamyatin confronts absolutistic control—extrapolated from both tsarist-bourgeois and early socialist state practices—with a utopian-socialist norm. As he wrote: "We do not turn to those who reject the present in the name of a return to the past, nor to those hopelessly stupefied by the present, but to those who can see the far-off tomorrow—and in the name of tomorrow, in the name of man, we judge the present." His novel brought to SF the realization that the new world cannot be a static changeless paradise of a new religion—albeit of steel, mathematics, and interplanetary flights. The materialist utopia must subject itself to a constant scrutiny; its values are for Zamyatin centered in an ever-developing human personality and expressed in irreducible and subversive erotic passion. For all its resolute one-sidedness, the uses of Zamyatin's bitter and paradoxical warning in a dialectical utopianism seem obvious.

The expressionistic language of *We*, manipulated for speed and economy ("a high voltage of every word"), helps to

subsume the protagonist's defeat under the novel's concern for the integrity of man's knowledge (science) and practice (love and art). By sensitively subjecting the deformities it describes to the experimental examination and hyperbolic magnification of SF, Zamyatin's method makes it possible to identify and cope with them. In his own vocabulary, the protagonist's defeat is of the day but not necessarily of the epoch. The defeat in the novel *We* is not the defeat of the novel itself, but an exasperated shocking of the reader into thought and action. Zamyatin's encyclopedic knowledge embraced the SF tradition before and after Wells, from the utopias through the planetary and underground novels to the anticipations of Odoevsky, About, Bellamy, Morris, Lasswitz, Willbrandt, Jack London, and most notably Anatole France. *We* is thus a document of an acute clash between the "cold" and the "warm" utopia: it probably fails to attain full consistency because of the one-sided assumptions, but Zamyatin remains a heretic socialist.

Zamyatin also wrote the SF story "A Story about the Most Important Thing," interleaving developments on three levels—an episode of the Russian civil war, the death of a caterpillar, and four people on a dying "star" (planet, asteroid?) rushing toward destruction on Earth. Its lyrical investigation of the kinds of love and death that are "the most important thing" doesn't quite come off, but presents an interesting literary experiment.

—Darko Suvin

MAJOR FANTASY  
WRITERS

**DUNSANY, Lord;** Edward John Moreton Drax Plunkett, 18th Baron Dunsany (1878-1957). Irish. *The Gods of Pegana* (stories), 1905; *Time and the Gods* (stories), 1906; *The Sword of Wellaran and Other Stories*, 1908; *A Dreamer's Tales*, 1910; *The Book of Wonder: A Chronicle of Little Adventures at the Edge of the World*, 1912; *Fifty-One Tales*, 1919 (as *The Food of Death*, 1974); *Tales of Wonder*, 1916 (as *The Last Book of Wonder*, 1916); *Tales of Three Hemispheres*, 1919; *The Chronicles of Rodriguez*, 1922 (as *Don Rodriguez: Chronicles of Shadow Valley*, 1922); *The King of Elfland's Daughter*, 1924; *The Charwoman's Shadow*, 1926; *The Blessing of Pan*, 1927; *The Travel Tales of Mr. Joseph Jorkens*, 1931; *The Curse of the Wise Woman*, 1933; *Mr. Jorkens Remembers Africa* (stories), 1934; *Jorkens Has a Large Whisky* (stories), 1940; *The Fourth Book of Jorkens* (stories), 1948; *The Man Who Ate the Phoenix* (stories), 1949; *The Strange Journeys of Colonel Polders*, 1950; *Jorkens Borrows Another Whisky* (stories), 1954; *At the Edge of the World* (selection), 1970; *Beyond the Fields We Know* (selection), 1972; *God, Men, and Ghosts* (selection), 1972.

\* \* \*

While Lord Dunsany may have been a minor figure in Irish literature, the extent of his role in the development of modern fantasy is major. He was a critical influence on H.P. Lovecraft, L. Sprague de Camp, and Fritz Leiber, and his play *King Argimenes and the Unknown Warrior* is one of the sources for Fletcher Pratt's *The Well of the Unicorn*. From his first book, *The Gods of Pegana*, in which he creates an entire pantheon, to his Jorkens series of adventure stories based on his travels in Algeria and the Sudan, to his masterpiece *The King of Elfland's Daughter*, Dunsany belongs with William Morris and George MacDonald as the generating forces of modern fantasy.

Dunsany's fantasy is characterized by his exotic settings; difficult, if creative and frequently numinous, prose; and stalwart protagonists and alluring, exquisite heroines. His ability to create vivid setting is partially explained by his relationship with Sidney H. Sime; Sime's drawings inspired "The Distressing Tale of Thangobrinde the Jeweller, and of the Doom that Befell Him" (in *The Book of Wonder*). Dunsany's visual settings are evident in the country village and the activities of love in *The Blessing of Pan* and in the fictional Spanish Golden Age in *The Chronicles of Don Rodriguez* and *The Charwoman's Shadow*. However, his greatest stylistic triumph is the much-heralded *The King of Elfland's Daughter*, and in this novel all the qualities of his fantastic fictions are epitomized. Drawing on the themes of alienation and identity and the structure of the quest, which characterize much of his canon, Dunsany creates an interplay between the world of faery and everyday with his innovative proper names, coined phrases, and characterizations. In the novel Alveric falls in love with an elfin princess, but after she bears him a son she can no longer endure the crude society of mankind and returns to faery. Alveric's quest for his wife provides ample opportunity for Dunsany's ability to create numinous wonder, and the quest is resolved through love and harmony.

The on-going reprinting of Dunsany's tales—especially "The Sword of Wellaran" and "The Fortress Unvanquishable Save for Sacnoth"—demonstrates Dunsany's continuing influence on the literature of fantasy, the lasting appeal of his fantastic settings, and his role as a progenitor of modern fantasy literature in all its varieties and techniques.

—Roger C. Schlobin

**EDDISON, E(ric) R(ucker)** (1882-1945). British. *The Worm Ouroboros*, 1922; *Styrbiorn the Strong*, 1926; *Mistress of Mistresses: A Vision of Zimiamvia*, 1935; *A Fish Dinner in Memison*, 1941; *The Menzientian Gate*, 1958.

\* \* \*

William Morris was an important influence on many later writers, including E.R. Eddison. Eddison's *Styrbiorn the Strong*, a historical romance, is based on materials found in the Norse and Icelandic sagas, and is often considered, with Haggard's *Eric Brighteyes*, one of the best modern depictions of the Viking Age. Four years later, Eddison published *Egil's Saga*, a prose translation of an Icelandic saga. In both works, Eddison mentions Morris's romances and translations.

Eddison's fame, however, rests largely on a work which has much in common with saga and historical romance but is actually pure fantasy, *The Worm Ouroboros*. It is both romantic and epic, filled with the lavish description and heroic adventure that delight fantasy readers. And at the end of the novel, just as the reader and the characters are wishing that it could go on forever, their wish is granted, the action begins all over again, and the plot of the novel, like the worm of the title, becomes circular and eats its own tail. Eddison's Zimiamvian trilogy—*Mistress of Mistresses*, *A Fish Dinner in Memison*, and *The Menzientian Gate*—which follows *The Worm Ouroboros* and is set in the heaven of the world depicted in that novel, is less successful. Most critics agree that the philosophy Eddison propounds in the Zimiamvian trilogy makes the novels difficult to read, and most readers find them harder going than *The Worm Ouroboros*. *The Menzientian Gate* is especially difficult because it was finished and published after Eddison's death.

—C.W. Sullivan III

**MORRIS, William** (1834-96). British. *The Earthly Paradise* (verse), 3 vols., 1868-70, revised edition, 1890; *The Story of Sigurd the Volsung and the Fall of the Niblungs* (verse), 1876; *A Dream of John Ball*, and *A King's Lesson*, 1888; *A Tale of the House of the Wolfings*, 1889; *The Roots of the Mountains Wherein Is Told Somewhat of the Lives of the Men of Burgdale . . .*, 1889; *News from Nowhere*, 1890; *The Story of the Glittering Plain Which Has Been Also Called the Land of Living Men, or the Acre of the Undying*, 1891; *The Wood Beyond the World*, 1894; *Child Christopher and Goldilind the Fair*, 1895; *The Well at the World's End*, 1896; *The Hollow Land*, 1897; *The Water of the Wondrous Isles*, 1897; *The Sundering Flood*, 1897; *Golden Wings*, 1900; *The Hollow Land and Other Contributions to the Oxford and Cambridge Magazine*, 1903.

\* \* \*

It is impossible to summarise the contribution of William Morris to his age, which he abominated, and to our own, which would not much have impressed him. As social thinker, as designer and influence upon both arts and crafts (and especially those of everyday life), as poet (though his biggest works are not much to our contemporary taste) and as the first great Englishman to declare himself a communist, he is unique and irreplaceable. Yet it may be that the ten great prose fictions of the last ten years of his life offer his most lasting influence and his finest work. In these romances he invented the modern fantasy

novel, set in an imagined, glamorous and self-consistent world, a "secondary creation," as Tolkien was later to call it.

Morris was directly influenced by saga, epic, and medieval romance: he in fact translated many sagas, as well as *The Odyssey*, *The Aeneid*, *Beowulf*, and some romances—the most important of which, *Havelock the Dane*, became the prose romance *Child Christopher*. The list of influencing genres would not be complete, however, without the wealth of folktales that he knew and used (mostly in verse) which give a pervasive colouring to the prose romances proper. Two of the ten books are time-travel stories, two evoke "barbaric" pre-history, and the other six are more or less radical redesignings of the patterns of quest-romance.

*A Dream of John Ball* takes a modern protagonist back into the time of the Peasants' Revolt, a period whose arts, crafts, and architecture delighted Morris, and with whose social turmoil he strongly identified. The time-traveller learns the impotence of "knowing the future": he cannot help John Ball and the other rebels, and the nightlong climactic discussion with Ball in the church is more enlightening to "modern man" than to the radical priest. The book's initial and lasting charm lies in the eager clarity with which the medieval setting is evoked.

*News from Nowhere* is a much larger companion work, a journey into and within a future world that is described in the same energetic, clear-edged style. This future world is the Commonwealth of "Nowhere," into which the protagonist dreams England has been transformed by revolution. It is the finest Utopia in English, the only one thoroughly worth living and working in, and Morris wrote it for a small radical audience, the readership of his leftwing magazine *Commonwealth*, who would find it worth living and working for.

*News from Nowhere* at times seems to divide between too much "history" of how this post-governmental England came into being and too easy a celebration of its early-summer idyllic aspects, but the time-traveller joins and justifies these contraries. The wise and subtle treatment of his responses to—and his salutary effect on—the people of Nowhere carries the narrative and powers its journey into the heart of England and of community. Contemporary readers knew the open secret that "William Guest" was Morris, and recognised every stage in his journey as part of Morris's life. His strength of longing also creates the intrepid soul-mate Ellen, who will safeguard and reshape Nowhere in its future, because she has met and loved the man that dreamed it.

*A Tale of the House of the Wolfings* and *The Roots of the Mountains*, between the two time-travel stories, explore two forms of the high barbaric society that Morris (like Marx and Engels) much preferred to high-capitalist civilisation. In *A Tale of the House of the Wolfings* the Gothic tribe's heroic resistance to Roman imperialism focusses upon the indomitable war-leader Thiodolf, but his love-affair with the nature-goddess and part-time Valkyrie Wood-Sun almost prevents the completion of his necessary selfless death. In *The Roots of the Mountains* another warrior-hero finds that the destiny of his people depends on both battle and his personal leadership, but the Gothic tribes are united and the Huns driven from that side of the mountains without his having to pay the final price. Goldmane is a more complex and contemporary hero than Thiodolf; both wildwood magic and personal luck and beauty protect him instead of destroying him.

*The Story of the Glittering Plain* evokes a later, Teutonic tribal world, and the hero, Hallblithe, has to pursue a Viking group that has kidnapped his betrothed. The quest takes him beyond this conflict, however, to an earthly paradise in which youth is permanently renewed and sensuous delight is not only

guaranteed but insisted upon. Hallblithe detests the Glittering Plain; he eventually escapes from paradise and is reunited with his love. In a similar short romance, Golden Walter flees a miserable failed marriage, following mysterious visions that take him to the Wood Beyond the World. There his sexual helplessness teaches him to grow, both by his being forced to lie with the Lady of that Wood and by his being forbidden even to touch the Maid he loves. Eventually, the Maid is responsible for the Lady's death, and the two survivors find a new life as welcome rulers of a strange city through the mountains.

In these short romances and their great successors, *The Well at the World's End* and *The Water of the Wondrous Isles*, Morris creates a world akin to an unchurched version of medieval north-western Europe. There is active magic in these worlds, both for good and for ill, and usually associated with a wise and beautiful woman (or two or more contrasting power-women). Natural and life-enhancing magic is available to the very rare adventurer who reaches the Well at the World's End, but the book focusses on Ralph's adventures travelling there and back, especially his contact with the two loves of his life: one is a Power-Lady, the other a beautiful and courageous "ordinary" girl who becomes far more astonishing than the Lady.

*The Water of the Wondrous Isles* has an even more revolutionary effect upon our expectations of the quest: the protagonist or "hero" is a girl. A witch has stolen Birdalone and reared her to be a trap for lustful males, but she escapes, naked and resolute, into the wide world. She travels among literally wondrous isles and is caught up in a typical male quest, whose heroes leave her in a safe, smug castle while they sail off to rescue their ladies. Since she has never been taught that ladies are supposed to be passive, she escapes this protection too, and causes a much more perilous and passionate story. Three kinds of power-women influence her life, but her own developing integrity brings a qualified happy ending to her story.

The last, and incomplete, romance, *The Sundering Flood*, returns to a male hero, aided by chthonic magic and doing great deeds even as a boy. Osborne's female counterpart, Elfhild, was never properly filled out, and the book has accepted the limitations of an Icelandic saga, whereas the major romances explore their own psychological and magical structuring forces in a more demanding way.

The enactment of archetypal events, the rich evocation of psychological fears and needs, and the unhurried delight in both adventure and environment, make Morris's best romances a valuable experience—Yeats described them as books he always read very slowly, so as not to come too soon to the end. Their radical political stance and keen celebration of female personality are also remarkable, when so many fantasies are (rightly or wrongly) associated with high-church conservatism. Like Ellen in *News from Nowhere*, the Maid, Ursula, and Birdalone are courageous and enterprising people, not baits or rewards for more "real" male protagonists.

Morris created his own language, with something of the texture of 14th-century English, but as unlike it as Spenser's is unlike Malory's. The resultant style is a unique experience, shapely and pleasurable, emphasising physical rather than abstract aspects of experience, while retaining a tapestried sense of distance. The romances are designed for a future society's audience, freed from the frantic busyness of his own age just as the folk of his Nowhere are. This audience loves a good story with both circumstantiality and wonders whether in an old folktale, a Dickens fiction, or a "reactionary novel." It delights in so active and sensuous a world, so radical and lucid a use of traditional conventions. Morris invented the fantasy set in an invented and magical pseudo-medieval land, but he also

invented a fantastic future audience that could appreciate it.

—Norman Talbot

**PEAKE, Mervyn** (1911-68). British. The Gormenghast books: *Titus Groan*, 1946, *Gormenghast*, 1950, and *Titus Alone*, 1959; *Mr. Pye*, 1953.

\* \* \*

Peake's major fictional works are the three books which relate the heritage, childhood, and adolescence of Titus, 77th Earl of Gormenghast. They are often inaccurately called the Gormenghast Trilogy, but the third volume is not set in Gormenghast, nor were they designed as a trilogy. Peake certainly intended a fourth book, and would probably have written more.

Gormenghast is an immense, ancient castle of crumbling stone and suffocating ritual, set in a wild and dreary land. Its inhabitants, from Count Sepulchre, suffused in laudanum and antiquarian gloom, down to Swelter, the mountainous chef, make up one of the greatest gallery of grotesques in English literature. Every aspect of their existence is dictated by the Master of Ritual from the Books of the Law, though the observances and ceremonies are so old that no one can even remember their significance. Seizing on his shadowy castle and its atmosphere of doom, many critics have called Peake a gothic writer, but the label is misleading. He makes almost no use of the supernatural, which is essential to Gothic, and his descriptive writing has a visual and tactile solidity foreign to the genre. His characters, with their extraordinary forms and names—Flay, Muzzlehatch, Prunesquallor—are caricatures whose robust and energetic presence recalls Dickens or Rabelais, not Walpole or Radcliffe. Again, Peake is farcical as well as horrific; he writes out of a relish for life and colour that is hostile to Gothic morbidity, sunlight to its vampires.

*Titus Groan* is the story of Titus's birth and the ripples of disturbance that spread inexorably from it. He is a natural rebel, impulsive, moody, idealistic; his arrival coincides with the rise of Steerpike, a more sinister figure, who works his way up from kitchen the highest place of power by insinuation, flattery, violence, and murder. The prose is deep, dense, eloquent, and richly detailed. Peake was a painter, and when he used purple he knew exactly what shade and texture he needed.

*Gormenghast*, which tells of Titus's truant childhood, the growing horror and inhumanity of Steerpike, and their eventual, inevitable confrontation, moves more quickly. Once set going, "change, that most unforgivable of all heresies," spreads like contagion. The rituals are disrupted. Love shows itself in strange distortions, ungainly, absurd, or corrupt. Steerpike is exposed and hunted. Peake loses none of his control as his plot gains momentum. He portrays the adolescent tumult in all its quicksilver ambiguity. Titus's experience of life and death both in and outside the castle brutally confirm his individuality, the impossibility that he will stay there. Disobeying his mother by going in to fight the cornered villain, he is attacking the Master of Ritual and manipulator of lives, powers of Gormenghast that he hates; but he is also ridding the castle of the man who would crush it to dominate it.

*Titus Alone* is entirely different again, which has put off readers who (unlike Peake) are more interested in Gormenghast than in Titus and the rest of the world. It is, though rarely acknowledged as such, science fiction, from a class somewhere

between Huxley's *Brave New World* and Harness's *The Rose*. Titus wanders, exiled and imperilled, in a strange land, a meticulous parody of modern Europe with furnishings and fittings that place it in an imminent, unpleasant future. He is arrested in a city of crystal towers and rockets; he is pursued by machine-like police and a robot flying eye, and hides in the refugee camp of the Under-River with all the malcontents and victims of a damaged civilisation; he falls into the hands of Cheeta, the corrupt daughter of the master of the death factory. Wherever he goes, no one has heard of Gormenghast, and few will believe it exists. Where *Titus Groan* was ponderous and slow, *Titus Alone* is fast and elusive. We barely glimpse the scenes as they whirr by. The effect is intentional, frightening in a way that Peake's other horror fiction never is; but the mysteries and frustrations of the book are, unavoidably, too many. Peake's last illness was well upon him when he began it, and his ability to express his ideas deteriorated as he wrote. The moral vision, at once urgent and subtle, emerges in flashes, or dimly; the novel is a characteristic document of the 20th century, damaged, hallucinatory, but intensely purposeful. (Langdon Jones's 1970 edition is the best possible version of what Peake had in mind.)

"Boy in Darkness" tells an extra story of *Titus Groan*, though without naming him. After the rituals of his 14th birthday he slips away from the castle into the wilderness, where he meets two old creatures called Goat and Hyena. They take him to the Blind Lamb, a malevolent deity who lives deep in an abandoned mine where once, like Comus, he commanded a rout of beasts transformed from human originals. The Goat and the Hyena are the last of this crew. He begins the metamorphosis of Titus, who fights back at the last minute for his humanity and that of the two pathetic courtiers. More sombre than almost any episode in the novels, "Boy in Darkness" has been read by some as spiritual, perhaps blasphemous, allegory, though interpretation was never the purpose of Peake's imaginings. Certainly the story is his most chilling and sensuous exercise in the macabre, far superior to the merely gruesome "Same Time, Same Place" and the ghoulish "Danse Macabre." *Mr. Pye*, Peake's only other novel, was unsuccessful when it was published because of expectations aroused by the Titus books. It is comic fantasy of a very different kind: a remarkable mixture of farce and fable, lighter in tone than the Titus books, but more exclusively adult in appeal. Set on Sark, it records the misadventures of a charming, irritating, self-appointed missionary whose work of disseminating love among the close, suspicious islanders is upset when God, "the Great Pal," rewards him rather too literally.

It can be said that Mervyn Peake lived before his time, and died too soon. Best known during his life for his dense, vigorous illustration of works by authors from Carroll to Coleridge, he also produced poetry, paintings, plays for radio and stage, and theatrical designs, as well as the prose fantasy for which he is now most famous. An eccentric to his own generation, he has been rightly honoured as a master by the next—unfortunately too late to know or benefit by it.

—Colin Greenland

**TOLKIEN, J.R.R.** (1892-1973). British. *The Hobbit, or, There and Back Again*, 1937; *Farmer Giles of Ham*, 1949; *The Lord of the Rings: The Fellowship of the Ring*, 1954, *The Two Towers*, 1955, *The Return of the King*, 1956, revised edition, 1966; *The Adventures of Tom Bombadil and Other Verses from the Red*

*Book*, 1962; *Tree and Leaf*, 1964; *Smith of Wootton Major*, 1967; *The Road Goes Ever On* (verse), 1968; *Bilbo's Last Song*, 1974; *The Father Christmas Letters* (juvenile), 1976; *The Silmarillion*, edited by Christopher Tolkien, 1977; *Unfinished Tales of Númenór and Middle-Earth*, edited by Christopher Tolkien, 1980; *The History of Middle-Earth (The Book of Lost Tales*, parts 1 and 2, *The Lays of Beleriand*), edited by Christopher Tolkien, 1983-85.

\* \* \*

In 1937, J.R.R. Tolkien published *The Hobbit*. The story, now a classic of the genre, introduces the reader to hobbits and their culture in Middle-Earth. As the tale develops, we are to meet characters that step into Bilbo's adventure out of folk legend and fairy story: a wizard, dwarfs bent upon revenge and the recovery of a fabulous treasure, trolls, goblins, elves both magical and dangerous, a bear-man changeling, and above all the great dragon Smaug. Much of the story's success depends upon the way in which Tolkien introduces us to the character of Bilbo Baggins, the hobbit whose uneventful life as a comfortable bachelor at Bag End is forever upset by the intervention of Gandalf the wizard who leads Thorin Oakenshield and his company of dwarfs to Bilbo's door with the promise that Bilbo will prove to be a daring and resourceful burglar, and just the person needed to win back the treasure of the dwarfs from Smaug. Bilbo is an unwilling adventurer who loves his comfortable hobbit hole and his reputation as a respectable member of a community of innocent, good-natured burghers. Tolkien manages successfully the difficult task of keeping the comic dimensions of Bilbo's character pleasantly in focus while at the same time developing the equally endearing qualities of good humor, humility, moral courage, and a temperate mind.

In the course of the action, two things are happening. The first is the discovery of the shape, constitution, and nature of Middle-Earth and its wondrous if sometimes menacing inhabitants. Tolkien opens a prospect of unexplored territory in fairyland, and rarely misses an opportunity to enrich the reader's imagination with new and permanent boundary markers. The second is that, in the course of the action, Bilbo comes to discover his limitations but also his own powers and his place in the wide world. Tolkien has shaped the action of Bilbo's quest as correlative to the experience of growing up. His adventures remind us with the solicitude of a wise parent: be yourself, trust your instincts for good, overcome your belittling fears, be generous and brave always, be courteous, especially in strange company or in foreign lands, be resourceful, and the world will discover your worth and praise your accomplishments, and you will be numbered with the mighty and powerful.

Since Bilbo's initiation into life is one of the substructures shaping this narrative, part of his learning experience comes from rubbing elbows with creatures of other kinds and species. He learns about the special virtues, powers, and shortcomings of dwarfs, elves, orcs, goblins, wizards, and men. He learns a bit of the history and lore of Middle-Earth and of the polite conventions that make common action possible between variant races and species. In learning these things, Bilbo comes to understand himself better as a hobbit and to see his place and that of his kind in the great scheme of things, although the full revelation of that awaits *The Lord of the Rings*. Bilbo learns to his surprise, discomfort, and eventual satisfaction that he has a role to play in life and in the great adventures of the wide world—even of the wild world.

Tolkien made a revision of *The Hobbit* after he had completed the trilogy *The Lord of the Rings*. The revision was a major one,

raising the tone and characterization considerably above the original child's story level to the threshold of the legendary, making it more consistent with the great sequel to which, in a way, it gave birth. Also Tolkien made some adjustments in the details of the original story so as to bring them into line with the more serious mythology of the trilogy.

In the end, the greatness of the trilogy has to be assessed on the basis of what Tolkien attempted. The trilogy is, of course, fantasy, an extension of the fairy-story elements of *The Hobbit* into the heroic tradition. Some critics have called it "high fantasy," others myth, still others saga, legend, even science fiction and "super science fiction." Tolkien himself described the trilogy as "feigned history," and as such it is best understood. Feigned history is imagined history, which is not at all the same thing as imaginary history.

The appearance of *Unfinished Tales* and *The History of Middle-Earth* throws new light on Christopher Tolkien's extraordinary contributions as editor of *The Silmarillion* and offers sufficient background evidence that *The Silmarillion* continued to mature in Tolkien's mind as much after the writing of *The Lord of the Rings* as before. Although the published *The Silmarillion* is unfinished and not the work the author hoped to produce, what we have is incomparable. *The Silmarillion* is best read as the scripture and legendary history of the elves. Nor is it presumed that the history was all given in the same voice, style, or at the same moment. All three of the major branches of the elves (Vanyar, Noldor, Teleri) seem to have their temperaments represented in the various books: the Vanyar in "Ainulindale," the Teleri in "Valaquenta," and the Noldor in "Quenta Silmarillion." As such, *The Silmarillion* is Tolkien's elvish scripture, a feigned sacred writing: the revelation, lore, and practice from which we are to surmise those myths and legends grew that gave birth eventually to the hobbit records of the last war against Sauron in *The Lord of the Rings*. The feigned history of *The Lord of the Rings* which includes its own epic-heroic-legendary transformations now ultimately rests upon the elvish revelations of *The Silmarillion*. If the gods be absent from *The Lord of the Rings*, as many critics once complained (even though gods are very much felt), they are present and immanent in *The Silmarillion*.

Clearly, *The Silmarillion* is the foundation of Tolkien's Middle-Earth and everything in it. He began writing parts of the Silmaril mythos before he went off to World War I, declaring to his future wife and to friends that his intention was to create a mythology for England. *The Silmarillion* was to be an English epic fit to rival Homer and Virgil, the stated ambition of every major English poet since Spenser. As the other poets, Tolkien rests his epic claims on language, but in his case it is not merely the narrative language but the languages of the subtexts of Middle-Earth. In the case of *The Silmarillion*, especially elvish. More than any work of its type, *The Silmarillion* grew out of language, both received and invented.

Tolkien's genius for naming grew directly out of his interest in developing imaginary languages spoken by beings all the more imaginary for dwelling in the world of faerie. Tolkien's world is the backward extension of the one we know from romance, legend, folklore, and fairy tale. Thus the revelation at the beginning of "Ainulindale" that the elvish name for Eru, the creator, was Iluvatar is revelation indeed, but perhaps more of elvishness than divinity. Tolkien is at his best when working at the roots of words and at the heart of languages wherein the inquiring mind discovers itself reflected in its most basic operations. Thus, the Tolkien power of name-giving is reflexive, revealing both the thing named and the namer—here the elves—but it stirs hidden responses in the receptive reader to the

universal sense of the power of names, when they are the right names. And Tolkien is almost infallibly right in his naming, perhaps because his inspirations come from an understanding of the nature and practice of language similar to that which a scientist might develop after long study of the secrets of nature. Inventing names is Tolkien's chief (but not only) method of activating the power of language structures to both quicken the imagination and convey the assurance that existence follows upon the name, as indeed in Tolkien's world it truly does.

We cannot separate Tolkien's interest in and experiments with languages both real and imagined from his vision of faerie, a vision that grew with his exploration of its imaginative potential. Tolkien revealed that the vision was in his words "a gift," and it remained for him all his life a hobby and a pastime, bound up with both his scholarship as an Oxford don and his parenting of his own children. Many of the key episodes that anchored *The Silmarillion* in Tolkien's imagination were visions, visual images, which Tolkien felt he was obliged to find the explanation of. He always held that Middle-Earth was a world discovered rather than dreamed up. It was to be found in the logic of cause and effect: an imagined language extended itself necessarily to ethology, and thence to geology, geography, botany, zoology and so on, producing the coherent infrastructures of a realized secondary world suited to the imagination.

No critical estimate of Tolkien and *The Silmarillion* would be worth producing without a word on style. Thanks to the publication of some of the earlier drafts of *Silmarillion* materials, we can assess the process by which Tolkien's mature style developed. How fortunate literature has been that Tolkien's elvish mythology did not enjoy an early success. The early drafts are discovered to be stylistically mannered, artificial in the bad sense, and feebly imitative of 19th-century aesthetic models. As Tolkien's imagination expanded so did the range of

his style. Finally, he found the proper voices for his elves in *The Silmarillion*, which contains elements of the most lyrical prose ever written in English. *The Silmarillion* is, moreover, rich in sustained, inspired story-telling, in mythic and epic elements that range from the literature of revelation to the tragic beauty of elvin history in Middle-Earth, an accounting of a species exiled by fate and by choice from felicity. In addition to numerous instances in the published version of *The Silmarillion*, readers should not overlook two jewels of heroic and tragic narrative reaching that rarest of all literary achievements, the sublime, in the stories of Tuor and Turin, both found in *Unfinished Tales*.

*The Lord of the Rings* and *The Silmarillion* are not merely great fantasy; they are great literature. Tolkien will continue to interest scholars and students who have already begun the exhaustive study of his work, its sources, inspirations, and its elements. There is little doubt that Tolkien will eventually take his place somewhere in the neo-romantic movement which followed the aestheticism and decadence of the late 19th century. He has already been placed in the tradition of writers like Rider Haggard and William Morris, and the influences of the Eddas, the Kalevala, Anglo-Saxon, and Middle English romance have already been noted and will doubtless yield more secrets in the future. Nor should we ignore the influence of the Inklings and their interest in Tolkien's work during the long, difficult years before recognition came. Other students will consider the relation or at least the parallels to contemporary writers of fantasy like Mervyn Peake and Austin Tappan Wright. In the end, it may be that Tolkien will be understood best when linked and compared to James Joyce, an unlikely pairing, perhaps, but one that is full of telling comparisons and contrasts.

—Donald L. Lawler

TITLE  
INDEX

The following list of titles includes all novels and short story collections (designated “s”) listed in the Science-Fiction Publications section of the entries in the book. The name(s) in parenthesis after the title is meant to direct the reader to the appropriate entry where full publication information is given. Series characters or locales (noted in the fiction lists) are listed here, even if their names do not appear in specific titles of works. The abbreviations “for” and “fan” indicate entrants in the Foreign-Language Writers and Major Fantasy Writers appendices.

- A for Andromeda (F. Hoyle), 1962  
A for Anything (D. Knight), 1961  
Abandon Galaxy (Fox, as Somers), 1967  
Abandoned (Verne, for), 1874  
Abbs (Hyne), 1929  
Ability Quotient (Reynolds), 1975  
Abode of Life (Correy), 1982  
Abominable Earthman (s Pohl), 1963  
Above All Else (Shiel), 1943  
Absolute at Large (Capek, for), 1927  
Absolutely Perfect House (Mayhar), 1983  
Abyss (Keller), 1948  
Abyss (Wilhelm), 1971  
Accidental Earth (Kelley), 1968  
Across a Billion Years (Silverberg), 1969  
Across the Ages (Fearn, as Statten), 1952  
Across the Sea of Stars (Benford), 1984  
Across the Sea of Stars (Clarke), 1959  
Across Time (Wollheim, as Grinnell), 1957  
Actions and Reactions (s Kipling), 1909  
Active Measures (Drake, J. Morris), 1985  
Adam in Moonshine (Priestley), 1927  
Adam Link series (s Binder)  
Adam the Creator (Capek, for), 1929  
Address: Centauri (F. Wallace), 1955

After Many a Summer Dies the Swan (Huxley), 1939  
After Some Tomorrow (Reynolds), 1967  
After Things Fell Apart (Goulart), 1970  
After 12,000 Years (Coblentz), 1950  
After Utopia (Reynolds), 1977  
After Worlds Collide (Wylie), 1934  
After World's End (Williamson), 1961  
Afterglow (England), 1965  
Against Infinity (Benford), 1983  
Against the Fall of Night (Clarke), 1953  
Age (Aldiss), 1967  
Age of Miracles (Brunner), 1973  
Age of the Pussyfoot (Pohl), 1969  
Agency series (Meltzer)  
Agent (Meltzer), 1968  
Agent of Chaos (Spinrad), 1967  
Agent of the Terran Empire (s P. Anderson), 1965  
Agent of the Unknown (St. Clair), 1956  
Agent of Vega (P. Anderson), 1983  
Agent of Vega (s Schmitz), 1960  
Ahead of Time (s Kuttner), 1953  
Airs of Earth (s Aldiss), 1963  
Airtrust (England), 1915  
Alas, Babylon (Frank), 1959  
Alastor series (Vance)  
Alchemical Marriage of Alistair Crompton (Sheckley), 1978  
Aldair series (Barrett)  
Aleph (Borges, for), 1970  
Algorithm (Gawron), 1978  
Alice's World (Lundwall), 1971  
Alicia II (Thurston), 1978  
Alien (Davies), 1968  
Alien (A. Foster), 1979  
Alien (R. Jones), 1951  
Alien Accounts (s Sladek), 1982  
AlienArt (Dickson), 1973  
Alien Cargo (s Sturgeon), 1984  
Alien Debt (Busby), 1984  
Alien Dust (Tubb), 1955  
Alien Embassy (Watson), 1977  
Alien from Arcturus (Dickson), 1956  
Alien from the Stars (Fanthorpe), 1959  
Alien from the Stars (Sutton), 1970  
Alien Heat (Moorcock), 1972  
Alien Horizons (s Nolan), 1974  
Alien Impact (Tubb), 1952  
Alien Intelligence (s Williamson), 1980  
Alien Island (Sherred), 1970  
Alien Life (Tubb), 1954  
Alien Main (Biggle, Sherred), 1985  
Alien Minds (E. Evans), 1955  
Alien Ones (Fanthorpe, as Brett), 1963  
Alien Planet (Pratt), 1962  
Alien Realms (E.E. Smith), 1980  
Alien Sea (Rackham), 1968  
Alien Seed (Tubb), 1976  
Alien Universe (Tubb, as Gridban), 1952  
Alien Upstairs (Sargent), 1983  
Alien Way (Dickson), 1965  
Alien Worlds (E.E. Smith), 1978  
Aliens (s Leinster), 1960  
Aliens Among US (s J. White), 1969  
Aliens for Neighbours (s Simak), 1961  
Aliens 4 (s Sturgeon), 1959  
Aliens from Space (Silverberg, as Osborne), 1958  
Aliens, Travellers and Other Strangers (Strugatsky, for), 1984  
All Around the Moon (Verne, for), 1876  
All Darkness Met (Cook), 1980  
All Flesh is Grass (Simak), 1965  
All Fools' Day (Cooper), 1966  
All for His Country (Giesy), 1915  
All Judgment Fled (J. White), 1968  
All My Sins Remembered (Joe Haldeman), 1977  
All the Colors of Darkness (Biggle), 1963

- All the Myriad Ways (s Niven), 1971  
 All the Sounds of Fear (s Ellison), 1973  
 All the Traps of Earth (s Simak), 1962  
 All These Earths (Busby), 1978  
 All Times Possible (Eklund), 1974  
 Alley God (s Farmer), 1962  
 Allies of Antares (Bulmer, as Akers), 1981  
 Alnians series (Hoskins)  
 Alone Against Tomorrow (s Ellison), 1971  
 Alph (Maine), 1972  
 Alpha Centauri—or Die! (Brackett), 1963  
 Alpha Yes, Terra No! (Petaja), 1965  
 Als Al het Andere Faalt (s Strete), 1976  
 Altar on Asconal (Brunner), 1965  
 Alteration (Amis), 1976  
 Altered Ego (Sohl), 1954  
 Alternate Martians (Chandler), 1965  
 Alternate Orbits (s Chandler), 1971  
 Alternating Currents (s Pohl), 1956  
 Alton's Unguessable (Sutton), 1970  
 Aluminum Man (Edmondson), 1975  
 Always the Blackknight (Hoffman), 1970  
 Alyx (s Russ), 1976  
 Amazon Planet (Reynolds), 1975  
 Amazon Strikes Again (Fearn), 1954  
 Amazon's Diamond Quest (Fearn), 1953  
 Amber series (Zelazny)  
 Amberdon, Telzey series (Schmitz)

 Another Kind (s Oliver), 1955  
 Another Tree in Eden (Duncan), 1956  
 Answer (s Wylie), 1956  
 Antaretic Mystery (Verne, for), 1898  
 Anthem (Rand), 1938  
 Anthology (s Anthony), 1985  
 Anthropol (Trimble), 1968  
 Antic Earth (Charbonneau), 1967  
 Anti-Death League (Amis), 1966  
 Antigeos series (Capon)  
 Antigra (Fisk), 1978  
 Anti-Man (Koontz), 1970  
 Antinomy (s S. Robinson), 1980  
 Anton York, Immortal (s Binder), 1965  
 Anubis Gates (Powers), 1983  
 Anvil of Time (Silverberg), 1969  
 Anything Box (s Henderson), 1965  
 Anything Tree (Raekham), 1970  
 Anything You Can Do... (Garrett, as Langart), 1963  
 Anywhen (s Blish), 1970  
 Ape and Essence (Huxley), 1948  
 Apocalypse Brigade (Coppel), 1981  
 Apocalypses (Lafferty), 1977  
 Apollo at Go (Sutton), 1963  
 Apology for Rain (Gawron), 1974  
 Apostle of the Cylinder (Rousseau), 1918  
 Appointment at Bloodstar (Goldin), 1978  
 Apprentice Adept series (Anthony)  
 Approaching Oblivion (s Ellison), 1974  
 Aquarius Mission (Caidin), 1968  
 Aquiliad (s Sucharitkul), 1983  
 Archipelago (Lafferty), 1979  
 Arcot, Morey, and Wade series (Campbell)  
 Arctic Bridge (s Meek), 1944  
 Areturus Landing (Dickson), 1978  
 Ardor on Aros (Ofutt), 1973  
 Arena of Antares (Bulmer, as Akers), 1974  
 Argentis (Tubb, as Shaw), 1952  
 Argos series (Lessing)  
 Ark, Simon series (s Hoeh)  
 Arm of the Starfish (L'Engle), 1965  
 Armada of Antares (Bulmer, as Akers), 1976  
 Armageddon (Waterloo), 1898  
 Armageddon Rag (Martin), 1983  
 Armageddon 2419 A.D. (Nowlan), 1962  
 Armed Camps (Reed), 1969  
 Arrive at Easterwine (Lafferty), 1971  
 Arsenal of Miracles (Fox), 1964  
 Artery of Fire (Scortia), 1972

- Artifact (Benford), 1985  
 Artificial Kid (Sterling), 1980  
 Artificial Man (Davies), 1965  
 As on a Darkling Plain (Bova), 1972  
 As the Curtain Falls (Chilson), 1974  
 As the Green Star Rises (L. Carter), 1975  
 As You Were (s Kuttner), 1955  
 Ascendancies (Compton), 1980  
 Ascension (Grant), 1977  
 Ashes and Stars (Zebrowski), 1977  
 Ashes, Ashes (Barjavel, for), 1967  
 Asleep in the Afternoon (Large), 1938  
 Assassin of Gor (Norman), 1970  
 Assault on the Gods (Goldin), 1977  
 Assignment: Hellhole (Offutt, as Cleve), 1983  
 Assignment in Eternity (s Heinlein), 1953  
 Assignment in Nowhere (Laumer), 1968  
 Assignment: Nor'Dyren (Van Scyoc), 1973  
 Asteroid Man (Fanthorpe), 1960  
 Astra series (Norton)  
 Astral Quest (Rankine), 1975  
 Astronaut (Searls), 1960  
 Astronauts Must Not Land (Brunner), 1963  
 Asutra (Vance), 1974  
 Asylum Piece (s Kavan), 1940  
 Asylum World (Jakes), 1969  
 At the Earth's Core (E. Burroughs), 1922  
 At the Edge of the World (Dunsany, fan), 1970  
 At the Eye of the Ocean (Schenck), 1980  
 At the Mountains of Madness (s Lovecraft), 1964  
 At the Narrow Passage (Meredith), 1973  
 At the Seventh Level (Elgin), 1972  
 Atilus series (Tubb, as Thomson)  
 Atlantean Nights Entertainment (Pangborn), 1980  
 Atlantic Abomination (Brunner), 1960  
 Atlas Shrugged (Rand), 1957

 Atom War on Mars (Tubb), 1952  
 Atomic Fantasy (Capek, for), 1948  
 Atomic Nemesis (Fanthorpe, as Zeigfried), 1962  
 Atoms and Evil (s Bloch), 1962  
 Atoms of Empire (s Hyne), 1904  
 Aton series (Anthony)  
 Atrocity Exhibition (s Ballard), 1970  
 Attack from Atlantis (del Rey), 1953  
 Attack on the Giant Baby (s Reed), 1981  
 Attar series (Joe Haldeman, as Graham)  
 Aurelia (Lafferty), 1982  
 Austin, Steve series (Caidin)  
 Authentic Touch (Wodhams), 1971  
 Automated Goliath (Temple), 1962  
 Autumn Angels (Cover), 1975  
 Autumn People (s Bradbury), 1965  
 Avatar (P. Anderson), 1978  
 Avenger series (Goulart, as Robeson)  
 Avenger of Antares (Bulmer, as Akers), 1975  
 Avengers Battle the Earth-Wrecker (Binder), 1967  
 Avengers of Carrig (Brunner), 1969  
 Avenging Goddess (s Fanthorpe), 1964  
 Avenging Martian (Fearn, as Statten), 1951  
 Aventine (s Killough), 1982  
 Awakening (Meredith), 1979  
 Away and Beyond (s van Vogt), 1952  
 Awful Egg (Dent, as Robeson), 1978  
 Ayesha (Haggard), 1905  
 B.E.A.S.T. (Maine), 1966  
 Babel-17 (Delany), 1966  
 Baby is Three (Sturgeon), 1965  
 Back to the Stone Age (E. Burroughs), 1937  
 Backward in Time (Kelley), 1979  
 Badge of Infamy (del Rey), 1963  
 Bagful of Dreams (s Vance), 1979  
 Balance of Power (Stableford), 1979  
 Baley, Elijah series (Asimov)  
 Ballad of Beta-2 (Delany), 1965  
 Ballroom of the Skies (MacDonald), 1952  
 Balls! (Rohmer), 1979  
 Baltimore Gun Club (Verne, for), 1874  
 Bander Snatch (O'Donnell), 1979  
 Barbarian of World's End (L. Carter), 1977  
 Barbarians of Mars (Moorcock, as Bradbury), 1965  
 Barbie Murders (s Varley), 1980  
 Barefoot in the Head (Aldiss), 1969  
 Barnard's Planet (Boyd), 1975  
 Barnstormer in Oz (Farmer), 1982  
 Barons of Behavior (Purdom), 1972  
 Barrier 346 (Fanthorpe, as Zeigfried), 1965  
 Barrier World (Charbonneau), 1970  
 Barsac Mission (Verne, for), 1960  
 Barton series (Busby)  
 Bastable, Oswald series (Moorcock)  
 Bathhouse (Mayakovsky, for), 1968  
 Battle Circle series (Anthony)  
 Battle for the Planet of the Apes (Gerrold), 1973  
 Battle for the Stars (Hamilton), 1961  
 Battle of Forever (van Vogt), 1971  
 Battle of Wizards (Hubbard), 1949  
 Battle on Mercury (del Rey, as Van Lhin), 1953  
 Battle on Venus (Temple), 1963  
 Battlefield Earth: A Saga of the Year 3000 (Hubbard), 1983  
 Battletar Galactica series (Goulart, Resnick, Thurston, Yermakov)  
 Beachhead Planet (R. Williams), 1970  
 Beanstalk (Rackham), 1973  
 Bearing an Hourglass (Anthony), 1984  
 Beast (J. Fast), 1981  
 Beast series (Stallman)  
 Beast (van Vogt), 1963  
 Beast Master series (Norton)  
 Beast That Shouted Love at the Heart of the World (s Ellison), 1969  
 Beastchild (Koontz), 1970  
 Beasts (Crowley), 1976  
 Beasts from Beyond (Wellman), 1950  
 Beasts of Antares (Bulmer, as Akers), 1980  
 Beasts of Gor (Norman), 1978  
 Beasts of Kohl (Rackham), 1966  
 Beautiful Biting Machine (s Lee), 1984  
 Because It Is Absurd (Boulle, for), 1971  
 Beckoning Hand (s Allen), 1887  
 Beckoning Lights (M. Hughes), 1982  
 Bedbug (Mayakovsky, for), 1960  
 Bedlam Planet (Brunner), 1968  
 Beetle in the Anthill (Strugatsky, for), 1980  
 Before Adam (London), 1907  
 Before the Dawn (Taine), 1934  
 Beggars series (Nelson)  
 Begum's Fortune (Verne, for), 1879  
 Behind the Walls of Terra (Farmer), 1970  
 Behold the Man (Moorcock), 1969
