## PREFACE

As with so many things, science fiction was undergoing widespread changes in the late 1960's. It was a commonplace belief at that time that the boundaries between science fiction and so-called "mainstream" fiction were eroding. Pulp science-fiction writers had once been thoroughly conventional in literary technique; but now they were adopting multiple points of view, stream of consciousness, and surrealistic and expressionistic styles. The young writer-critics, such as Delany and Ellison, openly rejoiced at what seemed a definitive departure from the pulp ghetto. Science fiction, it was implied, was gaining status for itself and acceptance from the mainstream, and mainstream writers, for their part, were choosing science-fiction subject matter. The term "science fiction" was said to be outmoded; the 20th century had become so bizarre that the realism of science could not describe it, and only "speculative fiction," whether written by pulp or mainstream writers, could continue as a category.

Although there was some truth to this "New Wave" critical perspective, we can now see, as the 1970's become the 1980's, that science fiction as a term and as a distinct genre is resilient. Walk into any bookstore and it is easy to find the science fiction, separately shelved under a special sign. There *is* science fiction, and there *are* science-fiction writers, as most members of the Science Fiction Writers of America would tell you. The call for "speculative fiction" was issued from a frog perspective, from science-fiction writers and critics weary of being laughed at. The fact is that there are enough deficiencies in the mainstream literature of western countries that it would not altogether have been a triumph had science fiction merged with it. For all its own deficiencies, science fiction will best develop from self-acceptance.

Although science fiction is here to stay, this does not mean that we can define it. Publishers seem to have no problem deciding what to market as science fiction, but it is by now an old joke that every science-fiction convention features a panel discussion in which experts strive, in futility, to define the genre. I have been teaching science fiction in a university since 1969, and nearly every book in every version of my course is challenged by some student as not being "really science fiction." I won't add to the joke by trying to define science fiction here; I will refer the reader to Darko Suvin's *Metamorphoses of Science Fiction*, perhaps the most ambitious attempt yet at definition. But I do think it worthwhile to talk about why defining science fiction is both difficult and important. The term "science fiction" originated as late as the 1920's, and in some ways the science-fiction genre is in its youth; it could develop in a number of ways, and a part of the critical debate is over not what it is but what it could or should be. What does the word "science" in science fiction mean, anyway? Does it mean that there has to be accurate science, or plausible extrapolation of current theory, for a work to be considered science fiction? If we insist on this, a rather large part of what is now science fiction must be banished from the ghetto—all time-travel stories, for instance, since time travel cannot be presented as a reasonable extrapolation from current theory despite Wells's impressionistic gymnastics in *The Time Machine*.

Suppose, then, we take the opposite tack and say that the science part of science fiction is a thin papering over a fantasy content. Science fiction, then, is a branch of fantasy. The problems with this view are severe. Modern adult fantasy has its own special history and conventions. More fundamentally, the best science fiction, by Wells, Stapledon, Lem, and Yefremov, does not seem to be describing a fantasy world but a world that bears an extrapolated resemblance to our own. New writers are not only imagining but thinking, and thinking in a way that has some relationship to science. The best science fiction is mimetic, and it is difficult to define science fiction because of the profundity of the meaning of mimesis in literature. Science fiction describes this world we live in, not some other; it is distinct enough as a genre to make such a book as this possible. Chronologically, this book's earliest authors are from the age of Wells. Of course there have been works arguably science fiction which predate Wells by thousands of years, from the Babylonian *Epic of Gilgamesh* to *The Odyssey* to

Lucian's *A True Story*. A reader can examine Marjorie Hope Nicolson's *Voyages to the Moon* and J.O. Bailey's pioneer work *Pilgrims Through Space and Time* for discussion and summaries of science-fiction works from the Renaissance to the 19th century. Brian Aldiss argues convincingly in his *Billion Year Spree* that Mary Shelley's *Frankenstein* is the first science-fiction novel, and Shelley's book is certainly one of the works which has most influenced the direction of 20th-century science fiction. Doubtless there was science fiction before Verne and Wells, but these two great popular writers were decisive in creating a special audience for what until the 1920's was called the "scientific romance."

The English-language writers in this volume are, by a rather large majority, Americans; and this fact reflects the American domination, numerically, of the field. But by a curious paradox the United States has yet to produce a science fiction writer with the stature of a Wells, Stapledon, Capek, or Lem. Why is this so? Perhaps, as Franz Rottensteiner has speculated, it is precisely because these great European science-fiction writers have developed apart from the inbred self-congratulations of the American science-fiction ghetto. Stapledon, for example, wrote his first great future history, *Last and First Men*, without even knowing that there was such a literary category as science fiction: he had read only a few of the works of Wells. Even more fundamentally, perhaps in the American culture of the late 20th century there are deficiencies and blind spots that make the fiction of social and scientific speculation difficult. Lem has pointed out the scientific absurdity of Asimov's laws of robotics, with their built-in assurances that robots—and by easy extension, technology—shall not harm humans. The assumption is that technology can be made safe by more technology (whatever "safe" is). All too often American science fiction has been public relations for technology, refusing to look at the potential dangers and the alternate social systems under which such dangers might be minimized. A telling critique of American science fiction comes from one of its ablest practitioners, Ursula K. Le Guin, in the November 1975 issue of *Science-Fiction Studies*. Le Guin contends that American science fiction has been singularly poor in presenting "the Other—the being who is different from yourself." The poor, the proletariat—and, until recently, women—have been conspicuous in American science fiction by their absence. Le Guin speaks of the domination of the masses by powerful elites in much American science fiction, and the assumption that wealth carries its own justification; she complains about the assumption that "competitive free-enterprise capitalism is the economic destiny of the entire Galaxy." A continuing weakness in American science fiction is the unwillingness or inability to imagine social change on the same scale as technological change.

Of course this is a generalization, perhaps an exaggerated one; Le Guin has said in a later context that she was speaking rhetorically. American science-fiction writers, after all, now include Le Guin herself, Philip K. Dick, Mack Reynolds, Marge Piercy, Joanna Russ, Walter M. Miller, Jr., Robert Silverberg, Theodore Sturgeon, and Chan Davis. The very fact that such criticism as Le Guin's is being aired portends well for change.

Nowhere is change more evident than in the place of women writers and women characters in English-language science fiction. In the so-called "golden age" of the 1930's and 1940's, women were hard to find in the stories, present only as voluptuous and helpless objects on the lurid pulp covers. The "hard" science fiction of *Astounding* found some of its justification in getting teenage boys interested in science, and of course girls didn't count. E.E. "Doc" Smith found writing romantic scenes so difficult that he asked Mrs. Lee Hawkins Garby for help in these parts of *The Skylark of Space*. The relationships between men and women were seen as extrinsic to science fiction proper, something to be added on.

Character development remains a weak point in English-language science fiction, so that some of the best science fiction is still being written by writers not primarily associated with the field, such as Barth, Durrell, Pynchon, Anthony Burgess, and Lessing. But at least there are now woman characters in science fiction, and an explosion of science-fiction writers who are women: consider Zenna Henderson, Pamela Sargent, James Tiptree, Jr., Ursula K. Le Guin, Joanna Russ, Lee Killough, Suzy McKee

Charnas, Anne McCaffrey, Octavia Butler, Marge Piercy, Zoë Fairbairns, and many others. These writers have brought speculation about the future of sex roles to science fiction. Science fiction, once totally the domain of men, has reversed itself and is now in the forefront of feminist thinking.

What now for science fiction? The field now seems more various than ever. Space opera is still around, although the simplistic good guys versus bad guys plot has perhaps yielded to the conflict between different kinds of aliens in the works of such writers as C.J. Cherryh. “Hard” science fiction—that relatively small group of works in which accurate science is the main plot—continues to be well represented by Gregory Benford and others. Post-nuclear disaster scenarios, which proliferated in the field after 1945 and produced such classics as George R. Stewart’s *Earth Abides* and Walter M. Miller, Jr.’s *A Canticle for Leibowitz*, are still being written by Bob Tucker, Christopher Priest, and others. But ecological disaster has tended to replace nuclear disaster in the works of such writers as John Christopher, Harry Harrison, Kate Wilhelm, Thomas M. Disch, and John Brunner. Although the New Wave has faded somewhat as a distinct movement, such writers as James Tiptree, Jr. and Gene Wolfe are carrying on experiments in style and structure. And a few writers, such as George Zebrowski, are carrying on the Wells-Stapledon-Lem tradition of prophetic extrapolation, writing poetry and philosophy on a gigantic scale.

The anti-utopian police state typified by *Brave New World* and *Nineteen Eighty-Four* dominated science fiction for decades, so that Kingsley Amis’s early book on science fiction was appropriately called *New Maps of Hell*. Beginning, perhaps, with Le Guin’s *The Dispossessed*, ambiguous utopias are challenging this domination. Marge Piercy has written an underrated utopia, *Woman on the Edge of Time*, which links the struggles of a minority woman of the present to a future utopia’s efforts to preserve itself. Another underrated writer, Mack Reynolds, has updated Bellamy’s *Looking Backward* (see Reynolds’s entry for his comments on his work). Ernest Callenbach’s “Ecotopia” series depicts an ecological utopia as a separatist movement in the northwestern United States. Science fiction is returning to one of its historical origins, the utopian tradition. Another of its origins, the fantasy tradition, also is gaining great strength in the works of Piers Anthony, Gene Wolfe, and others. Somtow Sucharitkul’s knowledge of the classical tradition is evident in his well-crafted stories. Brian Aldiss’s remarkable *Helliconia* series shows that science fiction writers still delight in worldbuilding.

In view of all these trends we can say that science fiction is one of the more protean literary genres in the late 20th century. People continue to turn to science fiction for escape and entertainment, as they should. But science fiction offers thought and involvement as well as escape. That there will be future conditions quite distinct from present ones is a proposition both disturbing and salutary. In the late 20th century the world is undergoing an even more profound transformation than is generally realized, and science fiction can help us to understand it.

CURTIS C. SMITH

## EDITOR'S NOTE

The selection of writers included in this book is based upon the recommendations of the advisers listed on page xvii. The main part of the book covers English-language writers of science fiction since 1895. Appendices include selective representations of authors in other languages whose works have been translated into English, and of major fantasy writers.

The entry for each writer in the main part of the book consists of a biography, a bibliography, and a signed critical essay. Living authors were invited to add a comment on their work. The bibliographies list all books, including non-science-fiction works. Original British and United States editions of all books have been listed; other editions are listed only if they are the first editions. As a rule all uncollected science-fiction short stories published since the entrant's last collection have been listed; complete short story listings occur for writers whose reputations rest primarily on their short stories; in those cases where a story has been published in a magazine and later in an anthology, we have tended to list the anthology. Entries include notations of published bibliographies, manuscript collections, and book-length critical studies. General critical materials appear in the Reading List of secondary works on the genre.

I wish to thank Donald H. Tuck, Peter Nicholls, R. Reginald, William Contento, Lloyd Currey, Jerry Boyajian, and Kenneth R. Johnson for their now-indispensable reference books. Thanks go also to the many entrants who took the time to complete an extensive questionnaire. Special thanks are due to Kenneth R. Johnson for information on original anthologies.

- "The Rotifers," in *Earth Is the Strangest Planet*, edited by Robert Silverberg. Nashville, Nelson, 1977.

\* \* \*

Robert Abernathy is a thoroughly enjoyable writer with a number of strings to his bow. He is gifted with wit and sagacity, and his style is equal to any demand he makes on it (though he seldom goes in for verbal fireworks), but he has had no new stories published since the 1950's and no collection has appeared in book form.

Like many science-fiction writers, Abernathy began publishing early, and two of his earliest stories are excellent. "Heritage" is a study of the far future of the world and the question as to who shall succeed the degenerate human race; it is told by "the great time traveler, Nicholas Doody." "Peril of the Blue World" is a story of the Martian Expedition to Earth and why it failed: the tone is light and the narrator in perfect control; Anthony Boucher could do no better.

In "The Canal Builders" Earthmen have long been established on Mars, which they visit by teleportation; but when at last a manned interplanetary rocket is sent, the travellers find a ruined city they have never heard of. Another very different story set on Mars is "When the Rockets Come," which studies the harsh frontier society and the character of the hero. Vic Denning is a successor to Achilles or to Sir Bors: the hero who is never so happy as when his life is in danger. But "when the rockets come, it is not war"; valour and chivalry are obsolete.

Several stories contrast man with other races. In "Pyramid" man is imported to the planet Thegeth to dispose of an infestation of hamsters that have ruined the ecological balance. The thagatha, who have foolishly imported man, value above all else the balance of nature. Man, on the other hand, turns out to be an infestation without parallel; and the thagatha are completely unable to comprehend their motives. "The Rotifers," which takes place on Earth, features a 12-year-old boy who is examining pond life in his microscope. But as he does so, the rotifers also examine man, and are most displeased to learn of his existence. The sinister quality of this tale is admirable. "The Thousandth Year" contrasts man with an empire-ruling race of squidlike beings, this time much to man's advantage. The Ratk are taught never to trust anyone, and their constant suspicion is their downfall.

One of Abernathy's best and funniest stories, "Junior," deals with the generation gap. Most of what the earnest elders teach is based on experience, though not necessarily true. Junior, the rebellious polyp, manages to transcend the parental wisdom—emphatically. I pity anyone who tries to translate the new changes rung on old clichés in this story. "Axolotl" is a powerful story. It describes the first man to travel in space

(some seven years early), and that part of the story has dated slightly. But the passages about the axolotl emerging from the ocean and undergoing a transformation it could not foresee remain powerful and moving. Space travel has not yet produced in us the transformation Abernathy describes; but the metaphor is immensely suggestive still.

Some of Abernathy's space opera remains lively: "The Dead-Star Rover," "Hostage of Tomorrow," "The Giants Return," and even "The Ultimate Peril," with its evil insect-like aliens who use one hundred percent of their brains. Other stories make more serious use of the author's strong sense of history: "Heirs Apparent" could have been a novel in other hands, but Abernathy wrote a long story of events on the Russian steppe after a Third World War, with expert cutting and no words wasted. "Hour Without Glory" is a fine short study of the military mind. And "One of Them?" is one of the most beautiful stories on the android theme that I have ever read.

Someone should bring out an Abernathy collection; his work is too good to remain buried in the reference libraries.

—Charles Cushing

**ADAMS, Douglas (Noel).** British. Born in Cambridge, 11 March 1952. Educated at St. John's College, Cambridge B. A. Free-lance writer: Script Editor, *Doctor Who* series, BBC TV, 1978-80. Agent: Ed Victor Ltd., 162 Wardour Street, London W1V 4AT, England.

Radio Play: *The Hitch-Hiker's Guide to the Galaxy*, 1978.

Television Plays: for *Doctor Who* series.

Other

*The Meaning of Liff*, with John Lloyd. London, Pan, 1983.

\* \* \*

Publication of *The Hitch-Hiker's Guide to the Galaxy* in 1979 brought Douglas Adams instant notoriety, if not throughout the galaxy, at least in the world of science-fiction fandom. His

success was well justified, for he managed to poke fun at nearly every one of the genre's popular conventions. Forget the faster-than-light drive, the total improbability drive makes it obsolescent. Douglas Adams has not only *conceived* the total improbability drive, but he has *created* it. It is the power which moves his *Hitch-Hiker* series. His imagination permits him to pile improbability upon improbability, whirling the reader into a tailspin of laughter. Yet improbability is not his only comic technique; he is equally at home with the fresh use of cliché phrases or situations. Puns occur frequently (who could forget the long "shaggy-dog" account of Frogstar B's economy—leading to the "Shoe Event Horizon"?). All these techniques serve one end—the deflation of pompous ideas held by people who take themselves too seriously.

But it is not just the comic techniques that make his novels worth reading. The characters, who may at first appear as mere parodies of science-fiction stereotypes, grow throughout the series into fairly well-rounded comic persons. Arthur Dent, at first merely an anti-heroic schlemiel, elicits our affection because of his provincial attachment to Earth. Ford Prefect's universal ennui seems appropriate to his profession of galaxy tour-guide writer. Zaphod Beeblebrox (who said two heads were better than one?) might eventually persuade us that not knowing what you are doing is in fact better. One even grows attached to Marvin, the perennially (millennially?) depressed robot.

The good fun of all this holds up well through the first two volumes, *The Hitch-Hiker's Guide to the Galaxy* and *The Restaurant at the End of the Universe*; but by the time one gets to *Life, The Universe, and Everything*, it begins to wear thin. Publication of a fourth volume, *So Long, and Thanks for All the Fish*, although it includes a number of details clearly intended to wrap up some of the loose ends from the previous volumes, proves to be too much of the same thing. The freshness which lent such force to *Hitch-Hiker* is gone; the joke has been carried too far.

Adams has collaborated with John Lloyd to produce *The Meaning of Liff* a supposedly comic glossary (complete with index) made up by giving meanings to place names (some few of which are comic in themselves). The definitions are sometimes (infrequently) witty and scintillating, sometimes vulgar or obscene, and mostly just boring.

—Robert Reilly

**ADLARD, Mark** (Peter Marcus Adlard). British. Born in Seaton Carew, County Durham, 19 June 1932. Educated at Trinity College, Cambridge, 1951-54, B. A. 1954, M. A.; Oxford University, 1954-55; University of London, B. Sc. (extra-mural) in economics. Married Sheila Rosemary Skuse in 1968; one daughter and one son. Executive in the steel industry, in Middlesbrough, Yorkshire, Cardiff, and Kent, 1956-76. Since 1976, full-time writer. Agent: Ed Victor Ltd., 162 Wardour Street, London W1V 4AB. Address: 12 the Green, Seaton Carew, Hartlepool, Cleveland TS25 1AS, England.

\*

Mark Adlard comments:

One of my main pre-occupations is the importance of personal economic activity to "the good life." It seemed to me that various hypotheses about such matters could be explored fictionally, by presenting a future world in which economic activity had been largely made redundant. This fictional device would also make it possible to consider the moral dilemmas and responsibilities of managerial elites. It was considerations such as these, and not a previous enthusiasm for the genre, that induced me to write "Science fiction."

\* \* \*

Mark Adlard's Tcity trilogy, *Interface*, *Volteface*, and *Multiface*, makes up a whole less than the sum of its parts but it is nevertheless a highly interesting and readable work. The parts are considerable and the project ambitious. Reviewing *Multiface* for the *Times Literary Supplement*, T. A. Shippey noted the ironic contrast between the plots and characters of the first two books and those of Wagner's *Ring* and Dante's *Commedia* respectively: "Only the boldest writer would invite such comparisons. . . . But Mark Adlard made a success of it, and has done so once more, in a novel based this time on *The Faerie Queene*." Shippey is an over-bold reviewer, for his criticism is not just, although it does adumbrate a critical problem. For one thing, Spenser is only one among several important literary sources in *Multiface*, where the controlling reference (matching Wagner and Dante) is to Buddhism; for another, the relationships between the novels and their sources are not the same.

It seems likely that one of the problems is that the three novels were not all completed together. As literature, *Interface* is inferior to the later two. It is overloaded with exposition at the expense of narrative and, although Adlard is clearly aware of the problem (throughout the series, a stock joke is the blunt interruption of robotic exposition), information whether cultural or technological appears to be simply dropped into the text and does not resonate within it. This is true of the Wagner references, which are only to *Götterdämmerung*, an odd choice for the first novel of a series. This novel concerns weaknesses at the interface between an enclosed society of drugged citizens and their benevolent, superior managers, weaknesses on both

sides, which end in destruction for some but salvation for others. Adlard stands too far off from his characters, and, because the emotive level of the narrative is low, the climactic horrors and pathos fail somewhat in their effect. *Volteface* is much richer in texture, and the Dante references are both more numerous than the *Ring* ones and more deeply embedded in the text; the leading characters are more highly developed, and the narrative consequently more engaging, the ironies more piquant. In the failed Utopia of *Interface*, work had been denied the multitudinous citizens: in response to their discontent, work is reintroduced to Tcity by the executives, who deliberately create an old-fashioned (i. e., 20th-century) managerial structure, knowing this will be inefficient, merely to make work, i. e., the distribution of goods (trinkets) which are, of course, manufactured in fully automated factories. This scheme enables Adlard to write splendid satire as he traces both the collective volte-face and some individual reversals of life in Tcity. The *Inferno* of workfree pleasure is exchanged for a dubious *Purgatorio*. However, I would need to have the author explain to me just how his Dante-Beatrice pair (Twynne and Ventrix) are really illuminated by their source. Ventrix is an interesting character in her own right.

If idle pleasure was hell, work purgatory, then *Multiface* seems to be asking what is the ideal mode of life. The answer is that it depends on the individual life. Even Theravada Buddhism, practised by one saintly executive, may not suit all executives; Mahayana Buddhism, considered more suitable for the citizens, seems too perversely appropriate for the tormented Taggart, persuaded that in a lame dog he sees the reincarnation of his sadistic father, on which he exacts vengeance for this mother's suffering which has blighted the whole of his own life. As Jan Caspol puts it, "Men have different faces. There are no two alike, and you can't expect them to wear the same mask. . . . Even Buddhas only point the way." Jan, though an executive, is the reader's choric companion throughout the series and he thus presumably voices the author's conclusion: but what consequences follow for the executives whose vast experiment has involved the beneficent control of a world society? The author seems to shy away from his bold socio-history, in favour of the predicaments of individuals. Their problems may be resolved for good or ill, but what of the further problems in Tcity? The trilogy seems to call for a further, maturer volume, one which will tell us what life is for, perhaps: we are at least provoked to consideration of this disturbing question. However, it may be in the intuition that life is open-ended, that there are no pat catastrophes, that the trilogy should properly end. One of its most appealing narratives is that of Osbert Osborne, discovering diversity and pattern in the apparently uniform stahlex beeblocks of Tcity (everything there is made of this remarkable versatile new material), yet knowing that he will never have time even to map his own multi-story block. Three faces can stand for the whole infinite polyhedron.

Bibliography: *Item Eighty-Three: Brian Aldiss: A Bibliography 1954-1972* by Margaret Aldiss, Oxford, Bocardo Press, 1972.

Manuscript Collections: Bodleian Library, Oxford University; Dallas Public Library.

Critical Studies: *Aldiss Unbound: The Science Fiction of Brian W. Aldiss* by Richard Mathews, San Bernardino, California, Borgo Press, 1977; *Apertures: A Study of the Writings of Brian Aldiss* by Brian Griffin and David Wingrove, Westport, Connecticut, Greenwood Press, 1984; by the author, in *Contemporary Authors Autobiography Series 2*, Detroit, Gale, 1985.

## Brian Aldiss comments:

Interested parties are recommended to seek out the critical study of my writings by Wingrove and Griffin. Although I do not always agree with all they say, they are at least as reliable as I would be. Even self-conscious authors sail on, charting their course through style and story, without much bothering about the rocks under the surface. It's for the critics to consider shipwreck.

One really writes because one has to. I never think of the reader until the act of creation is over. Then I hope I might nourish the creative spark in others; I imagine people and people imagination. I craved the freedom writing gave me. My fictions have taken place on many worlds. My central characters have been of many nationalities. Speech is a preoccupation. Even in *Non-Stop*, some sort of heightened speech was attempted. In *Life in the West*, scarcely a handful of the many characters speak "standard English," in *Helliconia* the languages are many. Aren't those volumes in part about the necessity of communication—and its difficulty? Mine is a literature of exile. Every novel undertaken is an act of xenophilia. The label "science fiction" doesn't fit.

The list of my writings seems impossibly long. The more reason to be brief here.

\* \* \*

In the Author's Note to *Last Orders*, Brian Aldiss (or "the author") says: "See, my stories are about human woes, non-communication, disappointment, endurance, acceptance, love. Aren't those things real enough?" They are, even when figured

through the most complexly thought out alien personages, as in the epic Helliconia trilogy; and in exploring "those things," Aldiss has created an *oeuvre* which for breadth of vision and variety of formal experimentation is beyond almost all other writers in the genre. As one critic has proposed, Aldiss's two gods are Proteus, the enigmatic shape-changer, and Prometheus, the seeker of forbidden knowledge, fire-bringer, willing martyr in the battle against the forces of tyranny. Thus his works not only speak out against the repressive aspects of the human imagination but by doing so in so many different and wittily stunning ways also formally demonstrate the power of liberated creativity.

Some might argue that Aldiss's ability to write any kind of story betrays a lack of a personal "voice," but they would be wrong. The uniqueness of his voice partly inheres in his willingness to explore imaginative forms, whether the early, classically perfect, stories of *The Canopy of Time* or *Starswarm*, the extraordinary formal experiments of *Report on Probability A* (an SF version of the *nouveau roman*) and *Barefoot in the Head* (an attempt to use the language of Joyce's *Finnegans Wake* to portray the mentality of a Europe literally bombed by LSD into the "stoned" age), the extraordinarily assured but never static forms of the recent stories and such novels as *The Malacia Tapestry*, or the epic metahistorical sweep of the Helliconia trilogy. Like so many British writers, Aldiss has never had to feel that he should either repeat himself or apologize for writing SF. As a result, he has always been able to seek the proper "style" with which to formulate his "content" most fully, which is to say he has always recognized the ways in which style and content are indivisible. From the beginning he has expanded his knowledge of and ability to handle technique and recognized the need to push against the conventional boundaries of the genre.

If he has refused to be held down by the conventionality of most SF, Aldiss has never turned his back on it. Indeed, as his various anthologies, many of them dealing with the most "romantic" themes of SF, and *Billion Year Spree* show, he has always loved it all. But he is fully aware of the negative imaginative effects of what he calls "power-fantasy," and has sought as "a real writer" to transcend the kind of writing which only transforms "a man into an organ of conquest in a knocking-shop of wish-fulfillment." (In this, he shares many attitudes with that often excoriated SF satirist, Barry N. Malzberg, and it's not surprising that he was on the committee which awarded Malzberg's *Beyond Apollo* the first John W. Campbell Award.) Thus, even in his early works, set in far-distant futures of galactic empires or the end of the solar system (*Hothouse*), he tends to look at the human and emotional sides of events: the need individuals will always have for love and communication/community; the ways in which imaginative empathy can help people to face their lives; the qualities of courage and endurance we all need to survive, whether confronting "ordinary" life or the end of all life as we know it.

Such a varied and complex *oeuvre* evades all simple systems of categorization. Certainly Aldiss always gives his readers rich and emotionally satisfying entertainment. And he always infuses his stories with powerful feelings, though the later fictions achieve far subtler nuances than the earliest stories do. From the very beginning, moreover, he reveals a particular capacity for a kind of elegiac vision, a quality of speech which uplifts even as it tells of the end of all we hold dear, and it is a tone perhaps even more akin to Anglo-Saxon poetry than to H. G. Wells's "scientific romances." It's a tone we might associate with Olaf Stapledon's works were they not so philosophically distanced. Still, Aldiss learned more from Stapledon than he did from Doc Smith, so that such memorable and moving

fictions as "Who Can Replace a Man?," "Visiting Amoeba," "A Kind of Artistry," and, especially, the triumphant yet tragically muted "Old Hundredth" bear the full weight of human history and human endeavour. Nor has the elegiac vision ever fully disappeared from his work; it's just as powerfully present, with an even more complex use of SF technology and greater, more dynamic gracefulness of style in "An Appearance of Life" (*Last Orders*). Here a "Prime Esemplastic Seeker," a sensitive with "a high serendipity factor," discovers in a vast galactic museum that humanity may be just "a projection" of an earlier great race, and, like the imprisoned holographic images of two long dead lovers, is "drifting further apart, losing definition." But Aldiss doesn't end on this despairing note; his Seeker exercises the human will he no longer fully believes in to refuse to communicate his discovery to the rest of humankind, a highly moral act. This story and the somewhat similar (and also purely SF) "The Small Stones of Tu Fu" say rather depressing things about humanity's potential yet they are not depressing because their elegant and graceful style transcends their seemingly obvious "message" and develops through a complex and paradoxical tension their *real* message, the message of human creativity inherent in all true art. The Helliconia books come at this theme in a different manner, via a complex epic vision of an alien planet whose history, of two battling intelligent races, continually offers a mirror to the human story, but one in which the reflections must be read with the greatest subtlety. The presence of human "watchers" who record Helliconia's various stories for an audience on Earth some centuries afterward underlines the structurally complex vision Aldiss is exploring in this series.

As well as an elegiac vision, Aldiss has a special affinity for landscapes. From the beautiful and very English evocations of "Old Hundredth," through the almost hallucinatory visions of *An Age*, the renderings of early 19th-century Switzerland and the almost surreal final descriptions of the eternal ice in *Frankenstein Unbound*, and the deliciously sophisticated versions of city- and country-scapes in *The Malacia Tapestry*, to the grandiose and scientifically grounded descriptions of an utterly alien planet in the Helliconia books, Aldiss uses landscape in a highly coherent manner as metaphor and context rather than mere background.

Because Aldiss hates repeating himself, he continually pushes into new literary territory, yet he remains basically a writer of SF and fantasy (with the exception of the Stubbs series and some non-fiction). Beginning as a superior, though classically restrained, stylist, he moves through intense and brilliant experiments (*Reports on Probability A*, *Barefoot in the Head*) and self-conscious fictions which explore both the conventions and the earlier classics of the genre (*Frankenstein Unbound* and *The Eighty-Minute Hour*), to emerge in the 1970's as an assured and elegant master of fictional forms.

In the 1970's, Aldiss turned out a glorious social comedy in *The Malacia Tapestry* and gnomic but captivating or frightening little fictions like the Enigmas in *Last Orders*, the "zeepee" stories, and the enigmatic, delicate, and superbly civilized "The Small Stones of Tu Fu." Having shown with such works that he could write almost anything he chooses, he then took on one of the major forms of SF, the grand, multi-volume future history, only his would be the history of another planet, under observation through the centuries by Earth personnel, with all the complex possibilities of such a multi-faceted narrative strategy. There is still one more Helliconia book to go, but *Helliconia Spring* and *Helliconia Summer* have already demonstrated how successfully he has transcended genre conventions, once again.

If Aldiss now appears to be a writer who could write anything he wishes to, it is by dint of a long and exhaustive apprenticeship to his craft, a concern to "never cease exploring" either his medium or the realms of imagination which SF at its best has claimed as its own. The results, at every stage of his career, are stories of great power and originality, stories which stand the test of critical re-reading better than most. As Brian Aldiss is at the height of his art, it looks as if he will give us many more such stories in the years to come.

—Douglas Barbour

**ALLEN, (Charles) Grant (Blairfindie).** Also wrote as Cecil Power; Olive Pratt Rayner; Martin Leach Warborough. British. Born in Alwington, near Kingston, Ontario, Canada, 24 February 1848. Educated privately in New Haven, Connecticut; Collège Impériale, Dieppe; King Edward's School, Birmingham; Merton College, Oxford (Senior Classical Post-mastership), 1867-70, B. A. (honours) 1871. Married Miss Jerrard in 1873 (second marriage); one son. Professor of Philosophy, Government College, Spanish Town, Jamaica, 1873-76; Tutor in Oxford, 1877; worked on the *Gazetteer of India*, Edinburgh, 1878; staff member, *Daily News*, London, 1879; lived in Surrey from 1880. *Died 28 October 1899.*

\* \* \*

Besides his "progressive" novels flouting Victorian political and, especially, sexual taboos, such as the famous *The Woman Who Did*, Grant Allen was probably best known to the public through his series of historical guidebooks to Europe. Allen wrote a few SF stories, two of which are collected in *Strange Stores*: "Pausodyne" deals with revival after a century in suspended animation, and "The Child of the Phalanstery" with a future utopian society practicing euthanasia on deformed children. But his only major SF work is the novel *The British Barbarians* in which an enlightened visitor from the 25th-century looks on the culture, religious observances, and erotic proprieties of 1895 England as an anthropologist would on the customs of a primitive tribe. Befriending an unhappy woman, he is for his pains finally shot by her scandalized husband, and fades back to his future. For all its obviousness, the novel is still a very good satire of the peculiar English "propertarianism" and puritanism, and prefigures the anthropological vogue in sophisticated modern SF, mediated through his admirer Wells.

Critical Study: *Kingsley Amis* by Philip Gardner, Boston, Twayne, 1981.

Kingsley Amis comments:

I have been reading science fiction for over 50 years. Writing it too: I can remember writing a story about a revolution in the year 2032, which must mean I wrote it in 1932 when I was 10. I say this to show that SF has always been an inseparable part of my reading and writing life. So when later I got an idea for a story or novel whose events could not have taken place in our world, I found it altogether natural to create a new world for it.

Take *The Alteration*. I heard on an archive record made in 1909 a castrato then aged about 40 (one Alessandro Moreschi) singing the Bach/Gounod "Ave Maria," a good musical performance and an awful, dismal noise I could not get out of my head. It dawned on me that here was a great theme: a boy chosen for castration to preserve his wonderful voice would lose the chance of love, family, friends to a large extent, and a normal place in society. But he might gain fame, money, artistic success and the approval of God. (He might also lose the first batch without attaining the second.) None of it possible in our world. I considered the coward's (or John Fowles's) way out: a remote island run by an eccentric millionaire. No, too cramped and private. It would have to be England in AD 1776, but as part of an alternate world where the Reformation had never happened and Rome was all-powerful—or nearly. On with the creation. . . .

\* \* \*

A typical Kingsley Amis work combines satire and humor with serious themes to mock sacred cows, question *a priori* premises, and speculate about the nature of man and God. It usually involves some erudite discussion of music, particularly classical, some focus on love as elevating and redemptive, and some sense of conspiracy, whether of church or state or the universe itself. It is witty and provocative.

Reflecting an enthusiasm for science fiction that Amis traces to his early youth, *New Maps of Hell* began as a series of lectures delivered at Princeton for the 1958-59 Christian Gauss Seminar in Criticism, and ended up the most influential work of science fiction criticism up to that time. It is clearly dated, and more personal than scholarly, but valuable—a slightly patronizing attempt to define and defend science fiction at a time when the genre was considered suspect by literary scholars. It argues that a definition is difficult, but that it somehow involves science and technology or pseudo-science or pseudo-technology, whether human or alien, though methods, goals and emphases may vary greatly. Thus *The Tempest* and *Gulliver's Travels* are certainly precursors, according to Amis, though H. G. Wells and Jules Verne begin the genre as we

know it. *New Maps* considers the literary quality of science fiction, pointing out that it ranges from the lowest pulp form, filled with scientific absurdities, violence, gratuitous sex, and innumerable monsters, to the highest literary levels—involving exploration of human nature, politics, and economics, satire of the present, and theorizing about the future. Ultimately Amis finds it allegorizing our own fears and insecurities, warning of future possibilities, and deflating *homo sapiens*. Amis's interest in the genre thereafter led to his joining Robert Conquest to edit the *Spectrum* series, four volumes of science-fiction short stories carefully selected for their interest and craftsmanship, volumes which helped establish the popularity and respectability of science fiction.

Having examined the efforts of others, it was a short step to creating his own. Amis's short stories and novels are intriguing and clever. His James Bond adventure novel, *Colonel Sun*, contains science fiction elements, as does his ghost story, *The Green Man* (time stasis and a heavenly encounter). "Mason's Life" focuses on the nightmare realization that one's seemingly tangible reality is only someone else's dream. In "Something Strange" space program volunteers turn out to be guinea pigs for government psychologists experimenting with psychological conditioning and isolation stress.

*The Anti-Death League* uses a spy/romance/sci-fi format as an excuse to explore philosophical questions about the active cruelty of God, the aimless horror and finality of death, and love as an antidote to combat insanity in an absurd universe. Amis, who feels at home handling a military ambience with its rigid orders and regulations and its male-male interaction, centers his novel on a British training camp, preparing soldiers for "Operation Apollo," germ warfare with an intensified strain of hydrophobia; though ultimately the operation proves a giant bluff, the ultimate deterrent, intended to be spied on and thereby to so horrify the Chinese that they will cancel invasion plans, it provides the backdrop for exploring life and death questions. As various zany characters rush about trying to expose security leaks, prove pet theories, or work out personal conflicts, the main thrust of the novel is an enumeration of signs of the motiveless malignity of God—numerous, sudden, random deaths or near deaths from accident or disease, reinforced by "pro-death" military plans, by signs of madness or incipient madness, and by futile attempts to combat both. The formation of an "Anti-Death League" provides the title of the book and Amis's model for man's ineffectual but necessary protest against whatever powers there be. The comic and satiric prevail, with characters including an atheist chaplain, a naive secret agent, a homosexual, alcoholic military officer, a dedicatedly promiscuous widow, an insane psychiatrist, and a conscience ridden romantic named Churchill.

*The Alteration* presents an alternative world, a world that might have been as the result of Henry VIII's elder brother Arthur surviving as monarch and siring a line of Catholic rulers. It postulates a Catholic England and Europe, forever at odds with Islam, and on a shaky diplomatic basis with "New England," a small nation inhabited by Indians and the descendants of "Schismatics" and convicts (including one William Shakespeare). The Martin Luther of this Catholic world was a pope, Himmler a powerful representative of Papal might, Jean-Paul Sartre a Jesuit, James Bond Father Bond, and our world a shocking, slightly absurd science-fiction novel read clandestinely by rebellious adolescents. Amis's world is a chilling vision of ecclesiastical totalitarianism with the Church tightly controlling people's lives, making decisions about whether or not ten-year-old boys will be castrated so they can sing for the greater glory of God, sending out Nazi-like secret police to mutilate and murder those who defy Church author-

ity, developing a disease that, spread through the drinking water, infects and alters males, and ultimately choosing a holy war against Moslems as a means of population control. As such, it is a grim commentary on hypocrisy, intolerance, gullibility, and mindless pieties—evil for the best of reasons. On another level it traces the story of Hubert Anvil, a brilliant child soprano chosen for castration, to explore adolescent yearnings, struggles against authority, and arrested development. Ultimately it is a paean to love, the greatest sin of all in this nightmare world of religious fanaticism.

*Russian Hide-and-Seek* partakes of the patterns and concerns established in these earlier novels. Drawing on the conventions of 19th-century Russian fiction and cloak-and-dagger adventures, it depicts a Russianized England, a future fifty years hence when the Soviet Union rules England and perpetrates upon the English all the horrors that Amis envisions as inherent in Russian culture: brutality, violence, lack of family feeling, exploitation, and paranoia coupled with lachrymose introspection. The plot turns on an attempted revolution, made futile by the naivety of the revolutionaries and the strength of the Central Government. The English prove plucky but muddled; the Russians bored, callous, self-indulgent. Violence and death again dominate this vision of the future.

Thus, Amis's science fiction serves as a medium for satiric debunking and sociological investigation, particularly of the military mentality, pat solutions, and totalitarian inflexibility. His works are witty, irreverent, and infectious. His handling of different levels of diction, linguistic clues to class and training, and his verbal inventiveness are always impressive, and his attack of conventional values and attitudes fun.

Chester Anderson comments:

I am basically a poet. I write prose because that's what people read. I write science fiction because that's what *I* read. The only reason I write fiction at all is that my memory is so poor. Everything but *Ten Years to Doomsday* is autobiography plus exaggerations. Only the names are changed, because I can't remember them. I don't consider my writing science fiction except in the sense that all 20th-century writing must be either science fiction or dreck—even newspapers, teenage love letters, papal encyclicals. The future is now.

\* \* \*

*The Butterfly Kid*, Chester Anderson's first solo performance as a science-fiction author, was nominated for the Hugo award in 1968, a significant honor for someone who had collaborated on his first science-fiction novel, *Ten Years to Doomsday*, only four years before. *Ten Years to Doomsday*, written with Michael Kurland, was a parody of some of Poul Anderson's novels. A small group of undercover agents for an interstellar empire accelerate the technological progress of a backwater planet to defeat an invasion by an unknown enemy. The denouement is rather perfunctory, and it is obvious that the authors enjoyed the creation of intricate plot twists and gave little thought to the resolution of the story. A certain lightness of tone in both the telling of the tale and the nature of the incidents related is apparent, and the same tone was used with more emphasis in *The Butterfly Kid*.

*The Butterfly Kid* is Anderson's celebration of the hippie life in Greenwich Village in the mid-1960s. Again the plot hinges on the defeat of an enemy of humanity, in this case a species of six-foot blue lobsters, who are intent on annexing the Earth into their empire. They intend to add a psychedelic drug to the water supply of New York City. The drug has the effect of materializing the takers' fantasies. Chester Anderson, the hero and narrator of the novel, and his friends foil the attempted conquest of Earth in a rather hurried conclusion. Anderson is particularly adept at depicting the social scene of Greenwich Village and his various friends and acquaintances who are the defenders of Earth.

\* \* \*

James Blish has called Poul Anderson "the enduring explosion" for the quality, quantity, and sheer breadth of Anderson's achievements are unique in science fiction. Seven Hugos and three Nebulas proclaim him the field's premier novelettist but 50 novels and 200 shorter works testify to his mastery of all story forms. Over the course of four decades, he has explored an amazingly wide range of literary types from madcap comedy to grimmest tragedy in such distinctive fashion that the term "poulAnderson" was once suggested as a generic name.

Consider the following colors in Anderson's fictional spectrum: broad farce (the Hoka series written with Gordon R. Dickson and *The Makeshift Rocket*); adventure comedy (*Virgin Planet*); action adventure yarn ("The Longest Voyage," 1960; the Van Rijn series; and the Flandry series); socio-political drama (the Psychotechnic Institute series and "No Truce with Kings," 1963); hard science fiction ("Epilogue," 1962); romantic fantasy (*Three Hearts and Three Lions*); heroic fantasy (*The Broken Sword*, and *Hrolf Kraki's Saga*); pastiche (*Conan the Rebel*); horror (*The Devil's Game*); historicals (the Last Viking trilogy); and mysteries (*Perish by the Sword*). Moreover, Anderson also writes songs, poems, parodies, essays, and children's books and is a skillful translator of Scandinavian prose and poetry. (For examples of his miscellanea, see *The Unicorn Trade*, written with his wife Karen).

Science holds first place among Anderson's raw materials. His formal training in physics imparts a special rigor to his handling of any science. (He has written some excellent articles on sf applications of scientific fact.) His research is thorough, his extrapolations imaginative. He will interweave hard and soft sciences as in *Orion Shall Rise* but the most direct outlet for his scientific knowledge is the problem-solving story. Here, characters must either discover a phenomenon ("The Sharing of Flesh," 1968, and "Hunter's Moon," 1978) or react to one that is already recognized (*Fire Time* and "The Bitter Bread," 1975). Setting objective physical problems in parallel with subjective personal ones and linking the outcomes is Anderson's favorite literary device. He builds these stories so well, they can outlive their scientific premises. The Jupiter model in "Call Me Joe" (1957) has passed away; the appeal of its tenacious hero endures.

Furthermore, Anderson makes scientific problem-solving a vehicle for philosophical enquiry. For example, four marooned spacemen conduct an intense, self-conscious debate on the meaning of life in *The Enemy Stars*. *Tau Zero*, which Blish has called "the ultimate hard science fiction novel," shows the crew of a crippled spaceship outmaneuvering fate on a slower-than-light odyssey beyond the end of time. Scientific phenomena likewise stimulate theological speculation in "Kyrie" (1968) and generate moral crisis in "Sister Planet" (1959). In Anderson's hands, the laws of nature assume poetic, symbolic, and even metaphysical significance.

A second source of Anderson's inspiration is history. The

author's broad, self-acquired education in this subject serves him well in preparing futures with either general or specific historical prototypes. For example, "The Sky People" (1959) replays the age-old feud between nomads and farmers while *The People of the Wind* is based on the Franco-Prussian War. Anderson also re-creates the past vividly (e. g., first-century Denmark in "The Peat Bog," 1975) and has produced some superb time-travel stories ("The Man Who Came Early," 1956; *The Guardians of Time; There Will be Time*). Furthermore, his interest in the historical process itself has led him to invent one of the longest-running and most elaborate future histories in sf. Now in its fourth decade, his Technic Civilization series embraces more than forty separate items including twelve novels that cover five millennia of galactic history. (See Sandra Miesel's chronology in *The Long Night*, 1983, and her afterword to the Ace edition of *Agent of the Terran Empire*, 1980.)

Third, Anderson draws upon myth, principally Nordic and Celtic. He has both remodeled ("The Sorrows of Oclim the Goth," 1983, from *Volsunga Saga*) and adapted (*Hrolf Kraki's Saga* from *Hrólfs Saga Kraka*) Norse materials with all their Viking doom and pride intact. His "Goat Song" is the definitive sf treatment of the Orpheus myth, a subject which earlier had inspired his sf novel *World Without Stars*.

Yet Gandalf award winner Anderson is not content simply to mine or rationalize mythology. He investigates the nature of myth-making and analyzes its effects—tragic in *The Night Face* and "The Saturn Game" (1981), mixed in "The Queen of Air and Darkness," (1971), and positive in *A Midsummer Tempest*. (See Miesel on the first in the 1978 Ace edition and Patrick L. McGuire on the last in *The Many Worlds of Poul Anderson*). Whether resisted (*Three Hearts and Three Lions*) or celebrated (*The Mermaid's Children*) the allure of Faery is a continuing preoccupation for this writer. (See Miesel's afterword to *Fantasy*.)

Anderson weaves science, history, myth, and countless other categories of learning together to fashion exotic alien habitats teeming with fascinating inhabitants. (His Technic Civilization series is a showcase for both.) Anderson is perhaps sf's finest world-builder, with inventions lovelier than Larry Niven's and more numerous than Hal Clement's. The lushness of Anderson's creations fits his sensuous style. He has said that he tries to appeal to at least three senses in each scene. His trademark use of poetic *leitmotifs* intensifies emotions still further—he strives for the colorfulness of his idol Kipling. These efforts produce a richer, larger-than-life quality in his work: no real woods could be quite as enchanted as his fictional ones.

Anderson is a throughgoing romantic. His enthrallment with the beauty and terror of nature borders on pantheism. His complementary idealization of women is admitted gynolatry. The resonances between woman and universe work exquisitely well in *World Without Stars* because the Cosmic Goddess is kept offstage. Unfortunately, without this restraint, *The Winter of the World* and *The Avatar* sink to the level of self-parody. Anderson exalts experience over intellection, love over knowledge. He rejects, even fears, absolutes. For him, savoring wonder is the purpose of life. The purest happiness is domestic. He emphasizes the joys of marriage and parenthood to an unusual degree (*Operation Chaos*). Since children are the only certain pledge of immortality, building a better world for one's descendants is the best motive for achievement.

The interaction between rational creatures and their environment is a matter of challenge and response. Anderson's heroes are always fallible beings who strive to meet life's challenge well. They are free, responsible persons sensitive to the needs of others. (Although sympathetic to libertarianism,

Anderson is no rugged individualist in the Heinlein mold.) As Blish observes they are willing to pay the price of doing "the right thing for the wrong reason."

Yet however bravely heroes struggle, "nothing lasts forever." As Miesel demonstrates in *Against Time's Arrow: The High Crusade of Poul Anderson*, the supreme enemy is entropy. How then are mortals to face certain doom? Anderson is not a Pelagian optimist like Gordon R. Dickson. He doubts that evolutionary progress will noticeably improve man's lot. Courage is the only fitting response. Unyielding endurance is a grim imperative in the language of the Northern heroic tradition: "No man can escape his weird, but none other can take from him the heart wherewith he meets it." The author states it more gently in his own voice: "Life can be cruel, and it is ultimately tragic, but mostly it is wonderful, or would be if we'd allow it to be." Anderson is his own best example of that process.

—Sandra Miesel

**ANTHONY, Piers** (Piers Anthony Dillingham Jacob). American. Born in Oxford, England, 6 August 1934; became United States citizen, 1958. Educated at Goddard College, Plainfield, Vermont, B. A. 1956; University of South Florida, Tampa, teaching certificate 1964. Served in the United States Army, 1957-59. Married Carol Marble in 1956; one daughter. Critical Study: *Piers Anthony* by Michael R. Collings, Mercer Island, Washington, Starmont House, 1983.

\* \* \*

As Piers Anthony said in an interview in *Science Fiction Review*, writing science fiction was an answer to the depression resulting from frequent moves, the death of a cousin, and the memory of adolescent frailty. The frailty of Cal in *Omnivore*, *Orn*, and *Ox* and the vegetarianism of Veg thus have biographical roots, as does the interest in the defensive strategy of judo in the Jason Striker martial arts novels done with Roberto Fuentes and the image of Alp the conqueror in *Steppe*. But the most persistent value advocated in Anthony's epic and picaresque novels and short stories is his concern for the environment, the fear that "we cannot maintain our present trends without destroying the world as we know it."

In *Chthon*, though the main action is the escape from the terrible garnet mines on Chthon, part of the horror is due to ecological problems. This ecological struggle is further expressed in *Phthor*, where Chthon, a planet-sized mineral sentience, opposes all of sentient life on ecological principles, and *Phthor*, or Arlo, is a rejected spirit integrating "the powers of Life and Death." Even *Prostho Plus*, though a light-hearted spoof of bug-eyed monster depictions who happen to be Dr. Dillingham's alien dental patients, nevertheless seriously deals with the sanctity of ecological chains. While the surface action of *Mute* is a galactic power struggle similar to that of *Phthor*, the issue here is mutation. Human societies on many planets depend on the power of psi-mutes who develop from the mutation induced by space travel through radiation belts; however, the physical mutants and psychological mutants are exploited, and seek an end to the pain and leper-like exclusion of mutants by normals. Not merely a human struggle, this quest for equity includes animals like Hermine the weasel, fleas, rats, chickens, and bees. *The Ring* also deals with ecology, as Jeff Font seeks his father's lost fortune in an earthly society whose criminal behavior is controlled by Skinnerian electronic rings. The respect that Jeff begins to feel for the ring is Anthony's response to a need for control beyond a rampant American individualism sometimes indistinguishable from selfishness.

*Macroscope* continues to explore restraints on liberty in order to promote the greater good. While the most capable brains using the macroscope are destroyed, the destructive alien transmission is particularly lethal for power brokers such as Senator Borland. Even the entry testing which occurs as Afra, Ivo, Harold, and Beatryx enter the alien space craft determines the fitness of the individual for knowledge, the ability to bear knowledge responsibly. Not only does the novel deal with environmentalism on earth and the effects of disastrous population growth; it also shows the necessity for a mental environmentalism in the group's interaction. Ivo must integrate his other personality. Schön and Afra must balance competence by compassion. The flight from UN power and the quest for the Traveller which make up the novel's double action enable Anthony to explore the physical and internal ecology.

*Race Against Time* appears to be a rebellion against the culture of the Standard Race on earth but winds up being an

acceptance of that race's ecological concern. The three pairs of genetically purebred adolescent couples, on seeing the earth's former devastation, begin to understand the genetic wisdom of racial preservation and peace. *Rings of Ice* shows a new destruction of the earth by military forces which hope to make energy use of ice rings from icy nebula. The threat of tremendous flooding goes unrecognized, as the story shows six people attempting to survive the apocalyptic destruction. Again outer imbalance and psychological imbalance are both dealt with in Anthony's novel: Thatch becomes aggressive; Gus masters his fear of water; Zena overcomes her fear of men. *Triple Détente* deals with environmental issues and war. Kazos and men avoid battle by acting as conquerors of one another's planet, reducing each planet's overpopulation. Similar strategies are used to avoid battle with the Ukes, although their special racial instinct causes both problem and solution.

The Battle Circle trilogy, composed of *Sos the Rope*, *Var the Stick*, and *Neq the Sword*, is set after an atomic war. The trilogy's action, showing a rebirth of big government in the tribe of Sol and the monastic preservation of "crazy" technology and learning, cautions orderly development. That Sol seeks political power to compensate for sterility and Sos plans battles as strategies for personal vengeance illustrates character but more importantly social weakness. The state set up by Neq and the crazies in the last novel occurs only after purgation of foolishness, pride, and quick temper. When the cost of violence is tallied, such as the needless death of the mutant Var, civilization begins. This Camelot will not be so easily undone by sexuality, jealousy, and pride as the original.

*Omnivore*, *Orn*, and *Ox* each deals with the preservation of the planets and the preservation of the symbiotic relationship of Aquilon, Veg, and Cal. Only in *Ox* does Anthony provide Veg with his own mate, the semi-clone Tamme, but in the two earlier novels, love is controlled because the pairing of lovers is destructive to the trio. Aquilon loves both men for different reasons, and neither man is willing to cut the other out. The symbiosis of the group is paramount, as it is in *Rings of Ice* and other Anthony novels. The conflicting claims of preservation and development are worked out in each novel—the fungoid world of Nacre, the Paleocene planet of Orn, and the high technology of Ox. The solution in each case appears to be to control earth's appetite by controlling population. Super agents such as Subble and Tamme become more than imperialistic James Bonds. Violence is necessary in Anthony's novels, but only to insure species preservation. To alter the environment unnecessarily is a major crime.

This is even true in Anthony's fantasies. *Hasan*, though a sexy Arabian Nights series of picaresque adventures, is an ecologically moral world. Magic is fine if magic is conserved. Since Bahram kills young boys, he is killed in turn. Hasan, however, passes up violence in refusing to kill the conquered Queen, making a happy resolution possible. Hasan's foolish ignorance, which could precipitate needless violence, is mocked by those gifted in magical power, such as the ifrit Dahnash.

The Cluster series, currently composed of *Cluster*, *Chaining the Lady*, *Kirlian Quest*, *Thousandstar*, and *Viscous Circle*, makes much use of the Tarot. While systems such as the *I Ching* have had a bearing on some novels, the Tarot, from the time of *Macroscopic*, has been dominant in Anthony's symbol system. In *Chaining the Lady*, for example, even the space craft have shapes common to Tarot such as swords and cups. As a system, it appears to be Anthony's answer to the age-old struggle between free will and determinism. Basic to each of the novels is the conflict between galaxies over galaxy-bonding energy. The means of preserving this energy, necessary for the capitalistic expansion of Andromeda, is related to Kirlian aura transfer. It

becomes Flint's job in *Cluster* to give alien planets the secret of Kirlian transfer in order to protect the Milky Way. As Flint enters the host body of each alien in carrying out his mission, an appreciation of other cultures results. He learns to appreciate alien differences and understand their validity; conquest is more often through sex than combat, even between Flint and the Andromedan opposing him. *Chaining the Lady* echoes the plot of *Cluster*, merely changing the sexes of the Milky Way and Andromedan agents. The novel's end is again ecological as the will of lesser auras is taken into consideration in transfer: civilization cannot be maintained by theft of massive new energy; development must be ecological. *Kirlian Quest* shows Herald of Slash assuming the roles of Flint and Melody of the previous novels. Rescue from the Amoeban menace turns out to be rescue from the ancients. What Anthony appears to be exploring is the psychology of bias, how sentiments allow one gestalt to block another. The ancients/Amoebans seek to foster Kirlian sapience and fail to recognize it when they contact it.

*Thousandstar*, which tells of a race whose contestants are Kirlian auras and their host bodies, shows the effects of sexual cooperation and understanding, as Jessica and Heem share the same body. The cooperation shown by the three hostile species is a paradigm for Anthony's environmentalism. *Viscous Circle* has a utopian dimension, as a human Kirlian aura transfer agent, Ronald Snowden, is transferred from his human host to the culture of the bands, mostly metallic creatures deriving energy from magnetic lines, who are peaceful, anarchic, truthful, kind, and generous. Enamored of band culture and a female band, Cirl, Ronald attempts to save the culture from human destruction, but his human methods, war and deceit, damage bands as much as humans. Only by suicide does Ronald prove his truthfulness to another agent he has lied to and find Nirvana, the viscous circle he regarded as myth but which is a spiritual reality.

The Tarot sequence is an elaborate Tarot fantasy which connects to the Cluster series by the use of Kirlian auras and aliens from Cluster planets. Nonetheless, the action is allegorical, as Brother Paul seeks the God of Tarot in encounters with religious leaders, representatives of secular philosophies, and in visions having more in common with Dante, *Piers Plowman*, Bunyan, and Freudian dreams than with contemporary fantasy. While the communist leader, the Mormon, and the Quaker seem too easily reduced in this spiritual odyssey, the series still has much power, and the Tarot symbols are probably more accommodating to fantasy than science fiction, where they seem anthropomorphic.

The Apprentice Adept series, which includes *Split Infinity*, *Blue Adept*, and *Juxtaposition*, deals with the effects of greed on the ecological system of a planet and on two completely different yet parallel societies. Anthony creates two planets, Proton and Phaze, which are parallel worlds or "frames." On the science planet Proton, a few decadent Citizens have selfishly destroyed the planet's environment by mining Protomite, a mineral which provides them with unlimited energy and enormous wealth. Served by serfs and machines, Proton Citizens are gods, living only for the pleasure of generating more wealth and playing a planetwide Game controlled by a computer. On the beautiful magic planet Phaze, Phazite provides the energy which allows a few Adepts to practice magic and gain control of both human and animal populations. Stile, Anthony's hero, uses the game skill gained on Proton to become Phaze's greatest Adept. Eventually he leads a revolution which equalizes the minerals on both planets, separates the two frames forever, and gives the serfs and robots of Proton and the humans and animals of Phaze independence from their greedy masters.

The Xanth series again focuses on conservation. Bink's quest in *A Spell for Chameleon* to discover whether he has magic uncovers a peculiar trait, resistance to magic's harm. The Magician Humfrey believes in conserving his power, and even Trent says, prior to renouncing force to gain a kingdom, "There is a balance of nature, whether magical or mundane, that we should hesitate to interfere with." In *The Source of Magic* Xanth learn conservation by temporarily losing its magic when Bink frees the demon. Again psychological ecology is important, as Grundy and Xanth learn about feelings and lose their cool, and in the demon's case, formulaic rationality. In *Castle Roogna* Dor, son of Bink, is on a quest in the past to restore a zombie to a former ghost. Dor, young, learns maturity in his quest, the "discipline of emotion and action," as he recognizes the consequences of actions. Nearly the same characters in *Castle Roogna* reappear in *Centaur Aisle*, although they are four years older. Dor, his friends, and Irene must rescue King Trent and Queen Iris in the Mundanian kingdom of Onesti, but their magic only works in a field created by the centaur Arnolde. Anthony's conservationism manifests itself in this novel politically, as good use is found for the usurper of Onesti, Oary, who must employ his cleverness as an ambassador to Onesti's warlike enemy, and ecologically, as even predatory dunes and sea dragons are protected and preserved. Smash, the half-ogre accompanying Dor in *Centaur Aisle*, goes on quest of his own in *Ogre, Ogre* with Tandy, a half-nymph. Although both learn their true natures on their journey, Smash has the most to learn, recovering his human intelligence through the artificial sanction of Eye Queue, and developing his soul which he barter not for power, like Faust, but love. Tandy and Smash, adding creatures to their pilgrimage, build a community as they go. This continues in *Night Mare*, where Imbri, one of the night mares in *Ogre, Ogre*, becomes King of Xanth when the Horseman and his Mundanian army attempt to conquer the magic kingdom, temporarily disposing of nine previous kings. The novel is Anthony's answer to feminist critics, as the females do the fighting to save Xanth, and Imbri overcomes her sexual instinct to defeat the white stallion—really the Horseman. The three principal characters of *Dragon on a Pedestal*—Stanley, the Grap Dragon, who is reduced in size due to the Fountain of Youth; Ivy, the child of King Dor and Queen Irene; and Hugo, the young son of Good Magician Humfrey and the Gorgon—all have symbiotic relations with one another through their magic talents. They have to deal with three problems facing Xanth, too much drinking at the Fountain of Youth, forget-whorls emanating from the Gap Chasm causing amnesia, and a plague of wiggles which bore through anything in their paths. By combining the talents of the children and dragon, and by combining the talents of much of Xanth's population, natural balance is again achieved, for as Chem the centaur says, "Everything relates." The frame tale of *Crewel Lye* occurs two years after *Dragon on a Pedestal*, while the central action involving Jordan the ghost, helper of Imbri in *Night Mare*, occurs 400 years earlier. Jordan in his lifetime develops heroic stature on his adventure-filled journey to Castle Roogna, where he is given a quest by King Gromden to discover and bring back something valuable to the Castle, on the way testing the powers of seven spells and counter spells created by Good Magician Yin and Evil Magician Yang, each of whom is competing for the succession; however, as in the Tao, both are one. The quest costs Jordan his life and his love, although Ivy brings both to life, unmasking the goodness of a cruel lie. Taoistic balance is characteristic of Anthony's concerns throughout the pun-filled, award-winning Xanth series, which continues with *Golem in the Gears*, where Grundy the Golem

has a quest to discover the little lost dragon, Stanley, from *Crewel Lye*, discovering his true love, Rapunzel, in the process.

The Incarnations of Immortality series, which, when finished, will be composed of five novels, currently consists of *On a Pale Horse*, *Bearing an Hourglass*, and *With a Tangled Skein*, dealing with death, time, and fate respectively. Each novel shows the selection of a new person to be one of the five incarnations of immortality—death, time, nature, war, and fate—and the struggle or quest, personal and global, that the incarnation undertakes. In *On a Pale Horse* Zane, nearly by accident, kills Death or Thanatos and takes over his office, taking souls of those about to die who are balanced between heaven, hell, and purgatory. Through love of Luna, a dying magician's daughter, Zane foils an attempt by Satan to manipulate Luna's death and American politics to bring about global catastrophe. The ecological theme is presented in several ways, as Anthony, like Dante, has special uses for hell in punishing litterers and wasters, but his most significant manifestation of his theme is in the balance between Gaea, Thantos, Chronos, Mars, and the three manifestations of Fate, Clotho, Lachesis, and Atropos. Also, instead of violence, the solution for this compassionate Death is reason. *Bearing an Hourglass* has Norton, a naturalist concerned with natural balance, assume the position of Chronos, manipulator of time and causality. Though women and Satanic illusions tempt Norton, he opposes Satan's attempt to manipulate causality and reverse the election of Luna that spoiled his plans in *On a Pale Horse*. Again the balance of forces holds, as the hero uses thought to overcome Satan's ploys. So far Anthony has trouble in adjusting emotional tone to situation in this series.

Anthony's futuristic series *Bio of a Space Tyrant* is a further illustration of his belief that individual liberty must be restrained for the good of mankind. Although only three of the proposed five novels have been published, Anthony makes clearer with each novel his basic theme. Man has taken his technology into the solar system, but though his technology has evolved, man has not. The best men still retain selfishness and a concern for individual interest, while the worst are bloodthirsty savages. Anthony's imaginary future parallels today's reality. Ostensibly taking place in the 28th century, each planet of the solar system represents a 20th-century country. Jupiter has been colonized by the Americas, Saturn by Asian countries, Uranus by European countries, etc. Poverty, racial prejudice, women's rights, minority rights—even the boat people—appear in various guises to reinforce Anthony's theme. In *Refuges* Anthony arouses reader sympathy for the Hispanic hero, Hope Hubris, with a graphic and bloody account of his 15th year, a year in which he experiences the gamut of man's inhumanity to his fellow man—or woman. He rises above rape, cannibalism, and the annihilation of most of the people he knows and loves, and comes to recognize the enemy to be not only the savage space pirates but the indifference of the colossus, the United States of Jupiter. In *Mercenary* Hubris seeks and gains revenge on the pirates, while in *Politician* he challenges the government of Jupiter, a government which has become so corrupt that only by ridding Jupiter of the executive, legislative, and judicial branches of the government can mankind's basic greed be controlled. Therefore, at the conclusion of the third novel, Hope Hubris is not President but Tyrant of Jupiter with the consent of the people and the legalized authority of a constitutional convention, making the rule of tyrant seem inevitable because of the chaos engendered by uncontrolled individual freedom.

Anthony, probably at his best when he is least profound, is nonetheless an engaging writer. He entertains through suspenseful adventure, the imagining of alien and fantasy cultures,

and humor—sometimes at the expense of dramatic conflict.

\* \* \*

Christopher Anvil appeared more frequently in *Astounding/Analog* from the mid-1950's to the mid-1960's than any other author, yet he remains relatively unknown today. His novels are slight efforts, and do not compare with his finest short fiction.

At his best, in stories like "A Rose by Any Other Name," which skillfully examines the effect of certain words on international relations, the widely reprinted "Gadget vs. Trend," on the impact of one invention on the functioning of society, and "Positive Feedback," a hilarious story that illustrates the problem of adjusting systems while they are in action, he is an inventive and expert manipulator of social trends and processes. Indeed, he has been one of the very best SF observers (along with Mack Reynolds at *his* best) of the foibles and presumptuousness of social thinkers and social managers. He was perhaps too successful—he found a formula and worked it to death, and was one of the main reasons why the 1960's *Analog* always left you with the feeling that you had just read last month's issue again. He was a John Campbell writer who could be relied upon to hew to the formulas and fads of that editor, and like Randall Garrett became lost from public view through constant, unchanging exposure. Perhaps he might have flourished artistically in another market—some evidence for this possibility can be found in "Mind Partner," his finest work, and one of his few stories published in *Galaxy*. In several respects "Mind Partner" is a New Wave story, a powerful example of psychological science fiction at its best, written before anyone was arguing about the term or had even heard of it. The story has a nightmare quality about it that lingers long after the reading. The editor-writer relationship in

science fiction is for the most part a mystery, and it is also possible that Campbell brought out the best in him.

Other notable stories include "Bill for Delivery," "The Captive Djinn," "The Great Intellect Boom," a major work that examines the effect of instant intellectuality on everyone in a society, "The Prisoner," and "Uncalculated Risk."

\* \* \*

Once a highly popular author, Edwin L. Arnold is little remembered and seldom read, and when read at all is generally examined as a possible source of inspiration for Edgar Rice Burroughs's Martian series rather than as an author of independent merit. Arnold's father, Sir Edwin Arnold, was one of the first Englishmen to study Eastern religion, philosophy, and culture. Very likely as a result of his father's influence, young Arnold became interested in Asian philosophy, in particular in theories of reincarnation and the cyclical nature of existence.

These theories are visible in Arnold's first and most successful novel, *The Wonderful Adventures of Phra the Phoenician*. Phra is described as a man appearing about 30 years of age, but in fact having no recollection of ever having been younger. His most ancient memory is of life in classical Phoenicia, but even in that recollection he was a man, not a child. Over the ages, Phra has lived and (apparently) died repeatedly. He describes himself as a simple military man, although he admits to being a great swordsman. As an early colonist in Britain he met and fell in love with the Princess Blodwen. Following her death he too "died" and encountered her ghost in the spirit world, but after many years Phra recovered, his undecayed body as good as ever, and resumed his life. This cycle is repeated numerous times, down to the present (Victorian) era. The book is an excellent example of Victorian fantasy, closest in spirit to Haggard's *The World's Desire*, written with Andrew Lang. To modern readers *Phra* will seem slow-paced, florid, and overlong, but it is still readable.

*The Story of Ulla and Other Tales* is a collection of Arnold's shorter fiction. Several of the stories contain fantastic elements, for the most part of rather conventional nature (i. e., ghost stories). Most relevant is "Rutherford the Twice-Born," in which Arnold reverts to the reincarnation/resurrection theme. *Lepidus the Centurion* is still another treatment of the resurrection/reincarnation theme. A Roman legionnaire revives from suspended animation in contemporary England, and then proceeds to acclimate himself to polite Victorian society, learning to play tennis and the like. *Lepidus* is the least of Arnold's novels in actual interest for the present-day reader. The author attempts the comedy of manners in style, but the result is poor.

*Lieut. Gullivar Jones: His Vacation* was Arnolds's final

novel, and the most interesting to the modern reader of science fiction. Jones, a lieutenant in the US navy, comes into possession of a magic carpet while on leave. He is carried to Mars where he encounters a race of cultured urban dwellers attempting to preserve a high ancient civilization against the maraudings of savage desert nomads. He rescues the civilized Princess An from the nomads, travels to an icy River of Death (compare Haggard and Burroughs), and has other adventures among the Martians before returning to earth. By combining the setting and plot elements of *Gullivar Jones* with the heroic figure of *Phra the Phoenician*—and with the addition of elements from such works as *A Journey to Mars* by Pope and *Zarlah the Martian* by Grisewood—one assembles the full recipe of Burroughs's Barsoomian saga, at least of the early volumes.

Although Arnold's last book was published in 1905, he lived until 1935, well into the period of modern "pulp" science fiction, but there appears to be no record of his attitude toward the works of later writers, including Burroughs.

\* \* \*

At the turn of the century, Frank Atkins, using the Fenton Ash and other pen-names, was writing a genre of fiction which contained elements of what critics today broadly term speculative fiction. To call Atkins a science-fiction writer, however, would be to push him into a category which his writing fits only at certain key points: in theme and plot, in characters, and in style. Atkins's work suits his time and place, but in at least one novel, *A Trip to Mars*, he explores possibilities only being hinted at by a few other writers and cinematic directors of his time.

Atkins stretches coincidence to the limit in certain areas. He hypothesizes lost civilizations on earth—the remains of Atlantis in the middle of the Sargasso Sea, El Dorado on a mountain top in an unexplored region of South America—in four books, and only in *A Trip to Mars* does he move beyond the earth. He frequently postulates long-lost relatives; the conflict often revolves around the good characters overcoming powerful forces of evil. But Atkins's outcomes are pat, and he prepares his reader well with very broad hints for any "surprise."

Atkins strives for believability in his settings, giving lengthy descriptions with numerous footnotes, of the flora and fauna both in South America and in the Sargasso Sea, though there are many descriptions of the fantastic in all his books—giant flowers, fruits, animals, huge dazzling jewels and massive amounts of gold. He also frequently hypothesizes seers who make accurate, if non-specific predictions, usually astrologically. Atkins's only real speculative scientific developments occur in his "red ray" (*King of the Dead*) and space ship (*A Trip to Mars*). "Hard" scientific developments play minimal part in his books.

Most of Atkins's characters are, at best, stereotypes. His infrequent attempts at light-heartedness generally occur when he introduces a lower-class Englishman (usually a sailor) with a droll, "uneducated" accent, uttering malapropisms. His "evil" characters are in all senses malevolent and frequently seem to be in league with some never-explained Dark Power. Only in *King of the Dead* does he portray a Power of Evil, called Mahrimah, who resembles a fallen angel. All the books have as protagonists male "chums" who are young, adventuresome, and typically British. Of lesser importance are the young women, generally the love interests of one or both of the "chums"; some are exotic, some are classically British, but without exceptions coy and beautiful, and are frequently endangered by natural or human foes. This is true even for Vanina, the queen of *A Queen of Atlantis*, who actually plays a very passive role in the plot. While in all of Atkins's books the good characters consistently behave nobly, most of the books contain a totally noble figure as well. In his Monella novels this character is Monella himself, a noble figure of great age who is roaming the world until he can regain his throne in El Dorado; in *King of the Dead* the noble figure is Lorenzo, né Manzoni, who is even more enigmatic than is Monella. They are consistently wise, strong, compelling, and remote, and both

also have to atone for some "sin" (primarily caused by his leaving of his people and venturing into the "real" world) by admitting his error and setting things to rights.

Atkins's style is probably the most interesting feature of his books. Atkins uses the common technique of ending each chapter with a hint of what is to come, and it does serve its purpose—to keep the reader reading. Atkins uses much description in his book, which is fortunate since his dialogue is often formal and stilted. Atkins's point of view is consistently third-person, but the particular outlook of each chapter varies determined by whom Atkins chooses to focus through. Atkins is at his best when describing the exotic features of his setting—costly and beautiful architecture, elaborate costumes, wonderful jewels. He excels at choosing exotic names for people, places, animals, and Gods—Ivanta, Alondra, Mellenda, Ullama, Lyostrah, Morveena. The tension in his novels frequently revolves around encounters with natural but terrifying animals, such as cuttlefish, enormous snakes, gorilla-type animals, pumas, and most of his novels feature supernatural monsters such as zombies, vampires, and, most particularly, the devil-tree in the novel of that name. The devil-tree, a huge tree which seizes its victims in tentacle-like branches and conveys them to its maw, a hollow trunk, is fully as terrifying and loathsome as any creation of current writers of horror novels or directors of horror movies. After the tree consumes the victims, it releases them, or what is left of them, to be carried off and eaten by crocodile-like monsters who live in a pond at its base. In the climactic scene at the end of the novel, the evil priests are all seized and eaten, some by the tree, and some by being torn to bits by the monsters as the priests are held in the tree's tentacles awaiting their turn in its maw. The nightmarish effectiveness of this description is such that its image remains vivid in the reader's mind long after he has finished the book itself.

In fact, if Atkins's writing is akin to speculative fiction, it is certainly supernatural and horror fiction which it most resembles. He does work with settings which are largely unknown to his world, but it is their exotic quality rather than any science-fiction aspect which he develops. Only in *A Trip to Mars* does Atkins extrapolate any scientific devices, and these are fanciful, based on principles long since outdated. Additionally, the Mars which Atkins depicts is so similar to his exotic settings on earth as to be interchangeable, and his Martian characters are certainly no less human, in physical features or in outlook, than the characters in his earth-based novels. Nevertheless, Atkins's books are still interesting reading, particularly in editions which contain the quaint original illustrations, as period pieces.

\* \* \*

The world's most prolific science writer, Isaac Asimov has written some of the best-known science fiction ever published. Avoiding action adventures, Asimov usually sets and solves puzzles to educate the reader in science and technology. If he lay claims to being an "artist," the conflict between his generally optimistic and detached tone and the plot lines and concepts of his fiction might be troubling. For a superior self-taught craftsman who has entertained millions over more than 40 years it may well be a key to his success.

Many Asimov short stories sacrifice everything for a gimmick, sometimes no more than a pun or surprise ending. Even clever gimmicks can get repetitious, as in three stories of technological societies so sophisticated that something taken for granted today must be rediscovered: writing in "Someday," mathematics in "The Feeling of Power," walking outdoors in "It's Such a Beautiful Day." Sometimes the gimmick is memorable. "Franchise" extrapolates polling methods to a logical conclusion—computer elections with toss-ups decided by a scientifically chosen average citizen. "What If?" imagines time as fixed but fluid, with variant means producing the same end for newlyweds who indulge their curiosity about what might have happened had they not met as they did.

The best of his longer stories surmount their gimmicks, but there may be nagging doubts. "Profession" reduces trends in accelerated education to the absurd. While everyone else finds his niche through programming suited to his brain pattern, the protagonist discovers he, as a really creative individual, must educate himself. That an interstellar civilization depends on one world's ritual "Reading Day," "Education Day," and job-seeking "Olympics" is no more credible, of course, than the secret conspiracy of creative individuals. Equally objectionable is the conspiracy of silence in "The Dead Past," but its extrapolative source has a sharper satirical edge, connecting to grants for scientific research and the spectre of government control of curiosity. Lacking clearance for direct observation of ancient Carthage, a historian persuades a physicist to build his own time-viewer from classified data, a simple task for the scientist. Before the government can act, these well-meaning rebels make public a surveillance technique extending to the most recent past, completely eliminating privacy in the present. If the interests of science and public policy clash in that story, the interests of science and ethics are at odds in "The Ugly Little Boy." If not Asimov's best, this is certainly his most emotional story, contrasting the imperative for scientific research with that drive's effect on individual human beings,

especially a little Neanderthal boy snatched into the present, and the nurse who views with deadly seriousness her job of taking care of him.

Other human interest stories also stand out in Asimov's short fiction, like "Dreaming Is a Private Thing," with its impressionistic glimpses of a literal dream-industry from an entrepreneur's viewpoint. At first glance, "The Martian Way" is just another gimmick story. Dependent on water as reaction mass for their spaceships, Martian colonists find their way of life endangered by an "Earth-first" political movement threatening to cut off their supply. The answer is simple, for a Martian: get ice from the rings of Saturn. The novella transcends its gimmick, propagandizing for human progress, suggesting a new kind of civilization, and satirizing recurrent demagogic types in America.

If Asimov's best fiction comes from the 1950's, his most popular works stem from the previous decade. Written when he was barely 21, "Nightfall" may be the most popular short story in all of science fiction. It creaks with 1930's pulp clichés, including the stock characters peopling a distant planet. The premise is implausible, an "alien" race only experiencing darkness once every 2000 years. Still, "Nightfall" is a classic of science-fictional perspective and sense of wonder. The astronomical situation, though fundamentally unstable, is possible in theory. The panic resulting from darkness is a credible metaphor for civilization's periodic fall. The scientists' viewpoint poses a suggestive antidote, studying rather than worshipping the strange phenomenon. Curiosity loses to fear, however, raising the same note of ambivalence toward science which provides an emotional undercurrent in other Asimov fictions.

The robot stories (begun in 1940) which overflow three volumes, *I, Robot*, *The Rest of the Robots*, and *The Bicentennial Man*, gave rise to the "Three Laws of Robotics," formulated with *Astounding* editor John W. Campbell, Jr. Asimov devised these control mechanisms to offset what he saw as a "Frankenstein complex" in science fiction. Repetitive puzzles, exploring limits and loopholes in the Three Laws, these stories more often trivialize than defuse the fear of technology that is their subtext. If some short works stand out, such as "Liar," "Reason," and "The Last Question," they are overshadowed by his first two novels featuring the Earth detective Lije Baley and his off-world robot partner, R. Daneel Olivaw, *The Caves of Steel* and *The Naked Sun*. They are set 3000 years in the future, when mankind has settled a few other star systems, but people on Earth have little to do with them. Examples of classic mystery form, they led Asimov to write other detective stories, of which those involving Wendell Urth are science fictional. Unlike them, however, the robot novels emblemize the necessity of man-machine cooperation for technological civilization on this planet as well as others.

A later series of six novels for children about David "Lucky" Starr concern a much earlier settling period. Mostly puzzle-stories set in the solar system as understood in the 1950's, they were reissued two decades later with disclaimers about their outmoded astronomical speculations. That same passion for accuracy informs his film-novelization, *Fantastic Voyage*, which scientifically rationalizes everything but the impossibility at the movie's core: a subminiaturized vehicle and five humans entering a scientist's bloodstream to remove a cerebral blood clot.

As a novelist, Asimov is most widely known for *The Foundation Trilogy*. Loosely based on historical parallels with the Roman Empire, these nine stories and novellas (1942-52) hypothesize a deterministic "psycho-history" that calls into question the free will of his anti-heroic protagonists. In a

crumbling Galactic Empire, they try to keep the spirit of scientific inquiry alive throughout a Dark Age until civilization can again be consolidated. Not the first to examine such an empire, Asimov's work was different: decision-making replaced blood-and-thunder action, and its empire—a compromise with editor Campbell's insistence on inferior aliens—was a civilization of humans only.

Three novels set in earlier stages of the Empire—*Pebble in the Sky*, *The Stars, Like Dust*, and *The Current of Space*—are significant for their portrait of a radioactive Earth reviled and neglected by her far-flung children, but less rewarding than much of Asimov's work. Loosely connected to the same future history, *The End of Eternity* echoes 20th century dystopias in his closest approach to a conventional love story. In it, 70 thousand centuries of Earth's history are stabilized through time travel by the organization, Eternity. Its overthrow brings about a temporal universe in which the Galactic Empire can come into being.

In a different vein, *The Gods Themselves* suggests an Asimov more serious about artistry and contemporary social relevance. At issue, in part, is an impending energy crisis temporarily solved by drawing energy from another universe. The major interest for Asimov-watchers is the para-universe itself, and his largely successful creation of an alien civilization and consciousness. Unfortunately, the alien viewpoint is abandoned in the conclusion, the energy crisis being shifted away from their cosmos to still another para-universe in a feat of auctorial sleight-of-hand.

The only major advance in his fiction in 15 years was sacrificed, another decade later, to giving the public what it wants. Two very late sequels to his most popular series displayed few of his virtues as a writer and all of his weaknesses. Set on a world with optimal cooperation between man and machine, *The Robots of Dawn* mediates between its predecessors, in which one or the other was dominant, but it has little of their flair, innocence, or brevity. Tying together most of his novels, *Foundation's Edge* adds to the First and Second Foundations yet another communal force for good and/or stability, Gaia, and a suggestion that the robots of his other series play a significant role (unhinted at before) in galactic governance. Interminably talky and convoluted for no apparent reason other than bulk, written with a tin ear for dialogue and prose style, taking little account of the changes in his own world since his earlier books, both were instant best sellers, with loose ends available for further sequels.

Asimov's latest novels add nothing of value to the canon of a writer who could well afford to rest on his previous accomplishments. Having brought into the field a low-key anti-melodramatic style, a love for playfully solving puzzles and problems, and a respectable air of scientific detachment, Asimov has written a body of work which is already one of the cornerstones of modern science fiction.

—David N. Samuelson

\* \* \*

One of the more energetic and interesting writers to emerge since the late 1970's, Robert Asprin compiled a most impressive record for productivity in his early years. His first book, *The Cold Cash War*, introduced themes present in most of his later works, and which can be traced, at least in part, to Asprin's pre-literary occupation. He had been a cost accountant for a large "high-tech" corporation, and was thoroughly familiar with corporate procedures and the problems of management and personal rivalries within the corporate environment.

In *The Cold Cash War*, Asprin posits growing impatience and dissatisfaction on the part of large corporations with governmental mandates and unresponsiveness. In this situation, the corporations form private armies; when the government, through its "official" army, tries to suppress this odd rebellion, the corporations triumph as a result of possessing superior technology and more effective means of troop-motivation. The book is somewhat limited in characterization and plot, but shows excellent powers of technological and sociological extrapolation, at least in the near-future range.

*The Bug Wars*, Asprin's second science-fiction novel (a fantasy novel of very different nature intervened), continued the military theme, and is a worthy experiment, but unfortunately fails seriously. Asprin portrays an interplanetary struggle between a race of highly advanced, highly militaristic, intelligent reptiles and a coalition of huge insects. The narration is from the viewpoint of the reptiles, and it is uncertain to both the reptiles and the reader whether the insects are truly

intelligent or not. A background rationale involves a mysterious elder race which had been instrumental in the spread of the insects through space. There is also passing mention of small warm-blooded animals, the reader being free to speculate as to whether these are pre-human beings, true humans of a degraded culture, or simply warm-blooded animals. A novel told completely from the viewpoint of a reptilian alien and involving no identifiable human characters was a most ambitious undertaking. The result, unfortunately, was a thoroughly one-dimensional book devoted almost entirely to the military details of battle; without characters suitable for reader empathy or identification, the volume makes poor reading. It is further marred by numerous minor solecisms and clichés. Asprin has suffered from poor editing.

*Tambu* shows marked improvement. It is the story of a band of professional pirate-hunters, laid against the background of a future interstellar trading culture. The structure of the book is unnecessarily cluttered with excerpts from a supposed interview at the end of Tambu's career, between which Asprin intersperses major incidents in his life. But the story-telling is brisk, the characterization indicates considerable progress, and a feel is achieved, at least sporadically, that is reminiscent of the old *Planet Stories* or E. E. Smith space operas.

Asprin's collaborative novel, *Mirror Friend, Mirror Foe*, was written with George Takei, the actor best known for his continuing role in the *Star Trek* series. In this novel, against a background of intercorporate espionage and cold-war, the authors place a corporate spy within a robot-manufacturing concern. The spy's heritage derives from the Japanese *ninja*; this, presumably, is Takei's contribution while Asprin's is the corporate situation. From a promising start, the book unfortunately degenerates into cliché as the robots, escaping from their normal conditioning, go lurching and clanking about a planet murdering every human being they encounter.

Despite his promising start as a science fiction writer, Asprin achieved far greater success in the allied field of fantasy, and by the mid-1980's had largely abandoned science fiction. His fantasy novel *Myth Conception* initiated a series of slapstick adventures in-and-out of an Arabian Nights universe of *jinni*, homunculi, spells, dragons, and gorgeous women. Within the familiar realm of published fantasy, Asprin's *Myth* series (all the books are pun-named) bears comparison to the works of L. Sprague de Camp. Asprin himself claims inspiration in the Bing Crosby/Bob Hope/Dorothy Lamour "Road" films of the 1940's.

Even more successful than the *Myth* books is Asprin's series of *Thieves' World* anthologies. The concept is essentially that of a vaguely Robert E. Howard-type barbarian culture, against which any number of stories can be laid by any number of authors. The anthologies have proved so successful that an entire mini-industry has sprung up around them, with authors using the *Thieves' World* setting for novels of their own, and with adaptations into comic books, role-playing games, video games, and the prospect of further, varied merchandising and adaptations.

\* \* \*

John Atkins's *Tomorrow Revealed* is cast some thousands of years in the future. When most people are living a mindless existence, the son of a star-gazer, who has been taught to read and write by his father, writes a history of the earth and the planets visited by earthlings, the facts culled from such authors was Wells, Graves, Orwell, C. S. Lewis, Bradbury, Kuttner, Heinlein, van Vogt, and others. The novel is cast in the form of historical narrative, and the narrator is responsible for much unconscious humor as he attempts to fabricate a plausible history of mankind incorporating the various sources he uses. Much of the delight of this novel for the reader conversant with the major works of speculative fiction derives from his recognition of the sources, his knowledge of contemporary history, and the often disastrous conclusions drawn by the future historian, who is often guilty of distorting facts to fit his theory. The basic orientation of Atkins's book is theological, though it is far from doctrinaire theology. At the conclusion of his history, the narrator is convinced that history "is nothing unless it is an adjunct of theology." He concludes from his fascinating reading of the "sources" that there is a theological significance to human destiny. As he says, "I am convinced of a purpose."

Atkins is very articulate and well-versed in speculative fiction; he has written a book which is marvellous entertainment. There is a great deal of humor in this book, an element all too often absent from speculative fiction. Its basic weakness is that the entire novel is narrated; there is not one dramatized scene, or any character development or interaction—simply the dispassionate voice of the historian.

\* \* \*

All of Brian N. Ball's action-packed science fiction novels depict humans and humanoids toying with their universe, manipulating time and space, for entertainment, adventure, and intellectual stimulation. In so doing they stumble upon intriguing puzzles that frequently involve an encounter with a thoroughly alien extraterrestrial presence. At times they find themselves manipulated and toyed with in turn, themselves the puzzle that another intelligence seeks to fathom. Ball's central characters range from spacepilots to world-scale movie directors but are almost always outsiders, adventurers, men who intentionally or instinctually break the normal patterns and thereby initiate a chain of events that leads to chaos, discovery, and metamorphosis. His heroes face physical, emotional, and intellectual terrors, but prove flexible enough to adapt and survive, and outwit computers, robots, monsters, and aliens. Usually an attractive, versatile woman adds her intelligence, ingenuity, or intuition to their cause, and ends up providing them a motive to endure.

In Ball's works stasis debilitates and perverts, while flux, no matter how terrifying, stimulates and challenges. Man achieves his destiny when forced to defend his ego, reassess his identity, adapt to new circumstances, and act quickly, decisively, and unexpectedly. He is at his weakest when he yields to hysteria, when he fails to react humanely to the plight of others, when fear overrules logic; but he is at his best when he can laugh at his own absurdity, accept his limitations and vulnerability, face up to his mistakes, and yet plunge back into the fray and pit his wits against the odds—hopeless though they may seem.

In depicting the unknown terrors that men must cope with,

Ball conjures up frightful, nightmare images: a nervous system turned inside out, the human "Patient" reduced to an unutterably distorted grotesque shambles (*Sundog*); a mound of flesh 200 feet high, an amalgam of misshapen parts and personalities, whose mouths gape open from knees and armpits, toes and earlobes (*Timepivot*); a doomsday army of 1000-year-old black robots, programmed to annihilate opponents long dead (*Night of the Robots*); the nightmare products of cell fusion—human intelligence trapped in the monstrous—a plot director transformed into a ravenous, writhing snake, greedy for live flesh, and giants that read their fate in the entrails of their victims (*The Probability Man*); and alien probability zones that send intruders down the evolutionary scale to become apes or tigers, beetles or dinosaurs, their humanity submerged in the bestial (*Planet Probability*). Yet even amid such horrors he infuses humor: a spacepilot blessed with a glowing halo, a devilish galactic prankster suddenly endowed with horns and tail, a strutting dandy turned ape, a cranky archeologist beset by inquisitive tourists, nude Valkyries on flying tigers, a pompous robot named Horace, and an 18th-century soldier swearing antique oaths amid 30th-century hells.

In *Sundog* an alien force field has turned man back on himself, causing him to set up a world of rigid regulations where dreams are controlled and psyches probed, until one man learns to set free his inner "Watcher," and thereby destroy past barriers—both human and alien. In *Timepivot* the hero must decipher the riddles of time and face its pivotal point and the alien that guards it to rid mankind of one form of tyranny. *Night of the Robots* records the accidental discovery of an ancient fortress whose computers, while awaiting final orders to launch an attack, have evolved into a menace that only the courage of humans past and humans present can defuse. The "Probability" series focuses on "the probability man," Spingarn, creator of world-staged dramas, historical recreations played out with whole populations from a bored, jaded, and overcrowded cosmos. By programming himself into all of the dramas and by joining forces with an unpredictable alien force to experiment with a Genekey on the pre-human planet of Taliskar, Spingarn dooms thousands to frightening metamorphosis, including, ultimately, himself. The series traces the bizarre and macabre adventures and transformations produced by an inhuman questing intelligence in search of its origins and the human machinations that ultimately satisfy it.

In sum, Ball creates fantasy and horror as he explores man's psyche, his potential for good and evil, for love and hate, for loyalty and betrayal. His aliens are beyond human comprehension, and can be contacted only by a special few, and then only with great discretion; his humans are an amalgam of man throughout the ages—Renaissance swashbuckler and 19th-century dandy, modern fighter pilot and mythic hero.

\* \* \*

Of all the British writers of the "New Wave," J. G. Ballard is unquestionably the most original. Though nourished by references to the masterpieces of literature (from Homer and the Bible through Shakespeare to Coleridge and Melville) and of the arts (from Bosch to Dali and Leonor Fini), his style is as distinctive as a signature: the abrupt openings which plunge the reader straight into the action, as if he were already acquainted with the circumstances – outlandish though they may be – and with the whereabouts and idiosyncrasies of the characters – even though they often border on aberration and mania; the painter's eye, which fixes things, landscapes and even living beings into striking pictures of geometrical precision as well as coruscating beauty; the rich comparisons, through which paragraphs, instead of being concluded, are prolonged by mysterious harmonies and correspondences far and wide into space and time.

But if Ballard's permanent approach is characteristic, his evolution is also conspicuous and coherent. His first stories still played with traditional SF hypotheses, such as the time paradox in "The Gentle Assassin," or warned of future exacerbation of present-day problems, such as unbridled urbanisation and overpopulation in "Build-Up" or "Billemium." Yet even in the first collections (*The Voices of Time*, *Billemium*, *Four-Dimensional Nightmare*), two dominant features of his later works emerge: fascination for objects, especially the products of technology – clocks in "Chronopolis," invading metal in "Mobile" – and interest in the deviating psyche – one story of 1962 is entitled "The Insane Ones."

In the short stories set in Vermilion Sands – a decadent seaside resort which, as the short-lived materialisation of wild dreams, may be called an "inner landscape" – fascination and insanity are indeed allied in the various heroines: an actress who continues her murderous career beyond death, a poetess who wants a young admirer to repeat the sacrifice of Corydon to the muse Melandra, a rich and beautiful widow who has her portrait sculpted in the clouds. Extraordinary creatures (flying rays, singing orchids) and artefacts (a psychotropic house, a metal sculpture that sings and grows, clothes that live and feel) reflect and amplify the inner and mutual conflicts of those glamorous lamias and their suicidal wooers, in a baroque symphony of art, love and death.

In the 1960's, Ballard was also writing a series of disaster novels, each dealing with one of the four elements, yet with striking correlations (for example, *The Drought* is paradoxically fraught with references to shipwrecks). Contrary to most treatments of the theme, these four books are not centred on the frightful destructiveness of the cataclysm but on its awesome beauty, not on the desperate resistance of courageous survivors but on the perverse desires, mad ambitions, and suicidal manias of aberrant personalities now free to fulfil fatal aspirations devoid of any rational motivation.

As if Ballard had exhausted the treasures of his poetic imagination by throwing them all into the last and most accomplished of those works, *The Crystal World* (in which a "time leak" causes matter to expand in space, turning plants, animals, and people into efflorescent masses of dazzling crystals), the 1970's show a sudden evolution towards bareness, both in his style – soberer descriptions, fewer far-flung

comparisons – and in his material – no more inordinate power and purposes in men, as in Hardoon the modern pharaoh, no more preternatural charm and exactingness in women, as in Leonora Chanel the modern Medea, no more remote deadliness and beauty in the scenes, as in the all-invading jungles, hurricane, sands, and gems previously described. Instead, commonplace characters (whose recurring names, Catherine, Helen, Maitland, Robert, suggest that they are projections of the author and of the women with whom he has love-hate relationships) live and die in the settings that present-day humanity has created for itself: the world of the automobile (*Crash!*), a landscape forcefully adapted to traffic (*Concrete Island*), gigantic apartment-buildings (*High Rise*). In thus passing from the natural catastrophes of tomorrow to the man-made cataclysms of today, Ballard claims he has not forsaken science fiction: in our environment, he sees "the fossils of the future," and reveals what is apocalyptic about it – coining the word "autogeddon" in parallel to the biblical "Armageddon," the cosmic battle at the end of time.

This second foursome is completed by a collection which seems to be a sketchbook for the three novels, and whose title significantly is *The Atrocity Exhibition*. Highly sensitive to the monstrosity of a way of life that we take for granted, Ballard throws it into a crude light by bringing together some of its apparently irrelevant aspects – political murder and sport in "The Assassination of J. F. Kennedy Considered as a Downhill Motor Race," promiscuous sex and traffic hazards in *Crash!* – or just by heaping up instances of its worst consequences – the victims of car-mania horribly maimed in mind as well as in body, perverse and obsessive sexual pursuits, ruthless conflicts raging among the inmates of vertical "concentration camps" or among the wretched "Robinsons" that survive in the ruins lapped against by the ocean of traffic. His descriptions of wounds as well as sexual organs – the two kinds of openings through the flesh are reached by the most exquisite pain and pleasure – are made even more unbearable by their cool precision, which may be ascribed to his medical studies; yet their recurrence points to a morbid fascination: Ballard takes part at least as much as his fellow-men in the worship of the new Moloch.

The meaning and the outcome of it all remain obscure: Ballard is fond of interpreting the most incongruous marks (of sperm as well as blood) in terms of mysterious alphabets, but the "writing on the wall" never finds its Daniel; we appear to be all carried away helplessly to some dark and terrible doom. The characters more or less willingly bungle their escapes; and, in the novel *Hello America* as well as in the collection *Low-Flying Aircraft* (especially in "The Ultimate City," and with the only exception of the story which gives its title to the book, where Dr. Gould's apparently meaningless actions turn out to aim at the protection of the mutants that may succeed the present forms of life), the interest is focused on those who madly attempt to resuscitate the most flamboyant aspects of the technology that has caused the collapse of this civilisation.

Ballard himself, as a writer, seems to be the prisoner of his system of thought: in his latest collections, *The Venus Hunters* and *Myths of the Near Future*, he gives us only the small change of his great intuitions. Can there be any more science fiction writing when the horizon is blocked – to borrow one of the author's favourite images: as by a stranded whale – by the huge corpse of our decaying society? The way out, then, can only be upwards – not through space conquest, which Ballard pictures as eminently deadly for humanity in mind as well as in body, but through the fulfilment of the eternal yearning to fly. Such is the subject of his novel *The Unlimited Dream Company*, which blends ancient myths with his personal obsessions, and recon-

ciles the through liberation of sex with the mystical aspiration to conquer death: a very rich and fascinating book, but is it still science fiction?

\* \* \*

Arthur K. Barnes is virtually unknown to the modern reader of science fiction; not a word of his considerable output in the field has seen print in a quarter of a century, and it has been more than 30 years since his last original story was published. To the reader of pulp "scientification" in the 1930's and 1940's, however—particularly to the reader of *Thrilling Wonder Stories*—Barnes was well known and popular, both for his own work and for his collaborations with Henry Kuttner. Nearly all of Barnes's fiction was either space opera or science fantasy. Although more or less solidly based on scientific knowledge of the period, his stories relied on farcical humor and rapid action for their effects. By today's standards they seem rather juvenile. Nevertheless, when viewed in historical perspective they are both interesting and entertaining.

The most popular of Barnes's space opera was a series about Gerry Carlisle, Tommy Strike, and the crew of *The Ark*, all of whom were employed by the "London Interplanetary Zoo" to trap and bring back alive nonintelligent alien life forms; the best of these novelets were collected in Barnes's only book, *Interplanetary Hunter*. Much of his science fantasy involves time-travel into the past, and was co-authored with Henry Kuttner.

\* \* \*

Steven Barnes presents an unusual critical challenge at this early stage of his career because it is difficult to distinguish his own traits from those of his mentor and collaborator Larry Niven. Two of Barnes's published novels, *Dream Park* and *The Descent of Anansi*, were written with Niven, as were two of four shorter works. *Streetlethal* was a solo effort.

Like Niven, Barnes is a California writer. He was born, raised, and educated in Los Angeles and still resides there. This environmental influence shows itself even in small matters—rain has fallen but once in all his fiction and merely to provide artistically reflective wet surfaces. More significantly, a near-future earthquake of apocalyptic proportions shaped the worlds of *Dream Park* and *Streetlethal*. Both books feature ghastly descriptions of ruined Los Angeles, and that chapter of *Dream Park* appeared separately as "Retrospectives."

The California Dream is a nightmare in the gory revenge thriller *Streetlethal*. The rotten heart of its Los Angeles is the Maze, a slum swarming with criminals, whores, addicts, and leprous VD victims. But beneath the rubble burrow the Scavengers, an ingeniously conceived community struggling to light candles of hope in this infernal darkness.

On the other hand, *Dream Park*'s nightmares are strictly fright-show entertainments. This glossy mystery set in a high-tech amusement complex modeled on Disneyland emphasizes the casual fun-and-sun aspects of California life. The park is an electronically equipped arena for acting out role-playing fantasies. It incorporates the mystiques of gaming, the Society for Creative Anachronism, and sf fandom. Niven's quick, slangy cleverness predominates here, with in-group jokes, crossplugs, and personal references.

But the cinematic flavor of these stories may be Barnes's own contribution. He studied communications in college, has worked for film studios, and writes screenplays. *Streetlethal*, which Barnes is currently trying to turn into a film, has a

definite Hollywood taste. Its visuals recall recent futuristic urban films such as *Escape from New York* and *The Enforcer* while its plot resembles a 1930's gangster movie. (Behind those 21st-century brown faces we glimpse the familiar wronged convict, golden-hearted hooker, and slimy ganglord.)

Yet empathy, not artifice, remains the optimum means of communication, for Barnes is a mystic as well as a technophile. "The Locusts" begins as a straightforward colonial adventure but its resolution owes more to magic than genetics. *The Descent of Anansi* offers the shiny hardware and tense action expected of a space thriller but also presents a romantic triangle and draws its imagery from a West African spider myth. His high fantasy ". . . But Fear Itself" makes especially imaginative use of African materials.

An accomplished martial artist, Barnes has made holistic Oriental ideals part of himself and his work. He advocates self-awareness and self-sharing and celebrates the spiritual potential of erotic love. Sensitivity triumphs in the grimmest settings, just as the lotus blooms in mud. As this young writer says in his own voice: "Humanity is a fragile thing, and the capacity to give without immediate gain is not the norm, or an obligation, but rather a recognition of the common divinity of man."

—Sandra Miesel

*Writing for a Reason*. Boston, Houghton Mifflin, 1983.

\* \* \*

William Barnwell's entire published work consists of a single trilogy of after-the-disaster novels published originally in 1980 and 1981, consisting of *The Blessing Papers*, *Imram*, and *The Sigma Curve*. They are set in Eire (renamed Imram) in a society that is almost feudalistic, a society in turmoil because of a number of political and religious schisms. Turly is a young boy with an unknown past who finds himself growing up within a passive group known as The Circle. His life is disrupted by a raid by the forces of Hastings, an ambitious man who wants to establish hegemony over the entire island. Hastings believes

that Turly holds the key to the Blessing Papers, which may hold the key to power.

Naturally there are others equally interested in whatever special knowledge Turly might possess, chief among them the Order of Zeno, a cloistered group that is not averse to the use of murder and torture. There are weapons and powers and the trappings of fantasy here in plenty. He evades his enemies all through the first volume, then falls into company with a poet. He and his companion fall into the clutches of the Ennis in the second volume, a primitive people who initiate their prisoners into their tribe after a series of bizarre rites.

The Ennis are opposed by the Gort, a northern people who have an understanding with the evil Order of Zeno. There is also a spy among the Ennis reporting on the activities of Turly. The Blessing Papers, it seems, contain the seeds of a prophecy of the rise of a new civilization, and their possessor may have the ability to shape that civilization. Locked in Turly's brain may be the key to their location.

In the concluding volume, Turly has sworn never to make use of the Blessing Papers, nor to make their existence known to anyone else. But even though he has independently helped to bring together a coalition of tribes for mutual support and protection, there is trouble in his world, and his old enemies are restlessly prowling outside the campfire. Ultimately he must face up to the charge he has been given and deal personally with the papers and the powers they possess.

Although ostensibly science fiction, much of this trilogy is written in the style and with many of the plot devices of a heroic fantasy. The Papers might well be the Holy Grail or some other sacred or magical object, and the powers of evil are truly that, untainted by any trace of kindness or humanity. That simplistic attitude dulls some of the impact of the trilogy, but as pure adventure, it demonstrated that Barnwell was a talented writer.

\* \* \*

Neal Barrett, Jr., was for many years a welcome but infrequent contributor to professional science-fiction magazines, and an occasional novelist, but it was not until the late 1970's that he seemed to attract much serious attention. His earliest published novel, *Kelwin*, employed the familiar theme of barbaric civilization rebuilding itself after the fall of our own society in a devastating war. *Kelwin* is a wandering adventurer whose destiny is to affect the unfolding of a possible new conflict in that setting. *Kelwin* is a pure adventure story, extremely well told.

*The Leaves of Time* was more ambitious. The setting is a parallel version of our own world, where history has taken a rather different course. To this standard setting, Barrett adds a second plot element, the fugitive shapechanging alien, in this case infiltrated from another time line. The protagonists must discover a method of identifying and neutralizing the invader, without letting him return to his home timeline.

These two novels were so good that two other early works, both light adventure stories of little lasting substance, seemed markedly inferior in comparison. *The Gates of Time* is a galaxy spanning adventure story about mankind's fate in the face of conquest; *Highwood* is set on a world of giant forests. A pair of human observers discover a radical change in the behaviour patterns of the indigent sentient species and become caught up in the fate of the species. Barrett published no novels for two years, and his reappearance with *Stress Pattern* was the equivalent of the emergence of a new writer.

*Stress Pattern* is certainly one of the most unusual novels ever to appear in the genre. A space traveller becomes marooned on what is certainly the most peculiar planet in the universe. The natives recognize his presence, but seem utterly indifferent to him, preoccupied with bizarre activities of their own. Travel is accomplished by means of organic railways; a variety of monstrous creatures populate the countryside. The entire biosphere of the planet seems to be one intricate,

integrated machine. Had this novel appeared under the byline of a more established writer, it would almost certainly have excited more comment than it did.

Barrett really hit his stride with the "Aldair" series, however, four novels dealing with Aldair, an adventurer on an Earth that has been deserted by humanity. Many of the animal species of the Earth were altered genetically so that a variety of intelligent humanoid species exist, each still displaying some of the attributes of its ancestry. Aldair himself is a pig, and among his companions are wolves and bears. The initial volume, *Aldair in Albion*, introduces the background and main characters, and follows Aldair as he wanders across Europe searching for his own destiny and clues to the fate of legendary Mankind.

The first and second volumes stand well independently. *Aldair, Master of Ships*, continues the search, now along the coastlines of the continents. For the most part, the adventure is equally well done in the third adventure, *Aldair, Across the Misty Sea*, but the cliffhanger ending mars its existence as an independent novel. Barrett summed up all the loose ends in the concluding adventure, *Aldair: The Legion of Beasts*, by transporting Aldair and his friends to an alien planet where malformed genetic freaks enslave a pacifistic remnant of the human race. Much of the charm of the previous volumes is lost with the change of setting, but as a whole this was one of the best written, most inventive series of its kind in many years.

Barrett's most recent novel, *The Karma Corps*, is an interesting but not entirely successful work. A shipload of colonists survives on an uncharted world, where their theocratic social structure finds itself in perpetual battle against an alien species that can teleport itself across short distances. A group of human teleports is revived from a kind of electronic storage and pressed into battle against the aliens, but inevitably control of the power they represent becomes a political issue.

Barrett's occasional piece of short fiction is usually of high quality as well. One of his earliest stories, "The Stentorii Luggage," is a nearly classic genre tale of shape-changing beasties inside an elaborate interspecies hotel. "The Grandfather Pelt" provides ironic justice to a criminal who steals the pelt of a revered ancestor on an alien world. A desperate man must outreason a single-minded computer when he finds himself the sole survivor of a disastrous accident in "Survival Course." A visiting alien is determined to find out just what it is that humans do that no other species can in "Greyspun's Gift," which also features some of Barrett's best realized characters. "The Flying Stutzman," which concerns a man who is doomed to eternal flights on commercial airplanes, is a very well-written, very disturbing fantasy.

*The Godwhale*. New York. Ballantine, 1974; London, Eyre Methuen, 1975.

##### Uncollected Short Stories

"Star Seeder," in *If* (New York), September 1969.

"A Game of Biochess," in *If* (New York), February 1970.

"Song of Kaia," in *If* (New York), November 1970.

"Rorqual Maru," in *The 1973 Annual World's Best SF*, edited by Donald A. Wollheim and Arthur W. Saha. New York, DAW, 1973.

\* \* \*

T. J. Bass's novels, *Half Past Human* and *The Godwhale*, give a vivid picture of a horrifying future society, of a world-wide Earth Society ("the big ES") that controls every detail of life in the planet-sized hive that Earth has become. Three trillion people, degenerate "Nebishes," live in warrens beneath the surface, every inch of which is devoted to crops. These shrunken souls live short and regimented lives, are processed at their deaths for the proteins that sustain their fellows, and even have puberty postponed until the CO—the Class One computer—decides they are ready for sexual maturity.

Yet these novels are not cautionary tales of the sort of Harry Harrison's *Make Room, Make Room*, although some have read them so: rather, their concerns are teleological, like C. S. Lewis's *Perelandra* Trilogy or Walter M. Miller's *A Canticle for Leibowitz*. Assuming a kind Providence and a personal God, these works ask, what is the end of man? While *Half Past Human* and *The Godwhale* do not directly address the question, they do show a Providence that cares about the fall of a sparrow—or a Nebish. If the hand of God has not been noticed in Bass's works, it is because the author shows God using unfamiliar instruments. In the *Perelandra* trilogy or in *A Canticle for Leibowitz* God works through human beings; here, His ambassadors are machines so intelligent that they have personalities. Not that God makes robots and sends them hurtling toward Earth: the machines in Bass's novels are the artifacts of earlier stages of human civilization, provisionally appearing when Mankind has most need of them.

In *Half Past Human* we see the plight of those few remaining real humans who live outside, apart from ES; like animals, they are hunted for sport. But in their vigor and resilience lies more hope for the future than in the Nebishes, whose machines are crumbling around them. However, even the Nebishes are not negligible or less than human: some among them can survive when circumstances remove them from the womb of their society. The novel is the story of a new beginning on a new planet for the humans living outside and for the Nebishes adaptable enough to accept it.

Both novels show an impressive command of biological knowledge, and indeed sometimes the flow of jargon obscures rather than communicates. But the point may be that most people in the society are treated (and regard themselves) just as mechanically as the many robots that work for them. Still, knowledge is regarded as good, and machines are good when they serve rather than control. This point is strongly argued in *The Godwhale*, named for a huge plankton harvester. Like the huge automated spaceship that is the *deus et machina* of *Half Past Human*, the Godwhale is an artifact of a freer, more expansive past. Although these machines are so powerful that they are regarded as "cyberdeities," they are purposeless without free humans to direct them. In *The Godwhale* that direction comes partly from the chosen few, true humans who have adapted to life in the sea, and partly from a superman bred by Nebishes to command the harvester. "Miracles" occur at opportune times in both novels: the rescue of the outsiders in *Half Past Human*, and the regeneration of marine life in *The Godwhale*. Whereas the first shows the hope of a new society among the stars, the second gives promises of a regeneration of life on Earth.

Together, *Half Past Human* and *The Godwhale* are rewarding novels, rich both in characterization and in scientific detail, yet concerned with still larger matters. That *The Godwhale* offers a new proof of the existence of God shows just how large that concern is.

—Walter E. Meyers

**BATCHELOR, John Calvin.** American. Born in Bryn Mawr, Pennsylvania, 29 April 1948. Educated at Princeton University, New Jersey, A. B. 1970; University of Edinburgh Divinity School, 1973-74; Union Theological Seminary, New York, M.Div. 1976. Editor and book reviewer, *SoHo Weekly News*, New York, 1975-77; book reviewer, *Village Voice*, New York, 1977-80. Lives in New York City. Agent: Barney Karpfinger, 18 East 48th Street, Suite 1601, New York, New York 10017, U. S. A.

#### John Calvin Batchelor comments:

I first read science fiction when I was 11 years old, and the first adult novel I ever read was *Nineteen Eighty-Four*. Which I can remember thinking was much too sad. I have learned to say that I write anti-utopian fiction. That is too technical a term, however, and lacks the fun of saying sci-fi.

My life in New York is especially happy now because every night at midnight I can settle down to Channel 11 and another episode of *Star Trek*. Yes, I would like to be a starship captain, or, failing that, a planetary geologist.

\* \* \*

Though often ignored by science-fiction readers and the body of organized "fandom," John Calvin Batchelor's *The Further Adventures of Halley's Comet* and *The Birth of the People's Republic of Antarctica* have received some extravagant praise from both general and sf reviewers. It is too early in Batchelor's career to assess definitively the weight and nature of his achievement, but his two big books are clearly works of greater substance, boldness, and durability than almost anything else that has appeared in sf or its borderlands in the 1980's.

Like Thomas Pynchon's gigantic and encyclopedic *Gravity's Rainbow*, *Halley's Comet* explores and satirizes the history of ideas in the West through a modern gothic tale told in a baroque and seemingly perverse style, against the grain of the accepted gothic *frisson* of shock and menace. The plot involves the abduction of a bunch of quixotic idealists by a family of fabulously powerful and capitalistic modern-day robber barons; the former are imprisoned in Craven Castle, while the latter pursue a machiavellian plan to extend their empire of property into space by means of secret technology and legalistic chicanery. This is all placed in historical perspective by the recurring visits of a trio of seemingly supernatural luminaries who are associated with Halley's Comet and seem to be the ever-returning Magi. The literary polarities of this book—zany comedy and Juvenalian invective—are seldom discoverable in the convention-ridden and stylistically lacklustre body of genre sf; however, the watered down mix of pyrotechnics should appeal to those who find Pynchon attractive but too inaccessible.

*The Birth of the People's Republic of Antarctica* begins similarly in a Pynchonesque mode, depicting a crew of down-and-out American draft dodgers in Sweden, together with an assortment of other eccentric, grandiose, and slightly comic characters. The tale gradually shapes itself into a new mode which can be described as post-heroic saga: larger-than-life tragic figures struggle with the hostile elements of storm wave, fire, and ice in a near-future world wherein civilization is collapsing and human nobility seems able to provide little hope of redemption amid ubiquitous evil and hardship. The protagonist-narrator's name, "Grim Fiddle," is a kind of rebus for the style and content of the book, uniting as it does concepts of severity and frivolity, though all transitions taking place through *People's Republic of Antarctica* are towards the increasingly severe: the book's "fiddle" concept is transformed eventually to one of the futility of struggle for survival or betterment. The entire book is a mythic life-story from the hero's mysterious conception and Christmas-time birth to his downfall, exile, and impending mysterious doom, while the key scenarios resemble elemental and societal designs for Hell: seas of fire and ice; societies falling into demagoguery and terror; a dark sea journey in which Grim Fiddle and his comrades drift to the barren Falklands and the northern fingers of the Antarctic, where human life is mean, violent, and easily corrupted.

Bruce Gillespie has remarked that *People's Republic of Antarctica* is spoiled by a "fluffed" ending in which the author "seems to lose control of the narrative." The criticism is well made, as the narrative fragments into a set of meditative pieces about the narrator's uncompleted story. More importantly

still, the ending attempts to draw grand ethical conclusions which are insufficiently tied to the body of the tale (which itself is marred by passages of loaded and simplistic ethical-philosophical analysis). This fault also betrays *Halley's Comet*: in each case, a stylistic tour de force is ineptly tied to a sentimental and superficial philosophy in which naturalism, positivism, capitalism, and utilitarianism are the abstract bad guys. Batchelor's vision will need to take on some of the irony, ambivalence, and troubled complexity of Pynchon's before his books are a fitting substitute for those of his role-model. Meanwhile, though the books are flawed and ultimately disappointing, their sights are set mightily high and they contain some writing that falls only just short of magnificence.

—Russell Blackford

**BATES, Harry** (Hiram Gilmore Bates III). Also wrote as Anthony Gilmore; A. R. Holmes; Quien Sabe; S. F. Whozis; H. G. Winter. American. Born in Pittsburgh, Pennsylvania, 9 October 1900. Educated at Allegheny College, Meadville, Pennsylvania, 1917-18; University of Pennsylvania, Philadelphia, 1919-20. Clockmaker, 1914-17, 1920-22; reporter, Philadelphia *Enquirer*, 1923; assistant cameraman, Whitman-Bennett Studios, 1924; Editor for Clayton magazines, including *Astounding Stories*, 1930-33, and *Strange Tales*, 1931-32; Editor, *Technocracy*, 1935-37, and for the WPA art and writers projects; actor and machinist; Story Analyst, Columbia Pictures, 1958-59, and David O. Selznick, 1960. Recipient: Midamericon World Science-Fiction Convention Award, 1976. *Died*.

Harry Bates commented:

(1981) *Astounding Stories* (now *Analog*) was born to the publisher William Clayton and one of his editors—me—in a now unimaginable world populated by a single science-fiction magazine, Hugo Gernsback's *Amazing Stories*, which published amateurishly written "gadget" stories. The *Amazing* writers got one-tenth of a cent a word after publication; the writers for the Clayton empire were professionals, getting the very-high-for-those-days minimum of two cents on acceptance. I agreed with Clayton that *Astounding* had to have competent professional writing with strong plots and physical action; but its stories had also, of course, to contain tinges of science and binges of excitements and moreover be astounding—and where was any body of writers to cook to this recipe?

I had to create one. Because they had already sold to me I called on the writers in adventure magazines of which I already was editor, coaxing them to attempt this very different new field. Almost to a man they knew no science, and to use their stories at all I had (when possible) to correct and amplify what they turned in. I gave out story ideas right and left and did enormous amounts of hurried rewriting. Eventually almost all of these writers quit trying, for they had to eat, and there was no second market for the stories I had to reject.

The public in those days had never heard the term science fiction and had to be educated to it. *Amazing* often used the ugly term scientifiction, which I had as quickly as possible to suppress from the genre. Physical action remained an Astounding requisite. No one then dreamed what today's science fiction of way-way-out imaginings—fantasy—would be; if one of today's stories had been submitted to me then I'd probably have had to turn it down so as not to estrange the readers we aimed for and were accumulating. In time *Astounding*, in spite of its minimum of two cents a word, all but got out of the red, so that it was instantly profitable when Street & Smith with its much lower word rate took it over.

The stories I wrote in collaboration with my assistant D. W. Hall during those infant years were the product of sheer necessity, to avoid filling out the magazine with worse. The first Hawk Carse story was written as an example to my writers of the wanted element of character, and it was its extreme success that demanded the writing of the several that followed. All the stories published later under my own name were written hastily for a quick buck after my separation from *Astounding*, my prime interests lying elsewhere. I remember that in each case I

hesitated at using my own name rather than a pseudonym; but its added value all but guaranteed the quick sale, however sloppy the writing. Who might have guessed that one day there would come into being such a phenomenon as museums of science-fiction—anthologies!—necropolises!—and that such imperfect stories as mine would be resurrected to populate them? There, now, they live again, after a fashion—zombies, all their sores still upon them.

The worst occurred with my "Not Understanding," which Gernsback characteristically renamed "The Triggered Dimension." When his *Science Fiction Plus* folded, his editor, wanting to squeeze into the last issue this last long story of mine, attempted the impossible, cutting out almost completely its very necessary central scene—the scene which gave reason for story and my title—and shortening the last sentence of paragraph after paragraph so as to save single lines. So one day I rewrote the story with the care I wish heartily I'd given it in the first place and with the cut-out parts restored—and then while I was at it I rewrote half of the others that had appeared under my own name. One, "A Matter of Speed," became "Oh Outrage!," a longish novel of very different mood which bad health has so far not let me quite finish.

Friends who since have read my "Alas, All Thinking" have asked me how I ever could have projected *Homo terminal* with mental processes so degenerated. The reason lies not quite in the realm of pure fantasy. Beginning when quite young (and having what I thought was a good body) I remained aware always that *Homo* of my day thoroughly forgets he is an animal with the body of an animal and early loses all inborn capacity to enjoy the *moving* of his body, coming almost always to overvalue the non-moving brain. I had merely to extrapolate. It happens that upon rereading the story I found I'd given no solid examples of his degenerated thinkings, so when I rewrote it I gave many, too many, Book-an-hour Devourers will say. But perhaps there exists somewhere a reader or two who, like me in the writing, will find pleasure in my assortment of bad thinkings. It is for *these*—educated *adults*—that I put a few strictly unnecessary extra ones in. Devourers, I do not rewrite stories for *you*.

\* \* \*

Building on his experience as an editor of action-adventure pulps for William Clayton, Harry Bates began his career in science fiction as founding editor of the magazine whose name—*Astounding*—would become under later leadership synonymous with hard science fiction. But Bates said that his first writers of stories for *Astounding* in 1930 were "almost wholly ignorant of science and technology." He named the magazine. He enlisted and cajoled professional pulp writers to add a science veneer to action and adventure narratives. He rewrote and wrote pseudonymously much of the material himself, and he paid professional rates. The result was a wider readership and a wider professional base for the genre that had begun hardly as literature with the Gernsback "scientification." Under the name Anthony Gilmore, Bates and his fellow editor D. M. Hall began the highly popular Hawk Carse series. The literary qualities of fast-paced action tale in this series helped establish the space-opera characteristics in science fiction that have to this day balanced the hard descriptions of scientific speculation and technology in order to make the genre exciting and popular as well as speculative and futuristic. The stories in the Hawk Carse series were collected as *Space Hawk*.

Bates edited the first 34 issues of *Astounding* as well as a few issues of a rival for *Weird Tales* entitled *Sirange Tales*, but he continued to publish important science-fiction stories under his

own name after his editing work had ended. Apparently the added speculative and scientific thoughts that he had worked up in the Clayton offices in order to capture more of the pulp market took a permanent hold on his imagination, and so Bates himself is representative of the professional pulp writers with little original scientific training who helped to create the genre. "Alas, All Thinking" expresses a classic theme of early science fiction with a tone and writing style that also embody the best and the worst characteristics of the genre. The theme is ultimately from the 18th-century enlightenment, and one wonders what has been the source of transmission from the *philosophes* to the New York pulp writers. But somehow the theme is intact: a fear of too much rationality and the ironic sense of progress leading to actual degeneration in humanness. The theme is mingled with the Golden Age/Iron Age myths in which life appears richer, more fertile, more heroic in the past; and the time-travel gimmick of super science facilitates the use of the present even as an heroic past so that satire fuses in the story with the myth of lost innocence. Bates's writing does not understate the theme, and when he tries to heighten emotion at the end the tonal effect is stiff. The story, like many others of this decade, is at the same time poignant, rich, and primitive.

Bates's single most well-known story (filmed in 1951 as *The Day the Earth Stood Still*) also first appeared in *Astounding*—this time the Campbell magazine of 1940. "Farewell to the Master" is a story rich with influence on the genre and less over-written than much of Bates's other work. The tapestry of the story weaves elements ranging backward in indebtedness to Mary Shelley's *Frankenstein* and forward in apparent influence to Walter Tevis's *Mockingbird* (1980). It is fascinating to think of the old pro pulp editor reaching backward to the romantics and influencing as academic a writer as Tevis several decades later. Bates tells the story of a technologically made creature who transcends his creators in competence so that he becomes the master, and yet there is an enigmatic sadness inherent in this future hero who is somehow more incomplete than his more primitive makers. The accomplishment of Bates illustrates how the genre which began in the practicalities of the pulp markets has progressed through a fine web of influence and allusion.

\*

## John Baxter comments:

Ted Carnell discovered and encouraged many young writers in the 1960's; almost alone among them I moved away from SF as I entered professional writing, a defection Ted tried hard, though unsuccessfully, to approve. He would probably be happy that, almost 20 years after he accepted my first story, I have drifted, in a roundabout way, back to the field he loved so much. Had he lived I might have convinced him that the cinema, to which I have given so many of my energy, combined technology and aesthetics in a form analogous to the best science fiction. In any event, it is this synthesis from which I hope to produce a third decade of writing—fictional, critical, and perhaps a combination of the two.

\* \* \*

As editor of the first two major anthologies of Australian SF writing, John Baxter laid some of the foundations for the recent "renaissance" of Australian SF. He exerted a twofold influence upon Australian SF of the 1970's. Rejecting the concept that science fiction must be prophetic, Baxter emphasized "insight rather than intelligent guessing," arguing that "a story which tells us that a rose is a rose and explains why is far more worthwhile than one which states that E equals MC squared and leaves it at that." Baxter also esteemed the literary qualities of science fiction, publishing material that was innovative in style and structure, yet neither ignoring nor denigrating stories written in a more traditional narrative style.

In short, he proclaimed an Australian SF that was literate, thoughtful, and original.

Baxter's own short stories reflect these criteria. They are original and ambitious, reflecting influences from both traditional and new-wave SF. One of his best-known stories, "Apple," is a traditional man-meets-monster story—except that the encounter takes place in a surreal setting, and the story evolves from imagery and setting rather than action. A gigantic apple lies cradled in a valley, the juices dripping from its side as men tunnel into its core. The central character is a professional Moth Killer who battles with the grubs that lurk in the apple's core. It is suggested that the apple-world may be the result of atomic warfare, but for Baxter the explanation is incidental; his story conveys its own inner logic, and that is enough. The same is true of the more experimental story, "The Beach." Described as "a first sketch of what an Australian SF story might be like," it employs distinctively Australian symbols, and abandons conventional narrative structure in order to emphasize mood and imagery. The style and symbolism are evident in the closing lines: "Without fear, he swam towards the sea mountains, the peaks of which even now he could see gilded beyond the green. There, he knew, he would find his grail, the sunken, brooding sun."

Baxter's SF novels are more pedestrian. *The Off-Worlders* is set on the planet Merryland in the year 2833 and deals with a rustic community which is suspicious of technology and has rejected God, turning instead to Satan. *The Hermes Fall* is based on *The Fire Came By*, Baxter's non-fiction work on the famous Siberian "meteorite" of 1908 (written with Thomas Atkins). Despite its well-researched background, *The Hermes Fall* is merely a conventional "disaster" novel using science-fiction effects, in this case an asteroid on collision course with the Earth.

Always interested in cinema, Baxter has been devoting his energies to this field, and has abandoned SF for the writing of novels in the "best-seller" mould (*Bidding*, *The Black Yacht*). He remains one of Australia's wittiest SF book reviewers.

Bibliography: *Barrington J. Bayley: A Bibliography* by Mike Ashley, Manchester, Becon, 1981.

Barrington John Bayley comments:

I have no personal philosophy as regards my work; I write according to my ability and interest. I regard myself as a genre SF writer—that is, as a traditionalist.

\* \* \*

Barrington John Bayley is one of the very few authors to have bridged the philosophical gap between proponents of traditional space opera and the more demanding literary tastes of more recent editors and readers. He has succeeded at this by utilizing the traditional devices of space opera and wedding them to a more sophisticated writing style and to speculation far more intellectual than physical. Pervading most of his fiction there is a wry humor that is frequently unsettling but equally frequently entertaining.

Many of Bayley's plots are unabashedly space operas. A mysterious anomaly in space known as "The Patch" is consuming entire worlds as an interstellar empire erupts into civil war in *Annihilation Factor*. This galaxy-spanning adventure was already a noticeable advance over his earlier *Star Virus*, and subsequent novels have been progressively better. *Collision Course* postulates that there are two separate "nows" and that the two waves of reality are moving in opposite directions along the time waves. The plot centers on the imminence of the passing of the two realities through each other, and the effects on the two societies of the transition. Bayley experimented with the nature of time again in *The Fall of Chronopolis*. This time a theocratic society that possesses time travel refuses to recognize the possibility that their attempts to police the timeways may themselves change reality and cancel out their own society.

Bayley's ability to turn a phrase against itself is most evident in *The Garments of Caeon*. A bankrupt sailor pilfers a priceless suit of clothing from a band of pirates, and when he subsequently dons them, his entire personality changes—clothes do indeed make the man. The pirates recapture the suit, at which point we learn that the suit itself is sentient, and that it considers its first owner to be its personal property. The planet Caeon, it seems, is host to a species determined to take over the universe.

Satire is the order of the day in *Soul of the Robot* as well. A robot possessed of extraordinary powers makes its way through a variety of decadent human societies trying to solve the mystery of existence. Humans and aliens indulge in elaborate gambling schemes that determine the entire future of the human race in *The Grand Wheel*, and a ship sets off to explore the universe through etheric travel in *Star Winds*. Bayley's most recent novels, *The Pillars of Eternity* and *The Zen Gun*, are both ostensibly space operas as well, but each is endlessly inventive and, particularly in the latter case, so offbeat in its approach to plotting and setting that they have attracted considerable critical attention.

Although not a prolific short story writer, Bayley has made an impression there as well. His satiric humor is at its best in "Integrity," in which a libertarian reaches the logical consequence of his beliefs by liberating the individual cells of his body. Aliens have joined human nobility in "All the King's Men." A single city survives the collapse of the universe in "Exit from City 5."

Galaxies themselves are entities in "Cosmic Combatants." A child who has no nationality is adopted by an airline in "The Man in Transit." Alien manipulation of our physical bodies is a common theme as well, repeated in such stories as "Sporting with Chid" and "Maladjustment." For the most part, Bayley's stories are darkly ironic, occasionally utilizing stream-of-consciousness writing techniques to emphasize the strange viewpoint presented. Bayley is not the most popular writer of space operas; his stories are too unconventional for that. But his is certainly a novel and entertaining viewpoint.

##### Greg Bear comments:

Science fiction and fantasy has always been a joy for me, and I've been writing both since I was eight years old. Now I've been accorded approval by my peers in the form of Hugo and Nebulas, which I deeply appreciate; my writing, however, continues in its straight-line development. While I feel at a kind of peak as far as ability goes now, I'll continue working to improve, which may inevitably mean signal change in the future. But for the moment, I'm having a great deal of fun, and earning a respectable living, doing exactly what I've planned to do since I was a child. The past two years have been very productive—a computer has not only improved my work (or rather, allowed me to be as nit-picky as I've always been inclined to be) but cut the amount of time it takes me to produce a book, often by as much as 50%. Those who criticize novels written on word processors are simply foolish. 'Tis not the machine, my friends, 'tis merely story and writer. . . ."

I continue to be fascinated with science, history, and myth, and have now plunged into the study of information theory and Kantor's information mechanics, with results already evident in novels such as *Blood Music* and *Eon*. I believe that these new disciplines hold incredible promise for the future, especially when combined with the discoveries of genetics and physics. Information theory may be to the late 1980's what black holes and astrophysics were to the 1970's. A wealth of stories to be mined!

\* \* \*

Since he began publishing his stories regularly in 1975, Greg Bear has written 7 novels and many shorter works. Bear's fiction consistently circles a central theme: how can mind come to terms with the universe? For this writer, understanding requires changing perception, so his protagonists usually come

to some greater understanding of the universe and themselves. Readers typically find themselves exploring nimble and diverse creations that fit together into a coherent and ultimately optimistic view of mind in the cosmos. A catalogue for this complex vision provides a testament to Bear's breadth of interest and his inventive virtuosity: in stories and novels ranging from modern fantasy to pure SF, he explores topics from the universe's origins to its end and transformation (an important part of his Star Trek novel, *Corona*). In novellas like "Hardfought" and "Scattershot," Bear studies humans and aliens, their perception and communication. In *Beyond Heaven's River* and *Blood Music*, he assesses the nature of civilization, fingering its historical cycles: birth, expansion through war or cooperation, decline and death. He has repeatedly focused his attention on the relation of art and society, from the design of the vast, biomechanical cities in *Strength of Stones* to the physical and mythical powers of stories, songs, and poetry in "The White Horse Child," "Petra," and *The Infinity Concerto*. At the same time, Bear balances these large-scale inquiries with sensitive portrayals of individual characters struggling with growing up, identity, guilt, creativity, and transcendence.

With such conceptual vigor, it wouldn't be unusual to find the play and development of ideas taking center stage, pushing aside values like character depth and plot diversity. But although some of Bear's early work succumbed to this fault (for example, *Hegira*), his subsequent writing has increasingly managed to right the imbalance. He has begun to leave behind the quest plot as his preferred form in favor of patterning together deft characterization, sensual description, and fascinating conceptual diversity, so that the plot movement arises from the interaction of the estranging central idea (Suvin's "novum") with the human concerns of the protagonists.

Some of his more recent works best demonstrate Bear's increasing maturity, development first signalled in the haunting combination of World War II survivor tale and Rip Van Winkle story in *Beyond Heaven's River*. Typical of the more developed work, this novel blends fascinating ideas (what would it be like to have your every wish become real? How can a man adjust to living 400 years after his own era?) with believable characterization. "Hardfought" participates in the same far future as *Heaven's River*, along with several of Bear's works ("Scattershot," "The Venging," "Perihesperon," "Sun Planet," "The Wind from a Burning Woman," and *Strength of Stones*). Focusing on war, history, and personal transformation, the story shows human and alien characters as they follow a complex and difficult process of self-discovery that Bear enriches with pungent detail. Through rapid shifts in narrator and perspective, the tale enacts the estrangement it depicts, forcing the reader to adapt for understanding just as the characters must. Such adaptation also characterizes *The Infinity Concerto*, a cross-dimensional fantasy rooted in the Celtic lore of the Sidhe. A novel about Michael Perrin's coming of age, *Concerto* also concerns itself with the role of art in the cosmos. Completing Coleridge's *Kubla Khan*, the young protagonist ensures the stability of a world where poetry has the power of physical law. Bear's first deep exploration of a single character, the novel shows considerable care in its depiction of motives and attitudes.

Perhaps the most intriguing of Bear's recent writing are "Blood Music" and the novel subsequently built around it. In its first form, the tale is mostly a frightening extrapolation into a strikingly altered near future. Comic and horrific by turns, "Blood Music" displays the mixture of alienation and fascination we associate with dark comedy. For the novel, however, Bear incorporated and rewrote large sections of the novelette;

in the result there are passages that achieve something more akin to Yeats's "terrible beauty." This effect comes both from the enhanced technical foundation and from evocative portrayals of characters who become the protagonists of alternating chapters. By varying the protagonists and the point of view, Bear gives us an encompassing circle of perspectives on the world's transformation. The final sections present a human apotheosis rivalling that in Clarke's *Childhood's End*.

Bear has become in the last five years one of the major new writers in the genre; even the lesser of his fictions are entertaining, the more developed ones are highly stimulating, suggestive reading.

\* \* \*

Charles Beaumont was a consummate craftsman of the popular market short story—perhaps the most accomplished writer of this type of fiction to publish in the 1950's and early 1960's. He wrote extensively for *Playboy* and other magazines, including many in the science-fiction field, and often blended elements of humor, horror, psychological suspense, and extrapolative SF. If much of his subject matter is grim, and many of his stories basically downbeat in resolution, his smooth and upbeat writing style keeps his work from being negative or oppressive.

Among his more than 50 stories (and articles) of science fiction and fantasy is "The Vanishing American," an allegorical tale about a man who becomes invisible to his fellow men, and perhaps Beaumont's finest short story. Others of quality include "Free Dirt," "The Love Master," "The Quadriopticon," and, the best of a number with a jazz music background, "Black Country."

His tragic death at 37, of a rare aging disease which had ravaged him and kept him from writing for three years, cut short a career which might have progressed to major stature.

\* \* \*

In *Looking Backward*, Edward Bellamy observed that both the "working classes" and "true and humane men and women, of every degree, are in a mood of exasperation, verging on absolute revolt, against social conditions that reduce life to a brutal struggle for existence." In its sequel, *Equality*, he added the ruin of prairie farmers by capitalist mortgages, the degradation of women through economic exploitation, the recurrent economic crisis, and the concentration of three-quarters of national wealth into the hands of 10% of the population. Bellamy's utopianism was the point at which all these deep discontents intersected with the American religious and lay utopian tradition and the world socialist movement. As the spokesman of the "immense average of villagers, of small-town-dwellers" who believed in "modern inventions, modern conveniences, modern facilities" (Howells), in Yankee gadgetry as white magic for overcoming drudgery, he accepted the financial trusts as more efficient and changeable from private

waste and tyranny to a Yankee communism or "Associationism": the nation "organized as the one great corporation . . . in the profits and economies of which all citizens shared."

Bellamy's new frontier is the future. It offers not only better railways, motor carriages, air-cars, telephones, and TV, but also a classless brotherhood of affluence socializing these means of communication and other upper-class privileges to achieve comfort and security for everyone through a re-organized "economy of happiness." Universal high education, work obligation from 21 to 45, equal and guaranteed income for everyone including the old, the sick, and children, flexible planning, and public honors reduce government to a universal civic service called the Great Trust or the Industrial Army. The generals of each guild or industrial branch are chosen by the retired alumni of the guild, and the head of the army is president of USA. Doctors and teachers have their own guilds, and a writer, artist, journal editor, or inventor is exempted from the army if enough buyers sign over a part of their credit. Individuality is fostered and objectors can "work out a better solution of the problem of existence than our society offers" in a reservation (the first use of this escape-hatch of later utopias).

Bellamy's economic blueprint is integrated into the story of Julian West, who wakes from a mesmeric sleep of 1887 into the Boston of 2000, is informed about the new order by Dr. Leete, and falls in love with Leete's daughter. This system of epoch-contrasts is reactualized in the nightmarish ending when Julian dreams of awakening back in the capitalist society of 1887. He meets its folly and repulsiveness with an anguished eye which supplies to each place and person a counterpossibility; the utopian estrangement culminates in the hallucination about "the possible face that would have been actual if mind and soul had lived" which he sees superimposed upon the living dead of the poor quarter. The lesson is that living in this nightmare and "pleading for crucified humanity" might yet be better than reawakening into the golden 21st century—as, if a final twist, Julian does. *Looking Backward*—intimately informed by Bellamy's constant preoccupation with human plasticity, memory and identity, brute reality and ideal possibility—reposes on a balance of world-times. Its plot is Julian's change of identity. In two of Bellamy's later stories, "The Blindman's World" and "To Whom This May Come," the alienated Earthmen are contrasted to worlds of brotherhood and transparency where men are "lords of themselves." As the anxious idealist becomes an apostate through a healer's reasonable lectures and his daughter's healing sympathy, the construction of a social system for the reader is also the reconstruction of the hero. This radical-democratic innovation, in which a change world is accompanied by changing people's "nature," is epoch-making for future utopias and SF.

However, Bellamy retreated from this discovery. Just as Julian is the mediator between two social systems for the reader, so Edith Leete is the steadying emotional mediator for Julian, a personal female Christ of earthly brotherhood. Bellamy's "sunburst" of a new order is validated equally by socialist economics, ethical evolution, and Christian love; his future brings a purified space and man. The friendly house of Dr. Leete is the hearth of spacious, clean, classless Boston, with Edith as the Dickensian cricket on the hearth. Hard-headed civic pragmatism is the obverse of a soft-hearted petty-bourgeois "fairy tale of social felicity." Bellamy expects a nonviolent, imminent, and instantaneous abandonment of private capitalism by recognition of its folly. With telling effects he extrapolated the Rationalist or Jeffersonian principles and institutions to a logical end-product of universal public ownership. But he also remained limited by such ideals. His fascination with the rationally organized army should

perhaps not be judged by our reaction today, since it was acquired under Lincoln and translated into peaceful and constructive terms. Further, any utopia before automation had to be harsh on recalcitrants, and Bellamy evolved toward participatory democracy in *Equality*. But even there he continued to stress State mobilization, "public capitalism," and technocratic regimentation *within* economic production as opposed to ideal classless relations outside it, dismissing "the more backward races" and political efforts by "workingmen."

Uncomfortable with sweeping changes of life-style, Bellamy is at his strongest in the economics of everyday life outside a capitalist framework—dressing and love, distribution of goods, cultural activities, democratic supply and demand (e. g., in organizing a journal or in solving brain-drain between countries). Here he is quite free from centralized State Socialist regulation. When contrasting such warm possibilities with stultifying private competition, he presents exempla of great force, as the initial allegory of the Coach, the parables of the Collective Umbrella and of the Rosebush, or (in *Equality*) the parables of the Water-Tank and of the Masters of the Bread. All such impressive and sometimes splendid apologues come from a laicized and radicalized New England pulpit style rather than from genteel fiction. Their ethical tone and the sentimental plot addressed themselves to women and all those who felt insecure and unfree in bourgeois society. Bellamy's homely lucidity made his romance, with all its limitations, the first authentically American socialist anticipation tale.

Bellamy's success fuses various SF strands and traditions. He interfused the preceeding, narratively helpless tradition of utopian anticipations—tales culminating in Hale and Macnie, Cabet—with an effective Romantic system of correspondences. His ending, refusing the alibi of dream, marks the historical moment when this lay millennialism came of age: the new vision achieves, within the text, a reality *equal* to that of the author's empirical actuality. Bellamy links thus two strong American traditions: the fantastic one of unknown worlds and the practical one of organizing a new world—both of which translate powerful biblical themes into economics. His materialist view of history as a coherent succession of changing human relationships and social structures was continued by Morris and Wells and built into the fundamentals of subsequent SF. Equally the plot educates the reader into acceptance of the strange by following the protagonist's puzzled education. Modern SF, though it has forgotten this ancestor, builds on *Looking Backward* much as Dr. Leete's house was built on the remnants of Julian's house and on top of his sealed sleeping chamber, excavated by future archaeology.

Traits from Bellamy's other works also drew from and returned into the SF tradition. The Flammarion-like, cosmically exceptional blindness of Earthmen and the transferral by spirit to Mars are found in "The Blindman's World," and despotic oligarchy as the alternative to revolution in *Equality*. Most immediately, the immense ideologico-political echo of *Looking Backward* reverberated around the globe through a host of sequels, rebuttals, and parallels. Bellamy had hit exactly the right note for a time searching for alternatives to ruthless plutocracy, and close to 200 utopian tales expounding or satirizing social democracy, State regulation of economy, Populist capitalism, or various uncouth combinations thereof were published in the US from 1888 to 1917 (notably Donnelly's *Caesar's Column*, Howell's *A Traveller from Altruria*, and London's *The Iron Heel*). In Britain the echo was felt in Morris's answer, *News From Nowhere*, in Wells, and in Germany in three dozen German utopian or anti-utopian tales.

Gregory Benford comments:

I am a resolutely amateur writer, preferring to follow my own interests rather than try to produce fiction for a living. And anyway, I'm a scientist by first choice and shall remain so.

I began writing from the simple desire to tell a story (a motivation SF writers seem to forget as they age, and thus turn into earnest moralizers). It's taken me a long time to learn how. I've been labeled a "hard SF" writer from the first, but in fact I think the job of SF is to do it *all*—the scientific landscape, peopled with real persons, with "style" and meaning ingrained. I've slowly worked toward that goal, with many dead ends along the way. From this comes my habit of rewriting my older books and expanding early short stories into longer works (sometimes novels). Ideas come to me in a lapidary way, layering over the years. Yet, it's not the stirring moral message that moves me. I think writers are interesting when they juxtapose images or events, letting life come out of the stuff of the narrative. They get boring when they preach. To some extent, my novels reflect my learning various subcategories of SF—*Deeper Than the Darkness* was the galactic empire motif; *Jupiter Project* the juvenile; *If the Stars Are Gods* and *In the Ocean of Night* both the cosmic space novel, etc. *Timescape* is rather different, and reflects my using my own experiences as a scientist. Yet short stories, where I labored so long, seem to me just as interesting as novels. I learned to write there. Nowadays, my novels begin as relatively brisk plot-lines and then gather philosophical moss as they roll. If all this sounds vague and intuitive, it is: that's the way I work. So I cannot say precisely why I undertake certain themes. I like Graham Greene's division of novels into "serious" and "entertainment," though I suspect the author himself cannot say with certainty which of his own is which.

It seems to me my major concerns are the vast landscape of science, and the philosophical implications of that landscape on mortal, sensual human beings. What genuinely interests me is the strange, the undiscovered, but in the end it is how *people* see this that matters most.

\* \* \*

A major writer of hard science fiction, Gregory Benford explores technological and social alternative futures in fiction largely focussing on "the alien." Fundamentally unknowable without a change in the observer, the "alien" for Benford encompasses the nature of the universe and the face of the future. Rooted in his experience as an Army brat and a physicist, living in the South, California, England, and Japan, his best work has a scientist's respect for data and an artist's flair for style. Combining, even rewriting earlier pieces, he has

"collaborated" with other science fiction writers and more "literary" models.

*Jupiter Project* (a "prequel" to Heinlein's *Farmer in the Sky*), *Shiva Descending* (with William Rotsler), and *Find the Changeling* (with Gordon Eklund) are fairly conventional, a juvenile exploration story, a catastrophe novel and a mystery-melodrama, respectively. A rewrite of his first book, *The Stars in Shroud* was a more popular success, a stylish space opera strung on East-West and human-alien dichotomies. His more substantial other novels demand even more of the reader.

Written with Gordon Eklund, the separately published pieces of *If the Stars Are Gods* chronicle several encounters of Bradley Reynolds with alien life forms. An aging astronaut, this meditative hero seeks the alien in part because of his own alienation from a youth-oriented society.

Another alien-seeker, Nigel Walmsley, encounters emissaries of an ancient and probably hostile machine civilization in *In the Ocean of Night*. Alienated from a world deteriorating socially and ecologically, a world which is not just bare background but lived in, he rejects artificial religions in favor of a different kind of faith. Unable to grasp fully the alien in human terms, Nigel gradually incorporates the alien viewpoint, coming to see an essential bond between any two sparks of intelligence in a hostile universe.

The sequel, *Across the Sea of Stars*, takes him to the stars, as elder statesman on a starship rife with alternative life styles. A quest for the source of radio messages becomes one for the sources of a barely understood attack on Earth; understanding aliens is vital, but minimal, in both cases. Nigel recognizes the enemy, but others cannot see in the ruins they encounter the work of a machine civilization whose very existence they refuse to credit. Counterpointing the weakening defenses of Earth and Nigel, the novel blames both on a cancerous mechanism; self-destruction in the face of a misunderstood enemy is also found in previous Benford novels.

Benford is not limited to stories about alien life forms. Such moving short stories as "Doing Lennon," "White Creatures," and "Exposures" show the reader the alien face of his own future, as does his best novel, *Timescape*. Set in LaJolla, California (1962-63), where Benford attended graduate school, and Cambridge, England (1998), where he has also worked, the story centers on future physicists' attempts to help their predecessors to avert a world-wide ecotastrophe. The body of the book, however, concerns people embedded in society, staving off quiet desperation, and most of all it concerns "doing science," with all of its political, economic and personality clashes.

*Jupiter Project* challenges Heinlein; *Timescape* improves on C. P. Snow. Benford also uses other models, among them Updike, Hemingway, and Faulkner. Southern behavior patterns and narrative structure in "To the Storming Gulf" parallel *As I Lay Dying*, after the nation, not just the region, loses a nuclear war. *Against Infinity* may invoke St. George and *Moby-Dick*, but its style and structure directly parallel "The Bear," with the wilderness encroached on by civilization transplanted to Ganymede, the unknowable quarry a sometimes marauding relic of alien technology.

Echoing other stylists except as parody or pastiche inevitably opens an author to charges of plagiarism. While Benford borrows a certain literary veneer, however, he also builds on the past, relating his fiction to the whole of literature, not just the science fiction tradition. He also reminds us that art, like science, is in certain fundamental ways a collaborative exercise.

\* \* \*

J. D. Beresford, born just seven years after H. G. Wells, had affinities of imagination with the older writer, and similarities of style and theme may have dimmed the Beresford flame in the Wellsian glare. All his excellent science fiction is forgotten save *The Hampdenshire Wonder*. The neglect is regrettable because his attitudes were almost diametrically opposed to those of the politicising and romanticising Wells. Beresford's superficially gentler treatments show, on examination, an appreciation of the grimmer aspects of human nature which Wells tended to gloss in comedy or satire.

The first of Beresford's science fiction novels, *The Hampdenshire Wonder* may stand for most of the qualities and methods of its successors. As the story of a super-intelligent child born to working-class parents (one of the few major science-fiction themes Wells never attempted) it is an obvious forerunner of Stapledon's *Odd John*, but is superior in handling to the later book. The story of the lonely child (unwanted by all except his doting mother, and in his intellectual solitude having little use for her) making his misunderstood way through childhood to an ironical death at the hands of the village idiot illumines the theme of "difference" more clearly than, for example, Sturgeon's melodramatic *More Than Human*. Beresford's viewpoint is peculiar to himself. He was not primarily concerned, like more modern practitioners, with the symptoms and displays of transcendent genius so much as with the effect of this doomed creation's existence on those about him. The child is strongly drawn, with considerable understanding of the requirements of super-intelligence, but the characters who remain with the reader are the father, an uneducated county cricketer and workman who deserts child and wife when he can no longer bear the child's "unnatural" presence, and the mother, whose devotion to the self-absorbed genius is given without any return of affection or understanding. The two, supremely human, emphasise the child's alienness and eeriness in a fashion denied to our "mind-blowing" contemporary writers. Also, they demonstrate that characterisation in depth is possible in a genre which prefers to offer types as symbols of humanity confronting "difference." Beresford presents, without strain, rounded personalities who also manage to symbolise humanity dealing with the incomprehensible.

*Goslings* recalls Wells's *War of the Worlds* in its portrait of a plague-ridden, deserted London, but again the emphasis is on the reactions of people. Wells's stricken city is a symbol of trampled mankind; Beresford's is a challenge to the ordinary, unschooled but individual people who must live in and defeat it. *The Camberwell Miracle* has a faith healer (if that be the phrase for the talent) as central character, and here Beresford gives love and serenity to a portrait one can only imagine Wells handling with pragmatic savagery. *The Riddle of the Tower* (with Esmé Wynne-Tyson) again invades Wellsian territory, via bomb blast into an alternate spacetime, to discover a human culture reminiscent of the hive or the termitary. Again the treatment is thoughtful rather than dramatic or satirical, though the warning against technological excess is clear.

These novels stand comparison with the best of current science fiction, and, in literary quality, head and shoulders above most. Beresford published over 40 mainstream novels and it is his mainstream approach to science-fiction problems of structure and balance that give his romances a unique flavour.

—George Turner

 "Strange Suicide," in *Authentic* (London), April 1955.

\* \* \*

The similarity of Bryan Berry's early stories to those of Ray Bradbury probably accounts for his initial success in *Planet Stories* (one issue carried three of his stories). Bradbury and other leading professionals had recently deserted the pulp magazine for better paying markets, and Berry's stories were unabashed space opera, an area the editor of the magazine, Jack O'Sullivan, liked and one in which Bradbury had been inactive for some time.

Berry's *Planet* stories weren't bad, but they hardly justified special attention. In "The Imaginative Man" space explorers encounter Venusians who appear to be mythological beasts. In "Grounding" a man's desire to go into space drives him to murder his wife. "The Final Venusian" tells of an earthman and two androids, the last sentient beings after a war has destroyed Earth and its planetary colonies. The story bears a resemblance to Bradbury's "Dwellers in Silence," and that, coupled with the special treatment singled out by O'Sullivan for Berry's *Planet* debut, led to some anti-Berry letters from readers. Berry's letter of reply stated that his favorite SF writer was not Bradbury but Clifford D. Simak; other favorites were van Vogt, Sturgeon, Russell, del Rey, and the "rising young star" E. C. Tubb.

As a writer, Berry could claim a fairly good style, somewhat more straightforward and less mannered than Bradbury's, but also lacking in Bradbury's verve. Even so, the Bradbury touch was definitely evident in much of his work. His novel "World Held Captive" is a typical sociological SF novel of oppressive government and secret underground organizations, and the world his characters move in is compatible enough with the one described in Bradbury's *Fahrenheit 451*. In his letter Berry described himself as an unabashed romantic with a taste for the melancholy, which probably accounts for a lot of the Bradbury flavor—that and the natural tendency of a beginning writer to fall under the influence of others. It can also be argued that for a relatively inexperienced writer forced to grind out scores of novels to make a living in a market dominated by prolific adventure writers, this was probably a very intelligent approach. British readers must have found Berry's stories a nice contrast to the often slambang fiction of John Russell Fearn.

Not all of Berry's fiction falls easily into the Bradbury pattern, however. "The Adaptable Man" is a highly simplified van Vogtian superman story with its protagonist caught up in a far-reaching plot of which, it turns out, he is the key figure. It's a well-done story, but not nearly so compelling as those more driven and irrational efforts of van Vogt himself. "The Toy" is a well-plotted time-travel story with a stronger ending than most of his stories boasted. "Mars Is Home" also has a strong plot, though weakened by a poor climax.

Berry died at the age of 25. He left a relatively large body of writing behind him, and we can readily discern his lucidity and the fact that in most of his fiction his concerns appear to be the familiar concerns of everyday life; even when his fiction draws its apparent inspiration from van Vogt, the characters remain rather domesticated creatures, not at all like the flamboyant archetypes of either van Vogt or Bradbury. Berry's case is complicated, however, by the fact that much of his fiction is buried under house names that can't be properly identified as belonging to him, though we know he wrote the well-received Venus trilogy as Rolf Garner. Because we can never really know what Berry might have become, it's impossible to read his fiction without regret.

Critical Study: *Alfred Bester* by Carolyn Wendell. Mercer Island, Washington, Starmont House, 1982.

\* \* \*

Alfred Bester has not been a prolific writer of science fiction. His career has generated so far only a handful of novels and short stories spanning some 35 years. In the space of a limited output, however, Bester has achieved a rare importance in the field. Two of his novels are classics, and a younger generation of writers already acknowledges his influence. Despite this stature, Bester still considers himself an outsider to the genre, and speaks of his "affair" with science fiction. Much of his life has been spent writing for comics, radio, television, and general magazines. Science fiction has remained for him primarily "a safety valve, an escape hatch, therapy."

Bester is the grand master of what has come to be called the "pyrotechnic" science-fiction novel. His works are fast-paced adventures, full of surprises, and brought together by remarkably intricate convergences of characters, events, and ideas. The manner is a little reminiscent of space opera, but Bester has been subject to more immediate influences in his "action-packed" comic book and broadcast media work. His novels, moreover, are vastly more sophisticated than simple adventure stories.

As a science fiction writer, Bester is more interested in people than in science. In his preface to "The Pi Man" (*Starlight*), he comments, "I'm not much interested in extrapolating science and technology; I merely use extrapolation as a means of putting people into new quandaries which produce colorful pressures and conflicts." Consequently, the science predominating in Bester's fiction is psychology. His short stories typically assume the focus of extravagant case studies, and—if we can judge from the prefaces—much of their substance derives from the author's habit of analyzing himself (which is perhaps the basis of Bester's "therapy" in science fiction). Bester's favorite character type is the compulsive, the driven man. His stories center on such figures as sources of interest and motivation. Bester calls them his "anti-heroes," but they are usually constructed of heroic material. He endows them with extraordinary powers and sets them loose to interact with their environments in significantly perverse ways. Other characters—representatives of social stability—hunt, observe, and manipulate them, or are in turn manipulated. There is a lot of intrigue in Bester's fiction and a lot of detective work.

When Bester made his move to long fiction, he found a medium well-suited to his compulsive leading characters. *The Demolished Man* makes no significant departure technically from his shorter fiction. The characters, however, have more room to move around. Bester doesn't waste the opportunity. *The Demolished Man* presents a more heterogeneous picture of a culture than was usual for an early 1950's science-fiction novel. Though its leading characters are the cream of an enlightened society—the unmistakable beings of romance—they do not remain insulated from their inferiors. Bester brings them into slums, houses of illusion, and the underworld. Some of this is for exotic contrast, but the willingness at least to recognize the seamy side of a future civilization is refreshing. On one level, *The Demolished Man* is a mystery story. A man commits a murder in the 24th century, when telepathy has made crime discoverable in advance and therefore preventable. How could such a man escape detection? Ben Reich, the murderer, is a powerful man with access to all the technology, brain power, and social deference necessary to legal immunity. He is also ironically a pawn of archetypal patterns, a man whose elaborate criminal strategy blinds him to his own motive. The representative of justice—the first-class telepath Prefect Lincoln Powell—finds himself faced with a predictable dilemma: the conviction and punishment of Reich, while

necessary to the continuing order, will not bring satisfaction. Reich, who embodies the best as well as the worst in humanity, must somehow be reclaimed. In 24th-century technology, Bester allows for such a process.

Bester's second novel, *Tiger! Tiger!*, is generally regarded as his greatest success and as a pinnacle achievement in the field. It is itself an epic success story: the account of a man—bleakly ordinary, abandoned, and near death in space—who manages to save himself, and, with the sole motive of revenge, acquires wealth, knowledge, and eventually the power to defeat his enemies, only to find on the brink of success that his goals no longer make sense to him. This failure of resolve is in effect his final test. He becomes a changed man, a saint instead of a tiger, aspiring to lead others on the road to self determination. In this novel, Bester ranges even further into the sordid future of poverty, crime, and vice. The protagonist, Gulliver Foyle, is himself a graduate of the gutter, who speaks a common dialect and moves easily among the dregs of 25th-century civilization. During his quest for vengeance, Gully passes through diseased cities and the marketplace of vice. He visits a slave labor camp and spends time in prison, and encounters an array of minor characters that would do well in a wax museum. It is, as Bester warns, "an age of freaks, monsters, and grotesques."

The variety of setting and abundance of ideas in Bester's longer fiction are an important outcome of structure and of method: his novels are episodic, moving as the term "pyrotechnic" suggests like explosions in series. Successive episodes introduce new surprises rather than resolving old conflicts, up to the eventual climax when the weight of ideas and events finally forces a synthesis. The method takes careful planning and a wealth of raw material. Bester's special talent as a writer is the art of constellation. He draws upon an awesome array of apparently incongruous materials, and proceeds to make connections until he has fabricated a tightly knit and interesting story.

*The Computer Connection* has the same kind of construction. Some of its social content has been updated in that the heroes include American Indians, blacks, and women who are not beautiful. The characterizations abound in stereotypes, however, and Bester pointedly pokes fun at the social movements of the early 1970's so it is difficult to see any clear social statement. While neither the approach nor the ideas in *The Computer Connection* are as fresh as in his 1950's classics, the novel is still entertaining reading. Bester now confronts the problem facing any major author, of having to write in the context of his own earlier achievements and those of younger writers who have learned from him.

The best-known creations of Lloyd Biggle, Jr., are the Council of Supreme and its extensions, the agents of the Galactic Synthesis, the Cultural Survey, and the Interplanetary Relations Bureau, known for mottoes such as "Democracy Imposed from Without Is the Severest Form of Tyranny." Supreme is a vast computer that is fed information by its eight councilors; the only human is number ONE, Jan Darzek, who ironically was recruited by Supreme from uncertified Earth (i.e., not fit for social intercourse with civilized planets because its inhabitants tell lies) through Rok Willon, who eventually becomes EIGHT. EIGHT dislikes ONE personally but they unite in common cause against the Dark Force, the Udef, which threatens the universe.

Supreme is not a ruler but an advisor, though people tend to accept its wisdom without hesitation since it eventually always proves reliable. Supreme—the ultimate in impartial democratic justice—fails in its function only when it is deprived of data input or asked the wrong question, thus simultaneously demonstrating the old programmers' wisdom "Garbage in; garbage out" and suggesting the need for an informed electorate of enlightened self interest.

Always highly readable, Biggle narrates the adventures of Jan Darzek as he saves Earth in *All the Colors of Darkness*, the galaxy in *Watchers of the Dark*, and a large part of the universe in *This Darkening Universe*, as well as two individual worlds in *Silence Is Deadly* and *The Whirligig of Time*. In *The World Menders* and *The Still, Small Voice of Trumpets* the Cultural Survey officers must cope with bureaucracy while solving the problems of how to bring an uncertified world into the Galactic Synthesis of self-rule and trade with other planets. *Monument* and *The Light That Never Was* also deal with the place of art and beauty in human culture and civilization.

Biggle's characterization is generally drawn with vivid broad strokes in the literary tradition of Charles Dickens; e. g., Darzek's assistant is a little old lady, Miss Schluppe ("Schluppy"), who loves the comfort of her rocking chair as she makes beer out of whatever exotic vegetation is available wherever she lands in the galaxy. The chief interest in Biggle's stories is not character motivation, but puzzle solving, understanding the nature of the universe so that it can be managed intelligently. Throughout his stories, intelligent life in whatever form it appears (even a giant vegetable computer) earns respect. In the ironic tradition of Jonathan Swift, humanoid-appearing creatures may turn out to be sub-human animals (*The World Menders*), as determined by their lack of culture, particularly religion and the arts. Repeatedly Biggle dramatizes the need for a holistic understanding of a culture, including the ecological balance of a planet and the physical strengths and weaknesses of its inhabitants. Tolerance and respect for differences between species is demonstrated to benefit all intelligent beings, and Biggle uses gentle satire to provide moral instruction as he delights.

His greatest strength is in creating believable alien worlds and civilizations, complete with native flora and fauna, linguistic idiosyncrasies, customs of courtship and marriage, provisions for raising children, social intercourse and folkways (always inseparable from economic trade and business affairs), religion, systems of government, and culture in its most inclusive sense. Because of this complexity, it is unfair to limit

his stories with the label juvenile—even though neither his heroes nor his villains ever uses expletives stronger than “drat”—but his clear-cut pro-life moral tone is particularly suitable for young readers.

Unfortunately Biggle is currently writing very little short fiction, but some of the best of his stories are available in three collections; *A Galaxy of Strangers* contains the perfect gem “And Madly Teach.”

Though the unique name Eando is formed from “E and O,” representing Earl and Otto Binder, for all practical purposes Eando was Otto Binder; the early, collaborative stories comprise a very minor component of the Binder works, both qualitatively and quantitatively. Binder maintained that a real professional could write anything, from the libretto of an opera to a technical manual. While not embracing quite this broad a range, his works were sufficiently varied to give the notion strong support. In addition to his science fiction, Binder produced weird-horror fiction, gothic romance, and considerable non-fiction, as well as hundreds of comic book and comic strip “scripts.”

Binder's most important single story is generally regarded to be “I, Robot,” published in the January 1939 *Amazing*. (The Isaac Asimov book, *I, Robot*, appeared in 1950. Its title was as much a tribute to Binder as anything else; in his autobiography, Asimov attributes the inspiration of his famous “positronic robot” stories to a meeting with Binder and the reading of Binder's “I, Robot.”) The significance of Binder's story lies in its sympathetic, even emotional, portrayal of the robot Adam Link. This effect is heightened by the first-person narration. The story was hugely successful and led to a series of popular sequels. Lester del Rey's equally significant “sympathetic robot” story, “Helen O'Loy,” was written independently and

simultaneously with Binder's "I, Robot," and actually reached print in *Astounding* a month before Binder's story. Del Rey abandoned the theme after a single effort, while Binder, Asimov, and shortly thereafter Eric Frank Russell (with his Jay Score stories) continued the development of the theme.

Binder's stories collected as *Anton York—Immortal* were also highly popular in their day, although lacking in the seminal significance of the Adam Link series. The Anton York stories are concerned with the impact of immortality on a lone man (eventually joined by an immortal wife) and on society. A number of Binder's other stories and novels achieved popularity in their time, but have little present readership. Their loss of popularity is probably due to Binder's stylistic limitation. Though a perfectly competent writer, he did not often succeed in bringing a sense of excitement to his prose; an illuminating comparison is E. E. Smith, whose unbounded energy totally transcended the limitations of his weak prose style.

Binder's "Via Etherline" tales were later collected as *Puzzle of the Space Pyramids*. Prior to the appearance of these stories, space travel and interplanetary exploration were almost always portrayed as glamorous, romantic activities. Binder instead portrayed them as grimy, difficult, dangerous, and often boring tasks. The stories were echoed in the realistic/predictive space fiction of Arthur C. Clarke, e. g., *Prelude to Space*, *Sands of Mars*, *A Fall of Moondust*.

In the 1940's and 1950's, Binder devoted most of his efforts to writing comic book continuity. As the principal writer for the *Captain Marvel* feature, he was chiefly responsible for the humorous, satirical, and often science-fiction elements that best characterized that altogether superior feature. In the 1960's, he developed an interest in UFOs and possible space-visitors, and three of his last works were devoted to these themes. One other series of stories by Binder is noteworthy. These are the tales about Jon Jarl, a young officer in the space patrol of the future. Binder wrote literally scores of these stories as text filler in the *Captain Marvel Adventures* comic book. As juvenile science fiction, they are charming, succinct, and stimulating. They have, unfortunately, never been collected.

\* \* \*

David F. Bischoff has, in just a few years, produced a substantial number of novels and short stories, either on his own or in collaboration with any of several other writers. His earliest book-length appearance was *The Seeker*, written in collaboration with Christopher Lampton. A humanoid alien crashes on Earth, a refugee from a repressive interstellar

society. His pursuers are not willing to let him disappear, and agents arrive determined to find him.

This was just the first of several collaborative novels under Bischoff's byline. Perhaps the most successful collaborative effort was *Tin Woodman*, written with Dennis R. Bailey. A young man with telepathic powers and an inability to fit into human society is sent on a mission to attempt communication with an alien sentient starship. Unfortunately, the man commanding the contact team is a power-hungry psychopath who bullies his crew, falsifies orders, and endangers the entire mission as the alien ship and boy escape, only to be pursued across the galaxy. The interplay of the crew as they consider mutiny is particularly well done.

*Day of the Dragonstar*, written in collaboration with Thomas F. Monteleone, is an adventure-filled variant of the gigantic artificial-world-in-space plot. The Dragonstar turns out to be an enormous zoo and the initial exploration team is massacred by dinosaurs, and a rescue team must discover whether there are any survivors. There follows a fairly predictable but entertaining series of events. A sequel, *Night of the Dragonstar*, is scheduled for release in 1985.

Other novels co-written by Bischoff include *The Selkie*, an interesting fantasy/horror novel written with Charles Sheffield, and *Forbidden World*, the adventures of some space explorers on a world that seem just a bit too good to be true, co-authored with Ted White. Bischoff has also written two movie novelizations, a young readers version of *The Phantom of the Opera*, and the novel tie-in for the recent movie *Wargames*.

He has produced a number of novels in his own right as well, most of which are above-average adventure stories. In *Mandala* a ruthless general from a world that has dominated inhabited space suffers amnesia, and is subsequently nursed back to health by a telepathic woman. The contact with the woman effectively alters his personality, and he returns to his former associates determined to change the status quo. The sudden reversal of the protagonist's personality might be a bit difficult to accept, but there follows a frequently interesting story of subversion from within.

A much more successful work is *Nightworld* and its sequel, *Vampires of Nightworld*. In the first, we are presented with a planet which is no longer in contact with the rest of humanity. An enormous computer dominates the world from its secret retreat, and has created hosts of androids to fill the parts of vampires, dragons, werewolves, ghouls, and other mythological creatures. An unlikely hero finds himself pitted against this computer and, accompanied by a man equipped with some remnants of mankind's technology, he sets off to locate and destroy Satan, the ruler of his world. In the sequel, the computer has been destroyed, but the roving devices it has created are still a genuine menace to the human inhabitants of the world, particularly the powerful vampires. The two novels are interesting blends of adventure, suspense, and genuine humor, and are probably the most successful of Bischoff's solo ventures.

*Star Fall* and its sequel, *Star Spring*, are worth noting as well. The former deals with the maiden voyage of a luxury star liner and the adventure that takes place on its journey to earth. The protagonist finds that he has inadvertently swapped bodies with a famous assassin, and vengeful relatives of the past victims are disinclined to listen to his protestations of innocence. The ship itself is owned by an alien who desires to provoke a war between humanity and his own species, and is not above causing an incident to that purpose. The same cast of characters returns for the most part in *Star Spring*, this time the targets of a series of murder attempts, and ultimately to become lost in space.

Bischoff is an infrequent short story writer, and has yet to produce a really outstanding piece at that length, but a few of his shorter pieces contain interesting ideas. "In Medias Res" is a fascinating piece about a hack writer who can only produce the middles of stories; he is totally incapable of writing a beginning or conclusion. An actor becomes lost in the interface between his play and reality in "All the Stage, a World." All times co-exist in "Waterloo Sunset," probably Bischoff's most successful short story to date.

\* \* \*

Michael Bishop is an extraordinary writer whose work has the scope and brilliance rivaled only by Robert Silverberg. In 1982, Bishop won the Nebula Award for his story "The Quikening," a hauntingly surreal tale of dislocation and loss. In 1983, Bishop again won a Nebula Award, this time for his outstanding novel, *No Enemy But Time*.

Where earlier Bishop novels suffered from structural problems—confusing narratives, intertwining subplots, shifts in person from first to third and back again—Bishop masters the technical skills to bring off a superb performance in *No Enemy But Time*. An infant, given away to a group of young girls near an Air Force base by his mute, prostitute mother, is adopted by one of the families and given the name John Monegal. The child grows up to be different from other children: he experiences intense episodes of dreaming—"spirit-travel"—where he goes back in time to the Pleistocene era in Africa. After an argument with his stepmother, John leaves and later confronts an expert on the Pleistocene during a scientific conference. He makes such an impression, he's later recruited by the expert for a special project: a time-travel expedition to the Pleistocene. John goes and finds his dreams were real: everything is as he dreamed it. He meets the primitive humans inhabiting the African wilds: the habiline. John cleverly becomes one of the small band of habilines, and "marries" a female he calls Helen. Helen bears him a daughter before dying. Then during an inferno, John takes his infant daughter time traveling to the present, where their lives are forever changed. *No Enemy But Time* is a searing novel of identity and misdirection. John's relationship with Helen is one of the most moving in the genre.

Also moving, but now in a more comic vein, Bishop's latest novel, *Ancient of Days*, explores the possibilities of a habiline surviving in contemporary society. Expanded from the brilliant novella "Her Habiline Husband," *Ancient of Days* is Bishop's vehicle to present a critique of American society. Narrated by a restaurant owner whose ex-wife scandalizes the small Georgia town by first living with the habiline—eventually marrying "Adam"—Bishop's clever sense of situation comedy and Southern mores delivers a story that is funny and sadly true. The characters are finely crafted and subtly drawn. *Ancient of Days* is Bishop's most controlled novel.

Bishop's first novel, *A Funeral for the Eyes of Fire* (later revised as *Eyes of Fire*) shows the problems of alien cultures trying to communicate. Much of the book is anthropologic: Bishop shows strange customs and taboos, alien Tropemen "celebrate" in their rites centering on their eyes and the eyes of their ancestors. The action is slowed by long descriptions of alien lifestyles; when the realization of the lead character finally arrives, the reader is far ahead of the narrative.

*And Strange at Ecbatan the Trees* (later retitled just as clumsily *Beneath the Shattered Moon*) reads like a dreamy Jack Vance novel. On the planet Mansucceria, the genetically engineered society is made up of two groups: Maskers, programmed against strong emotion; and Atarites, the rulers who are capable of strong emotion and domination. The groups complement each other; under the 6,000-years-old plan devised by the Parfects of Earth, the rulers and the ruled live in harmony on the island of Ongladred. Yet they are in danger of destruction by the barbarians living on the islands beyond Ongladred. Only Gabriel Elk of Stonelore, who presents dramas acted by resurrected corpses, has the power to create weapons to save Ongladred. But by saving Ongladred, Gabriel Elk disrupts the society and the ancient plan for harmony.

*Stolen Faces* is Bishop's darkest novel. Lucian Yeardance is exiled to the planet Tezcatl to govern a colony for victims of a leprosy-like disease where Aztec rituals are embodied in the culture. Lucian discovers the disease is nonexistent: instead, the victims are a bizarre society whose mental illness is so extreme that mutilation is the group's method of self expression. The writing is bleak and the action violent. Although macabre and depressing, *Stolen Faces* presents discrimination in graphic terms—a theme Bishop will return to in later works.

*A Little Knowledge* and *Catacomb Years* are a pair of linked novels. In *A Little Knowledge* Bishop presents 2071 Atlanta as a domed city where people's status is reflected by the building level they live on. The society is a theocracy dominated by the Orth-Urban Church. Six aliens from 61 Cygni destabilize the status quo by professing faith in the Church. The philosophical and theological foundations of the culture are shaken as the power brokers have to come to grips with the alien question. The most entertaining subplot is the love story between a deacon in the Church and an agnostic journalist. But the book suffers from too many characters—most of them undeveloped—and murky plotting.

*Catacomb Years* continues the story of Atlanta with many new characters. Bishop develops the implications that the Cygnusians are actually reincarnated humans. The resulting political and religious upheaval results in the breakdown of the domed city and a chance at freedom under open skies. Although technically superior to *A Little Knowledge*, *Catacomb Years* suffers from being overly long and tedious; a reedited single volume combining the best of *A Little Knowledge* and *Catacomb Years* would be much more satisfying than the present flamed twin novels.

*Transfigurations* is an expanded version of Bishop's novella that was a Hugo and Nebula nominee in 1973: "Death and Designation among the Adadi." The original story of an obsessed anthropologist attempting to solve the mysteries of an enigmatic race of aliens gives way to the anthropologist's daughter's search for her missing father. The result is a disappointing extrapolation of the original story's premises proving that by revealing more of a mystery you get a less compelling resolution than when the reader is left to imagine and ponder the inexplicable.

Bishop's short-story collections gather most of his Hugo and Nebula Award winners and nominees. *Blooded on Arachne* includes 13 stories published between 1970 and 1978. The best

are "Blooded on Arachne," "Rogue Tomato," "The White Otters of Childhood," and "Cathadonian Odyssey." *One Winter in Eden* includes a dozen stories published between 1979 and 1983. The best are "One Winter in Eden," "The Quickening," "Cold War Orphans," "Saving Face," "Season of Belief," "Within the Walls of Tyre," and "Collaborating."

As an anthologist, Bishop has shown marvelous taste. In *Changes*, edited with Ian Watson, Bishop presents a theme anthology centering on humans transforming into . . . something else. But Bishop's masterpiece anthology is the controversial *Light Years and Dark*. Bishop blends original stories commissioned for this volume with notable stories published in the last 25 years. The result is a definitive collection that should rank with Harlan Ellison's *Dangerous Visions* anthologies.

Michael Bishop is a talented novelist, short-story writer, and anthologist who is rapidly becoming one of the most important figures writing science fiction today.

\* \* \*

With second careers as editor, screenwriter, TV writer, real estate developer, and with a serious interest in musical composition, Jerome Bixby has not taken good enough care of

his work as a science-fiction writer or pushed his own editors and publishers hard enough to get his work into print for access by the contemporary reader. Only one volume of collected SF, *Space by the Tale*, and one of horror and fantasy tales, *The Devil's Scrapbook*, have been published. Beyond these only occasional tales in anthologies, led by Bixby's most famous story, "It's a Good Life" (1953), form the surface portion of an iceberg of over 300 SF stories and 1000 other stories.

*Space by the Tale* is an indirect compliment to Bixby as an editor, for his own selection captures the range of the skills of this most interesting and whimsical of short story producers. All of the stories, except perhaps the slightly laboured "The Bad Life," are models of Bixby's characteristic light, clean, quick style and of a story told clearly and quickly. For style and story-telling alone "It's a Good Life" fully deserves its classic status. In a series of short, macabre comic scenes Bixby sketches a mid-American farming town where little Anthony, a mutated "baby," is born with godlike powers of telekinesis, telepathy, and the ability to make and destroy the material universe. He has isolated the town, possibly destroying the rest of creation, and both as "baby" and "boy" he has struck back unconsciously when hate is directed at him, neatly planting in a cornfield the destroyed persons and animals which he first changes in unspeakable ways. The story is brilliantly paranoid, as no one alive in the town can *think* ill of Anthony, his acts, or their situation, for at any moment they may catch his attention and be struck down. The story has a pervasive air of inevitability and horror.

"It's a Good Life" is typical of Bixby's best stories in three ways. First, it presents a model of an omniscient god and poses the question of the morality of godhead. Anthony has immense powers but wholly immature moral judgement, which puts him part way between the omnipotent Judeo-Christian god and the capricious Greek Olympians. Bixby has written numerous fantasy stories about God and the Devil in conflict, which, however whimsical in the Stephen Vincent Benét tradition, are at heart moral tales. In "It's a Good Life" he asks what the universe would be like with a malevolent, child-like god who simply holds personal comfort and pleasure above any standard of his own behaviour. That "child-like" Anthony reminds the reader of Bixby's second gift, his skill at observing human beings. His young god is capable of malice but also of bored benevolence and even kindness. The frightened townspeople are very real, very typical, yet slight variations in their reactions stamp their experiences as authentic, heightening the terror. This same care with the creation of characters is of assistance when Bixby writes his more whimsical stories, giving a delicacy of shading to the humour. The third way in which "It's a Good Life" is characteristic of Bixby's SF work is that it is not a "hard" science story, Bixby can write such stories ("Small World" and "The Bad Life" in *Space by the Tale*), but his forte really lies at the juncture of SF, fantasy, and the moral tale, where a generalised scientific concept provides a base for a story of human nature. Anthony is a typical creation. His conception is not explained and his powers are described in general rather than technical terms. Anthony can "think" people into a cornfield, "do the thing" to separate the town from the rest of the world, and "change" people in horrible but undescribed ways. Stories such as these are fantasies but they are based on concepts accepted by SF. *Space by the Tale*, for example, contains "The Draw," in which telekinesis creates the fastest of all western gunmen; "The Young One," about a family of werewolves settling in the midwest with their son; "Angels in the Jets," about a planet where something in the atmosphere drives everyone crazy in a liberating fashion; and "Laboratory," about gigantic creatures whose laboratory

asteroid is wrecked when two humans blunder into its invisible environs.

Bixby's best stories have an energetic twist. The resident imp in "The Magic Typewriter" is bound to bring to pass everything typed on the machine, which is marvellous until its owner goes out for cigarettes and his horribly ugly landlady sits down and types an illiterate yet deadly letter making him her lover and taking over the typewriter. The Devil in "Trace" actually does a favour for a lawyer whose car has broken down. In this sly allegory about the sudden kindness of the rich at their summer places Bixby proves that even the Devil has his good moments. When the Devil finds out that he is helping a lawyer his murmured, "Ah. Then perhaps we may meet again" is typical of the quiet wit of this charming and skillful craftsman.

\* \* \*

Christopher Blayre remains an enigmatic figure. His extraordinarily versatile life in varied scientific and artistic fields is mostly well recorded—he did research in marine biology and palaeontology, horticulture, music, occultism, Persian literature, history, and bibliography—but the names under which he wrote some of his unacknowledged fiction have not been discovered, and how much more he may have written of possible interest is not known. What we do have is a quite interesting group of stories, mainly on supernatural themes, and a few with a place in science fiction's formative stage. The weird stories use familiar elements of ghosts and apparitions, possession, visions, and curses, but the treatment is modern. There is some effective satirical humor, as in the immortal Wandering Jew succumbing to modern medicine, and a visit to an annex to Hell with an institution for completing unfinished works.

"Aalila" concerns a visit to Venus by matter transmission. The Venerians, who inevitably resemble humans, have an incompatible culture, and the experimenter's inevitable sexual involvement with Aalila leads to the expected disaster. It is an effective tale for all its familiarity. "The Cosmic Dust" is a sequel, and must be among the earliest stories on the interplanetary transmission of life in spores. This was a very important concept and raises questions that remain open. "The Mirror That Remembered" has another idea often suggested, a device for visualising past scenes. A marginal item is "The Blue Cockroach," where a temporary change in personality follows an insect bite.

*The Cheetah-Girl*, dropped by the publisher at the last moment from *The Purple Sapphire*, is a more ambitious work, a serious story of a macabre project—the creation of a human-cheetah hybrid, and its consequences. The rationale is logical, considering the elementary state of genetics in 1920. These stories compare very favorably with the better known proto-science fiction of the period. The style is easy, assured, and fresh.

\* \* \*

James Blish can be seen as the complete man of letters for the young genre of science fiction from his early days of fandom in the 1930's until his untimely death from cancer in 1975, and one wonders whether Blish, if he had lived, might not eventually have published the masterpiece he insisted the genre would be incapable of producing. Out of such ironies often come great works of art; and Blish had a consuming and scholarly interest in great art—from music, James Joyce, and Ezra Pound to the best science-fiction writers. The irony is that Blish as a writer came directly out of the pulp and fan tradition with all its variety, and even at the end of his career, when he was producing his best theorizing about the genre, he was also grinding out the highly commercial *Star Trek* novelizations. Blish was a steady producer of short fiction for the pulps who later learned to write superb novels and series. He saw the need for continuing critical writing and theorizing about the new genre of science fiction and produced masterful examples of both. He was a fan, an agent, an editor; and he was both beloved and feared for his totally comprehensive involvement with the genre. Blish's first editor, fellow Futurian, and friend, Robert A. W. Lowndes, develops the argument (in his introduction to *The Best of James Blish*) that Blish learned to write and to admire science fiction that was crafted "the hard way." His work, then, demonstrates both the scope and the artistic depth that was possible in science fiction during his lifetime.

Several of Blish's most often used themes and the ironies and tensions inherent in those themes can serve as illustration. *The Seedling Stars*, a full length fiction made from shorter pieces about microscopic life, convinces the reader that mankind inhabits an infinite universe where the possibilities for protean

form-changing and new dynamic adaptations (the real mainstream of science fiction) are seemingly limitless and also necessary. At the end of the book, this Stapledonian view is summed up as follows, "There's no survival value in pinning one's race forever to one set of specs." And yet within the same period of his writing, Blish is continually looking for the one set of eternal specifications that govern human existence. Perhaps his most effective novel, *A Case of Conscience*, serves as the concluding part of a trilogy in which each of the protagonists is Christian; and the eternal battle between good and evil throughout the trilogy seems much more real and absolute than the open-ended relativism of adaptive evolution. Blish juggled these themes, and the comic tension from the resulting balance produces a high seriousness that (though the works appeared at first in the pulps) deserves to be treated as literature.

Another theme that apparently fascinated Blish because it appears often through his work (from a juvenile such as *The Star Dwellers* to the epic ending of his tetralogy *Cities in Flight*) is the catastrophism of the explosive first moments of creation seen also as the end of all things. The awesome fecundity of the moment of death is Blish's most subline image. I believe it appears frequently and interestingly enough in his work to allow a thoroughly Freudian analysis of Blish's fascination with death and with catastrophism. The point is that, though he as completely at home with the intentions and the conventions of the pulps as one is with his hometown, the true territory that Blish explores extends into the most profound speculations of our time. He was a good scholar and a good critic who would be delighted to know that future scholars and critics will also value his fictions.

Blish's own late theorizing about the genre maintains that variety and a kind of comic fecundity constitute its strength and reason for existence at this time in our history. He bases his theory on the historical speculations of Oswald Spengler; and R. D. Mullen has argued (in his afterword published with the gathered sections of *Cities in Flight*) that the tetralogy is grounded in Spenglerian theory. What Blish denies, of course, following from Spengler is that at this late date in our history and in this genre in particular, which best presents the variety of our time, no new synthesizing masterpieces (or epics) will appear. His own attempts are lengthy. *Cities in Flight* contains four novels. The trilogy that he intended to entitle *After Such Knowledge* contains the magnificent historical novel on Roger Bacon, *Doctor Mirabilis*, two novellas, and the science fiction novel *A Case of Conscience*. One would like to think that the theorist doth protest too much. But the trilogy was left unconnected at Blish's death, and the effect also of the tetralogy may be more centrifugal than centering. In any case, the work of Blish is rich with these dilemmas and tensions and, always, the art.

*The Kidnapper.* New York, Lion, 1954.  
*Spiderweb.* New York, Ace, 1954.  
*The Will to Kill.* New York, Ace, 1954.  
*Shooting Star.* New York, Ace, 1958.  
*Psycho.* New York, Simon and Schuster, 1959; London, Hale, 1960.  
*The Dead Beat.* New York, Simon and Schuster, 1960; London, Hale, 1961.  
*Firebug.* Evanston, Illinois, Regency, 1961; London, Corgi, 1977.  
*The Couch* (novelization of screenplay). New York, Fawcett, and London, Muller, 1962.  
*Terror.* New York, Belmont, 1962; London, Corgi, 1964.  
*The Star Stalker.* New York, Pyramid, 1968.  
*The Todd Dossier* (as Collier Young). New York, Delacorte Press, and London, Macmillan, 1969.

*It's All in Your Mind.* New York, Curtis, 1971.

*Night-World.* New York, Simon and Schuster, 1972; London, Hale, 1974.

*American Gothic.* New York, Simon and Schuster, 1974; London, W. H. Allen, 1975.

*There Is a Serpent in Eden.* New York, Zebra, 1979; as *The Cunning Serpent*, 1981.

*Strange Eons.* Browns Mills, New Jersey, Whispers Press, 1979.  
*Psycho II.* New York, Warner, 1982; London, Corgi, 1983.

*The Night of the Ripper.* New York, Doubleday, 1984.

## Short Stories

*Sea-Kissed.* London, Utopian, 1945.

*The Opener of the Way.* Sauk City, Wisconsin, Arkham House, 1945; London, Spearman, 1974; selection, as *House of the Hatchet*, London, Panther, 1976.

*Terror in the Night and Other Stories.* New York, Ace, 1958.  
*Pleasant Dreams—Nightmares.* Sauk City, Wisconsin, Arkham House, 1960; London, Whiting and Wheaton, 1967.

*Nightmares.* New York, Belmont, 1961.

*Blood Runs Cold.* New York, Simon and Schuster, 1961; London, Hale, 1963.

*More Nightmares.* New York, Belmont, 1962.

*Yours Truly, Jack the Ripper: Tales of Horror.* New York, Belmont, 1962; as *The House of the Hatchet and Other Tales of Horror*, London, Tandem, 1965.

*Horror-7.* New York, Belmont, 1963; as *Torture Garden*, London, New English Library, 1967.

*Bogey Men.* New York, Pyramid, 1963.

*Tales in a Jugular Vein.* New York, Pyramid, 1965; London, Sphere, 1970.

*The Skull of the Marquis de Sade and Other Stories.* New York, Pyramid, 1965; London, Hale, 1975.

*Chamber of Horrors.* New York, Award, 1966; London, Corgi, 1977.

*The Living Demons.* New York, Belmont, 1967; London, Sphere, 1970.

*Dragons and Nightmares.* Baltimore, Mirage Press, 1968.

*Cold Chills.* New York, Doubleday, 1977; London, Hale, 1978.

*The King of Terrors.* New York, Mysterious Press, 1977; London, Hale, 1978.

*Out of the Mouths of Graves.* New York, Mysterious Press, 1979; London, Hale, 1980.

*Such Stuff as Screams Are Made Of.* New York, Ballantine, 1979; London, Hale, 1980.

*Mysteries of the Worm.* New York, Zebra, 1979.

*The Twilight Zone: The Movie* (fictionalization of screenplays). New York, Warner, and London, Corgi, 1983.

## Plays

Screenplays: *The Couch*, with Owen Crump and Blake Edwards, 1962; *The Cabinet of Caligari*, 1962; *Strait-Jacket*, 1964; *The Night Walker*, 1964; *The Psychopath*, 1966; *The Deadly Bees*, with Anthony Marriott, 1967; *Torture Garden*, 1967; *The House That Dripped Blood*, 1970; *Asylum*, 1972; *The Amazing Captain Nemo*, with others, 1979.

Radio Plays: *Stay Tuned for Terror* series (39 scripts), 1944-45.

Television Plays: *The Cuckoo Clock*, *The Greatest Monster of Them All*, *A Change of Heart*, *The Landlady*, *The Sorcerer's Apprentice*, *The Gloating Place*, *Bad Actor*, and *The Big Kick*, all in *Alfred Hitchcock Presents* series 1955-61; *The Cheaters*,

*The Devil's Ticket, A Good Imagination, The Grim Reaper, The Weird Tailor, Waxworks, Till Death Do Us Part, and Man of Mystery*, all in *Thriller* series, 1960-61; scripts for *Lock-Up*, 1960, *I Spy*, 1964, *Run for Your Life*, 1965, *Star Trek*, 1966-67, *Journey to the Unknown*, 1968, *Night Gallery*, 1971, and *Dark Room*, 1983-84; *The Cat Creature*, 1973; *The Dead Don't Die*, 1975.

#### Robert Bloch comments:

Although I have had upwards of 100 short stories and novelets published in science-fiction magazines, I am primarily a writer of fantasy and mystery-suspense fiction: the bulk of my work falls within these two genres, as does my writing for screen, television, and radio. As a result my work has been almost entirely ignored by science-fiction critics and historians—thank God! Having somehow managed to survive as a professional writer over a period of 51 years, I'd hate to blow it now. I am still fascinated by the SF field and by the people in it.

\* \* \*

Although Robert Bloch has been associated with science fiction since his first fan-magazine appearance at the age of 15, he has never been regarded as a main-line science-fiction writer. As he says, "Through the years, most of my work has been on the peripheral edges of science fiction proper—fantasy, weird-horror and suspense, together with a smattering of humor. To the extent that psychopathology is classifiable as a branch of medical science, my other novels. . . all contain these elements as they pertain to an examination of subjective reality." Nonetheless, for five decades Bloch has made a positive impact and been a popular figure in the science fiction community, and has contributed scores of stories to the field.

The earliest period of his professional career was dominated by the influence of H. P. Lovecraft; Bloch corresponded with Lovecraft and sent him drafts of his earliest stories for comment. Among his early *Weird Tales* stories was "The Shambler from the Stars," in which he killed Lovecraft quite gorily; Frank Belknap Long had done the same to Lovecraft in a story several years before, and Lovecraft killed off Bloch

(renaming him "Robert Blake") in his turn. It was all good fun, and made rather good horror fiction as well. Bloch moved shortly to a series of horror stories with Egyptian motifs; titles such as "The Brood of Bubastis," "The Eyes of the Mummy," "Fane of the Black Pharaoh," and "The Secret of Sebek" speak for themselves. Still later works fall into the horror-suspense-crime area, with heavy emphasis on psychopathology. These include "House of the Hatchet," "The Skull of the Marquis de Sade," "Enoch," "Lizzie Borden Took an Axe," and others, including Bloch's best known and most successful novel, *Psycho*. Another recurrent theme in Bloch's works is that of Jack the Ripper. Bloch's most successful short story is "Yours Truly—Jack the Ripper"; a later use of the theme was in "A Toy for Juliet." Among other notions, Bloch suggests that Jack was a sort of vampire who prolongs his existence through his crimes. Bloch returned to his early enthusiasm for Lovecraft with *Strange Eons*. In this novel he collects numerous Lovecraftian themes, including the Cthulhu Mythos, and projects them into a future world-catastrophe, thereby providing a marginally scientific basis for the material.

Fondly remembered by many veteran readers are Bloch's "Lefty Feep" stories. Some 22 of these appeared in *Fantastic Adventures* (1942-46). All are pun-filled, wise-cracking, parodistic works. Once more, titles are indicative of content: "Time Wounds All Heels," "The Weird Doom of Floyd Scritch," "Stuporman," and (reflecting Bloch's topicality) "The Pied Piper Fights the Gestapo." Some of Bloch's works, however, have been thoroughly serious. The majority of these have been in the psychopathological vein, but some, such as "The Cloak" and "That Hell-Bound Train," have been "real" science fiction or fantasy. (The latter story won a Hugo award, a rare achievement for a fantasy story). In the science-fiction novella "This Crowded Earth" Bloch suggested the miniaturization of the human species as a solution for overpopulation problems; Vonnegut's *Slapstick* duplicates Bloch's device.

In later years Bloch continued to concentrate on his favorite and most successful themes, working in areas of psychological horror and violence rather than outright fantasy or science fiction. The inevitable *Psycho II*, as might be expected, dealt with the continuing saga of Norman Bates and his associates, following Bates's years of hospitalization. The identically named film was *not* based on Bloch's novel; nonetheless (and also predictably) its theme is similar.

*The Night of the Ripper* is a full-fledged novelistic treatment of the Jack-the-Ripper theme. It remains to be seen whether Bloch, having dealt with his twin succubi of Norman Bates and Jack the Ripper with these late books, will turn to other themes or will continue to mine this undeniably rich but by now tiresomely overworked material.

—Richard A. Lupoff

**BOND, Nelson S(lade).** American. Born in Scranton, Pennsylvania, 23 November 1908. Educated at Marshall University, Huntington, West Virginia, 1932-34. Married Betty Gough Folsom in 1934; two sons. Public relations field director, government of Nova Scotia, 1934-35. Free-lance writer and philatelic researcher; now a book dealer. Associated with the Roanoke Community Theatre. Recipient: International Stamp Exhibition Award, for non-fiction, 1960. Address: 4724 East-hill Drive, Sugarloaf Farms, Roanoke, Virginia 24018, U. S. A.

## SCIENCE-FICTION PUBLICATIONS

## Novel

*Exiles of Time*. Philadelphia, Prime Press, 1949.

## Short Stories

*Mr. Mergenthwirker's Lobblies and Other Fantastic Tales*. New York, Coward McCann, 1946.

*The Thirty-First of February*. New York, Gnome Press, 1949.

*The Remarkable Exploits of Lancelot Biggs, Spaceman*. New York, Doubleday, 1950.

*No Time Like the Future*. New York, Avon, 1954.

*Nightmares and Daydreams*. Sauk City, Wisconsin, Arkham House, 1968.

## OTHER PUBLICATIONS

## Plays

*Mr. Mergenthwirker's Lobblies*, adaptation of his own story (televised). New York, French, 1957.

*State of Mind*. New York, French, 1958.

*Animal Farm*, adaptation of the novel by George Orwell. New York, French, 1964.

Author of screenplays for government agencies, some 300 radio plays, and television plays for *Philco Playhouse*, *Kraft Theatre*, *Studio One*, and other series.

## Other

*The Postal Stationery of Canada: A Reference Catalogue*. Shrub Oak, New York, Herst, 1953.

\* \* \*

Nelson S. Bond's only novel published in book form is *Exiles of Time*, and it actually constitutes the fourth volume of a tetralogy; the earlier works in the series, *Sons of the Deluge*, *Gods of the Jungle*, and *That Worlds May Live*, were published in *Amazing*. *Exiles of Time*, though written in a clear, readable style, suffers from too great a reliance on stereotyped characters. It's the story of a time traveller who encounters Ragnarok, and the epilogue quotes from the Elder Edda, giving the reader considerable insight into Bond's skill at plotting. It's an impressive demonstration. The ability to plot is one of Bond's strongest points, and he was never more sure or ingenious than here.

By and large, Bond's best fiction remains his short stories, and he has displayed a remarkable range with them. During his years as a regular contributor to the pulps he wrote not only for Ray Palmer's *Amazing* and *Fantastic Adventures*, but for John Campbell's more demanding *Astounding* and *Unknown*. He also wrote for *Thrilling Wonder Stories*, *Weird Tales*, and especially for *Planet Stories*. "The Castaway" (*Planet*, Winter 1940) is an almost perfect example of Bond's ability to make a formula story and raise it above its own limits. A spaceship crew rescues a man marooned on an asteroid. Subsequent events suggest he's a jinx and suicidal to boot, with the ship finally zooming out of control at a speed that will cause it to burn when it hits Earth's atmosphere. The castaway devises a way to save the ship and its crew, but the real surprise lies in his actual identity.

"The Castaway" fits into a future history that includes most of Bond's space stories. These stories seem to take place mostly in the 23rd century, with the solar system explored and

colonized by Earthmen, and most of them center on members of the Solar Space Patrol or a space transport company called IPS. While Bond wrote a number of character series within this frame, the Lancelot Biggs series is probably the most important, and in many ways the most typical. Biggs is the eccentric and likeable first officer of the IPS ship *Saturn*, and he divides his time between getting on his captain's nerves and producing scientific miracles to save the ship from certain disaster. About half these stories were included in *The Remarkable Exploits of Lancelot Biggs, Spaceman*.

While there is no denying Bond's talent with the short story, many of his novelets and short novels are excellent. Two *Planet* novelets from 1941 demonstrate his skill with space opera. Both center on the adventures of the young, clean-cut spaceman Chip Warren and his partners Syd Palmer and "Salvation" Smith. "Shadrach" has them discovering a rich lode of "ekalastron," an almost impervious metal, rare and valuable, that plays a part in several of Bond's future history stories. "The Lorelei Death" pits them against space pirates, but, though the better action story, it's marred by some questionable science in its ending. "Pawns of Chaos" (*Thrilling Wonder Stories*, April 1943) is based on the sort of idea popular with editors almost everywhere at that time, invaders from another dimension where the political system bears some similarity to that of Nazi Germany. Bond obviously had fun writing it, especially those sections describing battles in and around his home town of Roanoke, Virginia. "Pawns of Chaos" doesn't fall into Bond's future history sequence, nor do the Meg the Priestess stories which constitute what is probably the best work he did in the SF pulps. In the Meg stories, civilization has virtually collapsed and humanity exists in scattered tribes, a few of which preserve knowledge of writing and reading through a matriarchal leadership, although their ideas of the past are distorted as myths and legends. In "Pilgrimage" (*The Thirty-First of February*) Meg becomes priestess of her clan in Virginia and travels west to consult the gods carved on Mount Rushmore. "Magic City" (*Astounding*, February 1941) has her visit the city of death—New York—to confront its goddess.

Bond's penchant for writing action scenes in settings he knows produced a superior story in "The Ultimate Salient" (*Planet*, Fall 1940). A science-fiction writer receives a manuscript purporting to tell future events: the democracies fall to totalitarian forces in 1963 and the survivors flee to the moon where they face almost certain death because they lack the knowledge to synthesize chlorophyll. Since they are known to have taken a number of old SF magazines along, the writer is asked to use the manuscript as the basis of a story, ending it with the formula for chlorophyll that the survivors need. The story was later completely rewritten as "The Last Outpost," and is included in *No Time Like the Future*. The new version sets up a revolt against a world dictatorship, with neither the minions of the dictatorship nor the rebels being very desirable. Disaster befalls both sides but a third group flees to Venus—where the item needed for their survival is the formula for vitamin A.

Bond has claimed he was never actually a science-fiction writer but a fantasist who wrote for the SF magazines. Certainly his first big success (in 1937) was the fantasy "Mr. Mergenthwirker's Lobblies," about a gentle man who acquires the companionship of two invisible beings who foretell the future. Such stories as this were probably the prototypes of the sort of light fantasies Ray Palmer sought for *Fantastic Adventures*. It should be noted that Bond wrote a number of SF stories for his ostensibly fantasy markets, including *Blue Book*, and expressed pride in such stories as "To People a New World," "Martian Caravan," and the Pat Pending stories,

about the inventor of a succession of incredible gadgets.

Bond's prose was polished enough for the prestige markets of the 1940's without being too slick to remain palatable today. By turns he can be humorous, serious, or adventurous, handling each approach with equal skill. But it remains plotting where he really shines. His story "The Cunning of the Beast" (*The Thirty-First of February*) may be that most overworked of stories, the Adam and Eve story, but it's the most cleverly plotted of them. A number of his yarns spring from Biblical or mythological sources, usually with happy results. "Uncommon Castaway" (*No Time Like the Future*) is a twist on the story of Jonah and the whale. Much of Bond's fiction resembles that of Saki or John Collier. "And Lo! The Bird" presents the Earth as an egg about to be hatched, and "Conqueror's Isle" tells of an outpost of supermen waiting for the passing of homo sapiens (both in *No Time Like the Future*).

Bond's knack for the off-beat is shown not only in his humor and his variety of approach, but also in a handful of stories written as poems. Two of them from *Planet*, "The Ballad of Blaster Bill" and "The Ballad of Venus Nell," show a touch of Robert Service (though to be honest, "Blaster Bill's" tempo is borrowed from Kipling's "Gunga Din").

\* \* \*

J. F. Bone made a considerable impact with the publication of his first novel, *The Lani People*, along with several first-rate shorter works. Unfortunately, his career faltered for approximately ten years; very few works appeared under his name, and none of them particularly memorable.

*The Lani People* came perilously close to being a narrated lecture, for it quite obviously intended to comment unfavorably upon man's tendency to dehumanize others. In the future, a race of humanoids exits, differing from normal humanity because of the addition of a prehensile tail. They are considered less than human, property in fact, and have virtually no rights under the law. Despite the plot—the slow realization by the

protagonist of the essential evil inherent in the situation—Bone was inventive enough to maintain reader interest throughout.

Of Bone's later novels, *Legacy* was a rather routine story of a marooned man who joins a police force on a far world and becomes involved with the effort to suppress a dangerous new drug, Tonocaine. Although not actively bad, the novel's trivial nature and trite plot were disappointing to those who had remembered Bone's earlier work. The two other Laser novels were even more insignificant. In *The Meddlers* the human race is engaged in conscious manipulation of alien cultures for its own benefit. In *Gift of the Manti* the situation is just the opposite, with secretive aliens manipulating human culture for our own good, offhandedly wiping out 90 percent of the human race along the way. Both novels are underwritten and unbelievable and totally forgettable.

Bone did better with *Confederation Matador*, although that novel also has serious flaws. After the collapse of a human interstellar empire, a new confederation has arisen, which is carefully trying to rebuild human technology. An agent is sent to one world colonized by Spanish-speaking peoples to discover why that colony is slowly losing its technological base, despite an absence of external pressures. The agent discovers that superhuman aliens have established a base and are systematically exterminating the human colonists. Although the novel has sections that are quite well done, Bone has added some unnecessary and confusing subplots that distract attention from the main issue.

There is a considerable body of shorter pieces by Bone, most of which remain quite readable. Of particular note is "Founding Father," a novella in which stranded reptilian aliens use mental control to force humans to refuel their ship, and a strange relationship grows between the two species. Another excellent story is "Triggerman" which calmly presents the man with the ultimate power to cause or avert a nuclear war, and his dispassionate reaction to a world crisis. "On the Fourth Planet" is not as ambitious as the other two, but this tale of a Martian slowly eating his way across the surface of his planet, and his unhappy encounter with a human probe is extremely inventive and, within its limited structure, possibly the most successful of Bone's stories.

—Don D'Amassa

 1969.

Critical Study: *The Eureka Years: Boucher and McComas's The  
 Magazine of Fantasy and Science Fiction 1949-1954* edited by  
 Annette P. McComas, New York, Bantam, 1982.

\* \* \*

Anthony Boucher brought both style and sophistication to  
 popular fantasy and science fiction, two qualities in rather  
 short supply during the 1940's and 1950's. Boucher enjoyed  
 successful careers in all three phases of popular literature; he  
 was a critic, an author, and an editor.

Boucher wrote both fantasy and science fiction stories.  
 Many of his best stories were published in Campbell's *Astound-  
 ing Science Fiction* and *Unknown*, and in *Weird Tales*.  
 Boucher's talent ran to the kind of fantasy or fantastic science  
 fiction associated with *Unknown* in the 1940's and *Beyond*  
 in the 1950's. His stories tend to be comic treatments of ordinary  
 people involved in situations and actions that run contrary to  
 their customary, common-sense approach to life. Boucher  
 seems to imply that most people, and certainly his truly  
 sympathetic characters, possess an innate disposition to believe  
 in supernatural forces. As was the case with most characteristic  
*Unknown* stories, mythic themes are treated lightly with a  
 comic and often ironic distance. That is certainly the case with  
 Boucher's most successful stories. "Q. U. R.," "Robinc," and  
 "We Print the Truth" may be taken as illustrating Boucher's  
 manner in science-fiction stories. The first two stories are bar-  
 room tales, similar to Henry Knutter's Galloway Gallagher  
 tales and Arthur Clarke's *Tales from the White Hart*. They

share characteristic themes with some of Heinlein's stories of  
 the private inventor and of proprietary business enterprise as  
 illustrated in "We Also Walk Dogs." Boucher's hero, Duggles-  
 marther H. Quinby, changes the world with a revolution in  
 android technology, making the androids more efficient by  
 making them less like humans. Boucher thus lightly shows two  
 of his virtues as a writer: effective comic reversal of clichés or  
 worn-out formulas to produce surprise and delight, and a  
 humanistic and often literary resonance.

The best of his fantasy tales may be the most famous of his  
 stories, the novella "The Compleat Werewolf." The title  
 suggests distantly perhaps yet fittingly a parallel to the Michael  
 Shea adventures of L. Sprague de Camp and Fletcher Pratt.  
 Many of the storytelling concepts are the same: an academic  
 setting; a strong courtship subplot; comic anachronism involv-  
 ing a modern character caught up in mythic or legendary  
 adventures but retaining a modern, skeptical sense of incongru-  
 ity; the concomitant farcical employment of magic; and the  
 obligatory happy ending in which the hero returns to the  
 prosaic world with a fuller appreciation of its homely values or  
 at least its familiar comforts. Best of all, he returns to a world in  
 which he fits. Boucher's 1942 tale includes a little Nazi  
 espionage to spice up the plot. Professor Wolfe Wolf, the hero  
 in spite of himself who ends with the right girl despite an earlier  
 unsuitable preference for a co-ed Venus, is the pattern of the  
 modern, domesticated hero that has run remarkably true to  
 form now for more than a quarter century.

Two or three other fantasy tales may be noted here briefly as  
 representative of Boucher's range. "Snulbug" is Boucher's tale  
 of modern demonology told with a more comic perspective  
 than C. S. Lewis's *Screwtape Letters*, which it recalls. In  
 Boucher's story, the human race is preserved from additional  
 mischief by the incompetence of a conjurer and the third-rate  
 demon he manages to call up to work his will. "They Bite" is an  
 effective suspense-horror story making use of the familiar  
 formula in which modern, skeptical men find themselves the  
 unbelieving victims of legendary desert ogres. "We Print the  
 Truth" is loosely based on the familiar theological chestnut of  
 the contradiction between divine foreknowledge and free will.  
 Boucher's fictional equivalent of divine foreknowledge is the  
*Grover Sentinel*, whose stories become true for all who read  
 them. Boucher's working out of the problem which involves  
 speculations of wish fulfillment and something he terms  
 "variable truth" is characteristically ingenious and amusing,  
 very much like the armchair mysteries he wrote under the name  
 of H. H. Holmes. It was under the same name that Boucher  
 wrote one of the most amusing science-fiction mystery *roman à  
 clef* novels, *Rocket to the Morgue*, which is also a pastiche of  
 styles, mannerisms, and familiar formulas of the main science-  
 fiction writers of the dominant eastern establishment.

Boucher's best known SF story, "The Quest for St. Aquin"  
 (1951), has lost none of its original luster after more than a  
 quarter century. If anything, its stature has grown by virtue of  
 the works it has to some degree inspired: James Blish's *A Case  
 of Conscience* (1958), Walter M. Miller, Jr.'s *A Canticle for  
 Leibowitz* (1960), and Robert Silverberg's "Good News from  
 the Vatican" (1970). The quest takes place in a post-nuclear  
 catastrophe California in which religious worship of any kind is  
 officially suppressed by the ruling Technarchy through its  
 KGB style "Loyalty Checkers." The quest ends with the  
 paradoxical revelation that the fabled Saint Aquin is in fact the  
 one perfect android of legend that had proved by its faultless  
 logic the existence of God, and whose present lifeless state  
 proves that existence in quite another way. The virtues of the  
 story are many, including the economy with which Boucher  
 creates his repressive, future world in which religious perse-

cution is once again a fact of life for all believers and the finely realized humanity of the story's characters from the pope who must hide his fisherman's ring in the heel of his shoe to the Jewish "good Samaritan" on whom the irony of his rescue of the questing priest is hardly lost. The central action, however, depends of Boucher's skill in creating two characters: the young, unsophisticated priest sent on the quest by the pope to discover whether the cult of St. Aquin is orthodox, and the priest's mechanical "robass," who turns out to be none other than Old Nick himself back at the tempting game in a new form. The confrontation is altogether enchanting and somehow satisfying theologically at the same time. Among the story's many achievements as prophetic SF entertainment, the reader should consider that it is one of those stories of the 1950's, and one of the earliest, to dramatize the future brotherhood of all people of faith, whatever their religious affiliation. A quarter century ago that seemed a far more radical notion than it does today.

Perhaps Boucher's most important contribution to the literature of popular fantasy and SF came not as an author but as co-editor and later editor of *The Magazine of Fantasy and Science Fiction*, which made its debut before the public without "science fiction" on the masthead in 1949. The magazine has proven to be the healthiest and most consistently influential competition to the *Astounding/Analog* tradition of science fiction/science fact literature. Boucher and McComas established their magazine as a quality pulp that was more concerned with literary standards than with literary ideology. It has continued to publish stories in both genres and mixtures of the two that are distinguished by literary, that is mainstream, writing. Something must be added also about the affection and respect that Boucher won by his amiable disposition and urbane wit. His was one of the more important benign influences on the encouragement and development of many of the New Wave writers with whom he probably had less in common than with the Golden Age writers of his own salad days.

Ben Bova's science fiction—with emphasis on *correct* science—can be likened to a schematic diagram in which each work is a component in a master design. Many of his characters reappear to interlock his works. This repetition, coupled with his themes, produces a mosaic unmistakably contrived. The design can be evidenced by grouping his works into three categories: "pure romps," Earth-based, and star stories.

The "pure romps" (Bova's own designation) show that people are often motivated by misguided principles, and include stories such as "The Secret Life of Henry K." and "The Great Supersonic Zeppelin Race." "Free Enterprise" jabs at

the American "free" but muddled enterprise system as compared with the more efficient Japanese system. And a tongue-in-cheek Bova proves in "Vision" that vision is a quality only few attain, until or unless they are confronted with a problem that makes them visionary because it suddenly involves them. The children's novel *Gremlins, Go Home!* (written with Gordon Dickson) and *The Starcrossed* complete the bedlam-type tales Bova enjoys spinning.

The Earth-based stories establish man's move to the stars as essential because of the mishandling of his Earth home. A few children's stories (as in *Forward in Time*) and novels fit in this category. The more serious short story, "Blood of Tyrants" and the longer work, *Escape!* feature a chaotic ghetto background in which protagonist Danny Romano is caught. *City of Darkness* deals with the same theme: youths fend for themselves against insensitive, insane odds. Forced to live a quasi-life in overcrowded conditions, they rebel violently.

Besides articulating the theme of overpopulation, Bova treats three other major themes: politics, the military, and science, particularly scientific progress. *Out of the Sun* is strictly military, introducing Frank Colt (who also figures in *Millennium* and *Colony*). *The Dueling Machine* portrays an inventor whose machine relieves tension but which creates inadvertently a setting for murder. A telepathic but fumbling hero makes this a readable novel. *The Multiple Man* handles the subject of cloning and politics. Bova's training as a journalist is obvious: the President's press secretary confronts a conflict of duty. As investigative reporter, he uncovers a fantastic story that he must either bury or make known to the public. *The Weathermakers* relates the encounter of a typical Bovan protagonist with bureaucratic folderol and military arrogance.

That same bureaucratic and military tripe is faced down by Keith Stoner in *Voyagers*, whose religion is expressed as follows: "The eternal mystery of the universe is its comprehensibility." Bova's male protagonists possess an instinct to lead and a sense of rightness that defies bureaucracies and decries anti-science sentiment. They succeed, though often at high personal loss (as in *Voyagers*, Stoner gives up love for an Earth-bound woman and, in the end, his own life, for the privilege of knowledge). One exceptional piece is *THX 1138*, based on a screenplay by George Lucas. Here, the main character, drug-encapsulated, is not heroic but part of an human-less society in which emotions are sacrificed and love becomes a death trap. His escape to a world made healthy again by the near absence of man expresses an insightfulness about 20th-century issues.

Whatever century, whichever eon man inhabits, he requires guidance to keep from destroying himself. "Floodtide" presents a reluctant yet dutiful guide/savior in a Neolithic setting that bodes a mysticism unusual for Bova. A similar mystique is seen in "A Small Kindness" and "Born Again" with sequel sure to follow. These latter stories are transitional and seem to suggest that since man can not or will not go to the stars for knowledge, the "stars" will come to him. They hammer at what is the crux of Bova's concern: man using his intelligence to make this world better, but with a curious addition of faith in something other than man to pull it off (in "A Small Kindness" and "Born Again," it's seen in an extraterrestrial intent on helping former assassin Jeremy Keating find his way).

The star stories situate man's move outward. Unable to solve his problems on Earth, man "island hops," escaping the old world and founding new ones, and discovering some older ones that nearly extinguish him. Though the major themes apply, man's environment and his ability to use scientific technology to benefit himself are important sub-themes. The *Exiles* trilogy belongs in this group. Dramatic and adventuresome, the books

trace the fate of a group of 2000 molecular geneticists and biochemists and their families, banned from Earth, who journey to a new star system. Of the three *End of Exile* is the most suspenseful, involving superstition, a juvenile protagonist, a real crisis and last-second salvation.

The *Kinsman* stories and *Millennium* and *Colony* represent the placing of man in the universe. From his first meeting with this daring individual, the reader recognizes near superhuman qualities in astronaut Chet Kinsman who has one flaw—a guilt that will not release him, lending credibility to his heroic stature. Kinsman declares Selene (Moonbase) a nation and averts a holocaust on Earth. His death wish in *Millennium* is for man to mine the moon for its resources. *Colony*, an involved novel, continues the conflict of power begun in *Millennium*.

When a solar flare destroys Earth, Moonbase survivors become slaves to their environment in *When the Sky Burned*. Like modern man, they have little concern for the future, except as it directly affects them. In *The Winds of Altair*, scientists probing an alien planet almost obliterate life on the planet so that they can make it more habitable for man. The boy protagonist *feels* the wrong being committed against the planet's creatures and convinces his elders.

The most far-reaching star stories are those which stem from the discovery of the Titan machines and the Others. In *As on a Darkling Plain*, Dr. Sidney Lee goes back to the Jupiter moon of Titan to uncover the purpose of the machines placed there by unknown beings one million years before. Lee comments: "They're not beyond the scope of human intelligence. That's the most important discovery of all." In his *Notes to a Science Fiction Writer*, Bova writes: "at the core of all good SF is the very good fundamental faith that we can use our intelligence to understand the world and solve our problems."

The other two major works in the Titan group are *The Star Conquerors* and its sequel, *Star Watchman*. Having defeated the Masters, a superior intelligence and culture, man now controls the Empire. How he will handle his responsibility is the Masters' question—and apparently Bova's, since man's quest continues to be riddled with destruction, mishandling, and nonconcern. In *Voyagers*, Stoner states: "Intelligent civilizations don't wipe themselves out. . . . We have a future ahead of us as wide and bright as the stars themselves, if we strive for it, if we work together, all of us—the whole human race as a species, as a family, as one family unit in the great interstellar community of intelligent civilizations. . . ." This thrust masks a concerned Bova hoping for cooperation among men at all levels. Will man survive interferences—political, militaristic, personal—that constantly bombard his better judgment? Is man intelligent, or not?

The short story "Stars, Won't You Hide Me?" provides an answer. After fleeing from the Others for billions of years, Holman (whole man) seems on the verge of losing, but at the moment of man's—Holman's—end, the universe also ends. The story concludes with a note of optimism and hope. As long as man survives, hope remains.

—Marylyn J. Underwood

BOYD, Felix. See HARRISON, Harry.

BOYD, John. Pseudonym for Boyd Bradfield Upchurch.

American. Born in Atlanta, Georgia, 3 October 1919. Educated in Atlanta, Fulton County, Georgia, and St. Paul, Minnesota, public schools; Atlanta Junior College, 1938-40; University of Southern California, Los Angeles, A. B. in journalism 1947. Served in the United States Navy, 1940-45: Lieutenant Commander; mentioned in Royal Navy despatches. Married Fern Gillaspay in 1944. Production Manager, Star Engraving Company, Los Angeles, 1947-71; free-lance writer, 1971-79.

Manuscript Collection: University of California, Fullerton.

John Boyd comments:

Insofar as any writer consciously erects a schema for the body of his work, my intentions in science fiction have been generally to take mythic themes and find—ideally to strike—their echoes in the modern world. I attempt, without pedantry, to be didactic and, above all, entertaining. A story without some moral theme, either expressed or implied, is usually frivolous, but an apparently frivolous tale with a strong moral basis can be a gem. In telling my tales, when the substance weakens, I attempt to beguile the reader with stylistic wiles.

\* \* \*

In addition to romances of the historical and contemporary South, John Boyd has published 11 science-fiction novels. Triumphs of style over substance, they are witty and sensuous, inventive in details if not major premises. Stylish variations on familiar SF themes, these tall tales kid the conventions of romance and science fiction, while satirizing human fatuousness.

*The Last Starship from Earth* depicts a dystopian alternate present, from which two star-crossed lovers are eventually exiled. A fast shuffle shows that exiles on the planet Hell have manipulated the romance, involving the young mathematical rebel in a time-travel story. Changing history, he fails to benefit from it, but lives on into our present as the Wandering Jew. Romantic courtship rituals come in for a ribbing, as do the "rational" practices of a rigid behaviorist society, and the whole is imbued with allusions to, and the spirit of, English Romantic poetry.

Positing intelligent vegetable life, *The Pollinators of Eden* is a more lyrical tale of a repressed female scientist, ending with a complicated defloration and impregnation by her fiancé and the orchids of the planet Flora. Partially balanced by satire of scientific grantsmanship and politics, titillation is the book's prime object, accomplished with poetic allusions and complicated metaphorical connections. *The Rakehells of Heaven* also involves carnal contact with aliens, as two astronauts educate university students on a distant planet in human culture. The natives of Harlech (Heaven) adopt our vices as well as our virtues, culminating in crucifixion of one scout and expulsion of the other. The satire is still broader, the plot more unwieldy, in *Sex and the High Command*, as the U. S. Navy officers and other bumbling males in high places fall prey to the world's women how have learned, with the aid of chemistry, how to manage quite well without men. Like the protagonist of *Rakehells*, the hero parodies Southern manhood, representing rigid values unprepared for change.

In post-catastrophe California a brilliant neurosurgeon is brought to *The Organ Bank Farm* to perform brain transplants while pursuing his "hobby" of trying to cure autistic children. Amid the trappings of music therapy and behaviorist computers, his sense of decency is engaged, especially on behalf of a beautiful girl lost in an imaginary medieval world. Love and sex and poetry are present in profusion, capped by a bewildering but plausible surprise ending.

Revolutions in *The Gorgon Festival* and *The I. Q. Merchant* result from discoveries in chemistry. Rejuvenated older women fail in the first, amid the paraphernalia of rock music, motorcycle gangs, racism, and the generation gap. Flirting with sexual taboos named for Oedipus and Electra, the second emphasizes family drama. Estranged from his alcoholic wife and formerly retarded son, the inventor sees events pass him by as his intelligence-booster transforms society. Then with his youthful lover he leapfrogs simple genius into communal ESP in another tricky ending.

*The Doomsday Gene* projects bitterness toward a world of high technology and scientific irresponsibility, seen largely through the eyes of a repressed clairvoyant girl. Unusual for Boyd, it is stiffly written, internally inconsistent, even incoherent in places, though not lacking in poetic allusions. A further decline is visible in *Andromeda Gun*, a spoof on conventions of the old West, in which an alien intelligence tries to reform the mind of a Southern rebel turned rabid outlaw.

*Barnard's Planet* revisits old haunts with an exploratory mission to an Edenic world where vegetable evolution has outstripped animal. Amid five "cluster-educated" multiple-discipline geniuses, representing national interests, the captain is an atavism. Unwilling to subject this world to Earth's

warring interests, he discovers himself as the saboteur (and poet) he's under orders to defeat.

The protagonist of Boyd's next book has a similar narrow escape. Bumbling bureaucrats and military men almost achieve what they are trying to prevent: takeover by a high-technology, hive-like alien race, temporarily marooned on Earth. Loving and loved by the queen, for whom Boyd's lyricism scales new heights, the hero escapes the fate of a discarded drone, to remember fondly *The Girl with the Jade Green Eyes*.

Freed from the sexual taboos and stylistic limitations of a previous era, Boyd approaches science fiction as entertainment, with literary tolls and aims. Viewed whole, his books are lightweight confections, their component parts wildly implausible. If one is prepared, however, in the act of reading, to trace interwoven motifs and allusions, while trying to outguess the turns of plot, Boyd generally supplies a superior diversion.

—David N. Samuelson

**BRACKETT, Leigh (Douglass).** American. Born in Los Angeles, California, 7 December 1915. Married Edmond Hamilton, *q. v.*, in 1946 (died, 1977). Free-lance writer from 1939. Recipient: Jules Verne Award; Western Writers of America Spur Award, 1963. *Died 24 March 1978.*

\* \* \*

Leigh Brackett was during the late 1940's and early 1950's the uncontested "Queen of Space Opera." As a girl, she spent summers exploring the beaches near Santa Monica; the majesty of the Pacific by day and its bio-luminescence by night, and her reading of Edgar Rice Burroughs provided much of the imagery that was to make her science fiction unique. In a *Planet Stories* "Feature Flash" in 1942, she admitted her addiction to things dramatic, repeatedly describing herself as "a ham." This quality served her well when she worked in films, very often "writing before the camera" that is, revising dialogue on the basis of actors' performances in prior scenes. Her facility with character and dialogue (in the "tough" detective novel, *No Good from a Corpse*) got her the movie job, and, later prompted

Pauline Kael to suppose that most of her dialogue in *El Dorado* was improvised by the actors because it seemed too realistic to have come from any script.

All these aspects of her personal and professional self found ready expression in the kind of science fiction that made her famous. At present, space opera is a derogatory term, denoting impossibly larger-than-life characters, melodramatic incidents, and flights of fancy quite distant from straight extrapolative science fiction. In the 1940's and early 1950's, however, space opera was the staple of most of the pulp magazines, partly because it was an escape from ordinary life, partly because it evoked a "sense of wonder" just by its portrayal of alien beings, awesome settings, and heroic acts, and partly because of the literary skills of Brackett herself.

*The Sword of Rhiannon* is perhaps the apex of Brackett's career as a writer of space opera. It begins with a renegade archeologist's being thrown back a million years by a strange "bubble of time" within the tomb of the ancient god-like Martian, Rhiannon. Once in the past, Brackett's hero finds himself involved in all sorts of adventures (he, with Rhiannon's help, frees ancient Mars of the Tyranny of one race, the serpent-evolved Dhuvians, and wins the love of the princess of a human Martian race). The way Brackett tells this story gives it much greater literary quality than the space-opera label suggests. Her setting—verdant Mars, with a luminous ocean—and her characters—of several Martian races, each independently evolved to the level of human culture—allow the reader a glimpse of Mars as a vital world, not the dying one the Terrans find when they arrive just before the beginning of our third millennium. In this novel, Brackett masterfully interweaves the melodramatic heroism of space opera with imaginative postulation of three sapient lifeforms besides the native human race of Martians.

Before *Rhiannon*, Brackett produced two space-opera masterpieces, "Enchantree of Venus" and "The Lake of the Gone Forever." Afterwards, she turned to more conventional science fiction with *The Long Tomorrow*, a post-Destruction narrative considered by many to be Brackett's best, and stories like "The Tweener" and "The Queer Ones." Then she turned to making novels of previously published novelettes; "Queen of the Martian Catacombs" and "Black Amazon of Mars"—both, incidentally, featuring not just extraordinary women characters but the literary "original," Eric John Stark—became *The Secret of Sinharat* and *People of the Talisman*.

Considering the excitement of her narratives and the immediate pleasure to be derived from them, one might assume that Brackett's science fictions are fun to read, even lessons in the use of English prose, but basically light entertainment. However, one can perceive three serious aspects of her fiction, whether it is space opera or not.

One, illustrated best in the stories and novels about Eric John Stark, is a thematic interest in the essential goodness of most forms of natural life. Stark, son of Earthborn humans who died on Mercury, struggles for survival among a supportive group of non-human Mercurians and only later is returned to civilization. Stark is a renegade and mercenary, a "criminal" only because he does not recognize the authority of artificial laws; whenever he finds himself in a situation calling for heroic action, the "primal ape" in him seems set apart from the civilized human. Nevertheless, both his natural and civilized selves—demonstrated by his consistent sympathy for the wronged, whatever their species may be—seek the good.

Another is Brackett's thematic egalitarianism and, along with it and Stark's appetite for the good, a strong sense of respect for other living things. The care with which she treats her native Martians and Venusians—though alien, they are

persons, too—makes this evident. *The Starmen* is the tale of the quest for equality on a galactic scale; respect for other life runs just below the surface of “The Tweener,” evoking sad sympathy from the reader. And “All the Colors of the Rainbow” is, like Le Guin’s *The Word for World Is Forest*, a cruelly bitter satire of racist and other mean prejudices, set forth by paradoxically delicate prose.

Then there is Brackett’s growth as a writer, helped along by her husband, Edmond Hamilton; as she influenced his deepening characterization, he influenced her growing ability to structure fiction with a strong yet uncontrived plot. This growth is evident in her Skaith series. Besides the technical expertise with plotting, Brackett had, by the time she wrote about Skaith, evidently rethought the biology in *Rhiannon*; on Skaith as on ancient Mars there are at least three non-human sapient races, but these have evolved from a single stock, each seeking survival by accommodating itself differently to life beneath the dying ginger sun.

From February 1940 when “Martian Quest” appeared in *Astounding*, almost until the day she died in March 1978. Brackett’s love for science fiction was self evident in her works. Her last work was the first full draft of the screenplay for *Star Wars II*.

\* \* \*

Ever since the remarkable critical and popular success of *The Martian Chronicles* in 1950, Ray Bradbury has been among the most visible of science-fiction writers, and although he has not produced a major work in several years he remains the most widely recognized spokesman for the genre, and particularly

for the romantic attitudes toward space flight and technology which it sometimes embodies. In some sense this is ironic, since Bradbury's best works—dating from the early 1950's—are powerful indictments of unchecked technological progress and question humanity's ability to deal creatively with the new worlds of which science and technology hold promise.

Bradbury is above all a humanist, and this humanism is evident throughout his career, which might be divided into three general periods roughly corresponding to the 1940's, the 1950's, and the 1960's to the present. The first of these periods sees the youthful Bradbury move from an adolescent science-fiction fan making his first professional sales (the first was the story "Pendulum" written with Henry Hasse) to a mature stylist who had become one of the most popular science-fiction writers in America. Bradbury's first book, the collection of stories *Dark Carnival*, was not science fiction at all, but rather ranged from satirical horror (such as "The Handler" which concerns a mortician who plays practical jokes on his "clients") to sensitive portrayals of lonely or pathetic individuals—a wife incapacitated with horror at her own mortality after viewing Mexican mummies ("The Next in Line"), a "normal" boy alone in a family of friendly vampires ("The Homecoming"). Many of the stories had originally appeared in *Weird Tales*, a horror pulp that represented a market Bradbury would soon abandon, but it was in these tales that he developed his craft to maturity, and many of them remain among his strongest work.

*The Martian Chronicles* began the second and most prolific phase of Bradbury's career. A series of stories, linked by bridge passages, concerning the colonization and exploitation of Mars by what seem to be exclusively citizens of small midwestern American towns, the book owed much to the American tradition of frontier literature, and quickly consolidated Bradbury's reputation as one of science fiction's leading stylists. Although the portrayal of the Martians ranges from sensitive, essentially ordinary families ("Ylla") to shapeless monsters ("The Third Expedition"), they soon fade into the background as the stories focus on different types of earth settlers—romantics, misfits, opportunists, idealists, even fugitive Blacks (in "Way in the Middle of the Air"). In the end, an atomic war sends most of the settlers back to earth to join their families, leaving only a few isolated families such as that depicted in "The Million-Year Picnic," whose father vows to start a new world on Mars without the prejudice and regimentation that had come to characterize life on earth.

*The Illustrated Man* appeared in the following year, and again connected the stories by a frame narrative; in this case, each story is presented as a tattoo come to life. A few of the stories retain the Martian setting of the *Chronicles*, and one of these, "The Fire Balloons," is an early attempt at treating a serious religious issue in science fiction—the question of whether a benign alien life form can be said to have achieved Christian grace. Other stories explore themes that had become familiar to Bradbury readers. The amorality of children which appeared as a theme in a few *Dark Carnival* stories here returns in stories in which children murder their parents in a mechanical playroom ("The Veldt") or assist invading aliens ("Zero Hour"). Mexico, which had fascinated Bradbury since a trip he took there in 1945, is the setting of "The Fox in the Forest" and "The Highway." And the romantic attitudes toward space travel that were to remain a Bradbury staple are evident in "The Rocket," "No Particular Night or Morning," and "Kaleidoscope," a tale of the crew of an exploded spaceship drifting slowly to their deaths, which Bradbury later dramatized.

*Fahrenheit 451*, a dystopian satire of a totalitarian state in which "firemen" are professional bookburners who set fires

rather than put them out, is the only science-fiction work of Bradbury's to approach *The Martian Chronicles* in popularity, and the only novel-length science-fiction work he has yet produced. *Fahrenheit 451* is as much an attack on mass culture as it is a satire of McCarthy-era censorship; the enforced illiteracy of this future society, we are led to believe, is at least in part due to the desires to avoid offending special interest groups in the mass media and to the rise of television (which Bradbury had already effectively satirized in "The Pedestrian"). The novel is as simple as a parable, and few attempts are made to offer a realistic portrait of an imagined society. The police state, it seems, exists almost solely to burn books, and the society of outcasts that the hero Montag finally escapes to join seems curiously incapable of political action, choosing instead to preserve literary culture by memorizing all the great books.

Of the other four collections Bradbury published during the 1950's, none was primarily science fiction. *The Golden Apples of the Sun* introduced what was to become a familiar Bradbury mix of small-town tales, fantasies, Mexican stories, science fiction, and crime tales. *The October Country* reprinted most of the contents of *Dark Carnival* and added four stories, and *Dandelion Wine* was a collection of sketches based on Bradbury's own boyhood in Waukegan, Illinois. *A Medicine for Melancholy* repeated the mix of *The Golden Apples of the Sun*, introducing in book form a new theme for Bradbury, Irish life and character, which had come to fascinate the author while he was in Ireland in 1954.

Bradbury's long-awaited full-length novel *Something Wicked This Way Comes* is a fantasy concerning an evil carnival that influences the lives of people in a small mid-western town. Despite occasional touches of real power, the novel is overwritten and self-conscious, and many readers regard it as the beginning of a third phase of Bradbury's career, characterized by a decreasing output of fiction, a tendency of that fiction to be self-imitative, and an increased turning to such new forms as the drama and poetry. Two new collections, *The Machineries of Joy* and *I Sing the Body Electric!*, suggested little in the way of new directions or artistic growth, despite some excellent stories. Bradbury's only new collection of the 1970's, *Long after Midnight*, contained several excellent stories—but many of them had been written prior to 1955. Other volumes of poetry and plays appeared, and Bradbury must be recognized for his efforts to introduce science fiction into forms that had seldom seemed amenable to it, but he has yet to produce a major work in either of these forms.

Whatever the final assessment of Bradbury's later work, his historical importance both in popularizing science fiction and making it respectable cannot be denied. Though the genre had produced excellent craftsmen before Bradbury, his finely tuned style and humanistic concerns exerted a profound influence on a generation of later writers and helped significantly to reduce the barriers that had long isolated science fiction from more traditional literary culture.

Marion Zimmer Bradley comments:

The secret of life is to do what you enjoy doing most, and to get someone to pay you enough so you don't actually have to starve while you're doing it. People who want other things, money and status, baffle me. I write professionally because it's the only thing I can do well, and every other job I have had has either bored or frustrated me past tolerance; and since I write compulsively and would no matter what else I was doing, it's wonderful that I can get paid for it.

\* \* \*

While she was still a college sophomore, Marion Zimmer Bradley had at least four book-length manuscripts complete. One was never published, but it laid the ground for much of her later work about the Darkovan telepaths. One hurriedly became *The Sword of Aldones* to provide *The Planet Savers*—the expanded version—with a companion in the 1962 Ace double. Rewritten and revised at least four times, one became *Web of Light* and its sequel, *Web of Darkness*. And another eventually resulted in *The Mists of Avalon*.

Bradley's early works indicate no favorite theme or subject. Some are extrapolative science fiction typical of the time, like "Year of the Big Thaw," "The Crime Therapist," and "Exiles of Tomorrow." Some are science fantasy, like "Jackie Sees a Star" and *Falcons of Narabedla*. And others, like "Women Only" and "Centaurus Changeling," are notable for the intrusion of women characters into what was considered, C. L. Moore and Leigh Brackett notwithstanding, "a man's field." As early as 1958, in "The Planet Savers," she introduced a Free Amazon belonging to a group of women who have by oath renounced all dependence on men. From this character one might infer that Bradley is a feminist, yet in *Darkover Landfall* she authorially denies one of the protagonists the right to terminate an unwanted pregnancy. Then not a feminist? But *Endless Voyage* is a novel absolutely without sex-roles for its male and female characters. *The Shattered Chain*, set on Darkover with its male-supremacist cultures, are probing and sensitive treatments of women's need to live according to their own decisions. Thus Bradley shows how women characters should be presented as strong human beings, but regards fiction in which they are strong because of the contrived absence of men as demeaning and, generally, propagandistic.

Bradley excels at writing well-plotted, exciting adventure narratives, like *Hunters of the Red Moon*, a novel with an astonishing yet credible assortment of human and non-human sapient characters. *Endless Universe*, too, is an adventure story on a cosmic scale, with the opening up of new-found worlds complemented by the maturation and interaction of its principal characters. Every one of the Darkover novels is some kind of adventure, and *The Ruins of Isis* combines the excitement of archeological searching for what may have been the first intelligent race with the sometimes agonizing adventures of a heterosexual couple trying to conform to the customs of a rigidly structured Matriarchate.

Although most of her novels—particularly those set on Darkover and others written since 1970—deserve reading for their story-telling, their thematic content is at least as significant as their plots. *Hunters of the Red Moon* and *Endless Universe* embody, respectively, themes of racial and individual tolerance and respect; *The Ruins of Isis* is clearly an indictment of any kind of sexual chauvinism. The Darkover novels test various attitudes about the importance of technology, and more important, they study the very nature of human intimacy. This latter “experiment,” having been initiated more than 25 years ago, is as unique as it is vitally important.

By postulating a Terran Empire the main features of which are advanced technology and bureaucracy, and a Darkover that seems technologically backward and is fiercely individualistic, Bradley sets up a conflict to which there is no “correct” resolution. As Terrans ourselves, we see the good of many of the Empire’s technological marvels. But the Darkovans are human, too, and evoke our sympathy, especially when we learn that their lack of technical “progress” is deliberate, for in the barely remembered past their psionically based technology very nearly annihilated their world. Bradley does not take sides; she allows her readers almost complete freedom to decide which of the technologies, or which combination of the two, is the more humanly practical solution.

Bradley’s “Experiment” with human intimacy relies on an extrapolated psychology of paranormal human beings. In 1964, *The Bloody Sun* drew readers into a world where sexual intimacy is clearly secondary to the nearly total union felt by telepaths working in close rapport. *The Heritage of Hastur* illustrates the psychical and physical effects of repression, and shows how Regis Hastur comes into his “heritage” only when he accepts his androgynous nature. *The Forbidden Tower* explores the “nakedness” of one telepath to another and affirms the interdependence of mental and physical intimacy. While the intimacies shared by Bradley’s characters are fictional, they are nonetheless correlatives both of real relationships between persons and of the physical integration of female and male qualities within a self.

*The Mists of Avalon*, a work that set publishing records in the U. K. as well as the U. S. A., extends Bradley’s explorations of polarities into anthropology, religion, and metaphysics. The long Arthurian fantasy-novel is a prodigious achievement in itself; its treatment of societal/natural, Christian/Pagan, and material/magical dichotomies has been reflected in Bradley’s recent Darkover novels, contemporary fantasies, and retellings of “history.” *City of Sorcery* is more a spiritual than a spatial quest, *Night’s Daughter* fleshes out in prose narrative the sources of Mozart’s *Magic Flute*, and (forthcoming) *The Firebrand* tells of the fall of Troy from the perspectives of the women principals.

Bradley’s writing openly with increasing sureness of the human psyche and the human being rendered whole prompted Theodore Sturgeon to call the former SF fan “one of the Big ones” currently writing science fiction. That she has extended her range from science fiction and gothic fantasies to mainstream novels, solidly researched historicals, and other book-sellers’ market-types suggests that Sturgeon’s phrase applies no longer only to the science-fiction writer Marion Zimmer Bradley continues to be, for she has transcended categories.

\* \* \*

Reginald Bretnor's career as a science-fiction writer is minor. Of his three works of fiction, only two are SF, the third, *A Killing in Swords*, being a *hommage* to the mysteries of Anthony Boucher. *The Schimmelhorn File* collects Bretnor's series about an eccentric Pennsylvania Dutch inventor of the future. These stories show Bretnor's talents for fast-paced comedy, but are otherwise forgettable. The stories about Ferdinand Feghoot include Bretnor's most influential fictions, a series of short anecdotes that conclude with an intricate pun. This form has proven popular with fans and editors, and has been copied by such authors as John Brunner and Damon Knight.

Bretnor's important work is as an editor. He has proven his skill as an anthologist with *The Future at War*, but his editorial talents are for criticism rather than fiction. His *Modern Science*

*Fiction: Its Meaning and Its Future* was the first attempt by a writer within the field to treat SF as a movement of social history, rather than an *ars nova* unique unto itself. Including major essays by Asimov, de Camp, and others, *Modern Science Fiction* is the primary document for understanding the climate of opinion that produced the SF of the 1950's. Its two successors, *Science Fiction, Today and Tomorrow* and *The Craft of Science Fiction*, are no less important to an understanding of the science fiction of the 1970's. Together, the trilogy is a pinnacle of analytical thought that will be studied long after Bretnor's own fiction is forgotten.

\* \* \*

Miles J. Breuer wrote some of the most intriguing tales that appeared in the early volumes of *Amazing Stories*. Like David H. Keller, he gave much of his attention to psychological themes and was more interested in the possible effects of machines on human kind than in mechanical marvels or life on other worlds. His stories often pointed a moral, yet were never mere parables; his characters were genuinely human rather than superhuman, and he wrote with a conviction that was rare

in those days. He was also something of a poet.

Though he had a weakness for plots involving relativity and the fourth dimension, as in "The Captured Cross-Section" and "The Book of Worlds," he produced some novel variations on other familiar themes, such as "The Hungry Guinea-Pig," depicting the drastic results of an experiment in growth stimulation. "Buried Treasure" was remarkable for presenting a code diagram enabling readers to decipher a cryptogram which figured in the story; later he adapted the same idea to "The Chemistry Murder Case." But his most striking contribution was "The Gostak and the Doshes," which satirised extreme nationalism and in its treatment of semantics was several years in advance of Korzybski. "Rays and Men" graphically portrayed the reactions of a man of 1930 to the strictly logical, emotionless world of 2180. "Paradise and Iron" drew a realistic picture of two future cities, in one of which art and beauty flourished at the expense of the other, where the workers were menaced by thinking machines. *The Birth of a New Republic* recounted the events which followed the colonisation of the Moon in the 24th century, when the miners and other settlers fought for their independence against the combined forces of Earth's powerful corporations. This was produced in collaboration with Jack Williamson, who did most of the actual writing under the strict guidance of Breuer, from whom he learned much about the techniques of storytelling.

Breuer also collaborated with Clare Winger Harris, the first woman writer to be featured in *Amazing*, in "A Baby on Neptune." In "The Fitzgerald Contraction" and its sequel, "The Time Valve," he departed from his usual economical construction to concoct a disordered mixture of science and adventure. The first story was based on the premise that survivors of the lost continent of Mu had repaired to the Moon. In the sequel, the author took up the tale to present a gloomy picture of the human race reverting to savagery after an atomic war—200,000 years hence. It was hardly Breuer at his best.

He continued to write almost exclusively for *Amazing* over more than a decade, his contributions becoming less frequent—and, generally, less impressive—during the years of its decline under its venerable editor, T. O'Connor Sloane. He appeared only twice in the revitalised magazine before he withdrew from the scene in 1942, leaving little trace of his work beyond the confines of the outdated pulps.

### David Brin comments:

I've been told my writing is very different in my novels than in my short stories. And both differ a great deal from my mid-length (or novella) works. Generally, the latter are my favorite. One has time to develop characters and detailed settings, and yet is forced to get to the point. SF is almost the last refuge of the novella form, bless it.

My own novellas deal very much in that commodity known as Myth. The novels on the other hand are real SF and I stretch out to try to make use of the scientific thrills this century keeps dropping in our laps. It is fun.

My short work is hard to typefy . . . from boy-engineer tales to attempts at epiphanies, I suppose. It's a lovely language, English, and a wonderfully exciting time to be alive.

\* \* \*

David Brin was not included in the first edition of *Twentieth-Century Science-Fiction Writers*. Today his name would be on anyone's list of best practising SF writers. Since 1980 he has published short stories, three novels (*Sundiver*, *Startide Rising*, and *The Practice Effect*), and two more titles are due before the end of 1985 (*The Postman* and *The Uplift War*).

*Startide Rising* is the novel that swept the 1984 Hugo and Nebula awards. It is to date the centerpiece of the Uplift series, which includes the other two and, presumably *The Uplift War*.

Brin writes in what may be termed the Verne tradition, which emphasizes the quest/adventure potentials of scientific technology. As that tradition has taken root in American SF, it has produced writers like Gernsback, John W. Campbell, Asimov, Clarke, Pohl, and Niven, who have explored the space opera as a vehicle for speculative extrapolation. The dominant interests of this tradition have been space flight exploration, encounter with alien beings, and "inner space" or the psychology of space travel. A related topic, PSI, is one that fascinated Campbell, touches Clarke, obsesses Pohl, interests Niven and expresses itself forcefully in Brin.

Inventors of future histories are to some extent, at least, engaged in mythmaking; and their literary mythology is judged

successful to the extent that it elicits secondary belief. Another pleasure of such mythopoesis lies in discovering the tracks of other mythologies in and out of SF, connecting the history both with the fabled past and the imagined future. Brin's debts to his predecessors in the Verne tradition are expressed thoughtfully to engage the imagination and sometimes playfully to tease the reader's memory. While never intrusive, the technique places the author firmly within a SF tradition and favorably invites comparison of Brin's mythos with that of Heinlein, Clarke, and Niven.

Brin's mythology of the Progenitors emerges in fragmented installments, as if grudgingly, from the background in the three novels published to date. But the mythos is only the sketch of what is to come: even an outline must be considered provisional, under correction of those chapters yet to be produced. The story of the Progenitors is told to humans after Contact (always capitalized) is made with aliens, several hundred years into the future from our time. This places the focus of the narrative at the level of galactic and species interaction, the traditional forum of space opera.

The universe disclosed to humans is dominated by five different species, styled Patron Lines of the five Galaxies. These claim descent from the Progenitors, who established galactic law. Each of the Patron lines regards itself as divinely chosen to impose its version of the law on everyone else. Humans find themselves in a cosmology ruled by less than philanthropic zealots who are forever warring against one another while they form shifting, entangled alliances to maintain balance within the system. Perhaps the chief stabilizing influence is the Galactic Library Institute, which is supposed to be the independent repository of aeons-old knowledge of the inhabited galaxies, the histories of their Patron lines, their largely inherited technology, and the galactic law passed on from the Progenitors.

The essential discovery of *Sundiver* is that the Library is not autonomous. It can be manipulated by its custodians, the Pila, a former client species of the Soro, one of the Patron Lines. With that information, the council of humans and their uplifted client species, apes and dolphins, decide not to rely solely on the Library for technological advancement but rather to develop human initiatives in all areas of change independent of the Library, while taking advantage of its resources. This decision further alienates the Patrons, especially the Soro, from a humankind already considered renegade. Such a status borders on galactic heresy because when the human race was discovered by the Patrons of the five galaxies at Contact, it had no tradition of having been uplifted or even guided by a Patron species. Humans therefore represented to the Patrons an anomalous species suspect as much for its self-developed technology (however primitive when compared with Library species) as for its abandoned condition. In other words, humanity did not seem to fit anywhere into the mythos of the Progenitors and their descendants.

The plot of *Sundiver* depends on humankind's orphaned condition. Probes sent into the photosphere of the sun seemed to reveal the presence of life forms. Using essentially human advances on Library technology, several exploratory voyages into the sun's outer layers are undertaken to prove the existence of such life forms and to establish contact with them. The preferred hypothesis is that if "sophont" forms exist, they may lead humanity to its lost Patrons or, indeed, may even be those mythical absconders. Although solarans are found to be intelligent and concerned enough with the crew of *Sundiver* to rescue the ship from destruction, the solarans are uninterested in any extensive communication. However, important lessons are learned about the Galactic Library and the potential danger

of becoming too dependent on its presumed cornucopia of ideas. Moreover, humans begin to suspect, and later verify, that access to the Library can be controlled and even manipulated by its Pila custodians.

The hard-won discoveries of *Sundiver* alert the Terragens Council to the threat to human independence implied in exclusive reliance on the Intergalactic Library and from those patron species who regulate access to its files.

This is the context for *Startide Rising*, a rousing space opera adventure which cleverly braids together several plot lines. The main argument narrates the plight of *Streaker*, a dolphin-commanded space craft from earth, which discovered an ancient, abandoned fleet of unidentified space ships in an area called the "Shallow Cluster." *Streaker's* resident cosmologist, Tom Orley, a genetically engineered super-human, retrieves an ancient cadaver from one of the ships and intends to return to earth with the prize. When *Streaker's* transmissions are intercepted by the Patrons, they send fleets to besiege *Streaker*, which takes refuge in an ocean of Kithrup, a planet believed uninhabited. A second plot argument concerns the testing of the dolphin crew in the crucible of siege by the Patron fleets, the first such command by the mutated client species of humanity. The one stroke of luck on the side of *Streaker* and its crew lies in the rivalry among the Patron lines which provokes a holy war in the space around Kithrup for the privilege of capturing *Streaker*, torturing its crew, and taking its prize. The Patrons assume that the discovered fleet must have been that of the Progenitors and the cadaver, therefore, a relic. Tradition had it that the Progenitors, who mysteriously disappeared millions of years before, had made the transition to a higher life form.

While the Patrons slaughter one another, the crew of *Streaker* works to repair damage and to devise a solution to their problem. Two schools of thought emerge: one is for surrender to the winner of the Patron battle and for turning over the prize and all information gathered at the "Shallow Cluster." The second, led by the indomitable Tom Orley, is to escape amid the confusion of battle. These options and the attitudes that underlie them are congruent with the competing schools of human thinking about aliens in *Sundiver* also. For Brin, the preferred resolution is in a philosophy of self-reliance espoused subsequently by Orley and *Streaker's* dolphin captain Creideiki rather than the naive and despairing pacifism of Takkata-Jim, the Vice-Captain and a stenos neo-fin. Takkata-Jim's trust in the reasonableness of the Patrons is entirely misplaced, as the reader is privileged to know. Moreover, Jim's reasoning is further undermined by a constitutional weakness produced by Ignacio Metz's faulty genetic experimentation that tainted all the stenos neo-fins aboard *Streaker*. Perhaps if it had not been for the unusual stress produced by siege, the genetic flaw would not have expressed itself in mutiny and, on the part of some, devolutionary behavior.

Kithrup itself and its inhabitants play decisive roles in the resolution of the main arguments. As well, they focus attention on the code of uplift in the galactic past, especially on its abuse by Patrons who look upon clients as nothing more than indentured servants or worse. Even at this late stage in galactic history, some of the more barbarous patrons hope to gain custody of humankind and its client species in order to teach them lessons in obedience and humility.

*The Practice Effect* stars Dennis Nuel, a near-future scientist who is transported to a far-future world by the unexplainable powers of the Zievatron and marooned there when he is captured by troops in the employ of the usurper, Baron Kremer. The novel is a less ambitious space opera that follows in the footsteps of some early Heinlein, Leinster, Anderson,

Silverberg and especially de Camp. Brin introduces us to an anomalous world such as only SF could hope to find. Nuel is confronted by a pseudo-medieval culture, dependent on the practice effect for its industry and commerce. The "practice effect" is one of Nuel's chief clues to the physical laws that govern Tatir. The effect is a reversal of entropy in which use and intention shape and perfect all made things. The premise is that the peculiar physical laws of Tatir have operated to influence the development of a feudal culture dependent upon impressed slaves who practice into perfection everything from clothes to buildings. In the world of Tatir, used anything is definitely preferable to new. Indeed, the new is so undesirable that there is very little of it.

Into this a-technological world steps a modern man enough like de Camp's Martin Padway of *Lest Darkness Fall* to be his twin. The rest of the tale is familiar and easily imagined. The evil Baron has retained a fair-haired princess as a hostage and has designs upon her virtue. Nuel rescues her through an incredible coup de hang glider and thereafter, with the help of the practice effect, reinvents the wheel and the airplane at approximately the same time! The conclusion of *The Practice Effect* is full of revelations, not the least of which is that Tatir is not an alternate world after all but rather a remotely distant earth future. Nuel chooses to remain in Tatir: after all, when else could a scientist/mechanic expect to know as much compared with everyone else and have an adoring princess as an audience? Besides, someone must remain ahead and protect the past from the *Blecker*, an enemy race that "plies the ziev space" and was responsible for the collapse of the Tatir civilization in the past.

In the hands of David Brin, space opera continues its legitimate appeal to SF authors and readers. Like Niven, Brin blends hard science speculation with SF mythopoeisis. As a real space engineer scientist, Brin is able to bring a sense of imagined presence to problems and solutions of space travel. A rather high level of such speculative problem-solving combined with a rousing scientific mystery plot are the chief interests of *Sundiver*. In addition, Brin has a genuine gift for animating his uplifted species, especially the human client species: apes and dolphins. Occasionally the symbolism of a derelict fleet or the whale dream in *Startide Rising* leaves a lasting impression on the imagination. Brin's fascinating linkage of PSI with elemental forces that control the universe (strong, weak, electromagnetic) in *Startide* beg further development in later works. We'll see.

However, Brin pays the price that seems almost inevitable for the writer of space opera, which none to date has altogether avoided. Brin's uplifted characters and even some aliens convey a greater sense of authentic identity than his humans. The interspecies and intergalactic scope of the Uplift saga makes for effective mythmaking but beggars humanity despite all its uniqueness. Human interaction especially gets reduced to rather simple, programmatic issues and attitudes. Whether these limitations are inherent in the form or only in the tradition remains to be proved. Brin certainly has given readers smashing examples of space opera, with *Startide* rivaling the best the type has to offer.

##### Damien Broderick comments:

Call me Pelagius of Hippo.

Are we humans sweetie-pies, our future endlessly hopeful? (The theologian Pelagius thought so, and was declared heretical for his pains.) Or are we mad beasts, all the world destined for nuclear burning followed by freezing, at our own stupid hands? (A prospect which would not have astonished Augustine of Hippo, his great rival.)

Science fiction, I have decided (bending Flaubert), is a cracked test tube we whistle tunes across, moved to pity and laughter by the stars, and by all the poor human souls beneath them.

During the last decade or so science fiction has become one of the darlings of formalist criticism because it is—or is meant to be—innately uncomfortable, disruptive, hair-raising, hackles-raising, alienating, oddball.

The Russian Viktor Shklovsky told us 60 years ago that the primary function of art is *ostranenie*: estrangement, the neck-wrenching which shows us the familiar in a fresh and challenging aspect.

Well, surely science fiction is the ideal candidate? There are few bed-sitters, adulterous stockbrokers, karate-trained sirens or crooked cops on the take. With Sf, it's all ghastly clangour and shock, just what Shklovsky ordered. Looming aliens

without eyes, flapples to travel in, doors that answer back, machines with hearts of gold.

The reality, as every Sf enthusiast knows with remorse, is otherwise.

The salutary jolt of the strange soon loses its force. Like bored rats which seek out a mild adverse electric tingle, Sf readers return contentedly to the paperback shelves for a buzz of what we might term *cosy ostranenie*.

In my misery I often wonder if science fiction and fantasy are, after all, simply *different in kind* to the sort of writing exemplified by Henry James and James Joyce and Joyce Cary.

Alarming. It does help account for the dreary fact that much classic, bona fide Sf is (by the standards one rightly expects of any middle-brow novel, any *New Yorker* short story) simply illiterate trash. I won't have it, though.

A decade ago, Brian Aldiss made prophetic utterance on this score, speaking of "the area of life where art and science meet nature": "One becomes more and more preoccupied with the idea that art is all," he observed. "Science fiction is an ideal medium for such a preoccupation . . . for the specifics of fiction versus the generalities of science. This beautiful tender place has been so betrayed by the practitioners of pulp science fiction (who use it for thick-arm adventure and jackboot philosophy) that those who prefer wit to power-fantasy generally move elsewhere."

Sadly, the triumph of Luke Skywalker and the Force, and all their pitiful paperback progeny, has done nothing in the interim but strengthen the thick arm of the artist's foe. One is indeed tempted to move elsewhere—almost anywhere else.

"But," Aldiss warned, "those reckless or fastidious writers who throw our science fiction's old banal contents—from last generation's clichés of faster-than-light travel and telepathy to this generation's over-population and mechanized eroticism—have to take care of form as well, for form-and-content is always a unity."

Yes. The usages, the tropes, of Sf—vulgar and absurd as most of them are—remain at the core of its artistic vocabulary. Sf's idiosyncratic images and their weddings in the murky depths of each writer's heart comprise a grammar devised to speak in a way uniquely valid to this century.

My own writing? *Transmitters*, avowedly a *non-Sf* novel "about" Sf fans, can be read as the centrepiece of a larger structure holding four novels as its vertices. Think of a tetrahedron. At the points place WORLD, WRITER, READER, WORK. Each is connected to the others. Imagine four major aesthetic theories: mimetic, expressive, conative, "objective." (This model derives from M. H. Abrams. Then there's Kiernan Egan's mode of child development: mythic, romantic, philosophic, ironic. It fits, too. Gosh.) See them work reflexively on one another. The classic construction of science, the romantic construction of the artist, the rhetorical construction of the social order, the deconstruction of the text.

My novel sequence might agreeably be mounted on that pyramid in the order just given: *The Dreaming Dragons*, *The Judas Mandala*, *The Black Grail* (a revision of *Sorcerer's World*), *Transmitters*. Between these styles of subject matter and their appropriate voices, plays, codes, will be the fifth book of the sequence, now in progress.

This sounds stuffy. No. I send my words dancing in light, hear them shout and snort in this newest of tongues: yes, in a medium where Gully Foyle's burning synesthesia fetches us shivers of truth no mere mixed metaphor could lay hands on. It's not Doc Smith, folks, I admit it, but we do what we can. Mmm, I could use a doughnut.

\* \* \*

More than any of his contemporaries, Damien Broderick has provided the intellectual cutting edge in Australian science fiction, producing work which has sometimes made that of his international peers seem unadventurous and routine. Perhaps this is most obvious when his numinous and gutsy novella "The Magi" is compared with other stories in Alan Ryan's anthology of sf stories on religious themes, *Perpetual Light*. These stories are by a who's who of contemporary sf writers, but many seem easily rehearsed pieces, trivialising the issues upon which they touch. Not so Broderick's portrayal of a Catholic priest shocked and grieved by remembered images which crystallise the disparities between the truths of dogma and the logical extremes which dogma requires.

"The Magi" in many ways typifies the fierce mind of this writer. First, though an unbeliever, Broderick remains super-saturated with the Catholic faith and continues to stare hard upon the claims of religious doctrine in general. He has shown an ability to depict the mind of the believer with a kind of provisional identification that transcends normal concepts of irony, however much the logically extreme outcomes may produce in the reader what Broderick has called "genuine ontological shock." Only on rare occasions has his treatment of religious feeling lapsed into a crude form of ironic impersonation, as with the Bible-bashing general of his best-known novel, *The Dreaming Dragons*.

Secondly, and related to this point, "The Magi" is typical of Broderick's wider interest in disturbed and untrustworthy states of mind. The priest-protagonist is morally repelled by the fact of abortion, and the story concentrates upon the experiencing of such repugnance: this is depicted with no scorn and a degree of sympathy. Yet, at obvious levels of the story's structure, it shows the protagonist's package of dogmatic beliefs to be inadequate to our experience, or even possibly to his own. Other work by Broderick has been misunderstood because of his ability to produce detailed, even loving, presentations of the perceptions and feelings of characters whose views are not in any simple way endorsed; part of the problem is the unsophisticated way in which even sophisticated science fiction is often read, and to which Broderick refuses to pander.

Thirdly, Broderick hoards his store of images and themes carefully, returning to his material, and treating earlier work as itself a subject for examination and development. "The Magi" is a rewrite of a much shorter story, "There Was a Star", which may be found in Broderick's early collection *A Man Returned* (while "The Magi" is planned as the central story of a new collection tentatively called *The Solipsism Samba*). The original story is a sensitive and literate celebration of the incarnation of Christ (in a collection notable for its profoundly varying attitudes towards religious feelings). By contrast, "The Magi" is a far more elaborate work in which, once again, Catholic doctrine turns out to be unequivocally true in the world of the story—but in this case the doctrine is saved in the story by revelations which are most conspicuous for their inapplicability to our own experience, while even within the world of the story the ultimate revelation of dogmatic truth sits unsettlingly with the paradoxes encountered by the protagonist. Broderick here turns a cold eye upon the assumptions and comforts implicit in his own earlier material. This attitude is also shown in his recent deepening and extension of an early science-fantasy novel, *Sorcerer's World*, through the means of a much more sophisticated and self-reflexive version: *The Black Grail*. Interestingly, Broderick has even scrutinised the science-fiction ambience itself in *Transmitters*, an ambitious mainstream novel largely involving the misadventures of science-fiction fans.

Throughout his career, Broderick has experienced with form

and ideas. He has described "The Magi" as proceeding from an almost technical impulse to create identification with emotions which are based upon profound metaphysical errors. The result is a story which preys upon the logic of its own plot and sets up disturbing feelings of ethical and ontological contradiction in the reader. This is a step beyond the half-playful ideational structures of *The Dreaming Dragons* and *The Judas Mandala*. *Mandala*, in particular, is dominated by a complex of dualities and transitions. The novel depicts a far-future world ruled with spiritless paternalism by seemingly omnipotent cyborg lords. There is no way to rebel against their awesome technological mastery, but some free humans have developed an ability to live part of their existence in "synchronic" time—at right-angles to the normal direction of experience. This is merely the first stage of a human, and specifically organic, ability to control time, providing a weapon against the otherwise invincible cyborgs. Drawing upon structuralist theory, Yeatsian iconography, and the concept of the Bodhissatva who attains enlightenment but returns to the sufferings of a fallen and unenlightened world, Broderick creates a triumphant example of metaphysical science fiction, partly vitiated only by its substantial failure to weave emotionally compelling substance into the intricately constructed narrative and setting.

Since *Mandala*, Broderick has moved on to more emotionally affecting work, including "The Magi," *Transmitters*, and an sf novel co-written with Rory Barnes, *Valencies*. Despite occasional uncertainties of tone, Broderick has shown a welcome ability to treat science-fiction themes with both wit and poignancy. His development into one of the field's major exponents can now be predicted with confidence; it is more difficult to predict the direction in which this ambitious and technically gifted writer will next set out.

\* \* \*

It is said that early telegraphers could be identified by their "fist"; that is, by their peculiarities in operating the transmitting key. Some science-fiction writers also have a "fist" by which they can be known. Fredric Brown is one of them. Much of Brown's skill with words probably can be traced to his early career as newspaperman. He wrote tightly, his language was direct and simple, sentences were often telegraphic, and his stories had a "grabber"—usually at the end. Such skills as these can be learned, of course, and their proper application makes for readable prose. If Brown had had only these qualities in his writing, he would have left a pretty sizable mark in the field of science fiction.

But Brown became a truly memorable figure in his field because of several other traits. Although he may at times have appeared cynical, most of his stories revealed an idealist, a firm believer in Man's god-like potential. *The Lights in the Sky Are Stars* devotes its entire span to the repeated assertions that man can become, that there may or may not be a God, but that there assuredly will be one if and when man develops to his fullest. This conviction is echoed in his "Letter to a Phoenix," where Brown points to the cyclical rise and fall of civilizations, with each ascent greater than the preceding plunge. After every collapse of a culture, Man the Phoenix rises from the ashes with greater vigor and determination. It is Brown's burning faith in human powers that lifts his works above the ordinary—partly because his heroes are ordinary. The central figure in *The Lights in the Sky Are Stars* is a rocket mechanic. Ordinary, too, is the hero of *What Mad Universe*, where our planet is Earth, but not quite. Brown's choice of protagonist for "Arena," a short story with Armageddon implications, is an ordinary space-ship pilot.

It is said that much writing of fiction is really autobiograph-

ical. Such could be so in the case of Brown's work, for he appeared to regard himself as an ordinary individual. He had very little college education—one year—noted he was "only" an office worker, and described himself as "mostly self-educated." Yet he was highly successful as a writer of mysteries and science fiction, and in many instances seems to have sublimated himself in leading characters determined to make something of themselves.

For the most part Brown's style was crisply journalistic. But he drew from his newspaper experience an even more valuable characteristic: each of his yarns had a "hook" or "gimmick" to give the work zest and interest. The casual reader of "The Star Mouse" is conned into seeing this story as a sort of variation on a cartoon character. Thought of a mouse representing Earth's civilized people is ridiculous, of course, and his comic manner of speech is mildly diverting. But what sets the reader on his ear is that gimmick, which gives the story tremendous significance and shows us a reporter who simply *had* to save the best for last. The same kind of withholding is evident in "Arena," where Earth's representative seemed doomed in his combat with the Roller from another universe. Reeling and bleeding from many wounds, our hero appears done for, and we struggle along with him toward the end to discover that gimmick on which the entire outcome hangs. An almost invisible hook propels *The Lights in the Sky Are Stars*. Not until the final scene do we find it, because our hero-narrator tells us only then that he has lied about a fundamental point. That lie provides the force which Brown requires, but it virtually destroys his hero and creates a deposit of disappointment for the reader as well.

Anyone looking for humour, however, will seldom feel cheated by Brown's yarns. Sometimes the humour is almost juvenile, as with "The Star Mouse," where not only the dialog but the denouement offer many chuckles. "Arena" displays a grim humor, not alone in the resolution of our hero's conflict, but also in Brown's use of power differentials—speculation that mightier forces exist of which man can only dream. More pointed is the humor of "The Weapon" in pitting human frailty against atomic force, with a final question which Brown leaves unanswered. And the close reader finds in *The Lights in the Sky Are Stars* an unspoken pun, when disclosure of the hero's failing literally leaves him without a leg to stand on.

Listing of a handful of qualities scarcely defines an author. Brown obviously enjoyed his craft; his hundreds of short stories and several novels appeared on shelves and in anthologies with deceptive ease. And in this flood floated the fragments of a most engaging personality. Like many authors he had only a smattering of real knowledge about most of the topics he dealt with: "Etaoin Shrdlu" bearing the spoor of the linotype, "The Waveries" betraying his failure to link accurately thunder and lightning, "The Star Mouse" blithely ignoring biological realities. But, despite whatever limitations and shortcomings one may detect, Fredric Brown was a buoyant asset to the field of science fiction. The reading diet of all of us became poorer with his death.

—Robert H. Wilcox

"The Artist," in *Amazing* (New York), May 1964.

\* \* \*

Many science-fiction writers have a sense of humor that enables them to populate a universe of their own creation with a myriad of creatures both homely and fantastic. Rosel George Brown had this and another rarer ability, the ability to portray men and women who are believable, sympathetic, and winning.

Her first published story, "From an Unseen Censor," describes a search for a missing inheritance from the narrator's uncle Isadore. Finding clues planted by his uncle, the young man finds the fabulously rare perfume trees that are his uncle's bequest. Humor derives from Brown's use of Poe's "The Raven" as a model for burlesque, with Isadore filling the place of the "lost Lenore." Another young man, a space traveler, finds love on a Utopian planet where time seems to stand still ("Of All Possible Worlds"). Dismayed when the whole race throws itself lemming-like from a cliff into the sea, the man has to adjust to a world that has no more meaning for him.

Brown's male characters are not the only ones with which she deals so carefully. In *Earthblood*, written with Keith Laumer, there are kindly extra-terrestrials like Iron Robert, a huge stone-like creature who has been taught the meaning of love and compassion by the earth-bred Roan. And there are well-drawn women characters, earthly and alien, who are more than the stock sex-objects that fill lesser fiction. An example is Stellaire, who is only half human genetically, but fully human in her love and understanding of Roan. By her death Roan is finally freed to find the earth from which the seed that endangered him came so long before. Another woman ready to love and work is the mail-order bride of "Virgin Ground." A tough, self-sufficient girl, she faces a surly, unwilling groom. Cruelly left to die in a Martian sandstorm, she saves herself and then takes the farm from the boorish man who deserted her. An ending twist finds the heroine five years later faced with an eager groom sent out to share in the farm she has worked alone. Other women likely to be familiar to a reader are the harassed mother of "Carpool," who finds that hungry earth children are likely to eat a gentle alien child who rides to the "Play Place" with them, and the garden club member who wants to make a prize-winning entry in "Flower Arrangement."

Rosel Brown's most memorable character, however, is Sibyl Sue Blue, the tough earth policewoman, whose job in the novel named for her is finding the Centaurian drug pushers who are killing earth teenagers. Since widowed by the death of her explorer husband, Sue has been plagued by guilt that her

daughter has "had to raise herself." Of course, the girl Missy has done no such thing, because the love and concern of Sue for her daughter is apparent whether she is worrying about Missy's being injured in retribution for Sibyl's work, or thinking that things would have been different if her husband had lived. *The Waters of Centaurus* shows Sibyl's further resourcefulness, not only at handling threats to interstellar peace, but at handling crises between generations, as Missy falls in love with a young alien.

Only a dozen of Rosel Brown's stories have been separately published, in *A Handful of Time*; but the collection and her novels show her remarkable growth as a writer in her use of character. Her early death was one of the most regrettable in the history of modern science fiction.

—Walter E. Meyers

BROWNING, Craig. See PHILLIPS, Rog.

**BROXON, Mildred Downey.** Also writes as Sigfridur Skaldaspillir. American. Born in Atlanta, Georgia, 7 June 1944; grew up in Brazil. Educated at Seattle University, B. A. in psychology 1965, B. S. in nursing 1970. Married 1) G. D. Torgerson in 1965 (divorced, 1969); 2) William D. Broxon in 1969 (died, 1981). Teacher's aide, Rainier State School, Buckley, Washington, 1966-67; psychiatric nurse, Harborview Medical Center, Seattle, 1970-72. Vice-President, Science Fiction Writers of America, 1975-77. Agent: Jarvis Braff Ltd., 260 Willard Avenue, Staten Island, New York 10314. Address: 7337 22nd Avenue N. W., Seattle, Washington 98117, U. S. A.

Mildred Downey Broxon comments:

As an American raised abroad and then re-introduced to the United States, I have always had a certain sense of alienness; I have tried to exploit this in my writing.

My late father was a professor of history (Irish and Latin American) and some of his interest in the subject seems to have rubbed off on me: I use historical themes to a great extent in my writing. More of my published work has been fantasy than science fiction, although such distinctions are arbitrary at best.

I strive to instill in the reader a "sense of wonder" which, after all, is what makes us sentient—and keeps us alive.

\* \* \*

Mildred Downey Broxon's first published short story was not the kind that attracts a lot of attention, but "Asclepius Has Paws," the story of an alien psychologist temporarily stranded on Earth, demonstrated a concern with human emotion and a sensitivity for the complexity of interpersonal relationships that was much more promising than the story itself. In "The Night Is Cold, The Stars Are Far Away," a non-human on an unspecified planet keeps a lonely watch on the sky, convinced that it is his world that moves and not the stars and other planets, for which he is ostracized by friends and family alike, until he is finally able to convey the importance of his perceived mystery to a younger generation.

"The Stones Have Names" is a bittersweet story, in which an incompetent but kindly political appointee governs the conquered alien world of a race that is fiercely independent. He and a local leader develop the beginning of a genuine friendship, but the momentum of both races is such that tragedy destroys both their lives. Broxon's interest in the history of the British Isles is obvious in "The Book of Padraig," which concerns a long-lived alien who spends a human lifetime as a cloistered monk in order to study our race from the inside.

"In Time, Everything" is an interesting but not entirely successful piece about a woman who, during the act of committing suicide, relives not only her own lifetime but that of all her ancestors back to the first lungful of air taken in by a

proto-amphibian. A dying child figures prominently in "Where Is Next Door?" The despondent mother begins to realize that there is something bizarre about her new neighbors—they don't seem to be quite human, and their stories of "home" seem like no place on Earth. The predictable and rather trite ending mars but does not fatally damage one of Broxon's best efforts.

"Singularity" is almost certainly Broxon's finest science-fiction story to date, a short novel that deals with a pair of scientists who are trying to learn as much as possible about a non-human species on a planet that will shortly be destroyed by the near passage of a black hole. There is no possibility of reprieve or evacuation, and first one and then the other becomes so personally involved with the fate of the world and its inhabitants that it alters the world of the human observers forever. Nearly as good is "Walk the Ice," a marvelously understated story of a shipwrecked alien who finds temporary shelter with a family of starving eskimos, and the effect that his brief interaction has on the sole surviving member of that family.

Broxon has also written a number of interesting fantasies, particularly including her excellent novel, *Too Long a Sacrifice* and, in collaboration with Poul Anderson, *The Demon of Scatterry*. Fantasy short stories of interest are "The Antrim Hills" and "Night of the Fifth Sun."

Critical Studies: *The Happening Worlds of John Brunner* (includes bibliography) edited by Joseph W. De Bolt, Port Washington, New York, Kennikat Press, 1975.

John Brunner comments:

For me, the essence both of science fiction and of the necessity for it can be summed up by quoting the opening sentence of L. P. Hartley's *The Go-Between*: "The past is a foreign country; they do things differently there." Given that we are all being deported willy-nilly towards that foreign country, the future, where we shall ultimately die, I'd rather make the journey as a tourist with no matter how fallible a Baedeker, than be deported as a refugee. This is, I suppose, the chief reason why my SF has tended to become more and more concentrated on that portion of the future I may reasonably expect to survive into myself, and less and less concerned with the unbridled fantasy of space opera.

Concurrently, I'm told, it has also become more difficult. In a case like *Stand on Zanzibar*, this is hardly surprising—I generally tell prospective readers to remember that it should be read like a newspaper, not like a novel, for we are used to snippets about a dozen subjects on the front page, each continued elsewhere. But, much as a jazzman can keep on coming home to the blues during a playing career of half a century or more, I retain enormous respect for the conventional narrative forms and use them for the great majority of my fiction. Rules must be learned before one can judge when they may safely be broken, even (one might say especially) in our so-called "fiction of the future"—which of course, like all fiction, is actually about you and me and the here-and-now.

Let me therefore suppose that someone has chanced on this brief entry in this monumental work and, being unacquainted with SF but interested in exploring the subject, decides that a good place to start would be with those writers who have won the field's major awards. What would I commend of my own work by way of an introduction? Three books above all: *Quicksand* because of its totally contemporary setting and ambiguous SF element; *The Squares of the City* because as long ago as 1960 I was there discussing the depersonalisation we are

all now acquainted with in the computer age; and *The Whole Man* because it would give a new reader some insight into the proper function of SF's standard devices, such as—in this instance—telepathy, a metaphor for total communication. It has been well said that the great contribution of SF to the corpus of literature is "the future as metaphor." I entirely agree, and though in the past I have had my doubts I do not currently feel that I shall ever exhaust the possibilities opened up to us by that discovery.

But in *Stand on Zanzibar*, *The Jagged Orbit*, *The Sheep Look Up*, and *The Shockwave Rider* I've done my best to put on the page everything I as an individual could garner and combine into a credible narrative, concerning that tomorrow we are doomed to endure. Every day necessarily alters it; SF, like all printed fiction, belongs to the past. . . . But even metaphors drawn from an obsolete future can be invaluable in preparing us for eventual reality, whatever form—out of an infinite number—it may actually take.

\* \* \*

"She had put on a green tunic that matched her eyes, which came barely halfway down her thighs," reads part of a sentence from "The Man from the Big Dark," an early (1958) John Brunner space operette. The unintentionally fantastic image it suggests, not to mention the humorous unintended rhyme, illustrates a problem facing the reader who undertakes to evaluate the large and important body of John Brunner's SF. Brunner is clearly serious about SF, with respect to both thematic concerns and the craft of writing, but he indicated in 1974 that the "medium" was more important to him than the "matter." Yet at times Brunner's work has a slapdash quality that challenges readability, as if the pressure to express the material generated by a prolific imagination has led him to take more care of his matter than of his medium.

An example of the problem is *Total Eclipse*, which Brunner himself has confessed was written too hurriedly although its premise was "one of the two genuinely original ideas I ever came up with." In that fiction, a team of terrestrial astronauts is trying to figure out why the advanced technological civilization of Sigma Draconis III died out, leaving behind only remnants of curious artifacts that include a crater-sized telescope on their moon. As the image of the vast telescope suggests, the extinct alien culture is a mirror of the explorers' on Sol III. They have apparently been abandoned by the authorities on earth, although the purpose of the investigation is to gain knowledge that will assist human society in averting a similar extinction. The main character is Ian Macauley, a brilliant linguist who eventually determines that the local culture had based its economic system on genetic exchange, with the resultant shrunken gene pool leading to some sort of biological collapse. With the starship's failure to return, however, this useful ecological lesson will never reach earth, which may already have "eclipsed" in any case. The marooned team attempts to establish a human colony in lieu of return to earth, but their offspring succumb to a pulmonary fungus, while the adults gradually die of assorted diseases and deficiencies—not the least of which is lack of solidarity and hope.

The pessimism of *Total Eclipse*'s conclusion, however, seems contrived, as if Brunner felt forced to it by the acclaim enjoyed by the dystopian novels of the late 1960's and early 1970's. For most of the narrative, we see the team coping with interpersonal problems and advancing their investigation successfully—the plot does not really offer any evidence that the humans are like their extinct alien counterparts in promoting a destructive rationalism to the detriment of their humanity: their problems

seem to stem more from emotionalism. Technically, Brunner's switch from the omniscient viewpoint to a first-person narrative in the final chapter is an attempt to paper over this confusion in vision and thematic concern—the final effect is to create an awkward and unsatisfying ending as well as a text that has no apparent audience.

The problems of *Total Eclipse* underline a difficulty faced by Brunner and any other writer who uses a popular fiction medium to deal with a serious vision of the human universe. Constantly looking over their shoulders to audience expectations, such writers are tempted to betray their better judgments about "medium" (craft) and "matter." In the first phase of Brunner's career, when he was turning out a prodigious amount of what John Clute has characterized as "literate space opera," Brunner played, one after another, with stock items from the SF repertoire: the old galactic empire now decayed into feudal anarchy and technological stagnation (the *Interstellar Empire* series); the angelic alien intelligences from a "higher continuum" of spacetime—from which humankind has fallen (*More Things In Heaven*); the sudden appearance of the transfer stations of an alien teleportation system, which bring to a halt the progress of human culture until the hero works out how to piggyback on them for the purpose of galactic colonization (*Age of Miracles*); the ancient and fearsome alien monster that has lurked unseen in the ocean and emerges to terrorize humanity (*The Atlantic Abomination*); the worldlet-sized space vessel that will permit intergalactic colonization (*Sanctuary in the Sky*). Whatever the limitations of such material, however, and of the publishing system that generates it (which he has described with poignant humor), Brunner used it well. His narratives are generally suspensefully paced and presented in a mostly graceful style that builds the story through dialogue and description. His heroes, who are not loners but work with others to solve problems, represent a human norm able to meet crises and overcome obstacles through pluck and intelligence. Though Brunner may have tired of writing this sort of SF, there is no question but that he was better at it than many of his precursors.

The critical success that eluded Brunner through the 1950's and early 1960's finally came his way when he began to treat SF devices not as literal elements of "future history" but rather as metaphors for the human condition in the present. *The Whole Man*, evolved from a series of SF thrillers using the premise of telepathy, begins with a scene of civil turmoil being put down by a UN police action that utilizes telepathic intelligence officers as well as military force, and ends with its physically deformed hero, Gerald Howson, having found love and acceptance outside the telepathic community. The freak Howson's quest for his full humanity ends when he visits his hometown and encounters a group of students who, less obvious freaks as they are, accept Howson as normal. The spiritual restoration he finds is reflected at the novel's end, where the possibility of curing his physical deformity is left open. As Brunner has pointed out several times, telepathy is a metaphor for communication, and it is subject to the same disabling factors as more ordinary means. Another example is *The Squares of the City* in which the old chestnut of a plot based on a famous game from the annals of chess is used to portray the breakdown of a hierarchical social order in which the rich and powerful manipulate the lives of the pawns who inhabit urban society's less desirable "squares."

*Stand on Zanzibar*, still regarded as Brunner's magnum opus, is often discussed in terms of its presumably innovative montage technique, used to a lesser extent in the other dystopian novels: *The Jagged Orbit*, *The Sheep Look Up*, *The Stone That Never Came Down*, *The Shockwave Rider*. In fact, all these novels are well-paced, smartly plotted fictions, only the narrative surfaces

of which are "experimental." They derive their effects from the dialectic suggested above: civilization is portrayed as a fragile ideal threatened by man-made ecological disaster, by organized violence, by information overload—and by that chiefest of the threats to human solidarity that stalk the pages of Brunner's fictions, racial apartheid and hatred. The potentially liberating technologies of control and communication are being manipulated by sinister and largely synonymous entities: government, organized crime, and great corporations. Although of the five only *The Sheep Look Up* has a clearly pessimistic ending, the set constitutes a grim vision of humanity's immediate future, far more unsettling, because its extrapolations are so much more plausible, than the fantasies of *Brave New World*, 1984, or the 1950's SF dystopias dubbed "comic infernos" by Kingsley Amis. Yet even at their most pessimistic, these novels portray as a noble ideal that person—whether physician, social scientist, or psychic sensitive—who has the compassion and the intelligence to struggle against our species' apparent mad rush to extinguish itself.

Nor are the dystopian fictions lacking a certain comic humor—albeit often macabre. Their themes, after all, are satirical, and Brunner exploits wordplay and other forms of verbal comedy in narrative as well as in dialogue, often to underline the corruption and unreliability of language and communication; his characters often find themselves in situations that are darkly farcical. This comic strain is often overlooked in discussions of his work, perhaps because it is more evident in his shorter fictions and in his light verse. But *Timescoop* is a hilarious comedy of manners that spoofs the paradoxes and other conventions of time-travel, even including an irreverent rewrite of famous discussion of the geometry of time travel in Wells's *Time Machine*.

Brunner has not been so prolific in the past ten years, but two recent novels show him to be as unpredictable and imaginative as ever. *The Crucible of Time* recounts, in seven linked novellas, the saga of an intelligent species faced with a number of cosmic accidents that threaten their very survival. Each of the novellas focuses on one explorer or scientist who makes a major contribution, often in spite of the malice and ignorance of his fellows, to the development of the species' technology and understanding of nature. Although the story is told from an inside point of view that never lets us clearly picture what these creatures would look like to us, that is more achievement than defect. The creatures are alien to us with their mandibles, their reproduction by budding, and their matriarchal societies, but they are fallible and fallen as well as capable of love, hard work, wit, sadness, and courage. And they survive as a species because they generate just enough of those rare individuals who ask questions, especially "why not?" As well as a *tour de force* of insight into the possibilities of exobiology and exo-social psychology, not to mention a technology based on organic structures, the fiction is a parable of hope in which Brunner counters the pessimism of his own dystopias and returns to the optimistic tenor of much of his pre-1969 fiction.

*The Tides of Time* is more obscure, but perhaps even more rewarding. It is less a narrative than a series of interlaced archaeological tapestries based on the dreams of two astronauts who, after being the first to survive flight-testing FTL spaceships, escape together from their debriefings. The FTL ships are being tested because reliable old "father sun" has become a variable star and raised earth's temperature to the extent that much of its landmass is under water. Unlike the people of Ballard's *The Drowned World*, Gene and Stacy do not plunge into primal unconsciousness and loss of ego; as Stacy goes through a pregnancy, they maintain self while they travel through the rich and varied layers of civilization on an

abandoned Aegean island. Though Stacy dies giving birth to their child Terra, Gene brings back a much more valuable lesson than the practicality of FTL travel; the density and texture of human experience are rooted in earth, and we cannot survive without our "mother." This parable might seem technophobic, but it complements that of *The Crucible of Time* when we remember that the struggle there was not only to survive, but also to hang on to the ecology that gave birth to the species and its cultures.

Brunner is now in the sixth decade of his life, and his fourth as a SF writer. If his recent fictions are any indication of what lies ahead for his readers, he will continue to surprise and delight them, and to keep their eyes open to the possibilities of the human future, which in his imagination are clearly manifold, even infinite.

Bibliography: *Edward Bryant Bibliography*, Los Angeles, Swigart, 1980.

Edward Bryant comments:

I find considerable contradictions at this time in my life and career (each, for the time, indistinguishable from the other). I love the glittering attractions of cities, but find the east and west coasts claustrophobic. I love the spaciousness and low population density of the mountain west, but don't wish the situation of a hermit. I love being a westerner, but have no nostalgic aspirations of living on a ranch again as I did when I was younger. The wide open spaces liberate, but do not trigger me to hunt or fish or ski. But I notice the metaphor of the mountain west creeping increasingly into my work.

People seem continually bent on telling me I don't truly write "real" SF, whatever that is, but then I continue to read and admire what I consider to be the best of other people's SF, and then go on to write more of the fiction I feel I'd like to encounter as an SF reader.

I seem to be a minority writer in SF, like Avram Davidson, Thomas Disch, and Carol Emshwiller (I don't pretend to place myself in their bracket—I simply admire the work of all three tremendously). All of us seem to communicate—at best—with perhaps 30 to 40 per cent of the great mass of SF readers. For me, that's a little frustrating—but not sufficiently that I plan a pragmatic campaign to include more telepathic dragons, mightily thewed barbarians, Empire blockade runners, or other crowd-pleasers in my fictions. I expect to continue swimming my own way.

Although the boredom quotient (a facet of Sturgeon's law) in SF is still rather high, I'm excited about where the best of the field seems to be heading in the 1980's. I think finally there are a decent number of literate writers of SF who have an eclectic grounding in the arts and humanities as well as in science and technology. They are articulate and genuinely inquisitive about the interrelationship between human beings and universe. They are blessed with minimal knee-jerk prejudices about science and technology. Many of them have been practicing and cogitating, perhaps consolidating their craft, during the past two decades. I may have my doubts about the future of the universe itself, but I'm sanguine about the prospects for science fiction.

\* \* \*

Like one of his best-known and most important mentors, Harlan Ellison, Edward Bryant has thus far tended to write short fictions. In fact, his only novel in an adaptation of Ellison's original prize-winning television script for the doomed *Starlost* series, *Phoenix Without Ashes*. Again, like Ellison, Davidson, Disch, and Emshwiller (all of whom he admires), Bryant is essentially a fabulist, a writer of fantasy who uses science-fiction trappings in his work for their metaphorical effect rather than simply as "realistic" background. He is the very opposite of a "hard" science-fiction writer, someone like Larry Niven, say, who believes in a fiction of ideas and specific extrapolation. He is also a more adventurous stylist than most traditional hard science-fiction writers.

Bryant's vision can be extremely dark, as his first collection of mostly nightmarish fables, *Among the Dead*, demonstrates. A portrayal of a world sliding on good intentions and nothing else into the deepest of pits, this collection is full of sad and terrifying glimpses of human ennui and failure of nerve. Entropy is the reigning god, and metaphors of decay, death, and Sisyphean effort appear everywhere. Many of the stories are set in a bleak near-present, but the far future of "Love Song of Herself" and indeterminate time/space of "Dunc's Edge" are no more

helpful. Nevertheless, and this is one of the marvelous paradoxes of good writing, the formal energy and black wit of the best of these stories often overcome their thematic sense of utter depression.

*Phoenix Without Ashes* is a collaboration in the best sense of the word. Taking Ellison's screenplay as his basic story, Bryant has written a novel which effectively works out some intriguing variations on the conventional SF "closed universe" theme, previously handled by writers as disparate as Heinlein and Aldiss. Characterization is minimal (it was to be a TV series, after all), but the story moves with a certain grandeur to its ending as new beginning, and it's an entertaining book, though not the rich and variegated entertainment *Cinnabar* proves to be.

Bryant calls *Cinnabar* a "mosaic novel," a richly evocative description for this sequence of interlocking stories. It takes another grand old SF metaphor, the city at the end of time and as the end of human endeavour, and, in a tour de force of colourful, glittering *fin de siècle* stylization, explodes the conventional possibilities of the metaphor in a grand fireworks display. The way the whole context alters its individual parts can be seen in the changes "Gray Matters"—also in *Among the Dead*—undergoes when it's set into the glamorous mosaic of *Cinnabar*. Although it remains a tale of sexual and emotional ennui, its focus shifts from the victims to the strong and positive personality of Tourmaline Hayes, who figures energetically throughout *Cinnabar*.

*Cinnabar* may be a "doomed city of hope," as Bryant says; but as he also says, "all things considered, I know I would rather be in *Cinnabar*"; and that desire informs the dazzling and energetic writing which propels these narratives. Anything is possible in this city at the centre and terminus of time because its brightest and most complex inhabitants joyfully recognise the profoundly human potentiality of the argument that "biologically speaking there are no imperatives," though moral choice remains a centrally human act. Only a few of *Cinnabar*'s near-immortal citizens accept the challenge to seek and grow implicit in the city's multiplex presence. Most suffer from ennui, emotional and spiritual entropy, but Bryant wisely keeps them well in the background while focussing on Tourmaline, the compleat tourist, Obregon, the always curious non-specialist, Leah Sand, the melancholy media artist, Jade Blue, the computer-created cat-mother, and Harry Blake, the 1963 university student who falls down a temporal rabbit hole and learns to view human potentiality anew. And then there's Terminex, the central computer slowly going crazy trying to run the city and hold all its different time zones in place. The style, grace, and wit apparent throughout *Cinnabar* mark it as a brilliant example of speculative fantasy at its best. Bryant's more recent stories, gathered in *Particle Theory*, continue to use and subvert SF conventions for symbolic purposes. As such disparate stories as the title story, "The Thermals of August," "Precession," and "Stone" demonstrate, Bryant discovers in the metaphoric possibilities of SF hardware a means by which to explore the byways of love and passion. That two of the stories in this collection won Nebula Awards testifies to his peers' awareness that sophisticated and stylish writing, when conjoined to a powerful humane vision, makes for an SF that is truly art.

#### Frank Bryning comments:

In science fiction my prejudice is in favour of "hard-core," or "science fiction." I hold that the essential problem or conflict in the lives of the characters in a science-fiction story will derive from their involvement in some event in the natural universe—some biological, psychological, sociological, technological, cosmological activity. Their experiences, however unusual or mystifying, will be explicable, ultimately, according to that accumulation of precise factual knowledge and verifiable experience and the logically reasoned theories and speculations based on it that we call "science."

This as distinct from "fantasy"—from fiction of the "super"—natural, from fairy tale, fable, legend, myth (religious or otherwise), magic, witchcraft, the occult, or ghoulies and ghosties and things that go bump in the night. In fantasy I have always found much profit and delight. I still do. I yield to no one in my capacity to find enjoyment there, or moral lesson. From fantasy I do not expect believable premises, strictly logical progression of cause and effect, or any real conviction, yet I consider those fantasies most satisfying which are internally logical after one suspends disbelief in their mystical premises.

I would like to think that the sum total of all my writing—fiction and non-fiction, plus my work as staff writer and editor—would designate me as a realist rather than a surrealist. Almost all my work has been to present the "rational" viewpoint, I believe. My fiction is concerned mainly with the doings of typical everyday people in the everyday world (including, perhaps, the world of tomorrow in my science fiction) rather than with "exploring" so-called "alternative realities" or fantasising about "other planes of existence." I want to be on the side of enlightenment rather than obfuscation, of rationalism rather than mysticism. I hope readers, of my science fiction in particular, and my fellow writers, may agree that I am.

\* \* \*

Having grown up on Wells, Verne, and Bellamy, Frank Bryning naturally turned to writing SF stories, and it was natural that he should become a writer who stresses the *science* in science fiction. Bryning is best known for his Aboriginal stories "Place of the Throwing-Stick" (his best story), "Nemaluk and the Star-Stone," and "Mechman of the Dreaming." Bryning regards the Australian Aborigines as "the most distinctively Australian phenomenon one might use," and these three stories reflect the theme of "the 'Aboriginal possessor of the land' versus the colonial invader." In "Place of the Throwing-Stick" the Aboriginal Munyarra attacks the most recent of the white man's importations—the rocket. The confrontation takes place at Australia's real-life Woomera Rocket Range, allowing Bryning to link the Stone Age past with the Space Age present through the name "Woomera" (Aboriginal for "spear-throwing stick").

Bryning's long-time membership in the British Interplanetary Society is reflected in his cycle of Commonwealth Satellite Space Station stories, embracing items written from the 1950's to the present. Eschewing the Americanization of SF, Bryning posits a near future in which the Commonwealth of Australia has established a network of space stations. The emphasis is upon character and realistic situations, with the ten stories being linked by the central character, Dr. Vivienne Gale. Plots are generated by the humdrum daily life in space, and many stories deal with space medicine and the problems of weightlessness.

There is nothing flashy or sensational about Bryning's stories. They are solidly and conventionally constructed, and their extrapolations are never allowed to outstrip the author's knowledge. As future histories, they are modest. But their strengths and merits lie in their quiet, dogged realism, their guarded optimism, and their compassion for the man with a day's work to complete.

—Van Ikin

**BUDRYS, Algis** (Algirdas Jonas Budrys). Also writes as Frank Mason. Lithuanian. Born in Königsberg, Germany, 9 January 1931. Manuscript Collection: Spencer Research Library, University of Kansas, Lawrence.

Algis Budrys comments:

My work, when found, speaks for itself. I think a piece of

creativity is its own justification. However, if a rationale is desired, then the theoretical underpinning of my SF is that speculative fiction is drama made more relevant by social extrapolation. That is, I proceed on the assumption that, by certain fortuitous strokes of talent, some prose artists can create conditional realities in which recognizably human behavior occurs under illuminating circumstances which are not yet known to have occurred in what we have agreed to call reality. The proposition is that a few members of the readership will be inspired to look about them anew and draw conclusions of benefit to mankind's continuing endeavor to escape extinction. I seriously doubt that any critical analysis of my work, however accurate, will have much relevance to my necessarily minor role in that endeavor. I commend to his or her god whatever hominid organism is eventually able to overcome the darkness, and I rest my case.

\* \* \*

Like Nabokov and Solzhenitsyn, Algis Budrys is ours by courtesy of Communism. I have been told that his real name means something like John Sentry, a pseudonym he has in fact employed. A sentry he is, if the brave who watched the stockade, the alien walls of the invader, may be called a sentry. A warrior he is by any definition. He understands more of the psychology of the man who fights—not the man who dies—than any other writer I know. Every age and every genre produce a few writers too good for them, authors who pour oceans into their wine cups or summon Sigurd and Fafnir in person to entertain the nursery. Budrys is one of these. He is, in the best sense, too serious a writer for science fiction.

*Who?* is the book that made him famous, it is perhaps as fine a study of dehumanization and alienation as science fiction will ever produce. A brilliant American scientist is torn by a laboratory explosion and repaired with what we would now call "bionic" parts by the Soviets. He is returned to the US—but the US cannot be sure of that. So much of him is gone that what remains cannot be identified. All this is simple enough. It is even—if you like—a retelling of L. Frank Baum's story of the Tin Woodman, who when he had sliced his "meat" (humanity) completely away could no longer recall his true name (which was Nick Chopper). The difference lies in intent, and in the treatments that result from it. Baum was manufacturing a paradox to amuse children, one not really much different from the rhyme about the Gingham Dog and the Calico Cat who ate each other up. Budrys is intensely concerned with the effect of technology—and particularly the technology of the Cold War—on our humanity. He asks if the Soviets were really doing the West a favour when they restored Martino, since he cannot be identified and thus cannot be of use. *Can* they do the West a good office, when all they do *must* be suspect? SF offers few figures of the symbolic intensity of this faceless, maimed scientist, the man who could prove ten thousand things, if only he could prove who he is.

Budrys's writing falls into two distinct periods, the first ranging from 1952 to the middle 1960's, the second from the middle 1970's to the present. The best work of his earlier period is surely *Rogue Moon*, which he wished to call *The Death Machine*, a vastly better title. In *Rogue Moon* a "matter transmitter" has been invented in a near future in which rocketry is still primitive; and an unmanned probe has managed to drop a transmitting and receiving station on the far side of the moon. The first explorers to go through the transmitter discover an alien construct millions of years old, a thing compounded of building, machine, and hallucination. It soon kills everyone who ventures inside. This alien construct is

perhaps the biggest and best red herring in all SF, because it is not really what *Rogue Moon* is about. It is about Hawks, the brilliant, compassionate, iron-souled scientist who has developed the "matter transmitter" and is determined to have the construct analyzed, and Barker, the death-obsessed Saturday afternoon hero he gets to do the exploring—through a score of deaths. Like *Who?* it is about the nature of identity. It is also about the nature of life, about what it is to live and have lived.

When a writer of Budrys's calibre is silent for so long as Budrys was silent, silenced not by the knouts and jails of totalitarian authority but by his own frustrations, his readers are entitled to expect him to be a different and even better writer if he chooses to write again. Budrys's justification is *Michaelmas*, his best novel and the book that has brought him considerable recognition outside SF. If *Rogue Moon* was cinematic, *Michaelmas* is bibliomatic—a story that can be told well only in a book. Americans are apt to find a certain glamour in kings and queens, princes and princesses—an amiable weakness. We are sometimes even liable to find an attraction in tyrants of one sort or another, in Napoleon, Caesar, and even Stalin—though we should know much better. But numbed by a parade of crooks and nonentities, we seem to have forgotten the romance of a President, of the good citizen elevated by his own efforts and the admiration of his fellows to a pre-eminence in the state, the romance our great grandfathers sensed so strongly in the embodiment of the Republic. Budrys, a Lithuanian refugee and the son of refugees, has not. G. K. Chesterton once said that a sword was the most glorious object in the world, but that a pocket-knife was more glorious than a sword, because it was a secret sword. Laurent Michaelmas is a secret President, the secret President of the Earth. In the hands of any other writer, he would almost certainly be a tyrant, and, no doubt in the hands of most, an insane tyrant. In Budrys's, as he struggles with human treachery and an alien visitor of awesome power, he remains an eminently sane and decent man, as lonely and as sad as our society's sane and decent men must always be. In flatly and persuasively denying the inevitable corruption of power, *Michaelmas* may well be the most optimistic book of the latter 20th century. It is certainly one of the best, as Budrys himself is one of its best—and least characteristic—storytellers.

—Gene Wolfe

**BULMER, (Henry) Kenneth.** Also writes as Alan Burt Akers; Ken Blake; Frank Brandon; Rupert Clinton; Ernest Corley; Arthur Frazier; Peter Green; Adam Hardy; Kenneth Johns; Philip Kent; Bruno Krauss; Neil Langholm; Karl Maras; Manning Norvil; Charles R. Bibliography: *The Writings of Kenneth Bulmer* by Roger Robinson, n. p., BECCON, 1983; revised edition, 1984.

#### Kenneth Bulmer comments:

If in an unwary moment I open one of my early books I find great difficulty in identifying with the writer. The immediate

purpose of the writer appears plain enough; he is dazzled by a vision of what this literature called SF might achieve, and is concerned to express this vision in terms then available to him. There is genuine feeling; but he is handicapped by environment, editorial prejudice, and lack of data. There is an unfortunate assumption that other people will readily share his insights, that the vision is so self-evident it must be conveyed. His own interests in the fascinating details of, for instance, the future, space and time travel, the interactions and potentialities of the human mind and spirit, appear to overshadow what he is driving at. Imperceptive, top-of-the-head critics have said that most of the writer's work is space opera; a closer reading will reveal this statement to be untenable. The vision of what SF might achieve remains, dimmed a little, it is true, by the current state of general SF, and this writer has in recent years turned to other interests, including the Fox books (as Adam Hardy) and adult fantasy, both incidentally, sharing that imaginative exploration of worlds unknown to the present day.

I have said many times, and will re-iterate, that SF is not respectable but is responsible. I remain unconvinced that this statement has been grasped by those to whom it is addressed. If poetry and non-establishment fiction are literatures of revolt, then SF is also. But it is more than merely a literature against, for example, the dead hand of authoritarianism or outmoded sexual mores: it is a literature against the spoliation of man by mankind's creations, which is by inference by man himself. This is not quite the same order of protest. This does not mean that SF is less as literature but more, for it incorporates more of life and, to enlarge a cliché, the felt responses within the emotional reactions to the human condition.

One underlying theme in my work is the exploration of the feelings and reactions of people forced, by the environment, other people, or inner compulsions, to perform acts and live lives far removed from what they would desire. As an introduction to my work I would instance the observation of a recent correspondent who remarked of my novels that they are filled with compassion all too often lacking in other works of SF.

\* \* \*

If any single writer could epitomize the formularized science-fantasy milieu of Donald A. Wollheim's popular Ace paperback line, Kenneth Bulmer would be a good choice for the designation. Inasmuch as American adventure-pulp took many formulaic elements from British adventure-fiction (violent conflict between cultures, stereotypes of romance, etc.), it might be seen as fitting that Wollheim's editorial devotion to the adventurous side of SF should be typified by a British writer who seemed devoted to formula for formula's sake.

It should be stressed that no author of narrative prose escapes at least some formulaic elements in his or her work—in fact, one measure of "art" might be the author's ability to transcend the formulaic origins of his narrative, as Conrad's stories rise above the classification of "sea stories." A formula writer, however, emphasizes the elements of the formula—the plot, the action, the melodramatic interactions of characters, and in SF, the "idea" or concept—and pays only superficial attention (if any) to the meaningful, thematic usages of such elements. Ace Books was noteworthy for printing many SF adventures with at least some moderate thematic interest, as with Emil Petaja's concern for regenerative myth-figures, or Leigh Brackett's preoccupation with beautiful, dying cultures. Yet the bulk of Ace's books were usually less thematically organized, and so Bulmer makes the best representative writer of that period. Bulmer is not, however, simply a "hack" in the

derogatory sense—rather, he does for the SF adventure what Edgar Wallace did for mysteries, and Seabury Quinn did for supernatural stories—that is, by the sheer bulk of his efforts in a single vein, he demonstrates the intrinsic fascination of the ritualistic nature of the formula and its icon-like imagery.

Bulmer's plots are his chief failing. Other formula-elements can be, and have been, neglected without necessarily diluting the effectiveness of the formula. Jack Williamson might use stereotypic characters, Edgar Rice Burroughs might overemphasize frenetic action, and Philip José Farmer might employ ideas of little originality, but all of them supply strong plotting that communicates some thematic commitment. Adventure-plots generally must be intricate to be compelling, but the formlessness of Bulmer's plots almost suggests the absurdity of a freewheeling comedy. Most of Bulmer's plots begin adequately enough—the protagonist and his allies learn of a mysterious force or perilous circumstance threatening their safety, but as they prepare to combat it, they continually become sidetracked, verging off into distantly-related episodic conflicts, so that, when they eventually re-enter the central conflict, the outcome is no longer interesting.

Some books in Bulmer's early cycle, such as *Behold the Stars* and *Secret of Zi*, are dully conventional, and it may be that Bulmer began his pattern of repeated scene-shifting to gain greater diversity. The tendency is markedly seen in *Cycle of Nemesis*, in which a group of humans try to bind an ancient demon into his crypt, and get thrown across various time-periods as they try. A series of Bulmer's books is even built around the various conflicts of an assortment of forgettable heroes against a dimension-conquering villainess, the Diamond Contessa, but with the exception of one of these (*The Wizards of Senchuria*) the other three, *Key to Irunium*, *Key to Venudine*, and *The Diamond Contessa*, lack narrative drive and coherence.

Bulmer's best work is probably *The Wizard of Starship Poseidon*, in that the plot is well-defined. Best described as *Topkapi* set in outer space, the novel has a certain amount of irony, concerning a scientist who fails to gain a grant to subsidize his project of creating biologic life, and decides to steal the necessary funds from a military payroll. (Wittily enough, the grant he wants is given to a literary scholar who hopes to prove that Bernard Shaw and H. G. Wells were the same man.) In this format, Bulmer's penchant for stocking his stories with an excess of eccentric characters is a benefit, and he manages to pull off a number of interesting plot-twists without becoming vague. A runner-up for best book might be *The Star Venturers*, in which a soldier-of-fortune, controlled by an artificial life-form implanted in his brain, is forced to track down a kidnapped princess, with the usual wild escapades that ensue when he combats her heavily armed kidnappers. Also of interest are *On the Symb-Socket Circuit* and *Roller Coaster World*, which attempt to break from the adventure-mold into that of social satire, directed toward the follies of hedonism and luxury-living. These have a degree of wit, but tend to flounder aimlessly: in *Roller Coaster World*, the hero is infatuated with a hopelessly unfulfilling romance, but Bulmer resolves an interesting dilemma in melodramatic terms, arranging for another woman to force the hero to renounce his hopeless love by the subtle strategy of her shooting him and carrying him off.

In short, Bulmer is a writer to be valued for his inventiveness, in spite of the fact that his inventions rarely transcend the level of basic "sensawunda" SF.

—Gene Phillips

**BUNCH, David R(oosevelt).** American. Born in Lowry City, Missouri. Educated at Central Missouri State College, Warrensburg, B. S. 1946; Washington University, St. Louis, M. A. 1949; State University of Iowa City, 1951-52. Served in the United States Army Air Force, 1942-46. Married Phyllis Geraldine Flette in 1951; two daughters (one deceased). Worked in cafeteria, as clerk and warehouseman, mail handler, druggist; staff member, Wagner Electric Company, St. Louis, 1953-54; civilian cartographer, Air Force Aeronautical Chart and Information Center, St. Louis, 1954-73. David R. Bunch comments:

I do not write mainly to glorify the scientific accomplishments of mankind or to predict how more and more unbelievably astounding those accomplishments are apt eventually to be. And they are, I am convinced, destined to be astounding, increasingly frightening. But I am much haunted by many questions and a wistful wondering concerning the true worth of man in his spaceship outbound for the stars. Aren't "stars" right here the main stars we should be true-headed for and inbound toward? Is not that elusive Light of Godly humanness locked and hidden in the obscured soul of man our main objective? And shouldn't the other stars whirling "out there" be regarded as the inscrutable business of God?

But because I do have these heart questionings and this wistful wondering concerning importances, it must make of my science fiction writings something other than a glorification of hard science. I write what the trade knows as "soft" science fiction, wherein social statement is as important as the soul-less telling of how a piece of machinery behaves. In many ways I am almost anti-science in my science-fiction writings. I believe we have upped too much our search for greater and still greater technological triumphs and lessened to our loss the quest for a clearer and brighter understanding of that sometimes blinding Light which is, or should be, our very sacred souls.

So I write not to shout-scream the glories of our great science breakthroughs, or to predict even greater thrusts. I write with more urgent business in mind: to make the reader "see," through my sometimes grim social statements and my often stark satirical comments—both apt to be perverse, even cynical—what worship of science may do in irretrievable detriment to Man and his Earth.

Did human kind come this far on our faltering, seeking,

sometimes glorious course only to dehumanize ourselves and become of no greater significance than the machines themselves that once we used as an aid in our search for significances?

\* \* \*

David R. Bunch's short, idiosyncratic stories have, almost invariably, been met with varying degrees of outrage from readers unwilling to work with his convoluted prose to reach the plot that to most is opaque. In his own way Bunch is one of the most original and creative writers in the genre, and it is unfortunate that the conservative bent of most readers is such that he is not given the attention he deserves.

The bulk of his work has been a loosely organized series set against the background of Moderan, several dozen of which have been collected as a book under that title. Moderan is a thoroughly repulsive future to rank with the Nebishes of T. J. Bass. Humans have acquired immortality, or as near to it as matters, through replacement of most of their body parts with metal. In fact, only a few flesh strips remain, the tiniest traces of humanity. Their physical transformation is matched by their emotional one. Most humans live in highly armed castles, called Strongholds. The protagonist of most of the series is Stronghold Ten, a man who early in the series is fitted with metallic limbs and organs, and makes use of his determination to make himself the foremost warmaker in the land. He alternates between highly mechanized combat and resting in his hip-snuggie chair within his stronghold, watching the sky change color as each month a new vapor shield is erected, or gazing out across his garden of metal flowers.

The series does much better as a whole than as individual stories, most of which are extremely episodic. Several do stand fairly well alone, particularly "Was She Horrid?" wherein Stronghold Ten is visited by a female, "The Walking, Talking I-Don't-Care Man" in which he has a male visitor, and "How It Ended" which concludes the first cycle of Moderan stories. An uncollected Moderan story, "Two Suns for the King," is as good as anything in the collection; Stronghold Ten is struck with an undeniable urge to grow something organic, and can find no unpolluted soil to work with.

There are literally dozens of stories not in the Moderan series, some of which fall into a lesser series of "Training Talks" by a male parent to his two young children. In one of his more straightforward stories, "Holdholtzer's Box," a scientist invents a box wherein he expects to entice people to their deaths. The interface between man and machine, so obvious in the Moderan stories, is present in much of his other work. A road clearing crew fails to distinguish between auto wreckage and human flesh in "Routine Emergency," for example, and people are lobotomized to happiness in "In the Land of the Not Unhappies."

The best single story may well be "That High-Up Blue Day That Saw the Black Sky-Train Come Spinning." In a style reminiscent of the best of R. A. Lafferty, Bunch introduces us to a group of aging nonconformists who decide that children need to be saved from the horrible fate of growing up. And they succeed. Another story that is extremely effective, though enigmatic, is "The Strange Case of the Birds" wherein an increasing number of people begin to see a malformed bird shape outlined against the moon.

Bunch often assails human vanity, rarely as well as in "Pridey Goeth," in which a town is taken in by a clever potion purveyor, and literally falls mortally wounded as the result. His clear-sighted view of the narrowmindedness of humanity is reinforced to a certain extent by the general reaction to his

work, but it appears that Bunch is far more interested in making the statements he feels necessary than in gaining critical acclaim.

\* \* \*

Science fiction is just one part of the literary landscape for Anthony Burgess, as reviewer, historian (*The Novel Now*), and novelist. Using bits and pieces of it in several books, he has also written four genre novels. Full of melodrama, they are not comfortable adventures with cardboard cutouts in rocketships, but studies of character, language, society, and morality in a world that disavows them. Agnostic in doubting God's presence, Burgess's world-view is Manichaeian in highlighting a conflict between good and evil.

A dystopian future is implicit in the social stupor and mindless violence of England in *The Right to an Answer*, the double-think and sexual ambiguity of Russia in *Honey for the Bears*, and the East-West conflict of the "eschatological spy novel," *Tremor of Intent*, all set against the backdrop of imminent nuclear holocaust. Precognition in *One Hand Clapping* gains Howard Shirley the riches to show his wife, Janet, that the material life is not worth living. Science fiction is peripheral to all of these, and even more so to *Inside Mr. Enderby*. Enderby's poem about a minotaur is made into a dreadful movie, *Son of the Beast from Outer Space*.

A film brought fame to Burgess, too: Stanley Kubrick's adaptation of *A Clockwork Orange* (departing considerably from the novel, it earned the author only a consultant's fee). In its neo-Orwellian England, men are on the moon but youth gangs mug and rape the old and young at will, provoking police-state responses. One of these kids who drink narcotic-laced milk ("moloko") and speak a Russian-rooted slang ("Nadsat"), Alex gives us his version of the joys of sex (a mechanical "in-out in-out"), of the "ultra-violent," and of classical music (especially the last movement of Beethoven's Ninth). He explains how his buddies ("droogs") got him arrested for beating up ("tolchoking") an old woman ("starry ptitsa"); her death got him imprisoned.

To get out, he volunteered for "Lodovico" aversive conditioning, rendering him unable to enjoy any of his three loves: sex, violence, and music. Victimized by old victims, he is befriended by one of them, unaware. Author of an essay, "A Clockwork Orange," this man, F. Alexander, uses Alex's case to overthrow the regime in charge, changing his political party from "outs" to "ins." The "cured" Alex returns to his old ways, except in the first (English) edition, whose last chapter rounds out his life, death, and resurrection. This controversial

episode shows Alex thinking of growing up and settling down, solving his problem, perhaps, but not helping us choose between his crimes and those of the state. Burgess finds both cure and disease repugnant (Kubrick is less equivocal); the State may be more culpable but its manipulation of Alex is just a step behind what made him a "clockwork orange" to begin with.

The symmetry of the original three seven-chapter sections, the pointed inversions of victims and victimizers, the parallels of Alex with F. Alexander, and "Lodovico" with "Ludwig van" show Burgess's conscious artistry, but his most striking device is "Nadsat." To read Alex's memoir, one must literally learn his language, not that difficult in context though later editions dilute the effect with a glossary. Verbal violence both shields the reader from and exposes him to physical violence, while learning to understand Alex leads to condoning his behavior, and accepting the conditioning effects of society in general. Although Alex accepts matter-of-factly his own allegiance not to goodness, but to "the other shop," the question of good-and-evil is both raised and rendered all but moot.

Burgess later labelled this book "too didactic, too linguistically exhibitionistic," but his other major dystopian novel, *The Wanting Seed*, employs a comparable amount of lecture and stylistic versatility to replay the Manichaeian dilemma. Treated here as accelerated history, it involves "Pelphase" (Pelagian perfectibility), "Interphase" (chaotic brutality), and "Gusphase" (Augustinian contrition). It takes little more than a year to go from an overpopulated age in which homosexuality brings advancement and unauthorized fertility is a fatal offense, to a plague-ridden world sacrificed to by massacre, orgies, and cannibalism mocking Christian communion. A return to actual Christianity (outlawed earlier) and active heterosexuality is witnessed by Tristram Foxc, his wife Beatrice-Joanna, and his brother (her lover) Derek. Flamboyantly homo, Derek becomes dutifully hetero, maintaining executive rank as his Ministry changes from Infertility to its opposite. In prison, then the army, where he alone survives a massacre, Tristram goes through Hell to return to his unfaithful wife. A living monument to ambivalence, she runs away to bear twins, naming them Derek and Tristram and claiming both men as fathers, husbands, and lovers. More obviously a fable perhaps, *The Wanting Seed* is seen by some critics as more optimistic than *A Clockwork Orange*. But in the context of a future crisis, the restoration of fertility is not an improvement, rather a restatement of the individual-state conflict.

Burgess revisited dystopia in 1985, a critique of Orwell's "cacatopia" (and his own) partly in fictional form. A loosely strung essay discusses the strengths, flaws, contemporary sources, and historical roots of *Nineteen Eighty-Four*, in Pelagian and Augustinian terms. Chronicling a common man's abortive fight against the system, in an Arab-dominated England beset with economic chaos, a breakdown in human relationships, and a return to religion (Islam), the talky story has almost none of the invention, wit, or style of its predecessors.

If that vein was played out, another one worth mining is suggested by a New Wavish tale reflecting Burgess's continued preoccupation with fate, and artists who care about both. Next to Joyce, his favorite literary subject is Shakespeare, about whom Burgess has written a biography and a novel (pastiche Elizabethan style), *Nothing Like the Sun*. Shakespearean scholar Paley visits a paralld Earth's Renaissance England in "The Muse," to prove that actor didn't write those plays. Hallucination, if not madness, awaits him, while the plays he, like previous visitors, has brought with him are taken by

Shakespeare to revise for performance in his own time. No serious accounting for that "impossible" genius, this jape subjugates scientific theory and technological practice to surrealist effects and extravagant fantasy.

A considerably longer "entertainment," *The End of the World News* interweaves three plots and sets of characters with the theme of facing catastrophic change. Paralleling a novelistic life of Freud and a Brechtian musical comedy about Trotsky in New York is that staple of British science fiction, a disaster story, involving the approach to and later collision with Earth of the new planet Lynx, and the escape of a chosen remnant of humanity. Not everyone who knows the worst wants to escape; a Falstaffian actor drinks life to the dregs, almost taking with him a professor of English whose specialty is science fiction. But half the fun lies in the stories' point and counterpoint, and their all but incomprehensible nature to their audience, generations later, in the spaceship that is now their home. If that convention is old, even hoarier is the outer narrative frame of a trusted editor offering an author's posthumous fragments to his cynical contemporaries. It is as if Burgess did not trust today's readers, let alone posterity, to get the joke, or as if he himself did not know how seriously to take it.

On balance, Burgess's science fiction lacks verisimilitude and extrapolative exactness, and suffers from obsession with a single theme. But his fables are prophetic in an Old Testament way, and his accomplishments with style and invention dwarf those of many other writers' lifelong careers.

Critical Studies: *Edgar Rice Burroughs, Master of Adventure* by Richard A. Lupoff, New York, Canaveral Press, 1965, revised edition, New York, Ace, 1968; *Tarzan Alive: A Definitive Biography of Lord Greystoke* by Philip José Farmer, New York, Doubleday, 1972, London, Panther, 1974; *Burroughs' Science Fiction* by Robert R. Kudlay and Joan Leiby, Geneseo, New York, School of Library and Information Science, 1973; *Edgar Rice Burroughs, The Man Who Created Tarzan* (includes bibliography) by Irwin Porges, Provo, Utah, Brigham Young University Press, 1975, London, New English Library, 1976; *A Guide to Barsoom* by John Flint Roy, New York, Ballantine, 1976; *The Burroughs Bestiary: An Encyclopaedia of Monsters and Imaginary Beings Created by Edgar Rice Burroughs* by David Day, London, New English Library, 1978; *Tarzan and Tradition: Classical Myth in Popular Literature* by Erling B. Holtsmark, Westport, Connecticut, Greenwood Press, 1981.

\* \* \*

While best known for his long series of jungle adventure tales featuring the character Tarzan, both in their original prose form and in uncounted motion pictures, television series, comic strips, and other adaptations, Edgar Rice Burroughs was in fact a very important and very popular science-fiction writer. In a lifetime output of more than 70 books, essentially equal numbers were devoted to jungle adventures and to science fiction. Burroughs's remaining output was widely distributed among westerns, Graustarkian romances, historical novels, and a few decidedly unsuccessful attempts at contemporary realism. The last group, most notably *The Girl from Hollywood*, are of interest for their autobiographical content. As a science-fiction writer Burroughs may be regarded as a descendant of Verne. His emphasis was on wonders: wonderful planets, strange creatures, magnificently melodramatic plots. Burroughs was himself of plebeian origins, but his works more often display a bias in favor of aristocracy. His heroes are

generally noblemen and/or wealthy, e. g., Lord Greystoke (Tarzan), John Carter (Confederate cavalry captain and plantation owner), David Innes (scion of Connecticut gentry). His heroines are often princesses, most notably Dejah Thoris, eventual consort of John Carter. (Exceptions include the hoodlum hero of *The Mucker* and the prostitute heroine *The Girl from Farris's*.)

It is important to note that Burroughs was not a significant creator in his writing, but rather was a synthesist of immeasurable natural talent. Every major theme in Burroughs's fantastic fiction (i. e., science fiction and jungle adventures) was anticipated in earlier works. Burroughs's genius lay in his ability to invest familiar material with such energy that it attained new heights of popularity. He did not invent the feral-man novel, the hollow-earth novel, the interplanetary romance, or any other significant fantastic form. He *did* write some of the most successful, most completely developed, most colorful, energetic, and suspenseful examples of each. Burroughs's science fiction divides into three major series, one minor series, and several independent works, two of which are of major importance.

Burroughs's literary career began, at least as far as published fiction is concerned, with the first of his interplanetary romances, *A Princess of Mars*. This novel and its sequels concern an earthly hero of somewhat equivocal and mysterious immortality who is transferred to Mars by a means that suggests astral projection. On Mars ("Barsoom") the hero discovers a dying world containing an ancient, decadent civilization, roving nomadic tribes, and a complex mixture of races, species, and traditions. Through a series of some 11 volumes John Carter rises to the supreme Warlordship of Barsoom, marries the incomparably beautiful red-skinned Princess Dejah Thoris (who lays eggs but is otherwise wholly human), becomes a father and grandfather, travels extensively upon Barsoom, visits one of its moons, and ultimately journeys to the planet Jupiter. There he presumably remains (he was in the midst of an uncompleted adventure when Burroughs died). While some of Burroughs's more ardent admirers consider Barsoom and all its associated material a brilliantly original creation, it was in fact the very opposite. The character of John Carter is virtually identical to that of Phra the Phoenician, while the basic rationale of Barsoomian history and culture closely resembles that of the planet Mars in a book called *Lieut. Gullivar Jones: His Vacation*; both books are by Edwin Lester Arnold. More of the Barsoomian culture and many of the plotting devices used by Burroughs appear in *Journey to Mars* by Gustavus Pope, in *Across the Zodiac* by Percy Greg, and even in some of the strange Theosophical teachings of Helena Blavatsky (as pointed out by L. Sprague de Camp). And the dueling, kidnapping, impersonating, court-intrigue ridden Barsoomian society, possibly borrowed from Pope, in itself is more than suggestively reminiscent of the court at Zenda as recorded by Anthony Hope, who might well have borrowed from Mark Twain!

Burroughs's second most significant science-fiction series was the Pellucidar books, beginning with *At the Earth's Core*. While the later books of this series are of inferior quality, the first two or three are among Burroughs's best work. Here the essential notion is that of an earth-boring machine accidentally breaking through the planet's crust to discover that the earth is hollow, illuminated by a miniature interior sun, and inhabited by a wide variety of species including primitive humans and paleontological survivals. Once again, elements derive from numerous earlier works, certainly including Holberg's *Nils Klim* and Verne's *Journey to the Center of the Earth*, and very likely (the name itself is suggestive) Bradshaw's *The Goddess of*

*Atvatabar*. While the Pellucidar series does let down in quality, it contains numerous fascinating features. One of these is a speculation—this one more likely original to Burroughs—on the nature of time and the timeless condition of a world of eternal daylight. There is considerable humorous and satirical material in the books. Also of interest is the so-called "series cross-over" volume, *Tarzan at the Earth's Core*, in which the two separately created universes of Tarzan's jungle world and the hollow earth, are merged—or at least, one may say, their separation is bridged via dirigible.

Burroughs's final science-fiction series details the adventures of Carson Napier on Venus. The books of this sequence date from late in Burroughs's career and are derivative of his Martian cycle without ever quite duplicating its spirit. There is also a degree of likelihood that the Venus books were written to strike back at Otis Adelbert Kline, who had written a series of interplanetary romances laid on Venus, under heavy influence of Burroughs's Martian cycle. (This theory is advanced by Sam Moskowitz, and is circumstantially persuasive although unfortunately is in no way documented.)

*The Land That Time Forgot* is one of Burroughs's major non-series science-fiction works (in some editions it is divided into three very slim volumes, corresponding with its original magazine serialization, and is consequently regarded as a small series itself). Opening with a sequence of submarine warfare in the first World War, the action quickly shifts to the island of Caspak (also known as Caprona), a place remarkably reminiscent of both Verne's *Mysterious Island* and Peter Wilkins's island retreat in the novel of Robert Paltock. There follow numerous incidents involving primitive and violent life-forms, intriguing speculation on evolutionary processes, and a final confrontation with a chilling post-human winged form (again reminiscent of Paltock). The paleontological elements in this book, like those in Burroughs's hollow-earth novels, are remarkably detailed and authentic. They derive from Burroughs's involvement with the subject at first as a student and later as an instructor at the Michigan Military Academy.

*The Moon Maid*, Burroughs's second major independent science-fiction work, is also divisible into three more-or-less self-sustained segments. It ties into Burroughs's Martian cycle, as a spaceship named *Barsoom* travels from the earth to the moon. The moon is found to be hollow and inhabited, with access to the inner regions obtained through lunar craters. All of this, of course, is strangely like the moon of Wells's *The First Men in the Moon*. In later sequences, using technology introduced from the earth, lunar forces invade and conquer our planet. At this point Burroughs's novel turns into a saga spaced over many generations. Burroughs handled the challenges of the form astonishingly well, and *The Moon Maid* is one of his most successful works.

His other works of science fiction have received relatively little attention. *The Monster Men* is a charmingly creaky cross of jungle adventure, desert island romance, mad scientist, and *Frankenstein*-monster plots. This last element occurs also in several of Burroughs's Martian novels, most notably *Master Mind of Mars* and *Synthetic Men of Mars*. *Beyond Thirty* is a surprisingly effective story of a future war-torn Europe reverting to barbarism—anticipating L. Ron Hubbard's *Final Blackout*.

Burroughs's Tarzan stories and other jungle adventures, while not essentially works of science fiction, contain many elements derived from science fiction and allied forms. After feralism itself, the next most common theme in the books is that of the lost race, tribe, city, or country. These are handled well if somewhat repetitiously by Burroughs; it should be noted that this form of adventure writing was perfected by Haggard,

whose works seem likely to have influenced Burroughs. The theme of feralism is itself very old in literature and folklore; it was best known prior to the creation of Tarzan in the *Jungle Books* of Kipling. The Tarzan novels also include Atlantean themes, immortality serums, paleontological survivals, at least one city of intelligent gorillas, and at least one satirical novel (*Tarzan and the Ant Men*) apparently based on Swift.

As Burroughs borrowed from many earlier writers, he in turn was read by and influenced uncounted later writers. The briefest smattering of these must include H. P. Lovecraft, Robert E. Howard, Edmond Hamilton, Leigh Brackett, Ray Bradbury, Gore Vidal, and J. R. R. Tolkien. Direct imitators of Burroughs range from his contemporaries J. U. Giesy and William L. Chester, to many present-day writers including Lin Carter, Michael Resnick, Anne McCaffrey, John Norman, and Philip José Farmer. In most cases, where the imitation of Burroughs is very literal the result is a rather lifeless pastiche; where Burroughs's influence is less specific and the later writer uses Burroughs as a wellspring of color, verve, and suspense, the result is often admirable.

—Richard A. Lupoff

**BURROUGHS, William S(eward).** Also wrote as William Lee. American. Born in St. Louis, Missouri, 5 February 1914. Educated at John Burroughs School and Taylor School, St. Louis; Los Alamos Ranch School, New Mexico; Harvard University, Cambridge, Massachusetts, A. B. in anthropology 1936; studied medicine at the University of Vienna; Mexico City College, 1948-50. Served in the United States Army, 1942. Married Jean Vollmer in 1945 (died, 1951); one son. Has worked as a journalist, private detective, and bartender; now a full-time writer. Heroin addict, 1944-57. Recipient: American Academy Award, 1975. Member, American Academy, 1983. Lived for many years in Tangier; now lives in New York City. Agent: Andrew Wylie Agency, 250 West 57th Street, New York, New York 10107, U. S. A.

\* \* \*

Best known as a leader of the American Beat movement, despite the cosmopolitan influences on his work, William S. Burroughs has repeatedly used science-fiction situations and images in his often bizarre novels of protest against social control. Burroughs has been praised as one of a select few major authors writing in English, if not a contemporary genius. However, his frequent opacity seems to have daunted criticism and has led to some cries of exasperation or outrage from critics, such as Martin Seymour-Smith's reference to his "monumental stupidity." In fact, Burroughs demonstrated his ability to write with conventional intelligence in his first novel, *Junkie*, and has done so again in his recent *Cities of the Red Night*. *Junkie* is an autobiographical confession of a morphine addict—it is also a map of Hell, attacking a spiritless society and its gratuitous abuses of power. Despite the autobiographical element, Burroughs shows a degree of detachment from his narrator, an unsettled picaro who sometimes interprets himself as an idealistic quester.

Burroughs's reputation rests mainly upon the four novels *The Naked Lunch*, *The Soft Machine*, *The Ticket That Exploded*, and *Nova Express*. These form a tetralogy which attacks the obsessive need for control which Burroughs sees as having gripped our planet. That obsession is often given its focus in such science-fiction images as the dystopias and advanced behavioural technologies of *The Naked Lunch*, and the ubiquitous fantasy of metamorphosis into arthropod form to repres-

ent the dehumanization of both controller and controlled. Especially in *The Ticket That Exploded* and *Nova Express*, Burroughs presents the extended metaphor of an invasion by aliens—the Nova Mob—whose members act through and control humans who share their weaknesses and predilections. *The Ticket That Exploded*, the more accessible of these two novels, makes it clear that the aliens are a metaphor for controlling powers on Earth, presented as if they could be only a Manichean force of evil from space.

It would be easy to condemn these novels for their frequent opacity and the paranoid sensibility which they seem to reveal. However, Burroughs does write with admirable confidence, power, and surreal detail; where the prose is readable at all, the phrasing is sharp and the dialogue unsentimentally convincing. The difficulty is that, as Burroughs has admitted in *The Job*, a series of interviews with Daniel Odier, the prose is sometimes "simply not readable." This is mainly the result of Burroughs's so-called "cut-up" and "fold-in" techniques: the mechanical rearrangement of sliced-up pages and the juxtaposition of words from quite different texts. Both Burroughs's admirers and his detractors have over-emphasized the genesis of the prose in these techniques, rather than the patterns of meaning which (sometimes) result on the page.

Since the publication of *Nova Express*, Burroughs has frequently appeared to be more a sage—an unsystematic philosopher of life—than a creative artist. Unfortunately, he has not been helpful in his role as a sage. A study of his interviews and theoretical works reveals occasional insights hidden amid obsessive and often inhumane pronouncements, such as this, on women: "I think they were a basic mistake, and the whole dualistic universe evolved from this error."

However, in his most recent major work, *Cities of the Red Night*, Burroughs has recast the vision of his great tetralogy in a form which is creative, lucid, and fascinating. Drawing upon elements of time-travel, space visitation, alternative history, and multiple realities, the book enacts a layered myth or series of myths of the Fall, fragmenting into shards from different realities before ending with a menacing vision of nuclear apocalypse. *Cities of the Red Night* will pay detailed study to crack fully its codes of recurrence and levels of reality.

Of Burroughs's other works since *Nova Express* perhaps the most compelling for science-fiction readers is *The Wild Boys*. This novel begins as a series of linked apocalyptic vignettes which are pulled together as the story emerges of packs of homosexual specialist warriors who are able to outfight conventional armies, and who ravage their near-future world. The book is a projection of the need which Burroughs feels to destroy all present-day institutions, including the family and the national state.

#### F. M. Busby comments:

I like to write science fiction because it gives me more room to breathe.

\* \* \*

F. M. Busby deals with "characters who are pushed hard by necessity and who generally manage to cope," or he puts his characters into "predicaments that could not exist in our own past and future."

In novels such as *Rissa Kerguelen*, Busby develops the theme of identity, with convincing detail, ironic and comic touches, and a quality of space opera and adventure. In Busby, it is man (and woman) against the establishment, identity versus those who would seek to assimilate the individual. He writes of "rebels who find themselves"—dissidents and outlaws on their escape ships and hidden worlds.

Busby taps a rich mine of science fiction: parthenogenesis, Total Warfare Centers, maltreated aliens, "ships that come from nothing," telepathic murders, time-warped drives are all persuasively and painstakingly described.

He explores the motif of the self as well as any writer in the genre, often using nakedness as a symbol of a character's quest for self-discovery. Barton, in *The Demu Trilogy*, is a caged prisoner of crustacean creatures who attempt to rob humans of their own identities and re-create them in their own self-images. Busby investigates the motives of his characters, who plot for revenge and heroism and revel in the pleasure of that revenge and their own self-survival. Survival is a theme as important as identity in Busby's fiction; the two, in fact, are linked.

Three novels that deal with Bran Tregare (before he meets Rissa, *Star Rebel* and *Rebel's Quest*, and their later adventure of primitive survival, *The Alien Debt*) pursue these themes in greater detail. In Bran, Busby depicts a protagonist who rises

above circumstance to sacrifice his own humanity for the good of humanity, though the reader sympathizes with Bran's pursuits and paradoxes. Bran does things that others cannot live with, but he is a person who also knows that "sometimes to survive you have to become a monster." He eventually achieves his goal (defeat of UET) and regains his identity through his love for Rissa and their daughter Lisele. Rissa, strong and stable, similarly wonders about her own identity, as someone who can turn from gentleness and love to ruthlessness and sadism. She comes in time to redress her problems and to understand how her life "was still beginning."

While Busby continued his Hulzein saga with *All These Worlds* and *Zelde M'Tana*, his short fiction remains most impressive.

"Tell Me All about Yourself," for example, is a bitter-sweet story about a lonely man's experience in a Necro house in Japan. The purpose of the place, supposedly, is that you do not have to talk to the women, but Dale selects a superlatively preserved virgin corpse whom he would actually like to get to know, someone, it seems, he had always been looking for. He feels foolish talking to the girl, so he steals her and casts her off to sea in a blaze, toward a death with dignity. Her only response to him had been a ubiquitous smile. Busby understates the macabre brilliantly in this story about the need for communication in love.

"If This Is Winnetka, You Must Be Judy," is a fascinating story, almost a spinoff of Heinlein's "All You Zombies—." The story deals with Larry Garth's ability to wake up periodically into a different time zone in his life. Busby gains a perfect sense of verisimilitude, with casual references to "circular causation," "research into the parameters of now," and "infancy skips." When we meet Garth, he has no idea how much of his existence had been lived "back and forth in bits and pieces." Busby uses this zig-zag experience as its own metaphor, set up against those of us who live "solely from one view that plod[s] along a line and [sees] only one consecutive past."

"First Person Plural" employs a similar conceit. Ed Carlain awakens to discover he has undergone a consciousness transfer with a once-comatose Melanie Blake. Despite a sense of loss, Ed and Melanie come together to cope with their incongruities: "she was himself, one day behind himself." The two must share their lives with "one . . . memory between them." But the idea of confused sexual identity reveals the overall theme Busby wishes to convey: "If I can't accept ME, I can never accept any man."

Octavia E. Butler comments:

I began writing fantasy and science fiction because these seemed to be the genres in which I could be freest, most creative. I had in mind from my first novel a series, a fictional history of people called Patternists who are, by mutation and selective breeding, developing psionic abilities. The books of this series are, in the order of the events they cover, *Wild Seed*, which begins in 1690, *Mind of My Mind* (present-day), *Survivor* (near future), and *Patternmaster* (distant future). The books are stories of power—adjustment to power, struggle for power, corruption by power. I bring together multi-racial groups of men and women who must cope with one another's differences as well as with new, not necessarily controllable, abilities within themselves.

A non-Patternist novel, *Kindred*, tells the story of a young black woman of the 1970's who is shifted back in time to the ante-bellum South where she is enslaved and forced to fend for herself in a world almost as hostile and alien to her as another planet.

\* \* \*

In her novels Octavia E. Butler creates a future history, beginning in 1690, focusing on the present and the creation of a patternist society, then moving to the future in *Patternmaster*, *Survivor*, and *Clay's Ark*. Although she has developed into a first-rate short-story writer and written a non-patternist novel, *Kindred*, which puts a strong modern woman back into a time when her race and intelligence make her a threat to society, Butler's uniqueness in SF is the concept of the bonding of people with para-normal abilities into a society apart from others. Her work develops the ideas of Theodore Sturgeon's classic *More Than Human*. As well as being an inventive storyteller, she is a writer with messages. Consistently her books attack racism, sexism, hypocrisy, and class divisions. Though she keeps strong black women center stage, Butler handles interactions of a large cast deftly.

Within the context of Butler's work *Wild Seed* is chronologically first in the Patternist series, explaining how Doro accumulates his breeding stock. For centuries, before Christ, Doro searched for people with mental gifts like his own. When in 1690 he finds a 300-year-old woman who can assume any form she wishes by manipulating DNA, he humiliates her and manoeuvres her to produce special children. Her assertiveness

makes her his favorite and confidante. At Anyanwu's death, Doro links with her—the first time he has used his mental power without killing the other person. This technique enables Mary to create the eventual pattern.

While telepathic powers are common in SF, a society of linked telepaths controlled by the most powerful of them is not. Patternmaster's vagueness is clarified in *Mind of My Mind*, which tells of the dynasty's founding in Forsythe, California. Doro's grand plan succeeds in his daughter Mary. References to Los Angeles, child-beating, shop-lifting, revivals, and everyday names like Rachel, Jon, and Karl indicate the present. The prologue breaks the commonplace by the simple statement that Doro (an uncommon name) was wearing a new body. Until her transition from latent to active, Mary is a disturbed, sullen slum child. Just before she reaches full power, Doro marries her to a wealthy telepath, Karl Larkin, just as he had found the right mate for Anyanwu. At first antipathetic, they form a strong attachment and become the "First Family" after Mary gathers such diverse telepaths as healer, artist, and teacher, who have led unhappy lives. She forms potential enemies into a pattern of minds attached to hers like threads. Before long they have rescued latents from squalor, crime, and death, making them a Southern California network of 15,000. Mary fights Doro to win independence for her people.

*Mind of My Mind* is a sort of companion to the other books. The art practiced by Amber in *Patternmaster* grows from Rachel's faith-healing. The system of arranging patternists into separate houses with the Patternmaster based in Forsythe emerges. Why brothers and lovers kill each other becomes apparent. The use of "mutes," non-telepaths, as servants and the code of honor that prevents their mistreatment develops as a correction of the latent's tendency to maim or kill inferiors. Although the other books can be read separately, this book shows how the society is established and run.

*Patternmaster* leads toward the inevitable duel of Teray and Coransee to determine their father's successor told in a bare, straightforward narrative. Mary's pattern has developed so that there are housemasters controlled by a Patternmaster. Low-level patternists manage mutes, and healers repair mental and physical damage. The young mature in schools, and after transition are attached to housemasters, learning skills, or become outsiders, remaining inferiors. The enemy Clayarks are mutants with lion-like bodies and human heads. They use rifles and protective gloves, speak, and capture mutes. Their hatred leads to Rayal's death from the incurable disease they are driven to transmit, a result of organisms the starship *Clay's Ark* brought to Earth. The plot is remarkably like *As You Like It* in conflict, escape from society, and the dynamic heroine. Its conclusion suggests a renewal of society through the union of patternists who show concern even for Clayarks.

*Survivor* deals with mutes whose goal is to spread the concept of normal man's superiority through the universe. Encountering people who communicate not only verbally but through changing the color of their fur, they misjudge them. Soon they are dominated by the Garkohn, who enslave them with the drug meklah. Before being adopted by the missionary leader, the Afro-Asian Alanna lived off the land as a wild human. When captured by the enemy Tekohn, she alone survives withdrawal from meklah. In fact, Alanna adapts so well that she becomes an honored hunter and wife of their highest judge. Returning to the missionaries, she and her husband help them to freedom. Ironically, the missionaries seeking freedom from patternists and Clayarks find themselves dominated by the so-called animals they had hoped to enslave. Prejudice endangers survival. Because she is willing to change, Alanna is a survivor, enduring through trial as the patternists have to survive

transition to achieve greatness.

*Clay's Ark* explains the origin of the feared Clayarks, the patternists' chief antagonists. The society of the near future seems to be based on the Mad Max films, with people living like scavengers in a violent world. As they cross the California desert, Dr. Maslin and his twin daughters are kidnapped to become part of a commune of victims of a parasitic life form that weakens and strengthens its hosts. The "monsters" emerge as more humane than the perverted normal specimens left in the society. As in much of Butler's work the time and point of view shift so that the novel fits together like a colorful jigsaw puzzle in a plain box.

Butler's work is thought-provoking, suspenseful, exciting, and internally consistent as she continues to develop her special future. She has created a world of her own while being contemporary in choice of themes, protests, and in her use of strong, admirable women and minority characters. Already her books have the depths of classics.

\* \* \*

Samuel Butler was the son of an Anglican rector, whom he later immortalized in his grim autobiographical novel of Victorian family hypocrisy *The Way of All Flesh*. He graduated from Cambridge in classics, then worked for one season among the poor in London, as a result of which he did not become a clergyman but moved instead to New Zealand. From 1859 to 1864, he managed there a sheep-ranch, began to write about the country and about the new and sensational theory of evolution, and gathered the elements for his novel *Erewhon*. His other writings attacked received opinion in religion, biology, philology, and child-rearing, proposing alternatives which are today generally seen as eccentric, though the controversy around his Neo-Lamarckism is by no means over.

Though Butler's literary masterpiece is *The Way of All Flesh*, some reversals from his country of Erewhon (itself to be read backwards as most other names in the novel) are as interesting and more modern. This civilization, found (as the subtitle has it) "over the range," in an unexplored part of the traditionally upside-down Antipodes, is used for satirical discussions; most importantly, the Erewhonians establish to their satisfaction that machines are using mankind as a means for their indirect evolution and ban all of them, beginning with clocks and watches. Other exposures of the ulterior moral motives, and thus of the hypocrisy of Victorian bourgeois society are the perfectly logical value-transferral between illness and crime, Unreason and Reason, or religion and banking. Unfortunately, Butler's overall stance is not at all consistent: for a crucial example, if the time-quantifying tool of clocks is banned, the basic agent of quantifying in modern civilization, money, should logically also be banned instead of being promoted as the religion of Musical Banks. Thus the various elements of Erewhon become mutually incompatible as the sketch of a believable alternative. As Edmund Wilson remarked, "Butler, though he could be most amusing about people's

mercenary motives, was too much a middle-class man himself to analyze the social system, in which . . . he occupied a privileged position" (*The Shores of Light*, New York, 1967). The novel dissolves into a string of more or less unrelated satires of the surfaces of Victorian civilization, hesitating between Swiftian bite and middle-class propriety, mildly diverting paradox and cynical justification (though, beside the amusing passages, the fable of the Unborn—who foster the libido of their parents in order to incarnate—retains a certain Platonic charm).

The continuation, *Erewhon Revisited*, is more coherent but less broadly relevant, focussing as it does on the religious cult that has sprung up in Erewhon around the totally misunderstood narrator of the first novel, now promoted to "Sun-child" in a clear parody of Christ (making this novel a continuation of Butler's *Fair Haven* at least as much as of the earlier satire). What is worse, this sequel retracts even the partial estrangement of *Erewhon*, as well as its own satire on the founding of religions, by its final horizon of salvation through annexation to the British Empire.

Butler's SF, thus, remains incidentally amusing reading, especially in the first book. However, its primary importance is in the satirical prefiguration of what will later become a much more anguished and wider debate on reification and "machine consciousness" in cybernetics, as well as in the general argument about controlled evolution. Butler had therefore an important influence on subsequent SF, from such Victorians as his friend R. E. Dudgeon through J. Carne-Ross, W. J. Roe, and W. Grove to G. B. Shaw's drama-cycle *Back to Methuselah* and some American SF. But his main problems will be picked up and brought to a more sophisticated level by Wells, Zamyatin, and Capek. There remains the striking freshness and irreverence of Butler's best satirical passages.

\* \* \*

Martin Caidin builds on his numerous non-fiction works concerning aviation and aerospace technology to provide convincing background for his speculative fiction. This fiction, set in the present or near future, consistently warns that America's naive idealism about peaceful cooperation in outer space should be tempered by a realistic awareness of nationalistic competition, that our technological capabilities are outstripping our emotional and psychological controls, and that a technological, materialistic, and empirical approach to phenomena fails fully to account for and control such phenomena.

Some of Caidin's books explore what could go wrong with a space flight: personal problems that affect efficiency (nagging wives, wayward children, secret affairs, drugs, and blackmail) in *The Cape*, the possibility of foreign sabotage on the ground (*The Cape, No Man's World*) or with laser beams in space (*Cyborg IV, The Mendelov Conspiracy*), technical and mechanical difficulties (*Marooned*), bombardment by meteors and invasion of alien bacteria (*Four Came Back*), and hostile confrontation on arrival (Russian and Chinese in *No Man's World*). Minor characters and anecdotes from one book become major characters and events in another. For example in the background of several books is a boorish newspaper man who intrudes where he doesn't belong, but who gets his story and ultimately helps out. In *Marooned* this brash, intuitive reporter breaks through NASA security to learn the truth of an astronaut's plight; in *The Mendelov Conspiracy* he investigates UFO's that prove part of an international scientists' plot to force the world to nuclear disarmament.

*The Long Night*, a terse and vivid step-by-step portrait of a family and town confronted with an atomic explosion and resultant fire-storm, demonstrates Caidin's interest in how people react to disaster or panic. Caidin believes a military elite must use force if necessary to quell irresponsible, destructive mobs born of irrational fears—a theme in *Four Came Back* where earthlings fear alien bacteria, *The Long Night* where rumors of radiation sends hordes flying, and *The Mendelov Conspiracy* where mobs attack nuclear stockpiles. To teach his audience about sea and space and disaster, Caidin relies on digressions, flashbacks, reverie, and experts explaining to neophytes, techniques that provide a wealth of interesting material, but which occasionally reduce the effectiveness of the plot. Caidin blends fact and fiction, the feasible and the speculative. His forte is his reliance on quotes by real men to make his tales of the emotions and conflicts of the near future seem perfectly natural and credible.

A Caidin hero is a tough, well-trained military man. He is proud of his work, devoted to his country, a man who can face up to and control his fear while those around him panic or succumb. Usually a one-time test pilot, he works hard and plays hard. His is a world of machines, whether in outer space or hydrospace. He is often excited and inspired by a strikingly beautiful, intelligent, and independent woman (secret agent, archaeologist, oceanographer, bionics expert, astronaut), but usually this romance remains unresolved or the woman dies suddenly, violently.

Caidin is fascinated by the idea of man and machine becoming a harmonic single entity—either in terms of sensitive reaction time or else literally as in the Steve Austin series. In *The God Machine* the ultimate computer is designed to interact with human operators and to mimic and transcend human logic, but a programming fault results in the horror of logic being carried out to literal, absurd, and inhuman ends. In *The Last Fathom* the developer of a revolutionary submarine manoeuvres at incredible depths to prevent the devastation of

the free world. *Cyborg* is a fascinating and highly technical dramatization of the reconstruction of a test pilot's body, with microscopic units replacing the nervous system, and a fusion of bone and metal replacing missing legs and arm until the man becomes more than mere man, capable of gruelling (and incredible) missions to expose Russian submarine bases and steal experimental planes. *Operation Nuke* and *Crystal* feature further cyborg wonders as Austin plays fugitive to infiltrate a terrorist organization dependent on nuclear arms and then races to find the power source of an ancient Indian civilization—a giant crystal. In *Cyborg IV* Austin, linked symbionically to his space vehicle to control it with thought and reflex action, attacks Russians in space to protect military security. Such missions are the price his country demands as payment for not leaving him a helpless paraplegic.

In general, Caidin's best pieces describe specific disasters to make the reader aware of the full horror of nuclear wars and other modern technological dangers. While emphasizing the courage and strength needed for controlling and surviving in experimental machinery, Caidin also demythologizes the glamour by focusing on practical, minute-to-minute detail. Perhaps his greatest contribution is in illuminating the relationship between man and machine to show that man must avoid becoming machine-like if he is to remain human.

\*

Ernest Callenbach comments:

It might be reassuring to other writers to know that *Ecotopia*, which has now been translated into eight languages and sold about 300,000 copies, was rejected by all major New York publishing houses; it was then initially published by the author and a group of his friends, using the employee-owned book wholesale house, Bookpeople, as distributor. Presumably the allergy of establishment publishers to the work was due to its being half-novel, half-tract; it is, so to speak, "politics fiction," making certain fictional assumptions and following their consequences much as "normal" sci-fi does with scientific assumptions; its technology is actually quite conservative.

The favourable response that *Ecotopia* received (except in Britain, where its Californian origins seem to have ensured disdain for it except among scientists and a few ecologically sophisticated readers) led me to write a "prequel," *Ecotopia Emerging*, which sketches a scenario for how *Ecotopia* came into existence.

\* \* \*

Ernest Callenbach is not a professional writer of science fiction; he is a reformer, an environmentalist, a "small-is-beautiful" proponent of the shift from a society devoted to technological progress to one more closely allied with nature. In his non-fiction *Living Poor with Style* he suggested that "Out of the welter of present industrial society it will probably take us several generations to sort out the few things which are essential to mankind—and to reject the others, of which no truly human or holy use can be made." But in three later books his imaginary land of *Ecotopia*, formed by secession of Washington, Oregon, and Northern California, is a model of what utopia based on environmentalist principles could look like. *Ecotopia* is a utopian novel in the traditional sense; *The Ecotopian Encyclopedia for the 80's* is a non-fictional series of entries on how to live in the *Ecotopian* manner; *Ecotopia Emerging* describes events leading to the secession. Together they form a fairly complete picture of the problems of attaining an ideal society, life in that society, and the impact of that society on a traditional 20th-century society.

*Ecotopia* describes a very different society from that of the United States, and the six-week assignment in the new country of the investigative reporter Will Weston is the first officially arranged American visit in the 19 years following secession. Both governments have hidden agendas: the American to restore good relations and perhaps lead the wandering states to return home, the *Ecotopian* to teach the visitor to understand their way of life and convert his countrymen to that view. The old problem of utopian writing, how to justify long descriptive passages, is solved by alternating excerpts from Weston's private diary with formal columns sent by way of Canada to his newspaper. The real story is in the contrast between the two kinds of reporting and in Weston's slow change from skeptical hostility to friendliness and, eventually, conversion. There are numerous friendly *Ecotopians* who help the visitor to adjust to and understand the new society, but the most important character besides Weston, the archetypal utopian visitor, is Marissa, a free-spirited woman whose love probably has much to do with his decision to remain in *Ecotopia*. President Vera Allwen, who appears mostly on TV but meets Weston once in

person, takes the important but comparatively minor role of showing the visitor that Ecotopian individuals and their government are very much alike—independent and caring.

Although *Ecotopia Emerging* is billed as “prequel” to the earlier novel, its action begins in 1986—secession is accomplished in 1988 rather than in 1981—and the earlier novel is actually referred to as a source of ideas for the Survivalist Party which engineers the whole project. A new character, 17-year-old Lou Swift, invents a cheap and efficient solar-electric power cell, Marissa’s cancer-ridden mother blows up a chemical plant, her brother Ben may or may not have planted nuclear bombs in major cities, and Vera Allwen, a state senator, slowly moves to leadership of the gradually more and more aggressive party. The secession begins on a small scale and spreads; the expected civil war fails to materialize (the “Helicopter War” of 1982, important in *Ecotopia*, is not mentioned); an agreement is reached for peace between Ecotopia and the United States; the Ecotopian constitution is written. This “prequel” is even more polemical than its predecessor, but it is much more interesting as a story and much more characteristic of science fiction.

Whether Callenbach will write more novels that are Utopian or even peripherally science fiction, as these are, is problematic. His interest is clearly in the reform of society, not the writing of fiction. On the other hand the experience of the past shows that there are few better ways to get a message across than to take advantage of the flexibility science fiction and utopian writing offer.

—Arthur O. Lewis

\*

Critical Studies: *John W. Campbell: An Australian Tribute* edited by John Bangsund, Canberra, Graham and Bangsund, 1972.

\* \* \*

Had it not been for John W. Campbell, Jr., science fiction as a publisher’s category might have perished with the demise of the pulp industry. As editor of *Astounding* (later *Analog*) *Science Fiction*, from September 1937 to December 1971, he demanded good writing and sometimes got it. That is his achievement (never mind his cranky indulgence in Dianetics and the Dean Drive), and he set the standard with the better of his own stories. As a result, his magazine attracted enough story-tellers that it and the science-fiction genre remain in

existence today. (The stories of reasoned fantasy he published as editor of *Unknown Worlds* are, however, no longer current.)

His early stories take off from the space operatics of E. E. Smith, but with that extra something-to-say that interested the industrial scientist who became his chief readers. The something that must have interested them was the idea of professional collegueship which stressed the intellectual value of shared discovery; the outcome of the research and development was not a new consumer product, but something to save the species.

Campbell's first story, "The Voice of the Void" (1930), set the pattern. Men ten billion years in the future prepare to leave the planets of the solar system because the sun is dying. By this time, science had become central to the human way of life and a scientist in training takes a 70-year course at an engineering school, where making inventions is part of the curriculum. Graduates from such schools have been gathering for generations to meet the growing emergency of the sun's death. At last they develop a matter transmitter that sends fleets of spaceships to another system of planets orbiting the giant star Betelgeuse. They accomplish this in a spirit of professional association, men of pure science called to salvationist duty, but in just those fields—aviation and broadcasting—under commercial development at the time of writing. Likewise in "Twilight" a time traveller from the far future asks what are the most important inventions of the day, and the answer is "airplanes and radio."

The pulp tradition of SF that Campbell elevated above adventure fiction—the last refuge of rugged individualism in American letters—was a world of "pooled mental resources." His intellectual hero was attractive to the young student or professional scientist in industry whose job was anything but free to explore wherever the research team's curiosity might lead.

Two groups of Campbell stories follow through with a standard set of heroes. The more popular one is the Arcot, Morey, and Wade series. Dr. Richard Arcot, a world-famous physicist, works for the research laboratories of Transcontinental Airways, selling it his inventions under the patronage of its president, who happens to be the father of Arcot's colleague, the mathematician Morey. Wade, introduced during the course of the first story, "Piracy Preferred," is an air pirate who preys on Transcontinental's great 30,000-passenger superplanes with a device for making his marauding aircraft invisible, but after being captured he joins Arcot's lab staff. Fuller, an aeronautical design engineer, joins the group in "Solarite," and proves his worth in *Islands of Space* by designing a faster-than-light ship on a principle discovered by Arcot. All four then make a tour of the cosmos. The title islands are island universes, galactic nebulae. Financing a tour of these is more than even Transcontinental can afford, so its president helps Arcot raise the rest in popular support from "the wealth of two worlds," Earth and Venus. All this is spent on a fantastic adventure of observational science. But the debt is repaid when the group is able to deal with an alien threat in *Invaders from the Infinite*.

The other story series is *The Planeteers*, dealing with Penton and Blake, a pair of cosmic explorers who land on various worlds and solve exotic puzzles. But again this had survival value. Curiosity is a tough-minded quality because what observation reveals is that "change is the natural order of things." Science is "a method of thinking" that can meet "goals ahead larger than those we know" by knowing how, when the problem is upon us, "to produce that which never existed." Science is the way mankind educates itself to meet the challenge of necessity.

Campbell's test of survival is nowhere dramatized more forcibly than in *The Moon Is Hell*. The first rocketship to the

moon crashes and its crew of research scientists, stranded on the dead rock, win from the object of their curiosity food, water, and air. This is the research and development process glamorized in a power fantasy that makes its most important business the winning of life itself. "Machines and gadgets aren't the end and goal; they are the means to the true goal." The commercial products of the technological revolution are but objects of practice on which to learn and organize the skills of innovative group thinking, come the day of unexpected crisis.

Curiosity is the mainspring of human adaptability, and may very well drive the products of man's inventions when he himself is gone. In "The Last Evolution" Campbell introduces an original concept of robots, heretofore imagined only as workers or slaves. He has them become man's evolutionary descendants. They are "science machines" that make other machines. They supercede man, but surprisingly they end by recreating him. The machines brings to perfection man's urge to explore and do research and create that which never before existed.

A technology that outlives its makers is also the theme of Campbell's most famous story, "Twilight." 88 million years in the future, man is extinct, but his great automatic cities are still in place. The deathless cities go on with "the tireless, ceaseless perfection their designers had incorporated in them."

Perhaps the best work of fiction Campbell ever wrote is "Who Goes There?" An alien monster is found frozen in the Antarctic ice, buried with its ship, by a team of scientists doing weather research. Once thawed, it gets loose in their camp and changes form by imitating one or more of the sled dogs and one of the men, down to their cells and memories. The dogs are killed, but the problem remains how to discover by some test which man is the monster before it takes over the camp and then the whole world. The leader of the expedition is the tough-minded scientist who has the intellectual prowess to do just that. He devises a blood test, taking a sample from each man and touching it in turn with the tip of a hot needle. The monster not only replicates any body it takes over, it reduplicates itself in every cell of that body. The test is this: when irritated the monster's "blood will live—and crawl away." It does, and the man whose sample it is reveals himself in hideous form. Alert for the transformation with poised axes, the others hack their false colleague to pieces. These few men, outnumbered by millions of life cells, all intelligent, were not defeated. Humanity is *real*, monster-hood is false. Humans have "not an imitated, but a bred-in-the-bone instinct, a driving, unquenchable fire that's genuine."

The monster is no villain: it is a problem. And to be conquered it must be understood, as must all the other unpredictable threats of nature in a universe of constant change. It is deadly to *adapt* to nature, a lazy, undisciplined way that leads to digestion by the cosmic process; survival means *control* of nature. The monster is the opposite of humanity because it goes with nature, not against it. For curiosity it has mere cunning, for pooled mental resources collective imitation. And here is the political note in Campbell's thinking, often sounded in his magazine editorials. For him, collectivism is a monstrous thing that would devour human ideals, but should not be able to do so as long as the superior strength of individuals is united in free association.

—Leon Stover

CAPON, (Harry) Paul. Also wrote as Noel Kenton. British.

Born in Kenton Hall, Suffolk, 18 December 1912. Educated at St. George's School, Harpenden, Hertfordshire. Served in the Royal Army Service Corps, 1940; Technical Director, Soviet Film Agency, 1941-44. Married 1) Doreen Evans-Evans in 1933, one daughter and one son; 2) Amy Charlotte Gillam in 1956. Free-lance film editor and scriptwriter for London Films, 1931-32, Gaumont British, 1933-35, Warner Brothers, 1936-37, British National, 1944-48, Walt Disney, 1955-58, and Granada Television, 1959-62; Head of Film Production, Independent Television News, London, 1963-67. *Died 24 November 1969.*

Paul Capon's novels have had very little distribution in the United States and he is generally unknown there, which is surprising in view of the large number of inferior writers whose works have been reprinted from their original European appearance. He received most attention with the Antigeos trilogy, portions of which were broadcast on the BBC. Antigeos is a twin world to the Earth, located at the opposite side of Earth's orbit, hidden from us by the bulk of the sun. This impossibility has recurred frequently in the genre, and is just plausible enough to be fascinating to casual readers.

Antigeos is a Utopia of sorts, or at least it is until the unscrupulous Earth humans arrive. In the first volume the initial contact is made, but the unpleasant results don't become evident until the middle volume where human vanities and greeds begin to work their way on Antigeos. In the final volume a group of financiers plot to exploit the newly discovered world as an involuntary colony, until they are thwarted by the true at heart.

The rest of Capon's adventure novels have been dismissed as juveniles, and two at least very definitely are, *The Wonderbolt* and *Flight Of Time*. But Capon's excellent narrative ability makes some of them of interest to adult readers as well. There is an alien invasion from Poppea in *The World at Bay*, for example, unique in that the aliens arrive in diminutive space stations. *Phobos, The Robot Planet* has as its central character the entire Martian moon, which we learn to be a gigantic robot spaceship which wanders around kidnapping people out of curiosity rather than malice. This latter novel is lighter in tone than the others, and has its moments of genuine humor.

Paul Capon went on to write one major adult novel, *Into the Tenth Millennium*, and made use of one of the oldest of science fiction plots—the journey into the future to visit a Utopian society. Capon transports three modern-day humans via drugs to a future society which does seem to have solved most of the significant societal problems, and we are treated to an unusually entertaining tour of that society. Never ignoring the need to sustain interest, Capon avoids preachiness, and portrays for us a world that is realistic as well as Utopian, a goal never achieved by most of the "classic" works of this type.

Capon was not particularly prolific and attracted little attention with his books, all of which are presently out of print. This is surprising because his narrative technique is masterful and his plots, while familiar, are not more so than many another far more successful novel. The predominance of young protagonists may well have stereotyped Capon as a writer of juveniles, making it impossible for him to reach a more adult audience with his more serious work.

—Don D'Amassa

**CARD, Orson Scott.** Has also written as Brian Green. American. Born in Richland, Washington, 24 August 1951. Educated at Brigham Young University, Provo, Utah, B. A. in theatre 1975; University of Utah, Salt Lake City, M. A. in English 1981. Married Kristine Allen in 1977; two sons and one daughter. #### Orson Scott Card comments:

When I tell stories, I generally follow my own unreasoned sense of what should happen—what events feel important and true to the characters. I subscribe to no particular literary school and never deliberately bend a story to fit a preconceived notion of correct writing.

In fact, it is not story writing that interests me, but storytelling. I believe that the art of the storyteller does not exist on paper or in language; rather, the storyteller creates a vicarious memory in the hearers' or readers' minds, using as he can the words of the language with all their nuance, as well as the public memory that binds the community of hearers together.

The reader coming to my work will find that there is only rarely any science in my science fiction. I use the freedom of the genre to create the situations in which my stories can take place, but I never try to predict or prescribe the future. I do not write utopias or rhapsodies to future engineering. I am uninterested in current fashion and so do not write about drugs, rock music, peace movements, or nuclear war. Nor do I attempt literary

experimentation, as it is generally understood—most literary “experiments” today being inferior repetitions of the failures of the modern writers of the early 20th century.

In looking back at my completed tales, both long and short, I find several recurrent motifs, some of which have been noticed (and sometimes complained about) by reviewers. Though I was not aware of these themes while writing, I do believe they are valid reflections of my own unquestioned beliefs about the moral universe.

Repeatedly my central characters occupy an unsought key position in their community; repeatedly they choose to suffer or cause unspeakable pain or sacrifice in order to save the community. Some have seen this as wanton violence; I see it as something holy in human nature, the inborn goodness that denies mankind is evil at birth.

Often my characters are children or otherwise innocent, forced ahead of time into responsibilities they cannot, but nevertheless do, bear. Whether they are children or not, they are always isolated from the community they uphold. They tend to have exceptional gifts and exceptional weaknesses; they are introspective enough to notice their weakness and strength and pain, but not enough to notice their virtue.

My characters frequently have a sense of fulfilling plans they did not make; ultimately, however, they accept all or part of those plans. Their achievements, however, are a direct result of their own choices, actions, and efforts. They are not mere toys of the gods; the gods, implicitly or explicitly, depend in part on the human characters to achieve their own overarching purposes. And all my fiction is infused with a strong belief in the perfectability of human beings, at least in part through their own desires and works.

\* \* \*

Like many young writers—and a substantial number of writers of all ages—Orson Scott Card concerns himself repeatedly with a single theme. This theme is the growth and transformation of the individual. It is the story of coming-of-age, the story of the rite of passage, the story of the transformation of the boy, clever and ambitious but ignorant and dependent, into the man of maturity, responsibility, and power.

Card’s earliest story, “Ender’s Game,” offered a brief glimpse of precisely this concern. It deals with Ender Wiggin (the odd first name is actually a nickname, and is significant) and his selection for enrollment at an elite and crucially important military academy. The story was immensely popular, and established Card from the outset as a favorite with readers of *Analog*, the leading science-fiction magazine. It also marked the beginning of Card’s association with editor Ben Bova; as Bova moved from post to post in the late 1970’s and early 1980’s, Card’s stories and books continued to appear under Bova’s tutelage. When it was revealed that Bova’s wife was also Card’s literary agent, strong criticism was expressed over potential (or actual) conflict of interest. Regardless of this controversy, Card has continued to prove himself a solid and continuously growing talent. He is, not surprisingly, much like one of his own protagonists in this regard.

His next major success, also in *Analog*, was “Mikal’s Songbird.” Thematically similar to “Ender’s Game,” “Mikal’s Songbird” is concerned with the selection of a young boy to be trained as the personal “songbird” of a galactic emperor. The position of songbird carries elements of poet laureate, court jester, and (at least on a level of inference) boy-love for the emperor. In addition to the theme of personal growth, “Mikal’s Songbird,” when built into the novel *Songmaster*, is

concerned with the ecstatic or transformational experience. In this case the ecstatic state is achieved through song; the book commends itself to comparison with Thomas M. Disch’s *On Wings of Song*. Card’s treatment of the theme is more serious than is Disch’s; where Disch is often wry and occasionally evasive, Card is earnest and relatively direct, although by no means lacking in subtlety.

Even Card’s lesser works carry out the major theme of his fiction. The early story-cycle *Hot Sleep*, revised and expanded to form *The Worthington Chronicle*, is of particular interest in the manner in which it shows Card’s own development of his skills and techniques as he carries his protagonist down through a long series of episodic adventures separated by periods of induced suspended animation.

Card has always insisted on maintaining his identity as a writer of science fiction but not one limited to science fiction. His duality stretches back to his childhood reading. He cites works of Robert A. Heinlein and Andre Norton, read when Card was in elementary school—but mentions that during the same period he was “just as excited by Nordhoff and Hall’s *Bounty* trilogy.” In college he read Bradbury, Tolkien, Clarke, Asimov—but also Ayn Rand, John Hersey, James Clavell, and later Vidal, Renault, and Goldman.

His most important work outside the science-fiction field, to date, is the long historical novel *A Woman of Destiny*. The story of an immigrant Englishwoman coming to America early in the 19th century, the book is heavily researched and beautifully written. Card has expressed anger and bitterness over the treatment given the book by its publisher, starting with a change of its name. The book was written as *Saints*, and was to have been published first in hard covers. The publisher changed the name to avoid identification of the book as a “Mormon novel” (although Mormonism is one of its major subjects), packaged it as a semi-torrid romance (it is a serious novel of character and manners), and published it as a paperback original with almost no advertising or other support.

Following this misfortune, Card returned to science fiction with a full-length novel version of *Ender’s Game*, of which the early story makes up a little more than a prologue. The book suffers from over-familiarity: it is a story that has been told and retold in both general literature and science fiction by authors from Fielding to Heinlein and Haldeman. The young protagonist makes his way despite loneliness and self-doubt from “new boy” to top grad, then enters the “real world” to make his way. Despite its lack of innovation, Card’s version of this familiar tale is exceptionally well written and readable. It is to be followed by two sequels.

Only in his mid-thirties, Orson Scott Card has already created a significant body of forceful and well-crafted work. An industrious worker, he will certainly continue to produce, and will in all likelihood achieve a steadily growing, and well-deserved, stature.

Jayge Carr comments:

It is probably no coincidence that my first published story was titled "Alienation." I have never tried to do anything more than tell interesting stories, about interesting people, written in a precise but readable style. But certain themes do crop up over and over, and alienation, whether of one society from the mainstream, as in "The Pacifists," or person from society as in "Alienation," does seem to be a common occurrence.

I've also discovered quite a bit about myself by reading my own work. Many people, on the evidence of *Leviathan's Deep*, have labeled me a feminist. Well, maybe. I prefer to think of myself as a peoplist. Every one should have equal opportunities and no one should be shoe-horned into a role unfitting or barred from a role desired because of sex—or age, creed, color, or what-have-you. "Mustard Seed" may be my best example of a truly egalitarian society. And *Navigator's Syndrome*, of course, a prime example of such a society gone sour. Sometimes, as in *Leviathan's Deep* or "The King Is Dead," I try to show men what it feels like to have the shoe on the other foot, pinching. But women are not our only minority, just the most prevalent one. Prejudice, intolerance, bigotry; all of them are so cruel, and they cause so much tragedy—and they're so foolish. Those who eliminate some people from their friends because of trivial reasons miss so much.

Another theme that keeps recurring—perhaps because I do feel strongly about it—is pollution. Humanity wasting our environment. "Child of the Wandering Sea" is the ultimate of that, where the Terran's population explosion has them taking over—and terraforming—world after world. Where will we go if we don't control ourselves, what will happen if we continue to waste our resources. I haven't any answers, but I can hope that just thinking about it will help, in some small way.

Besides, writing is fun. It is fun to make up a truly alien alien, as in "The Wondrous Works of His Hands" or a truly alien society of human beings, as in "The Pacifists." It is fun to meet new friends, and watch them have adventures. And of course, I can always hope, that if it's fun to write, it's equally fun to read.

\* \* \*

Jayge Carr's first novel, *Leviathan's Deep*, was published in the late 1970's just as feminism began to exert a powerful and controversial influence on science fiction. In addition to Carr's description of a low-technology but intellectually sophisticated alien matriarchate, and her creation of engaging characters—a lustful general/mad scientist, a gifted scamp of a writer, and the honest, brave, and more than slightly zany female narrative viewpoint character protagonist—and her clever, humorous style make this a remarkable book. Equally remarkable is the book's lack of those qualities which "feminist" SF is often (and often justly) accused of containing: stridency, hostility, and special pleading. Carr, a former physicist who encountered sexism in male colleagues, displays compassion, tolerance, and humor that would be completely extraordinary except for her admission that her most villainous male characters are life-

portraits of erstwhile co-workers.

A subsequent novel, *Navigator's Syndrome*, describes the legal and guerrilla battles to rescue a Navigator, the enigmatic, neurotic, and beautiful Jael, from the planet Rabelais, where decadent sadists indulge their worst fantasies on quasi-slaves bound to them by an incomprehensible system of contractual obligations. Jael's struggle is bound up with freighter-master Hannibal Reis's search for his brother, whom the worst of all the Rabelaisian contract-holders has turned into a berserk gladiator, and with the fight of more moderate "c'holders" to impose some sort of justice upon their world. What might be a rather sordid story in less capable hands turns into an intricate narrative of chase-and-find, spiced, of course, by Carr's humor, and by an elusive narrative structure that forces the reader to play detective. In addition, as the characters dodge plots with counterplots, they reveal themselves as richly human, capable of love, loyalty, and great satisfaction when—by the book's end—the punishments are made to fit the crime. In other words (as a yet unpublished sequel, *The Treasure in the Heart of the Maze*, reveals), there is bite behind Carr's whimsy.

In addition, Carr's many short stories display an extremely wide range. Though Carr's hard-science background makes her at home in *Analog*, her elusive, allusive narrative technique fits well with *Omni* editor Datlow's fondness for stylistic experimentation: her fantasy fiction explores a concept Carr calls B & B—Brains and Bewitchery, a sometimes lunatic cross between Mensa-level thought processes and magic.

Her other work includes detective stories and historical novels, again indicative of her wide range. Perhaps due to limited distribution of her novels, Carr is not as well known as she deserves to be among readers: within the community of fantasy and science-fiction writers, however, she is respected as a good craftswoman whose subtlety and disdain for self-promotion and ideological bandwagons keep her at her word-processor instead of on the convention circuit or the soapbox.

—Susan Schwartz

Terry Carr comments:

I've never been prolific as a fiction writer: most of my "career" has been devoted to editing, first as an editor for Ace Books, where I founded the "Ace Science Fiction Specials" series, 1968-71, and more recently as an editor of anthologies.

As a writer I'm known best for stories about alien creatures ("The Dance of the Changer and the Three," "Hop-Friend," *Cirque*, etc.), but in truth this is an outgrowth of my interest in communication between *all* kinds of "people." Short stories such as "Touchstone" and "They Live on Levels" are examples that don't include aliens: the novel *Cirque* has an important alien character but it's mostly about communication between the human characters. Another "theme" in my stories is transcendental experience: see particularly the novella "The Wind at Starmont" and the novel *Cirque*.

\* \* \*

Terry Carr's career clearly illustrates the versatility of many science-fiction personalities. Like other major writers and editors—including Robert Silverberg, Ted White, Gregory Benford, and Harlan Ellison—Carr first gained prominence in the fan community of the 1950's. (His first Hugo Award was for editing the amateur news magazine *Fanac* with Ron Ellick.) This and other amateur magazines helped to launch his career as a professional editor. He also became known for humorous, ironic writing, a significant feature of much of his professional fiction.

In 1961, Carr began writing science fiction professionally. His early novels, *Invasion from 2500* (with Ted White) and *Warlord of Kor*, are clearly potboilers. However, Carr's short stories from the 1960's reveal both literary polish and a fascination with alien beings characteristic of his later work, especially as shown by the millipede in *Cirque*. These qualities are shown in "Hop-Friend," a witty variation on Weinbaum's "A Martian Odyssey."

Carr's mature fiction includes "The Dance of the Changer and the Three" which provides an evocative study of an alien culture as told through one of its myths; "Ozymandias" linking Egyptian burial rituals with cryonics; and "They Live on Levels" in which cultures and characters are gradually revealed through messages between them. All display polish and a wide-ranging imagination.

These qualities also characterize *Cirque*. Carr utilizes the convention of a crisis in the far-future city of *Cirque* to force his disparate characters to change their lives. The novel, thus structured, adheres to the traditional unities of place, time, and action. It relies heavily on coincidence, yet characters and events are made plausible. The city itself is a near-Utopia, maintained by a literal rejection of filth which must be confronted and accepted. Thus the novel is both a psychological study of the need for change, growth, and acceptance, and a religious allegory of the power of love.

Carr's major importance in the sf field has been as an editor. *Classic Science Fiction* is his most important collection, since it offers not only stories from the Golden Age of the early 1940's but also Carr's meticulously researched background notes on

the authors and the period. For his *Universe* series, and the "best of the year" collections, he has become respected as "the editor with impeccable taste."

—Susan Wood

**CARTER, Angela (Olive, née Stalker).** British. Born in Eastbourne, Sussex, 7 May 1940. Educated at the University of Bristol, 1962-65, B. A. in English 1965. Married Paul Carter in 1960 (divorced, 1972). Journalist, Croydon, Surrey, 1958-61. Arts Council Fellow in Creative Writing, University of Sheffield, 1976-78; Visiting Professor of Creative Writing, Brown University, Providence, Rhode Island, 1980-81; Writer-in-Residence, University of Adelaide, 1984. \*

Angela Carter comments:  
Speak as you find.

\* \* \*

Angela Carter describes herself as a Gothic writer; in her fondness for decadent opulence and squalor she is a more stylish Moorcock, with greater charm and humour and less pretentiousness. In her persuasive "Polemical Preface" to *The Sadeian Woman*, she proposes a "moral pornographer" as an artist who demystifies the flesh to reveal "the real relations of man and his kind." More generally, I think she might see her work as that of a "moral mythographer" who creates myths to destroy myths, pornographic writing being one of her weapons. She, more properly than de Sade, is "a terrorist of the imagination": he is too boring and disgusting to be terrifying and she seems over-deferential as well as patronizing in her critique of him. Latterly, she has revealed a strong interest in the ideas of mixed natures and of metamorphosis, revamping classic tales of lycanthropy or hermaphroditism, of which the most charming is the uncollected "Overture for 'A Midsummer Night's Dream'" in *Interzone*. Students of Poe should note the fictionalized reconstruction of parts of his life, published in the first issue of *Interzone* (Spring 1982), "The Cabinet of Edgar Allan Poe."

Most of Carter's fiction may be classed as fantasy, and even the delightful mainstream comedy *Several Perceptions* uses fantasy as its subject. Three of her novels are in the SF genre, two of which are concerned with the harnessing of science in the service of fantasy, so that "science fantasy" might describe

them with particular felicity. The panopticon episode in *Nights at the Circus* fits here, though not the book as a whole, which is a sort of fantastic freak show, less than the sum of its parts but particularly sound on clowns.

In the post-holocaust world of *Heroes and Villains*, civilization has been reduced to ivory towers guarded by Soldiers (the heroes) and menaced by barbarians and mutants. The heroine Marianne, a Professor's daughter, rescues one of the Villains during a raid and flees with him, even though he is her brother's murderer; he rapes, then marries her. The account of their ensuing love-hate relationship is a kind of anti-romance, in which the ambivalent barbaric nastiness and beauty are paraded vividly before us. One of the novel's key themes is the treacherous nature of appearances, yet possibly the book exists principally as the frame for a strange *tableau-vivant* effect, whereby Henri Rousseau's painting *The Sleeping Gypsy* is brought to life.

*The Infernal Desire Machines of Dr. Hoffman*, where an embodiment of de Sade actually appears in one of the Grand Guignol episodes, is a much more powerful and ambitious work in which the author's evidently wide reading among the great satiric fantasists is everywhere apparent. The picaresque hero, Desiderio (a desirer), is on a mission to kill Dr. Hoffman, generator of mirages that drive men mad, and a quest to find and possess Hoffman's daughter, Albertina. The rational find impressionable hero is a reluctant exorcist and the end to his adventure seems of less importance than the erotic and horrific sideshows which distract him on the way. Although her coldblooded "mad scientist" villain is sufficiently evil, his chilling nature is matched by the resolute sangfroid of the author, even while describing multiple buggery, rape, cannibalism, or eye-juggling; the excessive violence is not accompanied by a commensurable emotional response (this distance is also a notable feature of Carter's readings of her own work). One of the best episodes is in a relatively low key, Desiderio's night of love with the somnambulist daughter of an absentee major, his subsequent arrest for her murder, and escape by climbing one-handed up a chimney. The writing is so good in this novel that one wishes it made a better whole, that it had more humour and more seriousness, in Swift's or even in Beckford's manner.

*The Passion of New Eve* achieves a better balance of horror and humour, wit and pathos, self-indulgent fantasy and cool iconoclasm. The hero, Evelyn, is an Englishman precipitated into the American nightmare. Not a nice man himself, he mistreats his black mistress in New York, once a "city of visible reason" but now in Ballardian decay. Fleeing to the desert, Evelyn becomes New Eve when captured by lesbian guerrillas; fleeing from them she is raped by the petty tyrant Zero and becomes one of his harem, of lower status than his pigs. She accompanies the nihilist Zero on his mission to kill the film idol Tristessa, whom Evelyn had worshipped. Tristessa is revealed as a transvestite, impregnates Eve, kills Zero, is killed in error by soldiers while Southern California burns in apocalyptic warfare, leaving Eve, after passage through an Earth womb, to escape American shores bearing her child, committed to the sea like a female Prospero. Machismo is mocked splendidly in both its male and female modes in this satiric anti-mythic novel, a bravura performance.

A few of the tales in *Fireworks* fall sufficiently within the genre to serve as an excuse for reading the whole fantastic collection. In the Afterword the author refers to her Gothic tradition as retaining a singular moral function, "that of promoting unease." She understands the quality of her own art perfectly here.

\* \* \*

Lin Carter's seemingly endless appetite for the varieties of heroic fantasy, sword and sorcery, magic, adventure, myth, and entertainments have led him along a prolific career as a writer and editor. He now stands at a position of command in a number of fantasy-related subject areas, where he is likely to remain for some considerable time.

It is possible and perhaps too easy to score Carter's characters for their lack of depth or complexity; they are nevertheless more layered and marginal—in the best sense of that word—than the characters of many of his contemporary fantasy writers. And besides, his greatest effects come from his expansive and impudent sense of wonder and an attitude reflecting the need of mankind for myth, heroes, superbeings, and magic to pursue the woes that plague it.

Carter's major work to date is the invaluable *Imaginary Worlds*, a thoughtful introduction, analysis, and survey of fantasy literature that is effective without being self-conscious. His section on how magic works is among his better writings. As an editor, his tastes are impeccable, evidenced by the range of choices in *Golden Cities* and *Realms of Wizardry*, both of which bear up after more than ten years.

*As the Green Star Rises* is appealing among his many works for the haunting way he dramatizes the need for faith. *Kellory the Warlock* shows him using humor and magic as entirely compatible bedfellows, *Tower at the Edge of Time* has a feel a menace and concern that clearly taps some hidden concern of the author as well as revealing his characteristic concerns for pace, revelation, and surprise. *The Warrior of World's End* is a typically good Carter set-up for his reach into the future, his ability to create worlds and moods, and his ability to become besotted with the superheroes he has created. *The Valley Where Time Stood Still* shows Carter ringing with nostalgia and good feeling, creating a magical system that is nearly text-book perfect in its liveliness and the way it maintains dramatic solvency: the rules of the magic are clear, vital to the plot, and the stuff good story-telling is made of.

Some Carter work is unabashedly pulpy, and, like the work of Ron Goulart in this context, is more memorable for its celebration of the pulp medium than any great originality.

Carter is, on balance, fun, engaging, and lively; his work holds up in aggregate because of the enthusiasm that spawned it. He belongs, particularly with *Imaginary Worlds*, on the shelf along with Bullfinch's *Mythology* and Fraser's *The Golden Bough*. His principal service is to show what can be done with fantasy in a good-spirited way.

—Shelly Lowenkopf

\* \* \*

Some writers in science fiction, as in other fields of literature, achieve notoriety not for their body of work but for a single story or novel. Tom Godwin ("The Cold Equations") is one such writer. Another is Cleve Cartmill, for "Deadline" (*Astounding*, March 1944). Although "Deadline" has dubious literary merits (predictable plot, pedestrian handling), the story is unique in that it describes, in considerable scientific detail, the manufacture and use of an atomic bomb a year before the United States dropped the first genuine atomic bombs on Hiroshima and Nagasaki. Its publication did not cause an immediate furor in science-fiction circles; it did, however, cause one in the War Department.

Shortly after the novelette appeared, Cartmill was visited by a representative of Military Intelligence and questioned at some length; his file of correspondence with the editor of *Astounding*, John W. Campbell, concerning "Deadline" was also confiscated. Cartmill was later cleared of any wrongdoing, although he was told that he had "violated personal security" in wartime by publicly disseminating the facts contained in the story. These facts, however, were a matter of public record, as Campbell himself pointed out to the Military in denying their request not to publish any further speculation on nuclear fission. Following the close of World War II, "Deadline" became a link in the argument that science fiction is a valid medium for predicting the future. It was also pointed to with pride as an example of science fiction as a "serious" art form for adults, rather than improbable escapism for juveniles, thereby worthy of consideration not only by members of the scientific community but by the heads of government.

Despite the fact that Cartmill's rather extensive output of science fiction and fantasy is largely forgotten today, at least some of it is of a quality to interest the serious student. His best work, perhaps, is the highly imaginative short novel "Hell Hath Fury." Other excellent efforts include his first published story, "Oscar," and a grim little tale called "The Bargain." Cartmill also wrote space opera; popular in the 1940's was his "Space Salvage" series featuring Jake Murchison and his crew of the spaceship *Dolphin* who tackled "impossible" problems and made fantastic rescues in space. The best of these stories were posthumously collected as *The Space Scavengers*, the only book to bear Cartmill's name.

Jack L. Chalker comments:

Although I have a technical background, my degrees are in the social, not the pure, sciences, and my work generally reflects this. My stories are about people, mostly ordinary people, caught up in extraordinary circumstances and usually changed by them. They use the fun-house mirror reflection of science fiction to examine people and culture, including ideology, as I see them today. The themes are anti-dogmatic: ideologies and human preachments are taken apart, examined, and generally found wanting. For this reason, a lot of my work had been taken as anti-utopian and downbeat, but there is a strain of optimism there because, not matter what, mankind copes with adversity and overcomes, although never without cost. There is an inherently absurdist streak in man which has caused him, over six thousand years of recorded history to kill, torture, and maim, mostly in the name of the people. Man adapts, advances, and grows despite this.

On the individual level, my stories examine the way human beings treat each other, generally brutalizing those most in need of help, and those individuals' quests for their own better life. For these themes, and others, interwoven in my stories, science fiction provides the perfect metaphors. I am a strongly political writer, without ideology, only hope. And yet all my stories are superficially plots of twist and turn, diverting entertainments, problems to be solved. Pacing is all important to me; I want the reader to turn to the next page, to keep reading, and to have a good time as my serious themes creep into the entertainment but never get in its way.

\* \* \*

Jack L. Chalker's novels combine a number of the genres from which SF arises: fantasy, detective fiction, Utopian fiction, and scientific extrapolation. The Well World novels and the Lords of the Diamond series stress fantastic metamorphoses of aliens and mystery-thriller elements, while Utopian

concerns, especially the communalism of Plato's city of pigs versus radical independence, combine philosophically with the mystery-thriller and an increasing concern for mimetic detail in many later works.

*A Jungle of Stars* is a frame novel, a story within a story that Chalker frequently uses to begin his alien novels. In this case he uses a realistic Vietnam patrol as a contrast to the fantastic struggle between the two aliens, the Bromgrev and the Hunter, both of whom are failed gods. Chalker sensitively handles the Vietnam patrol, the romance between Paul Savage and Jennifer Barron, but leaves the assumption of power at the end unsettled. No choice is made between the dictatorial Hunter and the Bromgrev communal totalitarianism; Paul's vengeance ethic may be modified by love, but his assumption of power leaves major questions unsettled.

*Midnight at the Well of Souls* further explores this question of what to do with power through the dilemma of another set of failed gods, the Markovians, whose answer is the creation of the Well World with hexes serving as prototypes for the universe's population. The metaphysical search which should be undertaken by Nathan Brazil is deflected by an adventure-quest to the Markovian brain by those thirsting for power and by a fascination with the different alien cultures of the hexes. Personality and character are cleverly matched to a species and an ecological environment. The threat to control the universe in *Exiles at the Well of Souls* and *Quest for the Well of Souls* is no longer directly through the Markovian brain but through the recreation of the Well World's transforming powers on New Pompeii. As in the previous novels, power for that purpose is subordinate to a quest, this time for rockets which crash land on the hexes of the Well World. The struggle to recover a rocket to travel to New Pompeii is the motive for the plots of both novels; *Exiles* ends when one rocket is destroyed by the Gedemondans, whereas in *Quest* the struggle for the rocket is successful, but the use of the combined power of a sentient Obie and New Pompeii becomes subordinate to Mavra Chang's thirst for exploration, delaying again the answer to the metaphysical problem. *The Return of Nathan Brazil* sets up a problem of universal proportions which is ultimately resolved in *Twilight at the Well of Souls* when the Council of the Community of Worlds is invaded by virus-sized Dreel, and an untested weapon using Gil Zinder's Markovian mathematics, in part a satire on nuclear weapons, is used to repulse the Dreel. The weapon creates a growing hole in the universe that absorbs worlds and stars; it can only be countered by shutting down the Well World computer, restarting it, and creating the universe anew. While *The Return* ends with Nathan Brazil's invasion of the Well World to fix the computer and Brazil's supposed death, *Twilight* traces the battle to get the real Brazil into the Well World computer despite the armies of the majority of the hexes. Most of the major Well World characters reappear in these two novels such as Mavra Chang, Gil Zinder, and Serge Ortega, but the suspense of conflict in *Twilight* really is subordinated to Chalker's exploration of cosmology and metaphysics. The dilemma of Brazil, to destroy the universe in order to correct its flaw and start anew or to do nothing, is nicely worked out, as the motives of immortals, the origins of myths and religions, are elaborated in the Well World final volume.

What to do with absolute power is a more limited political question in *The Web of the Chozen*: how to respond to human force and hegemony with a virus capable of changing humans to Choz. While becoming free of Mozes, the computer, and controlling the virus occupy much of the plot, the struggle between Choz and human results in conquest and a new apocalyptic beginning for social institutions. Bar Holiday, the

transformed scout, grows as bored with the new Choz society as he was by the bureaucratic fascism of human society however. *Dancers in the Afterglow* uses an alien conquest and defeat further to explore Utopian alternatives. Ondine, a resort planet, is a test case for two systems roughly akin to Maoist communism, where "we" replaces "I," and to capitalist individualism. While the work camps established by the alien robots resemble the worst Cambodian experiments, the result does produce a mindless happiness. Though no one fares well in the psychic competition of pre-conquest Ondine, the loss of individuality may not be worth the communistic happiness. *A War of Shadows* deals with this same political struggle in which the left and right victimize the United States, although the left is merely an extension of a conservative fascist conspiracy in government itself. Chalker handles the science, in this case viral research and recombinant DNA, better than in any previous novel, and the political forces are nicely characterized; however, the book resembles the science thriller *The Andromeda Strain* far more than science fiction. *And the Devil Will Drag You Under* returns to the essentially comic dystopianism of *The Web of the Chozen*. Mac Walters and Jill McCulloch, in an effort to save the world from an asteroid about to collide with it, go to alternate worlds to obtain powerful jewels for an alcoholic demon, Asmodeus Mogart, who says he will save the earth with them once he has six. In the process of their mission, Mac and Jill visit and evaluate alternate Utopian plans such as a stone age culture and a society similar to Islamic cultures only to be betrayed by Mogart, whom they unwittingly send to "hell," while they in turn are rescued by responsible demons. But beneath this cosmic sugar coating is cultural evaluation and an awareness of the responsibility of power. *The Identity Matrix*, about mind switching and its effects and in the form of a government report, is mostly told by Victor Gonser, a political scientist, whose mind is switched by aliens resembling jelly fish, the Urulu, and by his own people. The Urulu are fighting another group of aliens called the Association, but neither alien group, with the possible exception of the Association, is as dangerous as the federal government's Identity Matrix Center, whose programmed Skinnerian development gets out of hand. Chalker ponders once more how much social control is beneficial.

The Four Lords of the Diamond tetralogy explores an alien mystery on the four Warden planets, but this mystery only leads to more social and political exploration. The Confederacy, a league of several hundred worlds, is aware of a technologically superior alien force having some connection to the Warden planets, which have served as a Confederacy prison due to a symbiont life form, the wardens, that infests people, killing them if they attempt to leave. In order to gather information about and hopefully stall the aliens, the Confederacy replicates the mind of its best agent in four people's bodies. The mission of each is to murder a Warden planet Lord and report to the agent whose mind has been copied. The series thus has an extended plot that covers the Confederacy's gradual discovery of facets of the aliens which resolves in *Medusa: A Tiger by the Tail*, while each novel has its own action where the agent-assassin adjusts to his new world, evaluates its system, and attempts to murder its Lord. In *Lilith: A Snake in the Grass* Cal Tremon, the agent, learns to deal with a warden infestation that destroys technology, even clothes, unless emotionally willed not to. Lilith, much like earth, can only support a feudal organization based on ability to control wardens, to build and preserve and not merely destroy. Despite this positive talent, the Lilith culture exploits its worker-peasants. Marek Kreegan, the Lord who defends this system, is killed indirectly through Cal, although in terms of dealing with the aliens, this is a

mistake. In *Cerberus: A Wolf in the Fold* Qwin Zhang must deal with a planet whose citizens live and work in huge tree dwellings and offices above an ocean. Here the wardens allow mind swapping with the result that those who serve the planet best are rewarded with new bodies, creating a possible immortality, as long as a steady stream of children allows the exchange. In *Charon: A Dragon at the Gate*, Park Lacoeh must deal with a hot, steamy world in which magic is possible through the wardens, fostering religious cults and shape changing that oddly coexists with small town life and pre-fossil fuel manufacturing. In *Medusa: A Tiger by the Tail* Taran Bul learns to deal with a totalitarian Nazi-inspired culture on an extremely cold planet. Like characters in Le Guin's *The Left Hand of Darkness*, Medusans can change sex, although in Chalker's novel this leads to sexual enslavement. A similar pattern occurs in each novel in which the agent-assassin is modified by love to hate the planet's social organization, but only to see its similarity to the Confederacy. The senior agent, "Lewis Carroll," with the combined memories of his four replicates, is led to love humanity, but hate both Warden and Confederacy governments. Failing to find a formula for peace, "Carroll" watches helplessly as two alien forces collapse the interplanetary structure of the Confederacy, forcing humanity to redevelop, learning symbiosis rather than intolerance and conquest. In this series, the Indians have defeated the cowboys.

*Downtiming the Night Side*, like the Warden world novels, shows earth, the home world, being saved by the frontier, colonized nearby planets, in this long planned time travel book. Though there are many time spans in *Downtiming*, the major ones are an earth base a couple hundred years in the future with an energy problem seeking assistance from the past, the first American time travel installation two hundred years earlier, and two periods in Karl Marx's life in Vienna and London. Ron Moosic, a security officer for the time travel installation, is the point of view character who becomes, or has been, a dying London street boy in Marx's time, a nun in the later Middle Ages, a whore in several times and cultures, his own wife, a 19th-century German homosexual, and numerous other roles in this roller coaster ride of a novel. The Soul Rider series, presently in three volumes, but soon to be in five or six, consists of *Spirits of Flux and Anchor*, *Empires of Flux and Anchor*, and *Masters of Flux and Anchor*. World has been created out of matter-energy from an alternate universe or Flux by humanity and godlike computers. Since this partnership, people are classed by how much Flux energy they can process or use, and governments and religions are established on the nine Anchor communities to handle steady state or energy/matter conversions. As in Chalker's other novels, social organizations are weighed in terms of their necessity and corrosion of individual liberty, with satiric thrusts at earth's own theocracies. Power, as usual, corrupts.

At this point in Chalker's career, one has to consider him a major SF writer in terms of output, over 20 novels, and narrative quality. An allusive style similar to Le Guin's or Lem's and deeper characterization are all he needs to be great, but what he has, a good imagination, a fascination with political and social orders, and satisfying, suspenseful action plots, serve him and his readers well.

Bibliography: "Bibliography of the Works of A. Bertram  
 Chandler" by Ross Pavlac, in *Marcon XIII* (Columbus, Ohio),  
 March 1978.

A. Bertram Chandler commented:

(1981) Quite a few years ago Robert Heinlein said, "Only  
 people who know ships can write convincingly about space-  
 ships." At the time I thought that this was very true. I have not  
 changed my opinion. I believe that the crews of the *real*  
 spaceships of the future, vessels going a long way in a long time,  
 will have far more in common with today's seamen than with  
 today's airmen. I freely admit that my stories are essentially sea  
 stories and that John Grimes, my series character, is descended  
 from Hornblower. At a book-signing recently in Fukuoka I felt  
 flattered when one of my Japanese faithful readers gave me one  
 of Forester's Hornblower novels to autograph.

\* \* \*

A. Bertram Chandler produced an enormous body of work  
 that is based on his experiences as a merchant mariner, his love  
 of adventure fiction, and the role model synthesis of these two  
 aspects, the fictional character of Horatio Hornblower.

Beginning in about 1959, Chandler developed the character of  
 John Grimes, then an ensign, and the concept of the Rim  
 World—rim stars out on the fringes of galactic civilization. *The  
 Road to the Rim* reads as though it was composed of stories for  
 magazines. Grimes becomes aware of his love of space, his  
 fascination for the Rim World, and the adventure to be found  
 there.

Perhaps because he had such a good eye for detail and was  
 able to "sell" the locale of the Rim World, Chandler found the  
 necessary formula, in which he intertwined the lives of Derek  
 Calver (from *The Rim of Space*), Sonya Verrill, and then John  
 Grimes, whom Verrill eventually marries. Grimes extends his  
 activities over a period of time covered in thirteen novels to the  
 point where he becomes a commodore in the Rim Worlds  
 Merchant Navy, and finds a home for himself on a remote  
 planet, not only because it is "closer to work," but because it  
 allows a comfortable life style.

Chandler was a jovial man with an impish sense of humor—  
 he makes frequent topical allusions to current events, the works  
 of other science-fiction and imaginative writers, and, some-  
 times, even to such historical events as the mutiny on *H. M. S.  
 Bounty*. His works will never be accused of heavy going, an  
 overly philosophical point of view—unless you include frequ-  
 ent support of nudism—or raising complex moral issues.

His plots tend to be direct and linear: is Grimes getting too  
 soft for duty? Do his men respect him? Is he in danger of  
 becoming a ladies' man? (No.) Can he withstand temptations  
 to take bribes? (Yes) Can he be effective in putting down a  
 mutiny? His characters could certainly be role models for  
 television situation comedies or adventures: the good guys and  
 the aliens are readily apparent; there are few shades of grey, no  
 nuances of meaning, no room for misunderstanding.

As a consequence of flat characters, his dialog is rarely  
 exciting, and the reader, if not careful, can lose the way—who is  
 saying what? Several critics have noted the use of stock phrases  
 and clichés. It is also fair to question his speech cadences, and  
 the fact that the aliens are distinguished from the Earthlings  
 only by a different set of clichés.

What makes him endure, then? It is the obvious good cheer,  
 the quick turn of plot, the excellent sense of background, and  
 the realization that sea stories and space opera have a common  
 existential bond. Grimes, at best a good man, is just short of  
 boring, thanks to his over-all niceness and mischievous humor.  
 An excellent way to sample the Chandler Rim Worlds is in *The  
 Dark Dimensions*, in which Chandler puts Grimes in the  
 Captain's Paradise situation by having two John Grimeses, one  
 each from a parallel universe. The two meet, each with a  
 different wife, and each cuckolds the other and, by implication,  
 himself. Naughty, funny for as long as it lasts, and sensible  
 enough not to last too long.

Chandler is pure entertainment, lacking the craft and  
 intricacy to secure him a more permanent niche.

## Louis Charbonneau comments:

My science-fiction novels, most of which were written in the 1960's, would seem to be out of the mainstream of much current SF, though perhaps part of a longer running stream, one that begins with existing conditions, problems, or possibilities and projects them into an imagined future not all that remote, and with an emphasis on human characters rather than upon the grotesque or fantastic. It has been called social-science fiction, with a moral dimension often fairly evident. I can admire those fantasists who create wholly imagined worlds with little if any relation to our own, but I find myself as a writer interested more in the human predicament, as it is now or, given certain circumstances, as it might be in the future.

\* \* \*

Notable first novels are rare; notable first science-fiction novels virtually non-existent. With his first work, *No Place on Earth*, Louis Charbonneau showed himself a scarce bird indeed—a science-fiction writer with almost no interest in mechanisms and remote worlds. The peculiar appeal of this yarn lies not in outré surroundings or wild technology but in the little-known territory of man himself.

It is in its impact upon man, in fact, that Charbonneau finds a writer's use for science. He acknowledges with us that technology is marvelous, that we reap great benefits from the application of machines to our culture. But he confesses almost no background to deal with the intricacies of gadgetry; his concern is with the social aspects of things like automatons. So, in *No Place on Earth*, Charbonneau tackles the population alarm expressed by Malthus and treats its implications like the good reporter he is. His prose is lean and highly readable, and he gives life to his writing through heavy reliance upon dialog. His characters do not have to be complex, because he generalizes from selection of typical people who must deal with extraordinary demands. In a sense Charbonneau appears to encourage all of his readers to expand to meet the pressures imposed upon them by a sometimes-bewildering technology. Concepts like mind control and sirloin capsules have both good and bad points, as we see through the author's often-humorous treatment.

Like many good writers, Charbonneau has learned his craft in the demanding school of journalism (he still writes a daily column in the Los Angeles Times about the old Farmers Market). He learned about people and their glands—some readers might say a bit too much so in works like *Corpus Earthling*. This novel imagines the people of Earth being literally occupied by aliens. What might eventually have resulted without the enterprise of a college instructor could have produced quite a different story. But as said instructor gains telepathic knowledge of this invasion, the whole fiendish plot is revealed. It is the way he obtains his information—in bed with several coeds—that might prove objectionable to staid readers of this story. The research method, nonetheless, does stress the author's realistic understanding of the human condition to counter this threat.

A different slice of such understanding is found in *The Sentinel Stars*, where we encounter every person born as a debtor. This means the entire population must spend its whole

life span paying off the debt, which can't be done because of the high cost of living. In good reporter fashion, Charbonneau sounds a familiar dirge: a sense of slavery to the times. But all is not lost, for the hero—who bears the same sort of numerical I. D. as all of us today—suggests rebellious measures which might create unrest in contemporary free-spending law makers consciences.

It is the social-scientific concern of Charbonneau which has perhaps discouraged his recent production of science fiction. He expresses distaste for the gee-whiz aspects of much current writing, although he admits the value to society of many devices (he finds a word processor convenient in writing, for example). But he deplors the dehumanizing evident in works of science fiction which reach out far into the cosmos. So, evidently, do the Japanese readers of his *No Place on Earth*, which has gone through recent reprintings in that country. Charbonneau's labeling of current movies, with their spectacular special effects and elaborate settings, as "extended comics" would find considerable endorsement among serious, mature readers of science fiction.

Louis Charbonneau remains a worthy and interesting figure in the world of science fiction, not only because of his stylistic appeal, but also because he represents a source of the kind of science fiction which provided the impetus for the sort of reading that is still among the more interesting pursuits in a gadget-infested world.

—Robert H. Wilcox

Suzy McKee Charnas comments:

In my work I particularly enjoy taking up some hoary stereotype—after-the-holocaust, Amazons, vampires, wise old Gandalf the Grey—and turning it upside down to see what surprises and delights I can shake out of its pockets. Missing the usual claptrap clichés, some readers invariably accuse me of "propagandizing," which means daring to draw their attention to the possibility of something besides the received wisdom about this or that. The charge is nonsense. I do not feel that it's my responsibility as a writer to reform the world or save it from anybody else, and I think it a ludicrous form of hubris to imagine that one's books stand a chance in hell of doing either. My job and my pleasure is to continue to ask the questions that interest me and to pursue them to their possible answers as honestly and skillfully as I can, in the hope that something entertaining, beautiful, and possibly useful will result. My aim is to engage your attention, stir your thoughts, and break your heart.

\* \* \*

When Iago says to Brabantio, "you'll have your daughter covered with a Barbary horse . . . you'll have coursers for cousins, and gennets for germans," an example of malevolence addresses a symbol of patriarchal power. These two representational essences are fused in Suzy McKee Charnas's first novel, *Walk to the End of the World*, where masculine hegemony is synonymous with unmitigated evil. Iago's utterance also illuminates its sequel, *Motherlines*, in which daughters are indeed covered by horses who are thought to be the near kinsmen of their mistresses. As *Othello* explores the effects of exaggerated personality traits, Charnas's fiction presents an exaggerated vision of sexism's consequences.

*Walk to the End of the World* is set in "the Holdfast," a limited environment populated by survivors of "the Wasting," or nuclear holocaust. This postwar society is a paradise for white male misogynistic bigots: the entire population is Caucasian, and the men are taught that "females themselves brought on the Wasting of the world." Holdfast "fems" supposedly "had no souls, only inner cores of animated darkness shaped from the void beyond the stars. Their deaths had no significance. Some men believed that the same shadows return again and again in successive fem-bodies." We, with our Eve, Pandora, and cultures where women are fuel for the flames of their husbands' funeral pyres, cannot feel smug after encountering a Holdfast myth. In this manner, Charnas's fiction

continuously echoes reality.

The structure, as well as much of the content of *Walk to the End of the World*, reflects women's secondary status. Before encountering Aldera, the heroine, readers are familiar with the Holdfast's notions of "fem-taint," "Cunt-hunger," institutionalized rape, and girl children who must scratch for survival in the straw of the "kit-pen." Aldera's situation is immediately apparent: as a woman, she must satisfy all the demands of her male masters. Even a slave cannot be completely controlled by an oppressor. Since Aldera possesses mental acuteness and training as a runner, she can sometimes use her mind and body to suit her own best advantage. Her circumstances resemble those of an intelligent, talented Black person in the Jim Crow south. The novel's plot corrects the Holdfast's negative view of the feminine. For example, the text clarifies its own prologue: women certainly did not cause the Wasting of the world. Rather, "subhuman" men cause the wasting of women. Happily, something positive does manage to coincide with the sombering aspects of this novel and women's reality. Aldera has the opportunity to flee the Holdfast; some women have the pleasure of knowing that when they approach their house yard gate, they are not walking to the end of their world.

In *Motherlines* the open plains lying beyond the men's sphere of influence sharply contrast with the Holdfast's defined boundaries. Women completely control this terrain. In fact, to cite another example of Charnas's penchant for creating extreme circumstances, men never enter the domain of escaped "free fems" and the indigenous riding women of the motherline tribes. This women's world is not a Utopia for stereotypically peace-loving, nurturing females. The tribes routinely raid each other, one powerful woman dictates her will to the free fems, and the riding women's method of raising children reminds Aldera of the Holdfast's "kit-pen." Although the tribal women are imperfect, they possess impressive attributes: self-sufficiency, an identification with matrilineal relationships, and racial tolerance. Aldera and her free fem companion are allowed to live in the tribe with dignity. She no longer has the negative self-image described in *Walk to the End of the World*, where she feels "hollow in body . . . hollow in mind, for there was nothing else she might imagine, feel, or will that a man could not wipe out of existence by picking her up for his own purposes." This transformation is of primary importance in *Motherlines*.

Another aspect of the novel is a secondary concern. "Oh . . . We mate with our horses," is the answer to Aldera's question about reproduction in a completely female society. Those who judge this information to be a flippant, sarcastic retort react prematurely. The woman who answers Aldera speaks the truth about a situation which expands the definition of "perversion." Charnas's characters are not presented solely to titillate an audience. Although the sexuality of the motherline tribes is bizarre, they always mate to fulfill their natural reproductive purpose. And the women are in total control of the sexual arena. In contrast, human heterosexuality can be degrading and destructive.

In the real world, the idea of a totally independent woman is, using Harlan Ellison's term, a "dangerous vision." Many readers, men and women, might be taken aback by the controversial content of Charnas's novels.

##### C. J. Cherryh comments:

Having made thorough study of the past I am vehemently certain that I do not wish to live in it, nor do I wish to see three quarters of the planet weltering in conditions that should have been left in the past, with the same hunger and disease our ancestors knew. The reach for space and its resources is the make-or-break point for our species, and the appropriate use of technology and the adjustment of human viewpoint to a universe not limited to a blue sky overhead and the curvature of the horizon are absolutely critical to our survival. Therefore I write fiction about space and human adjustment to the unfamiliar. The references in my work are frequently to writings on the aesthetics of physics or other sciences, compared and contrasted to writings of the ancients and concepts and philosophies better known to anthropologists than to the general public: while I have the most profound respect for the traditions of English language literature, I consider the images overworked and frequently inadequate for the task of conveying non-English concepts. Therefore I use the form of English literature, but bring into it a great many things which are pertinent to the sciences, or to the far corners of the world. This in my estimation is what science fiction ought to do to literature, create new symbologies and new understandings appropriate to the space age, not forgetting the traditions of our own culture, but widening its viewpoints.

\* \* \*

Marked out with critical attention and expectation early in her career, C. J. Cherryh had by the mid-1980's established herself as a major author. Cherryh's fairly high rate of production (about twenty volumes plus scattered shorter works for the decade ending in 1985) may have helped to keep her before the public eye, but more important to her success than quantity has been the quality of her work. Cherryh has not been a great innovator of form; generally her settings and plot conflicts have been those traditional to science fiction. (The Morgaine trilogy is rationalized as science fiction, but consciously uses the devices, and has more of the feel, of heroic fantasy.) Most of Cherryh's works are adventure-sf novels set either in space or in non-industrial societies planetside. They generally deal with cultural conflict, frequently as seen from the viewpoint of an ordinary being (human or extra-terrestrial) wrenched by events out of his milieu. Cherryh has demonstrated a genius for reanimating what in other hands might seem routine or outworn conventions. Both her stylistic control and her characterization are far above the norm for adventure sf, and she is ruthless in pressing her viewpoint characters into extreme situations that will retain the reader's interest. At the same time, Cherryh manifests a stubborn faith in the ability of humans (and other intelligent beings) to overcome adversity, to come to at least a measure of mutual understanding and to spiritual triumph. Among the most effective of her characterizations are those of extra-terrestrials, who figure prominently in Cherryh's work. (Indeed, in the Chanur series, humans barely appear at all.) Cherryh has proven inventive in depicting alien species, cultures within each species, and individual non-human psychologies within each culture. A related Cherryh hallmark is the fascinating complexity of her backgrounds. Only occasionally has she been able to restrict herself to anything below a minimum of two species and three cultures. Indeed, Cherryh has now embarked, in many cases post facto, upon a link-up of nearly all her books into a common vast future history. Particularly noticeable are allusions to the wars and periods of uneasy coexistence of the two human interstellar powers, the Union and the Alliance.

Several Cherryh books diverge somewhat from her typical pattern. Some are set in the Alliance/Union history, but individually even these are less complex than her usual adventure plots, and in all works of this category psychological or philosophical themes lie closer to the surface. So far these works have not passed over the line separating genre sf/fantasy from surrealism, but they frequently stray near the border. *Wave Without a Shore* takes place on the planet Freedom, whose major cities are Camus and Kierkegaard. *Voyager in Night* is told mostly from the viewpoints of self-aware programs running on an extra-terrestrial computer. *Port Eternity's* situation (involving the King Arthur legend, a slave underclass, and alien kidnappers) is so *outré* it would take a paragraph just to outline. In a somewhat different vein, *Sunfall* is a collection of stories, some of them sf and some fantasy, set in the various major cities of Earth's twilight age. The Dreamstone series, as well as some short stories, are straight fantasy.

Cherryh's works are not without flaws. While her level of characterization remains above average for adventure sf, it has improved little since her first published works of a decade ago. In certain contexts, such as military jargon or bureaucratese, Cherryh's usually excellent style rings subtly false. Her fascinating complexity sometimes lands her in difficulties. In this connection, it may be instructive to consider the example of James Clavell's historical novel, *Shogun*. *Shogun* has in many respects a typical Cherryh-type plot, involving as it does conflicts among representatives of two races, three levels of

technology, three or more religions, four or five nations, and cross-cutting religious and national factions beyond easy numbering. Without even the complication of multiple intelligent species, it takes Clavell 1200 pages to tell his story. For reasons of book-manufacturing technology and of marketing, 1200 pages in one volume are not available to an sf writer like Cherryh. The obvious compromise would be to write a series of shorter, linked novels. Unfortunately, Cherryh's plots do not always seem to break down neatly into episodes of short-novel length. One result, as in *Hunter of Worlds*, can be excessive compression, throwing off pacing and impairing intelligibility. Another possible outcome, more frequent in Cherryh's case, is the publication of a supposedly independent volume that will not in fact stand up on its own. The most blatant example of this is *Chanur's Venture*, which baldly breaks off in mid-plot with a to-be-continued.

Sometimes Cherryh's work manifests a romantic faith that any other society, in particular any with extended households linking groups larger than the nuclear family, must be preferable to the human West or its successors. Such romanticism is relatively common in recent sf and genre fantasy. Perhaps more surprising in Cherryh's work is a vein of pessimism, not about the human spirit, but about the objective human condition. A parallel might even be drawn with the prison-camp novels of Aleksandr Solzhenitsyn: Cherryh protagonists triumph spiritually over adversity, but only infrequently is their worldly position better at the end of a tale than at the beginning, and the wicked (especially as exemplified by technologically superior alien species or by unfeeling human bureaucracies) usually come away both unrepentant and unpunished. Contrary to the conventional wisdom, this pessimism does not seem to be hurting Cherryh's popularity; perhaps readers take it as a sign of realism.

A decade into her career, Cherryh still has not made her way into the very front rank of sf writers. She is not, however, very far behind, and there remains a strong possibility that she will make up the remaining distance.

\* \* \*

Most of Robert Chilson's early stories appeared in *Analog*, and were little distinguished from the usual technophilic, politically reactionary fiction in which the magazine specialized. The most promising of these is "Per Stratagem," a tale of human-alien contact in which the alien entity's biology and culture are imaginatively rendered, despite the tired plot of humans outwitting aliens, proving racial superiority.

Chilson's later novels are somewhat more adventurous, even lyrical. *The Shores of Kansas* is a moderately successful formula story about time-travel, while *The Star-Crowned Kings* resembles the typical Andre Norton plot of a young protagonist coming into manhood. *The Star-Crowned Kings* is interesting in that it posits a stellar civilization in which psychically endowed humans called Starlings rule the rest of mankind. Young Race Worden, however, learns that he also possesses psychic powers, which, in most such adventures, is usually the impetus for the hero to "take on" the establishment. Chilson avoids that cliché, but substitutes instead another cliché less often used but familiar to *Analog* writers—the concept that the establishment (Starlings) is basically benign except for a dangerous few who are the only ones Race Worden must fight. While this is less melodramatic than a similar Andre Norton tale of a psychic's persecution by authority (*Forerunner Foray*), it is also less exciting as an adventure-story; Chilson is also formula-bound in following his hero's personal growth, so that the book also fails as a character study. One remark is interesting: "It shocked him to realize that many of the inequities were as much the fault of the underdogs as of the overlords." The concept itself is not objectionable, but the phrasing, as well as the circumstance of the observation, seems to express sympathy for the overloads, whereas a more radical writer, Harlan

Ellison, might express a similar sentiment with tacit sympathy for the underdogs.

Unquestionably, Chilson's best accomplishment is *As the Curtain Falls*. Its format resembles the Dying Earth stories of Jack Vance, in which organized civilization has completely decayed, succeeded by barbaric cultures and weird mutations of humanity. In many places, the novel approaches parody of the Vance style, but for the most part Chilson's colorful descriptive prose, attention to detail, and deep sense of his world's history serve the primary purpose of telling a vivid adventure story. *As the Curtain Falls* centers on the attempts of a young prince, Trebor of Amballa, to establish in his fumbling way a world-empire, and although most of the novel follows his adventures in rescuing his reculant bride, he does accomplish his task at novel's end with the help of man's former heritage, a functional computer. As with *Star-Crowned Kings*, the plot is extremely loose, but this is compensated for by Chilson's plethora of bizarre cultures and place-names, wild characters (such as Lyantha, the pulchritudinous witch-queen who becomes immortal with the sacrifice of young men), and strange inventions (such as a battle between opposing fleets of ships built to sail on dry salt beds). The essential quality of Vance that Chilson lacks is a fascination with alien mentlities, altered states of mind, abstruse philosophies, and magic. In this regard, Chilson again betrays a reactionary consciousness in the way he chooses to satirize the world of effete artists, in that he presents no alternative (as Vance might) to the pretentiousness that passes in literary circles for an "altered state of mind."

Yet, unusually enough, a recent Chilson story, "Moonless Night," concerns a female dancer whose personal artistry is beyond reproach. The gimmick of this tale is the brief encounter of the female and male trader, whose bodily proteins are so alien to hers that a touch results in mutual cellular destruction, and a painfully short romance. In essence, Chilson is a writer who has striven to strike a balance between lyricism and irony, but has not truly devoted himself to either.

—Gene Phillips

**CHILTON, Charles (Frederick William).** British. Born in London in 1917. Educated at Thanet Street Church of England School, London. Married to Penelope Colbeck; two sons and one daughter. Free-lance writer and journalist, and radio producer for the BBC, London; devised and wrote *Riders of the Range* annual, from 1953. Recipient: Western Heritage Award, for children's book, 1963. Address: 27 Commonside, Keston, Kent, England.

\* \* \*

The first of Charles Chilton's *Journey into Space* radio serials went on the air in 1953, with a strong cast of actors including Andrew Faulds and Guy Kingsley Poynter, and a sound-track of music and special effects into which the BBC Radiophonics Workshop threw themselves with enthusiasm. Over the next five years the three serials were a national institution in Britain, and the character and their creators became household names.

In the first serial the spaceship *Luna*, launched from the Woomera Rocket Range in Australia, achieved the first Moon landing in the Bay of Rainbows. Fauld's low-key comment, "Gentlemen, we are on the Moon," was to be much imitated by 1950's writers. As lunar night fell, however, power failed in the ship, and in the darkness someone or something could be heard investigating the *Luna* on the outside. After a strange encounter with a UFO at sunrise the crew attempted to return to Earth, only to have the *Luna* abducted and delivered to the Earth of 13,000 years in the past. Eventually the crew met one of the time-travellers and negotiated their return to their own time, but the serial ended as they faced another re-entry with no remaining fuel.

The second and third serials were set several years later, when a lunar base had been established and Faulds ("Jet Morgan") led an expedition to Mars in a fleet of ships commanded by the *Discovery*. Once again Chilton had gone to great lengths to make the technology authentic, by the design studies of the day, and the procedures of the Mars fleet were extremely convincing. In flight, however, the expedition was sabotaged by a man named Whitaker who had been kidnapped from Earth decades before, then returned to infiltrate the expedition. Whitaker had been "conditioned" by the Martians by slowing down his metabolism to adapt to Martian conditions, making him cold to the touch and also concealing his age, and also by hypnosis, making his speech a frightening drone ("Orders must be obeyed without questions at all times.") Crewmen went mad or died in his company, and a generation of British schoolchildren were terrified of him. Worse still, Mars turned out to have a population of similarly conditioned humans, preparing to invade the Earth which few of them knew they had left.

But Chilton's extra-terrestrials weren't monsters. The Martians had been the giants of earthly legends, coming to us in peace only to be hunted down and destroyed, finally driven to drastic measures as conditions worsened on Mars. But by the time of the invasion there was only one left, and when Morgan

and his crew prevented his attempted takeover by televised hypnosis, he went peacefully off to Alpha Centauri with volunteers from the human workforce. The time-travellers, too, had been trying to avoid interaction with mankind, using the Moon and the prehistoric Earth only in passing. Unlike their contemporaries (the purely destructive aliens of Nigel Kneale's *Quatermass*, or the wholly benign inhabitants of Angus Macvicar's *Lost Planet*) Chilton's creations had their own purposes and motivations, not specifically good or evil in relation to humanity. Space was an exciting realm for us to enter, dangerous perhaps but not hostile.

Subsequent incarnations of the characters were less successful. The comic strip in the *Express Weekly* was inconsistent with the radio serials, yet borrowed too heavily from them; and a one-hour play recapitulated the weakest parts of the strip's story line. *Space Force*, a new serial broadcast in 1984, caught the atmosphere of the original more closely. But Chilton conceded in a *Radio Times* interview that he hadn't kept up with developments in space science, and dramatic sequences borrowed from *Journey into Space*—the power failure, for example—were no longer convincing.

—Duncan Lunan

**CHRISTOPHER, John.** Pseudonym for Christopher Samuel Youd; has also written as Hilary Ford; William Godfrey; Peter Graaf; Peter Nichols; Anthony Rye. British. Born in Knowsley, Lancashire, 16 April 1922. Educated at Peter Symonds' School, Winchester. Served in the Royal Signals, 1941-46. Twice married; four daughters and one son from first marriage. Since 1958, full-time writer. Recipient: Rockefeller-Atlantic award, 1946; Christopher Award, for children's book, 1971; *Guardian* Award, for children's book, 1971; Jugendbuchpreis (Germany), 1976; George G. Stone Center for Children's Books award, 1977. Address: La Rochelle, Rye, East Sussex TN31 7JY, England.

\* \* \*

The reputation of John Christopher as a writer of science fiction for both adult and younger readers is solidly established. Perhaps the greatest single exposure was the film

version in the early 1970's of the novel *The Death of Grass*. The elements present in this relatively early piece are a hallmark for all of his science fiction. Taken together, it forms all kinds of answers to the question "What do people do when things fall apart?" An account of his work may fall rather naturally into three parts: the early short fiction and "Managerial" stories; novels of crises, catastrophe and survival; and novels for younger readers.

*The Twenty-Second Century* conveniently displays Christopher's apprenticeship period. Six of the stories in the collection feature Max Larkin, a Director in one of the "corporations" that govern earth in place of political institutions in the not-too-distant future. Read along with the fuller exposition of this state of affairs in *Planet in Peril*, the stories present the proposition that political institutions will bring civilization to ruin and that government by enlightened commercial interests may do better. The case for this is epitomized in the laid-back character of Larkin, the unmarried, late-middle-aged corporate director, whose manipulative genius is time and again effective in world crises where armies and doomsday weapons have always failed. The 14 additional stories are something of an index of the novels that would follow. Sterility doom in "The New Wine," a medieval level of technological survival in "Weapon," and the panorama of 20th-century ruin in contrast to the garden of a new Eden in "Begin Again" provide glimpses of the worlds of the catastrophe novels. Beyond these, imprisonment by adaptive necessity in a lunar vivarium in "Christmas Roses," the interdiction of books in "A Time of Peace," and the humanity-saving wholesomeness recognized by enlightened aliens in a human village dedicated to a technologically simple way of life in "Blemish" are typical of the settings and subjects of the juvenile pieces. At least one more story, "Rock-a-Bye," featuring the super-child born of a relationship between a Martian woman and a man from Earth is beautiful in its own right and deserves larger treatment. At this stage in his career Christopher's narrative craft is nearly mature. With minor refinements it is what it will be for the works to follow. He does not experiment with style. He tells stories with pace, suspense, sanity, and clarity. Moreover, unlike that of many writers, his strength is not in the short story but in the longer narrative work.

Two exceptions to the sort of novel for which Christopher is best known are *The Possessors*, wherein a group of people at a remote ski lodge are saved by "body-snatching" aliens, and *The Little People*, wherein a group of vacationers at a remote old mansion are savaged by dwarves created by Nazi geneticists. Both are excursions in science-fiction gothic. The strength of both lies in the plausible behaviours of small groups of people in short-term crises.

But it is to scenarios of planet-wide cataclysm and survival in a world that will never be the same again that the most famous stories direct us. *The Death of Grass*, reminding us that corn, wheat, and rice are "grass," has a blight on all the species of grass cause a world famine. *The World in Winter* shows European civilization destroyed by a new ice age. *A Wrinkle in the Skin* presents earth devastated by the effects of continent-heaving earthquakes. *Pendulum* varies the cause of disaster from that of nature run amok to human society run amok—an obvious fictional response to the social transformations taking place in western civilization during the late 1960's. But with few alterations the effect is the same. More people survive. Yet once more society is reduced to savagery, to endure again the insanity and agony of social evolution that in past history did not teach their lessons well enough. These pieces are variations upon several principal themes. Human civilization is fragile

and vulnerable. It cannot survive catastrophe either from natural causes or incompetent government. In the event of catastrophe the few who survive will be winnowed again by good health, knowledge of basic tools and nature, and the ability to kill other human beings, however reluctantly, out of necessity. Simultaneously, they must have the ability to love and form, once again, wholesome social contracts. Billions die in these stories, but hope and human potentiality have the final determination in each of them. Somehow mankind will recover and rebuild, though *Pendulum*, the latest of the novels, insists that it will not be swift.

With a sensible selection against the more badly brutal and explicit details of violence and sexual behavior these themes are produced again in the novels for younger readers. There is an evenness of quality of all these works, so that a few may represent them all. The most famous are those that form the Tripods Trilogy, featuring Will Parker. Will is born in a backwoods village on a future earth conquered and enslaved by alien invaders who travel on land and water in vehicles with three immensely long terrain-gobbling legs. They are reminiscent of the Martian craft in Wells's *War of the Worlds*. The aliens employ the very strongest young humans as body servants. The remainder are mere breeders, forbidden more than a medieval level of technology, and, ultimately, little more than vermin who will be exterminated when the aliens convert earth's atmosphere and gravity to their own. Fortunately, it doesn't happen. Will and two friends have a principal role in returning earth to humans. The theme is the meaning of individual freedom and honor. Knowledge and curiosity daring enough to see beyond popular mythology, self-discipline, respect for other people—especially odd ones—and the courage to act in the face of pain and under threat of death earn freedom. Beginning at the end of 1984 the first of three 13-episode BBC TV serials of *The Tripods* was aired. The broadcast of the complete production spans three years. A final work called *The Guardians* refreshes the Tripods propositions about freedom in a post-catastrophe story of a boy who, learning of a conspiracy by aristocratic "guardians" to keep the mass of men at a stuporous level of existence in the cities, determines to join a revolution to free them. The work received the *Guardian* Award in England, the Christopher Award in the US and the prestigious Jugendbuchpreis in 1976. Additional sf pieces published by Christopher in the early 1980's are exclusively children's books. The course seems a happy one. In terms of narrative art, Christopher's stories for young readers may be his finest achievement.

—John R. Pfeiffer

**CLARKE, Arthur C(harles).** British. Born in Minehead, Somerset, 16 December 1917. Educated at Huish's Grammar School, Taunton, Somerset, 1927-36; King's College, London, 1946-48, B. Sc. (honours) in physics and mathematics 1948. Flight Lieutenant in the Royal Air Force, 1941-46; served as Radar Instructor, and Technical Officer on the first Ground Controlled Approach radar; originated proposal for use of satellites for communications, 1945. Married Marilyn Mayfield in 1954 (divorced, 1964). Assistant Auditor, Exchequer and Audit Department, London, 1936-41; Assistant Editor, *Physics Abstracts*, London, 1949-50. Since 1954, engaged in underwater exploration and photography of the Great Barrier Reef of Australia and the coast of Sri Lanka. Director, Rocket

Publishing, London, Underwater Safaris, Colombo, and Spaceward Corporation, New York. Has made numerous radio and television appearances (most recently as presenter of the television series *Arthur C. Clarke's Mysterious World*, 1980, and *World of Strange Powers*, 1985), and has lectured widely in Britain and the United States; commentator, for CBS-TV, on lunar flights of Apollo 11, 12, and 15; Vikram Sarabhai Professor, Physical Research Laboratory, Ahmedabad, India, 1980. Recipient: International Fantasy Award, 1952; Hugo Award, 1956, 1969 (for screenplay), 1974, 1980; Unesco Kalinga Prize, 1961; Boys' Clubs of America award, 1961; Franklin Institute Ballantine Medal, 1963; Aviation-Space Writers Association Ball Award, 1965; American Association for the Advancement of Science Westinghouse award, 1969; *Playboy* award, 1971; Nebula Award, 1972, 1973, 1979; Jupiter award, 1973; John W. Campbell Memorial Award, 1974; American Institute of Aeronautics and Astronautics award, 1974; Boston Museum of Science Washburn Award, 1977; Marconi Fellowship, 1982. D. Sc.: Beaver College, Glenside, Pennsylvania, 1971. Chairman, British Interplanetary Society, 1946-47, 1950-53. Guest of Honor, World Science Fiction Convention, 1956. Fellow, Royal Astronomical Society; Fellow, King's College, London, 1977; Chancellor, University of Moratuwa, Sri Lanka, since 1979. Agent: David Higham Associates Ltd., 5-8 Lower John Street, London W1R 4HA, England; or, Scott Meredith Literary Agency, 845 Third Avenue, New York, New York 10022, U. S. A. Address: 25 Barnes Place, Colombo 7, Sri Lanka.

Clarke* by John Hollow, New York, Harcourt Brace, 1983.

\* \* \*

With 16 very popular novels to his credit, Arthur C. Clarke is one of the small handful of writers who have shaped science fiction in our century. His persistent spiritual—and sometimes lyrical—optimism concerning the place of humanity in the universe and his enthusiastic faith in technology gather together both the hard and soft sides of the genre in works of classic importance. Clarke's love of the details of technology also enlivens his highly regarded work as a science writer. By his own count, Clarke has produced "approximately five hundred articles and short stories" including "The Star," a Hugo-winning response to Wells's belittling of humanity in his famous story of the same name.

One can take a preliminary survey of Clarke's work by examining his short fiction. *Tales from the White Hart* gains coherence by establishing a tavern frame within which Harry Purvis tells one tall tale after another, displaying Clarke's energetic—and sometimes outrageous—sense of humor, a sense epitomized in the punishing ending of his later story called "Neutron Tide." Many of Clarke's novels and short stories have been repackaged in other volumes. In *The Nine Billion Names of God* Clarke collects his 25 favorites among his then-published short stories. The majority of his most famous pieces are here, including the almost pastoral title story in which Western science and Eastern religion confront each other and eternity, "Rescue Party" in which the would-be saviors of a doomed Earth are startled by humanity's self-reliance, "Superiority" in which a space war is lost by too much cleverness, "The Sentinel" which is often thought of as the germ for *2001*, and "The Star." One must turn to *The Wind from the Sun* to find "A Meeting with Medusa," a Nebula-winning novella that includes the discovery of life in the dense atmosphere of Jupiter, and Clarke's own choice for his single best piece of fiction, "Transit of Earth." This story tells of an astronaut on Mars who knows his life supports cannot long sustain him but who nonetheless sets up the equipment necessary to record for posterity the first human observation of Earth passing across the disc of the sun, a mythic moment typical of Clarke that holds both sunrise and sunset in suspense. This story is also typical of Clarke in depending upon technical detail for its setting and dramatic situation and in balancing a symbol of demise with one of rejuvenation. Clarke's characteristically isolated hero joyfully and paradoxically greets the future by rushing toward Bach, a beauty from the past: "Johann Sebastian, here I come."

Clarke's faith in technology is profound: he is quite proud "to know several astronauts who became astronauts through reading my books." He is also justifiably proud to have first proposed (1945) geosynchronous communication satellites, an

innovation that has already changed our world and will continue to move us toward the single community Clarke's heroes always contemplate when looking back at Earth from space. The majority of Clarke's novels are highly technological, human characters being invented primarily to provide occasion for humor, to put life at stake, or to locate a coherent point of view from which to explore in imaginative and thrilling detail the wonders of science and of the future universe. *Islands in the Sky* and *Dolphin Island* are juvenile novels employing teenaged boys as observers, the former presenting a grand tour of many sorts of satellites and space stations and a lunar fly-by and the latter showing science reaching out to the aliens with whom we share our planet, intelligent mammals of the sea. *Prelude to Space*, *The Sands of Mars*, *Earthlight*, *The Deep Range*, *Imperial Earth*, and *The Fountains of Paradise*, though more adult, are still primarily exciting guided tours rather than compelling dramas. In each of these the technology is amazingly detailed; the plot is admirably thickened by political impediments to the implementation of the technology; and these impediments are excitingly but predictably overcome. Within this general scheme, *Prelude to Space* concentrates on the development and launching of the first rocket to leave our atmosphere; *The Sands of Mars*, one of the two psychologically strong novels in this group, concerns first contact and the establishment of viable human colonies on a terraformed Mars; *Earthlight* studies political changes on the Earth and colonized planets as lunar technology develops, including that needed for self-defense and efficient mineral recovery; *The Deep Range* follows the development of whaleherding and its philosophical shift from a meat to a milk industry; *Imperial Earth*, the other psychologically strong novel and Clarke's favorite, also concerns the effect of technology on the social systems on several solar worlds and the personal and political maturing of a man bound to lead the people of Titan through necessary cultural adaptations; and *The Fountains of Paradise* chronicles the building of the "space elevator" that will effectively free humanity from the Earth.

Three other heavily technological novels need mention. *Glide Path*, Clarke's only non-science fiction novel, follows the very important World War II development of Ground Controlled Approach radar. Clarke was in charge of English GCA operations and this novel has interest not only for its technology but for its quasi-autobiographical detail. *A Fall of Moondust* concerns a tourist "boat" trapped within a lunar sea of microscopic dust. This highly effective novel compellingly challenges the reader to try to beat the fictional technicians to a plan for rescue while all the time anoxia and mechanical failures threaten the passengers. And finally, *Rendezvous with Rama* combines the absolutely fascinating exploration of an extra-solar vessel come into our system with profound philosophic questioning of the significance of humanity, of biological life, and of intelligence. This is the only work ever to win all major science fiction awards: Hugo, Nebula, Campbell, and Jupiter.

The questioning in *Rendezvous with Rama* recalls Clarke's novels of cultural exploration. *The Lion of Comarre*, the most like a fairy tale of Clarke's works, traces the quest of a young man to find the geniuses of the past, to destroy the enchanted city keeping them in pacified torpor through technologically induced pleasures, and to open the static pastoral land to science. A similar plot structures *Against the Fall of Night* and *The City and the Stars*, the one an earlier version of the other. These works are more convincingly written than *Comarre* and improve upon it by having the city and country cultures both static, but for different reasons, by creating in Alvin a central character with whose growing pains we can identify, and by casting the drama of terrestrial rejuvenation against a cosmic context. That cosmic context provides the overall power of

*Childhood's End*, Clarke's most popular novel and his first great testament of faith in human evolution to a higher plane. His last great testament, *2001: A Space Odyssey*, combines motifs and attitudes spanning Clarke's entire career to produce a technologically compelling story of the next generation's space program, a humanly moving story of struggle and courage against harsh interplanetary space and computers gone awry, and a philosophically moving study of the evolution of humanity and our meaning in the universe. Its belated sequel, *2010: Odyssey Two*, although popular, is less significant, for while the earlier book raises permanently important human issues, the later book lays these issues down again by providing them with too simple genre resolutions. The novel *2001* done while Clarke collaborated with Stanley Kubrick on the screenplay for the film *2001*, is the best summation both intellectual and artistic of Clarke's career. The film is perhaps the most widely important work of science fiction ever produced.

In his love of technical detail and his efforts to use science correctly in constructing his novels of adventure, Clarke has been perhaps the foremost writer of his generation to carry on the work of Verne and the editorial policies of Campbell; but in his abiding concern for society and philosophy, Clarke is also the foremost heir of Wells and Stapledon. Clarke has won himself a unique and towering position in science fiction by combining the enthusiasm of one camp with the breadth of vision of the other. Clarke has written that his youthful reading of Stapledon's *Last and First Men* (1930) "transformed my life." That book, chronicling the evolution and demise of humanity, ends with the suggestion that "we shall make after all a fair conclusion to this brief music that is man." Stapledon's line reminds us of the farewell of the astronaut in "Transit of Earth," but with a difference: Stapledon sees the music as a conclusion; Clarke sees it as an embrace in something greater than man. This spiritual faith in Clarke comes not from religion, however, but from science itself. As a character says in *The Fountains of Paradise*, the book with which Clarke prematurely claimed his retirement from writing, "he could not understand how anyone could contemplate the dynamic asymmetry of Euler's profound yet beautifully simple [equation] without wondering if the universe was the creation of some vast intelligence." Even for the reading generation that began with Hiroshima, Clarke in his fiction marshals the intimations of intelligence to justify human hope.

Critical Study: *Hal Clement* Donald M. Hassler, Mercer Island, Washington, Starmont House, 1982.

\* \* \*

A continuous fan since his mid-teens of physical science and of the fictional extrapolations from it that the genre has labeled "hard" science fiction, Hal Clement published his first story in John Campbell's *Astounding* in 1942 when he was an astronomy major at Harvard. He has gone on to become one of the

most highly admired scientific extrapolators and lovers of the tight demands of logic in the genre despite the fact that he is not a full-time writer. Clement and his classic fictions are mentioned whenever the discussion of science in the genre comes up; and hence he represents both the full maturing of the Campbell engineering effect on science fiction and the limitations of that approach. Campbell demanded a good story, of course, and Clement's stories are carefully constructed and often convey a certain excitement and suspense. But their distinguishing characteristic is that a problematic condition in physical reality, or simply a condition of difference such as an increase or decrease in heat or gravity, must be elaborated upon, explained, and taken through certain plot changes so that the reader can simply understand the problem or the difference. This is a literature of total imitation of mimesis, in which the facts of the universe are what is mimed. Often in Clement's work, words themselves seem secondary to the phenomena. It is no coincidence that Clement loves, and, in fact, himself paints—as George Richard—astronomical art works of the phenomenal universe. At the end of his most famous novel, *Mission of Gravity*, the alien hero who is trying cleverly to acquire a more useful science for his truly phenomenal planet, Mesklin, that orbits the double star 61 Cygni, comments, "They finished up with the old line about words not really being enough to describe it. What else beside words can you use, in the mane of the Suns?" His second-in-command answers, "this quantity-code they [humans] call Mathematics." Furthermore, for Clement himself any symbols seem to reside not in the words but in the Suns themselves—or in their mathematics.

The literary effect of hard science fiction that makes it good reading derives not so much from its accuracy (although Clement has written non-fiction essays in which he challenges the reader to catch his fictions in an inaccuracy thus implying that the puzzle element is central) as from its ability to tell how science can show difference. The sublime effect of the varied and infinite universe does not require the fanciful imagination in science fiction but can be, to paraphrase Wordsworth who wanted science and imagination linked, the simple produce of the common day if you are an astronomer. The planetary environments are main characters in Clement's fictions, major sources of the sublime, from the variable high-gravity world of Mesklin to the giant and peculiar planet Dhrawn that the mesklinites explore in *Star Light*, to a variety of other worlds in which differences in atmospheric components, in mass, in heat all demonstrate that scientific extrapolation is not dry as dust. But not only does scientific extrapolation discover exciting differences in environment; it also assumes and sets about to demonstrate, in Clement's work, that life forms would evolve differently in different environments. Clement is fascinated by alien view points, and the non-human characters are the most interesting characters in most of his fiction. This commitment to difference, not only in environments but also in life forms, makes Clement a far more interesting—and more accurate—extrapolator than his fellow hard science-fiction writer, Isaac Asimov, who peoples the galaxy with humans. But beneath the strange morphological surfaces and beyond the alien body chemistry, Clement's extra-terrestrials still seek humanlike goals, most often the goal of more knowledge and more scientific control. Thus Captain Barlennan of Mesklin can seem both strange and familiar as he connives to learn flight and even space travel under conditions far different from those given to us to learn the same things. The emphasis in Clement is on learning, movement, and difference—not on any symbolic revelation of oneness.

One of his first aliens can illustrate perhaps most vividly the

strengths and the weaknesses of Clement's brand of hard science fiction. This creature, the hero in *Needle* and reappearing in *Through the Eye of a Needle*, evolved from viruses rather than from protozoan cells into a highly intelligent life form in which only the memory cells are specialized. The other cells are continually changing into various organs as need arises; but usually the creature lives most efficiently as a friendly parasite, or symbiont, insinuating its small virus-like cells easily among the larger protozoan-like cells of its host. In *Needle* the creature has come to Earth in hot pursuit of a criminal member of its race. They come from light years away, of course, representing Clement's one bow to illogic—faster-than-light travel. The creature, called simply The Hunter, adopts as his host a teenage boy. They become the best of friends in a delightful and carefully detailed symbiosis. Clement has the enemy or adversary creature adopt the boy's father as its host. The story then unfolds as an exciting tale of detection with a lot of biological extrapolation worked in, but Clement adds nothing suggestive nor psychologically extrapolative about the basic filial conflict that readers of Wordsworth, Joyce, and even Thomas Wolfe might expect. In several different places, Clement has written sarcastically about "amateur psychoanalysts," and it is almost as though he invented this story, which contains one of his nicest and most different aliens, deliberately to demonstrate that hard science fiction extrapolates only with the physical. Furthermore, his most recent novel significantly continues his epistemological speculations because the nitrogenlife aliens in the fiction communicate without words through direct chemical transfer, thus reaffirming Clement's innate preference for "things" over words. In progress is a novel that Clement describes as "about a hollow world [which] calls for a rather low-probability concatenation of circumstances." Thus it is possible that future critics who deconstruct the genre will discover new resonance in the denials, the doublenesses, and the hollownesses of this classic creator of hard science fiction.

\* \* \*

Mark Clifton had a brief ten year writing career but in that short span he had an enormous impact on science fiction. Most of Clifton's work was sold to *Astounding* in the form of two series.

The first series was about Bossy, the first of the super computers, and it was clearly developed in the novel *They'd Rather Be Right*. As Bossy follows its program to "heal" and "perfect" humans, the treated humans develop psi powers and immortality. However, society fears these "perfected" humans and sets off a witch hunt to destroy the treated humans and Bossy. Although there's plenty of action, the novel's plot concentrates on society's fears of the unknown, even if the unknown might provide great benefits. This book has subtlety and rare sophistication.

The second series features Ralph Kennedy, an extraterrestrial psychologist who manages—in glib, light stories—to save Earth from alien invasions. *When They Come from Space* satirizes bureaucracy when Earth is menaced by the terrible alien Black Fleet. Kennedy is drafted to confront the invasion and manages to discover the secret of the Black Fleet. The plot is clever and the wit is as dry as a Martini.

Clifton's only novel not a part of any series is the underrated *Eight Keys to Eden*. This is a puzzle story dealing with a situation first developed by Clarke's *Childhood's End*. An E-Man (or Extrapolator) is sent to investigate the colony on the planet Eden when the colony mysteriously stops communicating with Earth. The E-man must solve the ecological-psychological problem which becomes, in Clifton's treatment, a critique of Earth civilization.

\* \* \*

In the earliest days of the science-fiction magazines, most of the stories were reprinted from other sources; shortly, however, new works began to appear in *Amazing*, *Science Wonder Stories*, and the others. One of the first of these "new" authors, along with such writers as Jack Williamson and E.E. Smith, was Stanton A. Coblentz.

Coblentz's work was unusual for these magazines, as most of the material utilized science fiction as a vehicle for transmitting "hard science" (i.e., the Verne tradition), or a device for establishing melodramatic adventure situations (i.e., the Burroughs tradition). Coblentz, by contrast, utilized the standard devices of science fiction—space travel, time displacement, discovery of lost races—in order to establish a satiric mirror in which to reflect the foibles of contemporary society and/or timeless modes of human conduct. In this sense, Coblentz

worked in the tradition of Lucian, Cyrano, Swift, and, to a substantial extent, H.G. Wells. Almost alone among Coblentz's contemporaries, David H. Keller exhibited similar attitudes and utilized similar techniques. Coblentz thus provided a model for such later humorists and satirists as William Tenn, Robert Sheckley, Frederik Pohl, and C.M. Kornbluth. Pohl, at least, of this group, has expressed his admiration for and debt to Coblentz.

Coblentz's first published science fiction was the novel *The Sunken World*. A modern submarine discovers survivors of the classical Atlantis living an idyllic existence in a glass dome on the ocean bottom, but they are destroyed through the inadvertent influence of the submariners.

In *Hidden World* a contemporary traveller finds his way into an unknown civilization hidden in giant caverns beneath the earth. This theme is one Jules Verne had used as a device for travelogue-like exploration of imaginary geography, and Edgar Rice Burroughs had used it, in his Pellucidar series, as a background for adventure tales with primitive human and non-human creatures. Coblentz's book harkened back to Ludvig Holberg's *Nils Klim* in using the inhabited hollow earth as a site for satirical events. In *Hidden World*, the traveller becomes caught up in a society at war for no comprehensible issue, except for the possible purpose of reducing unemployment and stimulating economic activity. *Into Plutonian Depths*, dealing with society on the planet Pluto, posits a situation in which men and women past child-bearing age aspire to become surgically neutered, these neuters being the pampered and powerful rulers of Plutonian society. The cover of the Avon edition described the novel as dealing with "the third sex" (a widely utilized euphemism for homosexuality at the time), to which Donald Wollheim, Avon's editor, later ascribed the success of the edition.

Many other works by Coblentz contain satirical matter, most often reflecting Coblentz's revulsion against war, consistently portrayed as senseless and ignoble, and his distress with the oppression and materialistic greed manifested in human institutions. *After 12,000 Years* portrays a future world in which armies of insects have been bred to giant and ferocious stature and enslaved for service in warfare. This anticipates *The Dragon Masters* (1962) by Jack Vance, a distant cousin of Coblentz. It should be noted that Coblentz had a long and varied literary career, of which his science fiction represents only one aspect. Two novels approaching science fiction are *The Wonder Stick*, a pleasantly done story of primitive life, and *When the Birds Fly South*, a beautifully realized novel of an unknown race in the Himalayas, this book being somewhat comparable to James Hilton's *Lost Horizon*.

\* \* \*

Theodore R. Cogswell's work ranges in mood from horror to irony and spoof, in form from novellas to short stories, poetry, and drama, and in quality from expert and meaningful storytelling to juvenile fantasy.

While portions of his stories (like "Test Area") are chilling, Cogswell's best horror story is probably "The Burning," which is about a demonic god (a terrible matriarch) who demands love and obedience from her "children"—and also eats them alive. Often horror is mixed with irony in Cogswell's work, as in "Emergency Rations" where cannibals are trapped in a Trojan horse scheme and literally cooked alive since they "can't feel nothing"; "Thimbs" where the unscrupulous main character demands vitality in his bargain with a "Guardian" for longer life—only to find that the lives "spliced" on to his are those leading to horrible sudden deaths; and "Wolfie" where Peter Vincent bargains with a warlock to be turned into a werewolf in order to kill his cousin and collect on his will, but is transformed into a mangy toothless mutt that must be put out of its "misery." In these three stories the would-be victimizers become victims, for as the Guardian says in "Thimbs," "the ethical universe is just as orderly as the physical one." Occasionally, Cogswell's mood borders on spoof, as in "Probability Zero! The Population Implosion" which manipulates statistics in order to "prove" that England's population has declined since the year 1000 from 275 billion to 44 million at the present time. So, the story advises ticklishly, if you hear doomsayers of the population bomb, you need remember only that "statistics show . . . you have nothing to worry about." "Probability Zero!" illustrates what a Pirandello character says of a statistic: it's "like a sack; it won't stand up till you've put something in it." Unfortunately, what we put into it is interpretation, which is usually debatable and rarely definitive.

Cogswell is quite adept in the various literary genres. His first novella, "The Spectre General," is an accomplished story in the Heinlein tradition, involving delightful situational and understated humor and an alternating chapter/scene plot structure, which deals with the revival of a dying empire by technologists. *The Wall Around the World* is a fine reworking of the Icarus myth, blending and contrasting magic and technology in its main character, Porgie. Cogswell's shorter works are also expert, as I have implied above and as the story "Early Bird" reveals. The most imaginative of all his fictions, this piece depicts a fascinating symbiotic relationship between the main character, Kurt Dixon, and his ship's mother computer and between "her" and two incredibly adaptive, semi-organic monsters on a planet Kurt was forced to retreat to during his battle with the gigantic, people-eating Kieriens. Cogswell's poetry, although different in theme and mood from his other work, is quite good, as his Swiftian lambast against contempor-

ary poets ("sparrow farts" and "word kickers") in "Faex Delenda Est" suggests. Finally, his drama is also impressive. For example, *Contact Point*, written with his wife, has an excellent sense of timing and action, dealing with the first space crew to reach a star and their anxieties and conflicts in bringing back a deadly radioactive organism. At first convinced that earth's doctors can save him, and willing to endanger the rest of humanity, the main character undergoes a dramatic change whereby he challenges earthlings to reunite and stop fighting among themselves in order to annihilate him and his ship before it lands.

Although Cogswell sometimes stoops to puerile fantasy as in "The Masters" (a vampire story), he is a versatile writer who usually makes a point. Even in "The Masters" we see that just as the ethical universe is orderly so is the physical one, so that we never know if we will need some endangered species (the snaildarter?) to help us in our afflictions.

## D. G. Compton comments:

Possibly the best introduction to any writer's work is to know why he does it. The reason I write what people have been kind enough to call SF ("kind enough" because the label makes possible a large and informed readership for stuff that otherwise would probably sink without a trace) is that I'm basically a rather embarrassed sort of person, afraid of admitting to commitment, who welcomes SF's distancing mechanisms. After all, it's far safer to dare to care about one's characters when the situation in which one places them isn't quite "real."

Also I've led what is sometimes known as a "sheltered life." For which read "limited." Thus I know very little about the commonalities of human existence: commerce, golf, brick-laying, what you will. The same sheltered life, however, has involved me in close and prolonged—and often painful—contact with just a few very positive individuals (mostly women, let's face it), and from these individuals I've learned a lot. So I try to write about that of which I know at least something, people, while setting them discreetly in worlds of my own devising (about which I may also be expected to know something.) Future worlds, for convenience's sake, but always closely tied to my own muddled understanding of the present world around me. In general terms I don't much like this present world, and developing it a few years on is a good way of finding out why. And perhaps even of seeing how to change it.

\* \* \*

D. G. Compton's science-fiction novels usually lead to extremes of reaction from their readers. Some are strongly attracted to his mature themes, richly fluent prose, strong concentration on character, and realistic appreciation of the seamier side of human existence. Others are dismayed by the density of his prose, the ineffectualness of many of his characters, the underlying distrust of technology as a cure for all of humanity's ills, the absence of much physical action, and the frequently bizarre nature of his situations. But it appears that Compton is beginning to win over an ever larger share of readers as he continues to skewer human foibles and failings.

Two of his more popular novels deal with our delight in vicarious experience of another's life. *Synthajoy* created a minor controversy because of the dissolute nature of its characters. The story concerns the development of a means to record the life experiences of an individual, to be played back at another time for an interested audience. Although there are obvious beneficial aspects to such an invention, it is almost immediately subverted. Compton returned to this theme in *The Unsleeping Eye*. In a world where disease and pain are virtually unknown, Katherine Mortenhoe has contracted a terminal disease that leaves her only weeks to live. The entertainment world is quick to realize that this provides a possibly unique opportunity to produce a profitable bit of entertainment, and

they employ a man with cameras surgically implanted in one eye. The cameraman manipulates Katherine so that she is emotionally dependent upon him, totally unaware that he is filming her agony for an unfeeling audience. But as time passes, his feelings for her become genuine, and there is a dawning realization that he too is being manipulated.

Compton apparently felt that he had not completely examined the consequences of this situation, because he later wrote a sequel, *Windows*. The Protagonist insists upon the removal of his camera-eyes and accepts blindness, but his personal statement about the world is not allowed to stand as it is. One factor abhors him for criticizing the status quo, another wants to make him a cult hero, and still another dismisses his gesture as an nuisance. The pair are finally driven to flee the country, but are still unable to withdraw into themselves.

Perhaps Compton's most accomplished work is *The Steel Crocodile*, set in an ultra-secret research institute. The protagonist rapidly realizes that more is transpiring within the research group than is apparent. Eventually it is revealed to him that the authorities fear that blind technological progress is too dangerous, and they have created a computer bank to monitor and even interfere with scientific developments. They are blithely unaware that they have surrendered their destiny to the very technology they hoped to control. This complexity of philosophy and plot is rarely found in any genre, and Compton's ability to control his work has rarely been equalled.

*The Silent Multitude* is perhaps his least conventional work. A spore from space attacks concrete, and most artifacts of man's civilization are crumbling. Against the background of a deserted city, Compton presents a small cast of characters, relecting their personal decay against the collapse of the city itself. Even without the brilliant characterization, this would remain a memorable novel, for Compton's description of the dissolution is haunting.

The isolated research organization appears again in *Chronocules*, also present as an island of hope in a crumbling society. It is clear that the collapse of the present society is accelerating and will come within the lifetimes of the protagonists, so they desperately seek a means of escape into the future. Although an excellent novel in itself, it suffers when compared to *The Steel Crocodile* and *The Silent Multitude*, to both of which it is thematically similar. *The Missionaries* should have been a very controversial novel, but attracted little attention. A small group of aliens arrive on Earth, preaching the religion of Ustiliath. Compton makes it quite clear that, for all practical purposes, the aliens are absolutely correct in their beliefs, and that conversion to their religion is the only logical course. But humanity reacts with fear and loathing, and the aliens reach the same fate that greeted many Christian missionaries in their efforts to bring "enlightenment" to the "savages."

Two of Compton's early novels were brought back into print as his popularity grew. Both are highly competent, but neither is of the quality of his later work. *The Quality of Mercy* is a low key examination of the tensions brought to bear on a group of military personnel when it becomes clear that something, perhaps a nuclear war, is imminent. In many ways, this is a forerunner of *The Steel Crocodile*, although in no way comparable with regard to quality. *Farewell, Earth's Bliss* makes use of one of science fiction's most well-traveled plots, the penal colony on Mars, to present a group of misfit humans against a kaleidoscopic background where reality and fantasy aren't always distinguishable.

*A Usual Lunacy* investigates the repercussions of a new disease that causes people to fall in love with each other against their will, and in many cases only until they are cured of the disease. Compton seems unusually bitter this time, for love itself

becomes a sometimes criminal activity. *Ascendancies* seems to have been largely overlooked despite yet another set of interesting characters. A strange substance begins periodically to fall from space, a substance which is soon revealed to be an inexpensive source of energy. Soon most of the world is freed from the normal work week, but subject to a new burden. There are scattered incidents of possibly hallucinatory singing, often accompanied by mysterious disappearances of people in the area. The protagonists are a woman whose husband disappears and the insurance investigator who discovers she has purchased a body from a criminal organization in order to ensure that she receives the insurance money. When he decides to blackmail her, the two are brought together in compulsive and compelling relationship.

Compton has written few short stories, none of which have been noteworthy, probably because his gift of characterization is not as apparent at that length. Although he continues to write both within and outside the genre, Compton has eschewed the traditional concerns of science fiction, using the plots that he borrows only as the frame upon which to hang his real interests, the morality of science, the peculiarities of humanity, and our ability to influence our own lives.

Michael G. Coney comments:

My purpose is to entertain myself as well as my readers. Each of my novels has been an experiment in style and content with one consistent trait: they are all mystery stories. Love is there too, and human psychology, and a little "hard" science, but my main intent is to keep the reader guessing. I think my earlier novels were too conservative; they were all hung on hooks of known science and "real" reality—which is odd, since as an SF reader my preference is for the persuasively fantastic: the "sense of wonder" story. My short stories are normally written as vehicles for ideas, situations, and characters which I intend to use in my novels—I find it much easier to work this way than to plunge into a novel cold. Other short stories have been written for specific purposes, generally to use up one-off ideas before I forget them.

\*       \*       \*

Michael G. Coney was a prolific writer in the mid-1970's and seems about to become so again, with his recent commitment to "The Song of Earth," a kaleidoscopic future history. Because he has contributed to so many of the genre's traditions, his work is not easy to classify: perhaps his originality has been in his ability to take the old forms and themes and quietly but persuasively stamp his own hallmark upon them. Philip K. Dick may have been his model in *Mirror Image*, John Christopher in the post-holocaust novel, *Winter's Children*, Heinlein and Aldiss in the closed environment stories *The Hero of Downways*, *The Ultimate Jungle* and "The Mind Prison," Asimov's "Nightfall" in *Syzygy* and "Evidence" (from *I, Robot*) in "The Martyrdom of Raccoona Three" (a fine short story embedded in *The Celestial Steam Locomotive*), Cordwainer Smith in *Cat Karina* and other stories in "The Song of Earth" that feature the "Specialists" (animal-human melds). His powerful sequel to *Syzygy*, *Brontomek!*, takes up several ideas from the earlier stories: the amorphs from *Mirror Image*, the heroine's name and personality from Susanna in *Charisma*, the brontomeks and the idea of post-hypnotic suggestion from his grim story "Esmeralda." Throughout his work, Coney's range of theme and tone are remarkable; his touch is usually light but the fare not bland. He is equally at ease with horror, romance, and humor ("The Byrds" should become a classic of comic fantasy). "The Song of the Earth," therefore, which forces him by its structure to evoke the sense of wonder freshly at least once in each of its many short chapters, is ideally suited to his genius and has the further advantage of enabling him to subsume his taste for fantasy within a formal science-fictional frame, through the idea of a computer-programmable Dream World.

Coney likes to study the reactions of a small group to a large threat or challenge, whether natural but alien, as in *Hello Summer*, *Goodbye* and *Syzygy*, or social but inhuman, as in *Brontomek!*, or both, as in *The Ultimate Jungle*. Solutions are not likely to be achieved by technological means but, after valiant efforts, may be granted by special grace; to some

problems the only solution is escape or transcendence. As an SF writer, Coney is properly concerned with the issue of scepticism and its contrary, credulity; he is not so hasty as some writers to come down on one side. The framing chapters of *Syzygy* expose the dangers of group vulnerability to suggestion, yet it seems in *Brontomek!* that it may sometimes be better to rest happily deceived, as individuals are by the amorphous "Tes" (thous, ideal companions). Coney hates manipulators: his sympathetic characters are after their victims; yet it is not easy for these characters to find someone to blame. In *Brontomek!* the immoral Organization stamps on a whole planet, yet its own agents are themselves victims and there is something sublimely admirable in the irresponsible force of its symbol, the rogue brontomek, which rampages malignly for a time, before pathetically losing its motive power, "betrayed by its own mechanical weaknesses." Cat Karina complains against the bullying gods but human manipulators and strong egotists may be regarded with horrified admiration, as are Carioca Jones and Hector Bartholomew in the Peninsula stories, while their devoted lovers are seen with baffled disgust. Nevertheless, if the author, for narrative purposes, identifies with such lovers, he will present them with strong sympathy, and perhaps it is for this reason that in *Charisma*, *The Jaws That Bite*, *The Claws That Catch* and *The Ultimate Jungle*, Coney seems over-tolerant of some repellent features of his heroes, concomitant on their devotion to such unpleasant characters. Alien manipulators may also be present sympathetically (their control is accidental in *Syzygy*, accidents are rectified by benevolent fostering in "The Tertiary Justification" and "Symbiote"; they show wise control of beasts in "Oh, Valinda!"). So disposed, Coney gives us one of the genre's sweetest heroines in the alien Pallahaxi Browneyes (*Hello Summer*, *Goodbye*), and seems to envy the self-containedness of his multi-individual aliens (Kli a' Po in *Brontomek!* and the amusing Vegan in "Trading Post"), whereas his humans often find it hard to relate to other individuals.

There is strong dystopian satire in *Friends Come in Boxes* (which offers a radical solution to superfluous people – those over 40) and *The Jaws That Bite*, *The Claws That Catch* (where prisoners reduce their sentences by voluntary bondage). As a dystopian writer, Coney's animus is principally against the notion that utility or justice should outweigh compassion. The darker side of his vision culminates in *The Ultimate Jungle*, an important but depressing novel in which Coney seems to have given in to a compulsion to put on record those inadequacies which hereafter will force him to treat humans as members of a dead species. Maybe he had to get this book off his chest before he could achieve the mellower tones of "The Song of Earth."

Coney has stressed the element of mystery in his stories his plots often draw upon those of mystery fiction: like Bester's *The Demolished Man*, *Charisma* offers an SF variant of the locked-room mystery, for instance, and "Monitor Found in Orbit" wickedly plays on the spy thriller. Coney appreciates that the SF form can be used to shed new light on old problems; in my favorite of his novels, *The Hero of Downways*, he studies heroism as it were in a clinical laboratory situation—and also takes a fresh look at such SF standards as clones, the multi-individual self, mutations, and miniaturized people. Others may enjoy this author more for his presentation of new forms of locomotion or of unusual tidal conditions on strange planets; few should fail to find him entertaining and he deserves to be rediscovered.

\* \* \*

Although Glen Cook's first publications were "Song from a Forgotten Hill" and "And Dragons in the Sky", published in the first *Clarion* anthologies in 1971 and 1972, he is primarily known for the series of novels that appeared in a quickening torrent nearly a decade later. "Song from a Forgotten Hill," a short story about future racial strife, was typical in its brevity and theme of the apprentice SF of its time; but "And Dragons in the Sky," a space opera involving a mile-long spaceship, contrasted conspicuously with the subject matter and styles of the other *Clarion* alumni in whose company Cook made his debut.

After the appearance of a post-holocaust novel, *The Heirs of Babylon*, Cook published "In the Wind." Like the earlier pieces, it deals with familiar SF scenarios awkwardly but with some vigor, and not without evident ambition. Like all Cook's work, "In the Wind" shows his weakness with metaphor and structure, and what was to prove an enduring propensity for cliché. Cook's tale of airwhales hunted by humans in flimsy aircraft is derivative in many respects and marks the beginning of his practice of transferring wholesale the sentimental particulars of romantic military fiction into the future, but remains, with the earlier stories, his most impassioned and interesting work.

Some years later Cook described his early career as comprising "several transmogrifications and near-sales to editors immediately fired and publishing houses immediately going bankrupt." Whether owing to these difficulties or not, the fiction Cook resumed publishing in 1978 was expediently and carelessly executed, being a series of fantasy adventures whose backgrounds were strongly flavored with the regalia of 17th-century British piracy ("Ghost Stalk") and the oriental warrior ("Soldier of an Empire Unacquainted with Defeat"), and prompt suspicions that they were set in imaginary worlds simply to avoid the need for research. Both stories share the same background as the Dread Empire Trilogy, as a second

trilogy, "Starfishers," rather nominally shares the historical background of "In the Wind."

These books are unqualified potboilers, either cynically conceived or truly cruel-spirited tales of warriors who have never lost and suffer no change in fortune through the course of the stories. They conspicuously lack the craftsmanship that goes into many paperback novels of no literary pretension, and are so badly written as to prove frequently ludicrous—sentences such as "As Tor hit the deck he began growling orders through a grin of anticipation" may be found in every paragraph.

Four novels published in early 1985 indicate the range Cook has shown over the first half of the decade. *The White Rose* concludes another fantasy trilogy, notable for its cruelty of incident and haphazard, seemingly improvised structure. *A Matter of Time* is a science-fiction novel dealing with homicide detectives and time-travel paradoxes which, although similar to numerous genre novels such as Silverberg's *The Time Hoppers*, moves with some crispness. *With Mercy Toward None*, a sequel to *The Fire in His Hands* and presumably middle volume to another fantasy trilogy, deals with a desert prophet's uprising in a predictable manner but with some attempt at greater emotional depth.

Manuscript Collection: University of Wyoming, Laramie.

Edmund Cooper commented:

(1981) I believe, along with people like Kurt Vonnegut and J. G. Ballard and earlier illustrious writers such as George Orwell, Aldous Huxley, and H. G. Wells, that science fiction is the perfect medium for making a social or political statement. I am not interested greatly in gadgetry. I am interested passionately in the future of mankind. People matter to me far more than machines or innovations, which is why I concentrate on characterization in my novels. I try to entertain and believe I

am successful in doing this; but basically I want to put up ideas for consideration by my readers. Voluminous correspondence assures me that I have succeeded in this end.

\* \* \*

With the publication of his earliest novels and stories of the late 1950's, Edmund Cooper quickly established himself as an urbane stylist whose sometimes almost intuitive grasp of science fiction's key themes and images could distinguish his best fiction and almost redeem his lesser works. There is always a moment in a Cooper story when the "sense of wonder," so often cited as the basic emotional stance of science fiction, becomes concretized in a dramatic image or action, whether it be an encounter with a god who turns out to be a spaceship ( *A Far Sunset* ) or simply an epiphanal moment of self-discovery on a distant planet ("M81—Ursa Major").

Cooper's plots and characterizations do not always match his style and vision. His early stories and novels sometimes read almost as practice exercises in traditional science-fiction themes: the revolt of androids in a "utopian" society ( *That Uncertain Midnight* ), time-travel paradoxes ("Repeat Performance"), generations-long space voyages ( *Seed of Light* ), the pitting of humans against a rival culture in a setting alien to both ( *Transit* ). Such themes had been treated in earlier, classic science-fiction stories, but for the most part Cooper succeeded in working his own variations on them. *That Uncertain Midnight*, for example, is unusual in its sympathetic portrayal of the dilemma of the androids, and *Transit* focuses sensitively on the character and emerging relationships of the four humans who find themselves stranded on an unknown planet. Though *Transit* shows that Cooper is capable of developing complex characterizations, he all too often reverts to the near-superman genius-hero of traditional pulp science fiction for his protagonists.

Perhaps the most persistent theme in Cooper, though it seldom emerges as more than background, is that of nuclear war. Nuclear war is the cause of the rise of the androids in *That Uncertain Midnight*, the dystopian state in "Tomorrow's Gift" (one of his finest short stories), the escape from earth in *Seed of Light*, the destruction of the entire human race in *The Overman Culture*, the dominion of satellite cities over Earth in *The Slaves of Heaven*, and the rise of the antitechnological Luddite society in *The Cloud Walker*, the best-received and most successful of his novels in the United States. Though it might be misleading to categorize Cooper as a simple technophobe, his cautionary attitude toward technology is also revealed in a number of stories in which "primitive," non-technological societies are shown to be morally superior to decadent technological ones. This is a theme of "The Enlightened Ones," *A Far Sunset*, and *The Slaves of Heaven*. *A Far Sunset*, in fact, is one of science fiction's more sophisticated treatments of an anthropological theme in its depiction of an alien society and its mythology.

Perhaps because he published little in the American magazines, Cooper never established a strong following among American readers; perhaps because he belonged in the early 1950's tradition of John Wyndham and John Christopher, his reputation began to wane after the changes wrought in British science fiction during the "New Wave" of the late 1960's. In any event, his works in the 1970's took an increasingly conservative and sometimes unpleasant turn, especially apparent in his "Richard Avery" novels and his anti-feminist novels of societies dominated by women, *Five to Twelve* and *Who Needs Men?* Occasionally, however, he was able to incorporate some of the New Wave ideas with some success. *The Overman*

*Culture*, for example, features an enjoyably surrealistic portrait of a London in which Victoria reigns, Churchill is prime minister, and the young hero is Michael Faraday. All this gives way eventually to a traditional science-fiction explanation, which is nevertheless ingenious and does not destroy the novel's sense of playful fantasy.

By the time of his death in 1982, Cooper had come to be regarded as a minor, if competent, novelist in a somewhat outmoded tradition. His reputation was probably further damaged by the ugliness of some of his later works. But at best, he was a writer capable of witty and literate variations on familiar themes, and one who for all his faults managed to establish a clear identity despite his use of such themes.

Alfred Coppel comments:

I began writing in the SF genre for two reasons: first, it was a field that did not limit the imagination (untrained though it might be) of a young writer, and second, I had read SF since early youth—and I believed then (as I still do) that a writer should write what he enjoys reading.

I have since turned to writing "general" novels, but I am told there is still a bit of the SF writer's mark on my work. I accept this with pride. Those of us who learned our craft in the hard school of the SF magazines learned early on to be professionals. To my mind, there is no higher praise that can be bestowed on a writer.

\* \* \*

Although Alfred Coppel has done most of his writing in other fields, his few contributions to science fiction have been almost invariably among the better attempts in the field. His novel *Dark December*, for example, is one of the best post-nuclear war novels ever to appear, far superior to many whose titles are better known.

His more straightforward novels in the genre consist of the Rhada trilogy written under the pseudonym of Robert Cham Gilman. Man's interstellar empire has collapsed into a feudal society that is a mixture of science and magic, spaceships and incantations. Against this background, Coppel wrote three adventures of young men attempting to come to grips with the stresses and internal contradictions of their society. Although writing ostensibly for younger readers, Coppel has not pulled any punches. The novels deal explicitly with the seamier side of human acquisitiveness and the urge for power. The cyclic drive to self-destruction is an almost ever-present backdrop against which the characters play out their lives.

Coppel uses his settings and plots to examine his characters, rather than just employing characters as animated tour guides of exotic landscapes. The protagonist of *Dark December* is a fighter pilot who wanders across an America torn by nuclear bombs, plagues, famine, and human savagery. But it is not his adventures with which the reader is concerned but the effects of those adventures on him as he grows increasingly desperate to discover the fate of his missing family.

In recent years, Coppel's closest approach to science fiction has consisted of a pair of excellent near-future political novels. In *Thirty-Four East*, the world is on the brink of conflagration as the President is apparently assassinated, and the Vice-President is held hostage by Arab terrorists intent upon the destruction of Israel. In Washington, the generals move to fill the power vacuum, while across the ocean a weak premier of the Soviet Union begins to succumb to pressure from his own generals. The only chance to sidetrack the headlong movement toward war is to rescue the Vice-President. The situation is similar in *The Dragon*. The Red Chinese have developed a new weapon which gives them effective superiority over the Russians. Unless the President can somehow restore the balance of power, a war between the two Communist giants is inevitable, and it is just as certain that the rest of the world will be drawn into the confrontation. In both cases, Coppel has captured the reins of suspense firmly, and linked them to a credible sequence of political and personal events. Each novel is complex and satisfying, and it is interesting to speculate about Coppel's possible achievements had he devoted his efforts primarily to science fiction, rather than remaining as diversified in his interests as he has.

Some hint of that may be found in his recent science-fiction thriller *The Burning Mountain*. Alternate histories have long been fertile ground for genre writers and mainstream writers alike, and Coppel now speculates about what would have transpired if the atomic bomb tests had resulted in failure. After investing considerable effort in researching the war plans of both the United States and Japanese governments, he constructed this novel that deals with the invasion of mainland Japan by allied troops. Outside of the basic premise, the novel really isn't science fiction at all, just another World War II adventure story, but it is an outstanding achievement regardless of which category might claim it. With a large cast of characters, depressingly convincing descriptions of the unfolding events, and Coppel's clear, gripping style, it is clearly among his very best efforts.

Coppel wrote many short stories early in his career, most of which were above average in quality. Possibly his most successful is "The Last Night of Summer." Stellar evolution

has caused a change in the energy output of the sun, and an astronomical event is imminent that will briefly make the Earth uninhabitable. Except for a limited number granted a place in the Burrows, shelters constructed underground, the entire human population will be wiped out within a few days. The protagonist murders his wife and sacrifices his own chance at life in order to provide a change for survival to his two daughters. It is at one time one of the most brutal and one of the most effective world disaster stories of all times, accomplishing more in a few pages than is usually done in entire books. Other stories of note include "The Hills of Home" and "Double Standard."

## Lee Correy comments:

Since 1951, I've written "hard" science fiction because that's the sort of story I like to read. I was influenced at an early and impressionable age by one Robert Anson Heinlein who, in 1950, was kind enough to take me under his wing and coach me. But John W. Campbell, Willy Ley, Dan Cole, and Herman Kahn must also share the blame for what I've become. Much of the background for my s-f novels came from consulting work for NASA, the Department of Energy, or the Hudson Institute, for example. Or from careful and continual reading, reading, reading of scientific journals, reports, books, magazines, and papers to keep up with our growing knowledge of a universe that's becoming stranger every day. Often I've written an s-f novel rather than present the same material in a science-fact book because (a) it made a better fiction piece, and (b) nobody would believe it as a science-fact work! ("Shuttle Down" is an example of this.) Incidentally, I've used the pseudonym "Lee Correy" to tag my s-f in order to separate it from my science-fact writing, a differentiation that's getting more difficult to determine every day. Although I've written some "far out" science fiction, I'm just not interested in "swords and sorcery" fairy tales masquerading as "science fiction." (People are free to write and read what they want, but I wish they'd start referring to s-f for what it is, and it isn't science fiction!) I don't write "literature" or to change the world; I try to write entertainment as Heinlein taught me. I find lots of story material in the potentials and problems of the next hundred years which come down to: How do we learn to handle wealth and power in a universe where we're largely in control of the forces of nature? I've never written a downside doomsday story and probably never will. I have enormous faith in the ability of human beings to make the world a better place for their children. I would have enjoyed being a member of John Herschel's Analytical Society at Cambridge, England, whose

members promised one another to "do their best to leave the world wiser than they found it."

\* \* \*

Even the most cursory exposure to the science fiction of Lee Correy would demonstrate his preoccupation with space travel and its importance to the human race. Most of his novels and short stories deal with space travel not just as a plot element but as the focus of the entire plot.

*Contraband Rocket* suggests that if the government is not willing to exert time and money in conquering space, then perhaps private industry will do so instead. The idea that a collection of idealists could refurbish an old rocket for a moon flight has become silly in view of the sophisticated knowledge we now possess, but this early novel exudes the optimistic self-confidence of its time. Correy's recent novels *Star Driver* and *Space Doctor* have returned to this idea, but have taken into consideration the realities of high technology. In the former, a small company develops a working anti-gravity unit and mounts it on commercial aircraft in order to make a dramatic presentation of its possibilities and enable them to evade government regulation. Unfortunately, Correy was unable to overcome the practical problems with the plot, and his polemics sometimes disturbed the pace of the plot.

*Space Doctor* is far more successful. An orbital construction project is underway to create a new power source for the Earth. Its completion will be an economic boon for the companies financing the project. To reduce their expenses and the possible loss of lives, they hire a doctor to head an orbiting hospital outfitted to handle emergencies as they arise. Correy has much better control of his plot this time and while his lectures on the advantages of an active space program are still there, they fail to distract us from the main story.

The government is sponsoring space travel in *Shuttle Down*, in which an aborted space flight results in a shuttle stuck on Easter Island, faced with physical and political problems before it can be removed. The protagonists have to deal with terrorists, spies, Russian naval manoeuvres, and various problems of supply and manpower before everything can be resolved. Correy seems to have lost faith in the established governments in his recent *Manna*, however, for now he has created a libertarian Utopia in Africa with a large-scale manned space program, but which has attracted the unfriendly attention of most of the rest of the world because of its unorthodox form of government.

For the most part, Correy's short stories deal with the mechanics of space exploration. In "The Test Stand," for example, a man's view of his own career is revised when he is nearly killed preventing an accident during a test firing. The importance of the human factor in even the most sophisticated aspects of space flight is demonstrated in "Coffin Run" in which a substitute pilot must be retrained rapidly to complete a necessary flight, despite the objections of some of the authorities. Neither story descends into overt lecturing, but it is clear that Correy is attempting to humanize the space program.

Correy's best short story is "The Easy Way Out." Alien invaders land in a remote part of the Earth and set out to discover how susceptible the planet is to invasion. They encounter a number of animals and rate each on a "Ferocity Index," eventually retreating in utter terror when they witness the bullying of a pet wolverine by a pair of human children. Although the basic concept is amusing, the story does encompass a flaw; it is unlikely that a race that had conquered a large chunk of the universe would automatically assume that every animal species it encountered was a separate intelligent species.

Less ambitious is a very mild but well-handled story, "Something in the Sky." A test missile veers away from its intended target and strikes something invisible in space, constructed of materials unknown on this planet. In just a few thousand words, Correy conveys a mood of mystery and wonder.

## Juanita Coulson comments:

Before I could write, my mother transcribed my earliest attempts at story telling. For my 8th Christmas, she gave me a typewriter, compounding the felony. In a sense, I have been writing fiction since before I could write. My only interest was in concocting characters and adventures that satisfied an audience of one—me. It wasn't until I was in my 30's that Marion Zimmer Bradley insisted I should submit my work professionally. Without her encouragement, I never would have made the effort. I am still surprised to find that some kind of people actually pay me for writing stories I wrote so long ago solely for my own entertainment. Other than the fun of creating, my aims are to follow two maxims: There Are No Simple Answers and Take The Long View. To some degree, I share Marion Bradley's theory that a villain is just a protagonist with a different point of view; the story *might* have been told from the villain's position, *if* he (or she) is a valid character to start with. And in any story, I don't think all the questions can be answered—certainly not completely. People—and characters—are too complex. As for The Long View, its a humbling rule to write by, but it serves me equally in science fiction, contemporary woman's genre fiction, or a historical romance set in 1770 B. C. The Long View ought to be an essential ingredient of all science fiction, especially considering the past and future history of humanity *and* of other species, known and unknown, and cosmology. Putting us in our place in that immense scheme of things is, for me, the foundation of a sense of wonder.

\* \* \*

Since its first appearance in professional print in 1963, Juanita Coulson's writing has included science fiction of both the speculative and the adventurous varieties, heroic fantasy, romantic suspense ("Gothics"), and historical romances, as well as occasional non-fiction.

Her first story, "Another Rib," a collaboration with Marion Zimmer Bradley, tells of a group of men, the only survivors of a destroyed Earth, and what happens when alien medical technology offers them an unconventional way of perpetuating the human species. The theme is handled with skill and delicacy, resulting in a memorable story.

Coulson's first novel, *Crisis on Cheiron*, deals with the struggle of a small band of allies to save an undeveloped planet

from economic and ecological ruin at the hands of an unscrupulous Terran corporation. In *The Singing Stones* another world is in peril: Pa-Liina, with its quasi-telepathic Stones of Song, suffering under the domination of its decadent sister world Deliyas. In both novels the alien environment is well thought out and convincingly portrayed, and the scientific underpinnings are given colorful settings and action reminiscent of the work of Leigh Brackett and Marion Zimmer Bradley. The theme of an alien world suffering the unwelcome attentions of Earthmen is also present in "A Helping Hand": this time the Earthmen's intentions are benevolent, but their complete misunderstanding of the world they are trying to help leads to disaster.

*Unto the Last Generation* is the story of a future Earth where population control has been all too successful, rendering most of mankind infertile. The young battle with the old for the inadequate supplies of food distributed by a military government, while a group of scientists work in secret, trying to ensure humanity's survival. *Space Trap* deals with the first contact between Earthmen and a telepathic civilization from across the galaxy, as representatives of both groups battle for control of a remote planet on which they are trapped.

"Unscheduled Flight" is more anecdote than story: it sets up an interesting parallel-worlds situation but does nothing with it. Two long fantasy novels, *The Web of Wizardry* and *The Death God's Citadel*, are both set in the same imaginary world, in which sorcery and the presence of supernatural beings are facts of everyday existence. The backgrounds (geographical, cultural, and linguistic) are worked out in detail; the characters are interesting, the action well-paced, resulting in two very entertaining adventures. Two earlier short stories, "Wizard of Death" and "The Dragon of Tor-Nali," are set in the same world as the novels.

Coulson's best work to date is found in her multi-generational family saga which bears the overall title "Children of the Stars". The first volume, *Tomorrow's Heritage*, introduces the Saunder family, owners of one of Earth's most powerful industrial and communications conglomerates in the early 21st century. The focus is on the three Saunder children: Patrick, leader of a fiercely isolationist political party, opposed to any extraterrestrial colonization or contact; Mariette, a supporter of the man-made satellite, the Goddard Colony; and Todd, who has just established electronic contact with an extraterrestrial space craft heading toward Earth. The conflicts among the children, and between them and their autocratic mother, are set forth in a rich and emotionally complex story. The saga continues in *Outward Bound* in which the next generation of the Saunder family establish contact with the alien Vahnaj and achieve faster-than-light space travel. As of mid-1985 the third volume, *Legacy of Earth*, is still awaiting publication.

#### Robert Coulson comments:

First of all, I don't write because I have any burning desire to tell stories, or to influence the masses, or even to be admired (though I suppose the last might have some bearing on my writing). I write professional fiction because it's the most enjoyable way I've found to make money. Not the most reliable—which is why I work at a regular job and write as a sideline—but the most enjoyable. Since writing is extra income, rather than my living, I can afford to write pretty much what I like. What I like, mostly, is humour: puns, incongruities, parody, satire (not farce: I seldom find farce particularly funny). Basically, I don't take writing—my own, or anyone else's—seriously, and I'll make fun of a writer who shows that he takes himself overly seriously. I try to be entertaining, and any profundities will be slipped in gently and (I hope) well hidden. Any influencing of the reader in a work of fiction should be subtle.

Fortunately for our co-authorship, Gene DeWeese has much the same sense of humor that I have; once one of our books is finished and in print, it's impossible even for us to remember exactly who wrote what. Saves a lot of disagreement during the writing.

\* \* \*

Robert Coulson has been a science-fiction fan since the 1940's and has been involved in amateur SF journalism for more than 25 years. His journalism work has been entirely non-fiction: humorous articles and the incisive reviews which he still writes for his and his wife's magazine *Yandro*. Coulson has remained active as an SF fan even after becoming a professional writer.

Most of Coulson's science-fiction writing has been done in collaboration with his long-time friend, Gene DeWeese. In 1967, under the name Thomas Stratton, Coulson and DeWeese wrote two paperback spinoffs from *The Man from U.N.C.L.E.* TV series. *The Invisibility Affair* involved THRUSH's use of an invisible dirigible in their latest plan for conquest. One of the chapter titles from the book ("Charles Fort Never Mentioned Sandbags") would turn up ten years later, transmuted into the title of another Coulson/DeWeese collaboration. In *The Mind-Twisters Affair*, Napoleon Solo and Illya Kuryakin foil a THRUSH attempt to control the minds of world-famous scientists. Both books feature the unlikely situations and off-beat humor which made the television series so popular.

The Coulson/DeWeese novel *Gates of the Universe* is the story of a bulldozer operator and would-be science fiction writer, Ross Allen, who is accidentally whisked from Earth to the planet Venntra through a Probe Gate, a means of alien interstellar transportation. Both the Bulldozer and Allen's SF background aid him in coping with the dangers of a world threatened by the antics of an apparently mad computer. *Now You See It/Him/Them . . .*, a combination murder mystery and SF novel of psi powers, is set at a science-fiction convention. A follow-up novel, *Charles Fort Never Mentioned Wombats*, takes place in Australia, among a group of science-fiction fans on their way to attend the World Science Fiction Convention in Melbourne. The trip is complicated by assorted encounters with extra-terrestrials.

All of the Coulson/DeWeese collaborations, as well as Coulson's solo work, involve standard SF ingredients, handled with skill, humor, and occasionally a refreshing irreverence. They also employ the practice of "Tuckerizing," named after the SF fan and writer Wilson Tucker: using the names of family, friends, and well-known SF figures for characters in the story. This is not noticeable to the general reader, but can prove distracting to those who are familiar with the names.

Coulson's only solo works to date are *To Renew the Ages* and "Soy la Libertad." The novel is set in a sparsely populated North America after a nuclear war, and chronicles the hero's battle against an unknown telepathic menace which is threatening the safety of the scattered pockets of civilization. His search for the source of the danger leads him into contact with the remarkable heroine, Tamara Bush, and the matriarchal society which she represents. "Soy la Libertad" is an alternate-world story, telling of the aftermath of a political assassination in a version of North America where Texas, the Confederacy, the Five Indian Nations, and the Mormons' Deseret are separate counties, not part of the United States. Based on the author's broad knowledge of history and told with a nicely calculated irony, it is a memorable story.

Coulson's name also appeared as co-author on *But What of Earth?* but Coulson merely revised a manuscript submitted by

Piers Anthony. The result, after further changes by editorial hands, was unsatisfactory to both writers.

—R. E. Briney

\* \* \*

Like many young science-fiction authors, Arthur Byron Cover is identified with one imaginative universe and group of characters. Influenced by the Clarion Writers Workshop and, especially, Harlan Ellison, Cover is obsessed with popular culture archetypes, and his penchant for irreverent satire and sardonically humorous ideological discussion would seem to embody an homage to Ellison, the genre's most colorful and creative *enfant terrible*. Indeed, Cover's first two novels suggest that their author is himself determined to be another *enfant terrible*, particularly in their displays of juvenile shock effects and virtuoso exercises of impressive erudition—as well as in their indifference to the values and methods of formula narrative.

*Autumn Angels* was published as part of an entry in a short-lived "discovery series," edited by Ellison, with a typically laudatory introduction, along with the casual admission that Cover's "first draft" required a good deal of revision. This episodic novel has a unity of tone, setting, and characters, but its rambling and discursive nature tends to undercut the author's inventiveness. Essentially, *Autumn Angels* describes a community of "godlike men" who inhabit a golden city in a distant future, and who find their immortal lives boring and sterile. The "godlike" men and women are, according to the narrator, all that remains of earth after its destruction. Fortunately for them, some experimental aliens called the "bems" saved them and endowed them with immortality. However, instead of trying to find their own identities the characters were allowed to select identities from the realms of history and popular culture; hence, the novel deals with "the demon" (Lucifer), the "fat man" (Sidney Greenstreet), the "other fat man" (Nero Wolfe), the "Big Red Cheese" (Captain Marvel), and so on. Of course, Cover is required to use such nicknames for his principals in part to avoid infringement of the copyright laws. It must be conceded, however, that an eclectic narrative in which the characters are never mentioned by name frequently becomes tedious.

Not much of interest happens in *Autumn Angels*. The characters complain of their lot, threaten each other, and visit other planets where grotesque things happen. In order to provide a challenge for the immortals, the "other fat man" introduces depression to their world, but the possibilities of this theme are not realized. At the end of the novel, the introduction of "sexism"—by which the author means romantic love and conventional family life—is promised as a further antidote for ennui. Meanwhile, there is a good deal of puerile incident: for instance, the demon spends much of the book fondling his genitals, an action suggesting an unkind metaphor for the book. In fairness, however, *Autumn Angels* is an immature novel by a writer of promise.

Equally eclectic, *An East Wind Coming* returns to the golden city of the immortals and enlarges Cover's vision, but the book fails to establish him as a mature novelist. Cover has expanded his cast to include Sherlock Holmes and Dr. Watson (the "consulting detective" and the "good doctor"), Lois Lane (the "ace reporter"), the Continental Op from Dashiell Hammett's stories, and other well known popular culture archetypes. The story is unified by a dramatic (if unoriginal) plot: Jack the Ripper is loose and killing in the "East End" of the city of the immortals, and Sherlock Holmes is obliged to track down and defeat this horrifying murderer and mutilator of women.

Despite the rich possibilities in such a plot and theme, Cover's novel is as much a parody as a recreation of the drama and suspense of a Holmesian tale. Constantly digressing from the detective story plot, *An East Wind Coming* allows itself dialogues and monologues about art, sex, existentialism, Marxism, violence, the necessity of dreams, and the futility of all human effort. Clearly the book is more a philosophical novel or a literary "anatomy" (in Northrop Frye's definition of the word) than a suspense story or a successful melodrama. Even the Ripper is a philosophical murderer somewhat vaguely reminiscent of Raskolnikov. Hence, although the Holmes-Ripper conflict has enormous potential for drama, few of its possibilities are realized in this narrative.

Cover's handling of characterization is more assured in *An East Wind Coming*, but his archetypes are statically conceived. Unfortunately, too, the obvious comparison with his sources, especially Conan Doyle, Rex Stout, and Dashiell Hammett quickly makes Cover's novel seem rather juvenile.

Cover's golden city also rouses inevitable comparisons with

other science-fiction and fantasy authors, like Philip José Farmer and Michael Moorcock, and again these parallels are to Cover's disadvantage. Cover's work lacks both the dynamic action and force of Farmer's River-world novels, and the inventiveness and poetic charm of Moorcock's "Dancers at the End of Time" trilogy. Clearly Cover is a writer of promise, and his conception of a Valhalla of pop culture heroes is an interesting one. But more intellectual maturity and artistic mastery are needed for an author to bring off successfully the kind of novel that Cover attempts in *An East Wind Coming*.

#### Richard Cowper comments:

First and foremost, in my writing, I aim to please *myself*. Experience in the form of some 15 novels has taught me that if I do this I usually contrive to please some other people too. That's just as well, for to write books that did not give me pleasure in the writing would be a grim sort of punishment and I'd very soon pack writing in altogether. But having said that I feel bound to add that I am profoundly conscious that I am in the entertainment business where "those who live to please must please to live."

My ambition has always been to write fine novels. By that I mean novels in which, as it were, I contrive to put the beat of the human heart on to the printed page—to make the reader endure and enjoy the whole gamut of human experience through the medium of my imagination. I contend that, to have its full impact, science fiction must be presented in human terms and allow the reader scope for imaginative identification with the characters in the stories.

\* \* \*

Richard Cowper entered the SF genre from the mainstream with *Breakthrough*, which used a contemporary setting to unravel the story of "passengers" in the minds of his characters, survivors of a more perfect, poetical age. This emphasis upon the "dream state," central to Cowper's work, is used in a different manner in *Phoenix*, where a youth, Bard, wakes after suspended animation and finds himself two thousand years in the future, in a simpler, post-holocaust society. Like the protagonist of *Breakthrough* (and, indeed, like many of Cowper's protagonists) he is possessed of special paranormal powers, which are unknown to him at the book's outset and which he discovers and eventually learns to use with sensitivity. These powers are evidence again in *Domino*, where the young protagonist (still at school), Christopher Blackburn, finds himself pursued by people from the future who are trying to stop him from experimenting in genetics, experiments which are to change the face of future society, making a master-slave arrangement. The interaction between different realities wit-

nessed in these three books is to be seen in his later work as a strong theme.

In 1972 the satiric *Clone* launched Cowper upon the SF reading public. It is marked by its hostility to the technophilic direction man is taking, and by a distaste for modern living in general. It is all delivered with humour, and follows the picaresque adventures of the young innocent, Alvin, who remains morally intact despite the gross advances of the world to him. He discovers he is part of a four-man Clone which develops immense paranormal powers but, as in all of Cowper's books, disposes of these powers in a humane, almost mystical manner. *Time Out of Mind* said little more than had been already stated in *Domino*, and is another tale of future interference in present (or near-present) society. *Kuldesak* is a far better book, showing us man in degeneration, living beneath the ground at the command of robots and computers, becoming (literally) vegetables as the years pass. Mel, the inquisitive young protagonist of this story, goes to the surface and changes it all, leading man out of his rut and back to the sane path of existence.

*The Twilight of Briareus* is probably Cowper's finest SF novel, written in a consummately elegant style and building to a powerful and emotive climax. Man becomes sterile as an after-effect of a nearby nova which sweeps the Earth and, as a result of the nova, "passengers" are discovered in the minds of several people. The new "aliens" and the old man struggle to take control of man's destiny, and the peaceful resolution of this contest in the mind of Calvin Johnson, the central character of the book, brings the book to a close, even as Johnson himself dies in the snow. Like the earlier books it is set in a near-contemporary England and most of the critical events are internal ones, arising from the tension between the "dream state" and "reality": "So that moment joined my previous glimpse of the sun-sculpted hills as just another strand of the elusive web that had drawn us here, and, as I stumbled forward beside her up to the house, I had the wierdest feeling that I was a fugitive in limbo fleeing between two worlds, one dead, the other powerless to be born." Johnson's words echo a feeling that is prevalent in many of these books, and he is perhaps the most subtly drawn of all Cowper's characters and the nearest to the author, involved, as so many of Cowper's protagonists are, in watching the external world crumble around him as the internal landscape of his mind opens up to display previously unguessed paranormal powers. *Twilight of Briareus* is the definitive exploration of this inner conflict and its resolution.

*Worlds Apart* breaks from this serious lyricism and satirises SF writers in a most direct manner. George Cringe, an unimportant junior science teacher, writes an SF tale about Chnass while a Chnassian, Zil Bryn, writes a tale about George. Its humorous contrast between the mundane and the sublime is beautifully done and its comic delights are many.

It was after this comic break that Cowper first tried his hand at SF short stories and produced "The Custodians," the first of a series of delicately imagined and richly written stories. It deals with prescience and the nuclear holocaust but dwells, almost paradoxically, on the medieval past. There is a wealth of emotion in these stories and while "Paradise Beach" is flawed, "The Hertford Manuscript" and "Drink Me, Francesca" possess the same poetic lilt. The most important of these stories, however, is "Piper at the Gates of Dawn" which deals with the birth of a new religion. A novella of immense wealth and power, it brings to mind Le Guin's Earthsea books; its post-holocaust setting is similar to that of *Phoenix*. The young boy, Tom, has the gift of joining men together in a brotherhood through the music of his flute and the image of the White Bird. These images, picked up 18 years later, when the "kinsmen" of

Tom's "religion" are being persecuted, form the basis of *The Road to Corlay*. It is a sensuous book that pampers both heart and mind and, as in both *Breakthrough* and *Twilight*, has a "passenger" in the mind of one of its contemporary characters. Carver, a 20th-century scientist, sees through the eyes of Thomas of Norwich, an inhabitant of the world of Corlay—AD 3018—and through the "double-vision" Cowper emphasises once again that it is only by shedding man's present direction (which, he infers, can only be achieved by some natural or unnatural catastrophe which robs man of almost everything) and assuming a new life-style, that any future can exist for *Homo sapiens*. *Profundis* is once again in the vein of *Clone*, with an innocent protagonist, Tom Jones, re-enacting the Christ myth in a beserk computer-run submarine, *HMS Profundis*, which has already denuded the Earth "above surface" by causing global war. As black comedy it is not as effective as *Clone*, but it is, perhaps, much more profound in its message.

Two further volumes of Cowper's stories appeared in the 1980's, drawing upon a wide range of subjects; ecological disasters ("A Message to the King of Brobdingnag"), mystical experiences ("Incident at Huacaloc"), 19th-century adventures ("The Web of the Magi"), and highly literate ghost stories ("The Attelborough Poltergeist" and "The Tithonian Factor")—all with a science-fictional rationale. Most significant from this period, however, were the two final books in the Corlay sequence (the four parts termed by Cowper "The White Bird Of Kinship"). The first *A Dream of Kinship*, was set 1000 years on from *The Road to Corlay* and showed how the loose ethic of the boy piper, Tom, had become a highly dogmatic religion. The second, *A Tapestry of Time*, describes the travels of another Tom, almost a reincarnation of the first, who must face the moral implications of his "gift" (he can pipe men into "madness"). Overall, the four parts of the "Bird Of Kinship" form one of the most lyrical and beautifully written sequences in science fiction. Cowper's recent work, however, has drifted outside genre definitions and it may well be that we have seen the last of his science-fiction writing.

—David Wingrove

**COX, Erle (Harold).** Australian. Born in Melbourne, Victoria, 15 August 1873. Educated at Melbourne Church of England Grammar School. Farmer, then journalist: drama critic for *Argus* and *Australasian*, both Melbourne, 1918-46. Recipient: *Lone Hand* prize, for short story, 1910. *Died 20 November 1950.*

#### SCIENCE-FICTION PUBLICATIONS

##### Novels

*Out of the Silence.* Melbourne, Vidler, 1925; London, John Hamilton, 1927; New York, Henkle, 1928.  
*Fools' Harvest.* Melbourne, Robertson and Mullens, 1939.  
*The Missing Angel.* Melbourne, Robertson and Mullens, 1947.

\* \* \*

Originally a farmer, Erle Cox graduated from free-lance writing to professional metropolitan journalism in his forties. His early short stories in Australian magazines were never collected, and he is known only for three novels. He never

gained literary recognition: orthodox criticism ignores him and comprehensive literary histories give him a bare mention.

Yet *Out of the Silence* had great popular appeal, though Cox had to finance the 1925 edition himself. An earlier human race, destroyed in a world catastrophe 27 million years ago, left time-capsule spheres preserving their culture and chosen representatives in stasis. Found and revived in modern Victoria, the superwoman Earani prepares to take over the world and recreate her highly developed, rational, heartless civilisation. Her intellectual stature and enormous personal magnetism give good prospects of success, certainly with the other survivor she detects in the Himalayas revived as well. The book is well told, if slow and wordy by later standards, maintaining suspense as the mystery and menace unfold. The atmosphere of middle-class rural Australia about 1910 contrasts strangely with the threatened scientific tyranny. Earani is a terrible figure: a prodigy not of evil but of self-assured virtue without compassion. Characteristically her program includes genocide of inferior elements, including the colored races. The grotesque racism, almost too absurd to be abhorrent, was perfectly acceptable in the Australia of 60 years ago and caused no comment. No longer a book to sympathise with, it has historic importance.

Cox's other books are quite different. *Fools' Harvest* is a typical warning of foreign conquest of Australia, foreseeing the scale of World War II atrocities but without scientific interest. *The Missing Angel* is a light satire about the Devil in Melbourne's polite society.

##### Michael Crichton comments:

I am interested in the quality of verisimilitude and how it is developed and sustained in fiction. All of my work, both science fiction and other writing, has tended to revolve around issues of what we believe and why. In recent years a good deal of my work has been devoted to films, which I direct as well as write.

\* \* \*

Michael Crichton's primary science-fiction works are: *The Andromeda Strain*, *Binary*, and *The Terminal Man*. Classified as "soft" science fiction, each of these books is set in what is essentially contemporary society. In each case, though, a science-fiction element has been introduced upon which the subsequent development of the plot depends. In *The Andromeda Strain*, for example, a mutating micro-organism brought back from the upper atmosphere by a satellite kills all but two people in a small northern Arizona town and then threatens the rest of humanity. In *Binary* the tapping into a "closed code computer mechanism" to determine the time and route of a shipment of nerve gas permits a psychopathic multi-millionaire to concoct a devious plot to assassinate the President. In *The Terminal Man* psychosurgery permits the connection of a psychopathic patient's brain to a computer and turns him into a living time bomb. It is, of course, their nearness to real life that makes these three novels believable and frightening. The novels are highly technical, and the narrative is laced with graphs, charts, diagrams, and computer printouts. Some of the information is real; the rest of it is fictionalized but dressed up to raise the level of credibility. Jargon from the appropriate scientific field adds to the realism. The drama of the stories develops from the threat of imminent disaster and the subsequent efforts to prevent it.

*The Terminal Man* and *Binary* are clearly less effective than *The Andromeda Strain*, but interesting and entertaining nonetheless. The terminal man himself is a psychotic named Harry Benson, who believes that machines are taking over the world. He becomes a threat when he is chosen for a unique experiment that connects his brain to a miniaturized computer which is powered by an atomic pack containing 37 grams of radioactive plutonium. Though the pack is implanted under his skin, if Benson breaks it open, he will kill himself and expose anyone in the immediate area to deadly radiation. Benson's physical problem is psychomotor epilepsy, and the computer is supposed to stop his seizures with a counteracting electrical shock. Because the sensation produced is more pleasurable than several orgasms, however, he learns to increase the frequency of the shocks through biofeedback techniques. Benson, in fact, becomes an electronic junkie. Though the novel produces a believable female lead in Dr. Janet Ross, a psychiatrist working on the project, it fails successfully to build tensions between the major characters, and much of the potential drama remains undeveloped. Moreover, the sense of a threat never really materializes because Benson is more pathetic than dangerous.

Pacing is Crichton's strongest quality, and *Binary* is much better in that regard. A more complicated plot and a high level of suspense—a State Intelligence Agent, John Graves, unravels a complicated puzzle created for him by John Wright, the insane right-wing multimillionaire, before a half-ton of ZV nerve gas kills the President and more than a million other people in San Diego—make *Binary* a more compelling book. Wright is a much more worthy adversary than Benson, and more deadly. He is both intelligent and clever. His anticipation of every move that Graves makes creates an eerie drama, a sense of frustration, and genuine "daylight" horror. When Graves finally figures out the puzzle and prevents the binary gasses from mixing to create ZV, it brings a sigh of relief.

The best of Crichton's books, without question, is *The Andromeda Strain*. Though the antagonist is a micro-organism, drama is achieved by the fact that its properties are unknown and that it has great potentiality to kill. It is heightened when the mutating organism eats through the rubber seals in one of the workrooms and contaminates that level of the underground laboratory. This sets the self-destruct mechanism of the complex into operation. Unless countermanded, the mechan-

ism will set off an atomic bomb which will destroy the complex and disperse the deadly organism over the Earth's surface: the key to the spectacular success of the work lies in its pacing. Suspense is built with each development. Clues to the nature of the organism are so interwoven with plot impediments that the reader is compelled to read on. Though the characters are only moderately interesting as people, the roles they play in the development of the drama are important and add to the suspense.

In general, Crichton's style is clinical. His narrative is lean and well-adapted to the fast action, dialogue, and rapid pacing upon which he relies. There is some social commentary in the novels as they depict the follies of man's self-assurance. Lack of judgment or planning combines with deadly technology in all three cases to remind man that he is often his own worst enemy.

Crichton's recent work has been almost exclusively for Hollywood, either as writer or director. Unfortunately, it has steadily declined in quality. For example, *Runaway*, his most recent effort, was nominated by one critic for "the most idiotic movie of the year award," and indeed it seems to be but a collection of the oldest and tired science-fiction clichés. As such, it epitomizes Hollywood's approach to science fiction, which, despite the successes of the Star Wars trilogy, *E.T.*, and *Close Encounters of the Third Kind*, has been to mask standard tales with science-fiction trappings. Even Ridley Scott's brilliant film *Bladerunner*, which bears only a passing resemblance to Philip Dick's original story, and *Alien*, to mention two excellent, recent films, are very standard fare conceptually for hard-core science-fiction fans.

The tendency of Hollywood to ignore many brilliant and original stories and to avoid consulting with those who best know the field has given science-fiction film a bad reputation among devotees, many of whom hoped that Crichton's move to Hollywood would prompt a new era of science fiction film. Rather than changing it, however, it appears that he has become part of the entertainment mill.

#### Short Stories

*The Romance of Poisons, Being Weird Episodes from Life*, with T. S. Wilson. London, Jarrolds, 1903.

\* \* \*

All that is known about Robert Cromie is that from 1889 to 1904 he published 11 books of fiction (one with T. S. Wilson), a number of which are SF. The list begins with *For England's Sake*, which cashed in on the patriotic popularity of the "future war" tale by transferring it to India, where loyal natives headed by heroic maharajah defeat dastardly Russian invasion. Its continuation is *The Next Crusade*, whose battles and love entanglements are not as interesting as Cromie's Preface, briefly discussing "the history of the future" and with a too easy facetiousness concluding that as against the history of the past it contains fewer errors (Cromie's Britain allied with Austria occupies Constantinople, so that he may have been co-responsible for Churchill's disastrous World War I venture against the Dardanelles). Two other novels are more important. *A Plunge into Space* is an interplanetary novel halfway between Vernes and Wells (the second edition in 1891 has a brief and unrevealing preface by Verne) detailing how a scientist discovers anti-gravity, how his explorer-friend helps him to cast a steel globe in Alaska in spite of Indian attacks and sullen half-breeds, and how the two with four more friends—again characterized by profession—fly to a desert Mars. Vegetation and a decaying utopian civilization (which has TV and aircraft but no politics or money) are found near its polar sea. A love affair between one of the heroes and a beautiful Martian coyly named Mignonette results in the latter first becoming a stowaway in their spacecraft on return and then sacrificing her life; the craft is destroyed. *The Crack of Doom* has one of the first mad scientists in SF planning to use the secret of atomic energy to blow up our planet. The plot flounders through lots of genteel Victorian love melodrama, telepathy, hypnotism, secret societies, stereotyped characters, vague echoes of drawing-room Schopenhauerism, and a sentimental happy ending. A final SF novel, *A New Messiah*, also leans on a melodramatic plot.

Editor, *Best Black Magic Stories*. London, Faber, 1960.

\* \* \*

A short story writer in the tradition of Saki and John Collier, a popular anthologist of horror stories, and an occasional writer of science-fiction and fantasy dramas for the BBC, John Keir Cross is especially noteworthy for his juvenile science fiction. *The Angry Planet* was among the first modern science-fiction novels directed at a young audience, and is interesting for the manner in which it reworks themes from Wells and C. S. Lewis into a context more readily accessible to younger readers.

*The Angry Planet* involves a group of three children who travel to Mars by hiding on an experimental rocket ship. The life they find there is elegantly portrayed, and reveals Cross's familiarity with earlier science fiction as well as intelligent speculation. Martian society is dominated by intelligent plant life, the major forms of which are called the Beautiful People and the Terrible Ones. This opposition of two divergent strains of the same evolutionary path calls to mind the Morlocks and Eloi from Wells's *The Time Machine*, and the moral values attached to each race calls to mind C. S. Lewis's *Out of the Silent Planet*. The relatively sophisticated multiple viewpoint narrative adds further interest to the tale and helps to maintain suspense. A sequel, *SOS from Mars*, describes subsequent journeys to Mars. Another juvenile science-fiction novel, with the unlikely title *The Flying Fortunes in an Encounter with Rubberface*, concerns the launching of an artificial earth satellite, and may be the first juvenile treatment of this theme except for Arthur Clarke's 1952 *Islands in the Sky*. Cross's adult fiction, represented by the collection *The Other Passenger*, tends more toward fantasy and the occult than science fiction, but includes the classic *doppelgänger* story "The Other Passenger." Cross's short fiction is distinguished by sensitive style and psychological insight.

\* \* \*

John Crowley is one of the most promising young authors of science fiction and fantasy to come along in the 1970's. His first three novels have numerous virtues, and his epic fantasy, *Little, Big* (World Fantasy award), reaped a harvest of laudatory reviews and, inevitably, comparisons to J. R. R. Tolkien's work, as well as other memorable works of fantasy from *A Voyage to Arcturus* to (rather surprisingly) Gabriel García Márquez's novel of "magic realism" *One Hundred Years of Solitude*. While Crowley is still relatively early in his career, his fiction has already expressed a highly individual vision, worthy of comparison with the most original science-fiction writers emerging in the 1970's.

Crowley's first novel, *The Deep*, received some praise from readers like Ursula Le Guin, but in the light of his later work it seems to be his least satisfactory and least characteristic performance. Set in a distant future on a planet vaguely like earth, *The Deep* describes the power struggle between two aristocratic houses with names derived from Celtic mythology, mostly old Welsh. Young Sennred, one of the Reds, eventually emerges as a victor who reconciles the impulsive Reds and the Machiavellian Blacks; but no particular hero predominates, and Learned Redhand, a scholarly apostate from the Reds, remains the most memorable character. The conflict is observed by an alien who assumes various guises, and eventually confronts his antagonist, a denizen of "the deep" who is an avatar of the Leviathan myth. Crowley's use of the Leviathan mythology does not clarify his cryptic plot, and the novel suffers from the repetition of similar and identical Celtic names. Despite high ambitions, Celtic and biblical myth do not rescue this immature first novel.

In *Beasts* Crowley produced a better work, dealing with a bitter ideological conflict in an America of the near future where central government has collapsed and small regional governments struggle to maintain their authority. Their opponents are the bureaucrats of "the Federal," a government striving to restore a dominating central authority. The surface conflict, however, symbolizes the perennial struggle between rational organizers who wish to subject nature and humanity to a monolithic tyranny and those romantics and lovers of nature who resist such dehumanizing efforts. Among the rebels are the "beasts" of the title, hybrid creatures resulting from genetic experiment in the last days of the old United States; the products of these projects are sentient beings combining human and animal qualities, somewhat reminiscent of the creations of H. G. Wells's Dr. Moreau. One measure of Crowley's achievement is his successful characterizations of Reynard, a fox-man, and Painter, a lion-man, each of which manages to circumvent (in his own fashion) the opposition of

the Federalists. Although *Beasts* is resolved somewhat ambiguously, Crowley's novel clearly takes a stand on the side of the romantics, and in favor of the energies of natural life.

Even more impressive is Crowley's third novel, *Engine Summer*, a story of a young man's initiation into adulthood in the primitive tribal world of a post-disaster America centuries hence. This book describes the search for meaning and understanding of Rush That Speaks, who leaves his community of origin as a boy and searches for his lost love, Once A Day. Although he finds her and some knowledge of the outside world, he discovers the unhappiness that accompanies the loss of innocence when she deserts him again. Crowley's hero also learns much about the vanished 20th-century civilization, the brave new world of science and technology called the age of the "angels." One of the lessons that Rush That Speaks learns is the "angelism" or excessive rationalism of the ancients was anything but angelic in our sense of the word. An additional sign of Crowley's technical mastery in this novel is his use of an inventive narrative mode: Rush tells the story of his youth through a recording cube, and his auditor, who occasionally comments on his tale, is a person who lives generations after his death. This narrative method provides aesthetic distance.

Even the mature artistry of *Engine Summer*, however, scarcely provides a hint of the marvelous achievement of *Little, Big*. *Little, Big* describes three generations in the life of the Drinkwater-Bramble-Hawksquill clan, as seen through the eyes of several members, but primarily from the point of view of two: Smoky Barnable, an outsider from the midwest who comes to New York City and marries "Daily Alice" Drinkwater; and Auberon, their son, who finally becomes an avatar of the fairy king, Oberon, just as his black paramour, Sylvie, is metamorphosed into a new Titania. After Smoky's marriage to Alice, a charming and credible heroine, he takes up residence at the Drinkwater family home, Edgewood, a curious architectural wonder in upper New York State housing a family of eccentrics who have a secret alliance with fairies. Smoky's father-in-law, Old Doc Drinkwater, for instance, writes successful children's books which narrate tales he gets first-hand from the fairies themselves. Other members of the family are blessed or cursed by gifts from the "little people." The novel comes to a crisis when a fascistic politician becomes president and attempts to oppress and destroy all those who revere the power of nature and the imagination. Through Daily Alice's heroic sacrifice of herself, the Drinkwater clan is able to leave the modern world, which will no longer allow them to ignore it, and enter the earthly paradise of the realm of "Faery," and there Alice appears in an immortal form.

This humorous, whimsical, inventive, and richly allusive fantasy deserves many readings and is likely to become a classic of its genre. Here, as in the rest of his world, Crowley defines his vision as that of a sophisticated romantic, suspicious of technology, committed to the cause of his imagination, and possessing prodigious literary gifts of humor, characterization, and lyrical description. At its best, Crowley's work is comparable to that of the best science-fiction and fantasy writers who have emerged in the 1970's, such as Gene Wolfe, Gregory Benford, and Joan Vinge.

\* \* \*

Ray Cummings had a long writing career, but it must be said that he long outlived his originality, and was noted for shamelessly rehashing a few early stories. Established as one of the trailblazers before the advent of *Amazing Stories*, he was the only one of them to carry on as a prominent name. His output was exceeded only by Hamilton and Kuttner, but he did not move with the movement, and was soon dated.

The early tales that made his name had sketchy but strongly suggestive scientific foundations. Though he showed his debt to Wells by borrowing his narrative frame from *The Time Machine* more than once, his stories were closer to Haggard's or Burroughs's. Usually visitors from 20th-century New York in a strange setting with a vague pre-industrial society resolved a conflict and helped pave the way for more advanced thinking.

His first and favorite inspiration was sub-microscopic, even subatomic life—atoms or sub-atomic particles as worlds. The idea dated from Nicholas Odgers's *The Mystery of Being; or, Are Ultimate Atoms Inhabited Worlds?* (1863), but Cummings added the idea of reducing one's size indefinitely to penetrate

such a realm—later reversing it to visit a super-world in which we inhabit a particle. It is a tribute to his skill that a story based on such an idea could be a popular success. The unnamed chemist in *The Girl in the Golden Atom* (Rogers in the sequel) sees with his super-microscope an infinitesimal human race, including a nubile wench. (Compare Fitz-James O'Brien's *The Diamond Lens*.) But instead of agonising over the unattainable he devises size-changing drugs. (Compare *Alice in Wonderland*.) The relativity of size and the experience of changing size are vividly evoked. The book was fresh and exciting then, and it still reads well, and rates as a classic—though it is not precisely science fiction. (Incidentally, this adventure does not reach the level of an atomic world, despite the title; G. P. Wertenbaker has the doubtful honor of first taking the idea that far in "The Man from the Atom," in *Science and Invention*, August 1923.)

In the extended book version the villain was called Targo, and many later evildoers were named alliteratively—Taro, Toroh, etc. They are typically greedy megalomaniacs, usually gross or deformed, good at sneering and cynical laughter. Subtleties of character and motivation are not displayed, but human relations were simplified and fogged with romantic myths in most science fiction then. The writing is direct and conversational. To modern eyes there was much overstating the obvious, especially in the novels, but there were mystery and suspense supporting the action for the original audience.

Cummings was an early exploiter of time travel, scarcely touched since Wells, in *The Man Who Mastered Time*, *The Shadow Girl*, and others, though mostly for change of scene only. *Explorers into Infinity* reversed the exploration of the inconceivably small to visit a vastly greater sphere. *The Man on the Meteor* told of a tiny worldlet in Saturn's ring with seas and aquatic microscopic humans. *Tarrano the Conqueror* had a future of interplanetary affairs and a new Napoleon. In *The Sea Girl* an undersea people threatened the land. *A Brand New World* had a new extra-Solar planet entering the system. *Brigands of the Moon* moved into the kind of future interplanetary traffic early magazine SF postulated and helped establish space piracy as a popular theme. Cummings wrote many routine space adventure shorts thereafter. In "Jetta of the Lowlands" (*Astounding*, 1930) new nations grew from settlements on the dry sea bed after the oceans receded. Not to be overlooked were some robot stories of interest, particularly "Zeoh-X" (*Thrilling Wonder Stories*, April 1939) and "X1-2-200" (*Astounding*, September 1938); 16 stories featuring the character "Tubby" carried some gentle satire on many of his own plots and concepts.

Brian C. Daley comments:

Asked his reaction to becoming a millionaire, Neil Simon once said that the main difference in life was between being broke and bringing down 200 dollars a week; the rest was gravy. Writing has been a bit like that: making a living writing my own books, dealing with popular movie material, having scripts produced, and so forth has been gratifying and on the whole very enjoyable, but it's icing on the cake, after all. The real dividing line in life was in selling my first novel and seeing it in print.

I do my best to keep in mind the desire I had to tell a story, and how crucial it was—and should continue to be—to give the reader full value for his or her time, attention and money. One of the pitfalls of writing for a living is that a certain perfunctoriness can creep in if you're not careful, especially in a genre where being prolific can be such a plus.

I don't have much to say, here, about art, literature or moral uplift. The SF/Fantasy audience is quick to let you know if you're not delivering; my efforts are concentrated on satisfying the customers.

\* \* \*

A relatively new author, Brian C. Daley so far has worked in one of two categories: fast-paced adventure tales with a film background, or alternate universe novels with linkage to our universe that explore the borderline between fantasy and science fiction. Quest themes with competitive elements leading to elaborate chase sequences are central to much of his writing and permit development of his outstanding talents for humor and vividly visualized description. At this point his characteristic hero tends to be a young man whose initial idealism, somewhat unrealistic, develops toward temporary cynicism, but with greater experience of the world does or will mature into a capacity to act responsibly.

It is not surprising, then, to find a sequence of three Han Solo

stories from *Star Wars* background in the first category of his work, with steady growth in technique through the series. The first tale is the one most closely linked to opposition to the Empire, involving an arms drop to rebels, combat to defend an outlaw tech base, and a quest to recover prisoners held in stasis by the Empire, in particular the leader of the outlaw tech base at the request of his daughter. The basis for Han Solo's deficiency in human relationships and his relationship with Chewbacca is set up in a not very convincing scene: he was cashiered through perjured testimony by his commanding officer in spite of the favorable testimony of his first mate, Chewbacca. The revenge in the second novel is for an attempt to involve Han in slave-running; recovering the charter payment results in the break-up of the slave gang, with a little blackmail necessitated by hidden identities and shifting allegiances—the plot twists are carefully clued. The third novel turns on the conventional plot of the hidden treasure that once was priceless but now has lost much of its value.

In the structural pattern of the tales, one of the best-handled parts is the initial tangential incidents with a thematic relation to the rest of the novel that create sympathy for Han. Often these are humorous: for example, in *Lost Legacy*, Han wins a prize for best exemplifying the theme of a fair, "Fertility of the Soil, Challenge of the Sky," by outstunting his braggart temporary employer in an inferior ship carrying a cargo of fertilizer—which he releases directly over the open canopy of his employer's ship. A quest pattern is then set up, with a varying group of companions; a series of fast chases develop; and problems are solved by Han's survival skills of quick intelligence, adaptability, and skilled piloting, with important assistance from the robot crew members.

The continuity with *Star Wars* is excellent. Atmospheric technical terms are thrown around casually; aliens differ widely in physical structure and abilities, but sociological and psychological differences are not explored. Robots are self-aware and a source of humor, though the limitations are different from those in *Star Wars*: Blue Max is designed for electronic snooping capacity in limited space and so has no ability to move, but is hidden in the chest of the slow farm robot Bollux.

*Tron* is of little interest, a novelization of the Steven Lisberger screenplay. The film had value primarily for the special effects with lights in the gameboard of the Electronic World; even Daley's descriptive talent finds them hard to translate verbally, and characterization is so shallow that there seems to be little difference between the personalized programs and the human beings—in fact, that is part of the point. The plot is standard: defeat of an attempt to take over the world by controlling computer programs.

Daley's earliest published work, rich in promise, is the alternate universe Coramonde series, *The Doomfarers of Coramonde* and *The Starfollowers of Coramonde*. This world is structured on magic, but is accessible from Earth, and Earth weapons work there; an armored personnel carrier from Viet Nam is brought in to combat the dragon Chaffinch and rescue a sorceress from Hell. One character, Gill MacDonald, returns again to Coramonde and is a central character in the second novel; the typical Daley hero, though, is Springbuck, mild-mannered, nearsighted, and rightful heir to the throne of Coramonde, from which the evil sorcerer Yardiff Bey is attempting to displace him. Yardiff Bey in the second volume turns out to be the active agent for a still more evil group, the Five of Salamá, who in the last age betrayed world order and destroyed all but one fragment of the Lifetree, which must be found and replanted, while the combined armies defeat Salamá's armies and bring the de Courteney's magic to bear on the Five. The difficulty is that while there are many good

minor characterizations and vivid descriptions, the novels are too rich, with too many characters and incidents, for depth of characterization or theme, especially in the sequel.

*A Tapestry of Magics* is outstanding. The central character, Crassmor, is characterized in depth as the younger brother admiring a heroic older brother, guilty over the love that has developed between him and his brother's fiancée, Willow, and over the contribution that he feels he has made to his brother's death. In accepting his father's partial rejection that couples knighthood with a dangerous job on the borders, he matures, developing patience and enough cynicism to avoid risky missions or achieve them by the easiest possible means—an effective anti-hero. But the best point in the novel is the central symbol of the tapestry, woven by Willow and her father, which pictures the completed past and can predict and to some extent control the possibilities of the future. It also symbolizes the structure of the world: the Singularity is in touch with all worlds, real and fantasy, and attracts immigrants from all of them, a tapestry of magics that ranges from Nazis to troll-like glitches shipping tiles for the space shuttle to Dracula, Saynday (the Trickster), Heinlein's Rico from *Starship Troopers*, Di Cagliostro and the Eye in the Pyramid cult. There are also a substantial number of invented allusions, and the interweaving of the material into a pattern that exists in its own right is a considerable accomplishment.

Jack Dann's fiction has until recently shown a notable unity in dramatic concern, elaborating at various lengths and moods what has been essentially a series of variations on a theme. Over 15 years, his three novels and several dozen shorter works have developed a recognizable figure in the solitary, obsessive young man whose disaffection with the stratified society he belongs to leads to a dramatic encounter with a larger strangeness that resonates in the telling with a powerful and sometimes disturbing psychic resonance.

Dann published his first fiction in 1970, and some of his characteristic concerns were seeing expression as early as in the 1971 "Windows," but it was not until the appearance of his 1973 novella "Junction" (basis for the later novel) that he began to dramatize his essential confrontation between consciousness and a mutable universe with a degree of assurance and skill. Dann's village of Junction, the last redoubt of causality following a catastrophe that disrupts physical laws to render the rest of Earth a region of physical indeterminacy, effectively embodies his theme of inertia roused by chaos, and the

protagonist's journey into the surrounding "Hell" uses a conventional narrative to introduce provocative speculations on consciousness, metaphysics, and Teilhard de Chardin's concept of an evolving universe.

In 1975 two shorter works appeared that confirmed Dann as one of the most audacious and technically assured SF writers of the decade. "Timetipping," a deceptively whimsical short story that recalls Isaac Bashevis Singer at his more energetic, presents a situation similar to that of "Junction"—the world experiences a dissolution of temporal sequence that allows free and sometimes involuntary slippage through time—in a witty and kinetic display of stylistic virtuosity. It was, however, with his novelette "The Dybbuk Dolls" that Dann first showed all his strengths in a single story. Dann's dark tale of the invasion of a pious man's consciousness by an alien malevolence able to excite his sense of guilt stands as an exceptional example of SF's seminal theme, encountering the unknown, dramatized exclusively through one participant's point of view.

With his novel *Starhiker* Dann adopted the familiar folk tale of the young man who leaves his bucolic world for a journey of wonder, from which he ultimately returns bearing wisdom and power. Bo Forester's wanderings among the starlanes of a more advanced civilization are told in a dense, richly textured but dispassionate language that shows up one of the limitations of Dann's work until that time: the intense but narrow focus upon his protagonists leaves his other characterizations pallid, and allows no scope for portraying relationships. The novel version of *Junction*, which can be considered almost a companion piece, shows the same virtues and shortcomings.

Dann's celebrated novelette "Camps" can be seen as a culmination of this phase of his work. The story of the now-familiar young man who moves in delirium between hospital and a Nazi death camp accords equal weight to the movement of its "inner" and "outer" narratives, like two cycles turning on the same axis, and has in the healing synthesis of its resolution (the protagonist's deliverance from the death camp coincides with the break in his fever) something of the resonance of myth.

In the years since, Dann's writing has broadened in scope and sympathy, and *The Man Who Melted*, his longest and most ambitious novel, shows his past strengths while dealing, somewhat uncertainly, with the tortured relationships between his three protagonists. As the title suggests, the mutability of consciousness remains an essential theme, but both the protagonists' obsessive natures and the decadence of the society around them are portrayed more complexly and convincingly than before.

Recently published stories, as well as an excerpt from *Counting Coup*, a contemporary novel in progress, suggest that Dann's work is shifting from the trappings of genre SF to encompass that larger fantasy of which mundane fiction is essentially a subset. Standing at a watershed in his career, Dann remains one of the field's most accomplished story writers and promising novelists.

—Gregory Feeley

\* \* \*

Arsen Darnay's fiction first began to appear in 1974, a blend of fast-paced action with considerable original thinking, marred occasionally by superficial characterization and lapses of plot logic. Although he published several short stories, it is only at novelet length and greater that he has truly been successful.

"The Splendid Freedom" follows a young man on his adventures on Mother Earth during a visit which is to mark his passage into the adult world. He does not immediately discover that the surface of Earth is in fact uninhabitable, and that most of the things he has experienced during his visit were directly implanted in his mind and never happened at all. One of his best shorter pieces is "The Eastcoast Confinement." North America is now a dictatorship, and all those who dissent are confined to large camps set up around the country. The inhabitants are allowed to govern themselves along the lines of Robert Heinlein's classic "Coventry," but the outside authorities limit food supplies in an attempt to reduce the dissident population, which is now approximately one of every three adults. The result is tribal warfare among various groups such as the Ecofreaks and Peacefreaks. A visitor from Europe is instrumental in altering things slightly so that the new type of culture arising within the Confinement will have a chance to succeed as a viable force in the future.

Perhaps the best of Darnay's novelets is "Plutonium," which was to start a series that was rewritten as the novel, *The Karma Affair*. In the shorter piece, two men and a woman meet in a Nazi concentration camp. Their souls are repeatedly reincarnated through the years until, in our own near future, reincarnation becomes an accepted scientific fact. One of the two men invents a soul catcher and establishes a priesthood to watch over nuclear wastes, each of whom will be tied to that job for eternity. The novel presents the ultimate crisis of that priesthood far in the future, when the rest of society has dissolved into a new barbarism.

*A Hostage for Hinterland* is set in a similar, or perhaps identical barbarous future. Society is split into two forces, the Structure Cities with their high technology and nuclear arsenals, and the Hinterland, nomadic tribes living under comparatively primitive circumstances. The cities use their weaponry to blackmail the Hinterlands into trading them the helium they need to run their equipment. But the tribes are not content to be the lesser partners, and plot to develop an umbrella against the missiles. Darnay works out the political maneuverings between the two powers and within the two camps convincingly, without interfering with his fast-paced plot. This was a quite promising adventure story to appear as a first novel.

*The Purgatory Zone* is not as successful. The Kibbutz Zone is a society that has renounced most forms of aggression and approximates what we would think of as Utopia. The occasional individual who cannot adjust is urged to travel to an alternate world, and the protagonist in this case emigrates to the Purgatory Zone, an alternate America where a vicious caste system makes life increasingly difficult for him. He is almost immediately on the run from the authorities and sets off on a chase adventure that is sometimes entertaining, but which falls apart toward the conclusion.

Darnay returned to barbarism of a sort in *The Siege of Faltara*, although this time the setting is another world, the planet Fillippi. It's a peaceful world, but peaceful because of the ruthless dictatorship that dominates it through the use of slavery and drugs that condition the mind to loyalty. The protagonist is an outside agent whose job is to destabilize the government and cause a revolution. Naturally he does, after a series of adventures, in a well-handled, above average adventure novel. Darnay established himself with five books as a

progressively interesting writer, with some innovative ideas. He has had no new fiction published during the last four years, however, and may have turned to other pursuits.

\* \* \*

Avram Davidson is primarily a writer of fantasy and fantasy SF. His best stories are comic or ironic, and he is also a master of the mystery and weird fantasy and SF story. In structure if not in style and thought, Davidson writes in the O. Henry tradition. But though his stories possess a familiar pattern of development, Davidson gives the impression of being unpredictable and eccentric. In part, this view may rest on Davidson's sometimes oblique method of developing his stories, deliberately omitting anticipated transitions so as to heighten contrasts and increase tension. It is a technique which a

mystery writer may be expected to favour. It is particularly effective in his Hugo-winning story "Or All the Seas with Oysters," a tale based on the premise of the animated machine, in this case a red French racing bicycle, and the contrasting reactions of the two main characters to the discovery of such an alien being. The story has a finely developed sense of narrative irony, which is one of the characteristics of Davidson's best fiction.

A related type of science fantasy in Davidson's repertory is the comic tale rooted in Jewish humor. "The Golem" is a deservedly famous story in which Davidson combines comic formulas of traditional ethnic humor with an overlay of modern SF. The contrasting expectations of each tradition makes for the special comic sense of the story. Davidson also displays a fine talent for parody in such literary stories as "Author, Author," in which the reader is treated to some delicious echoes of the Asimov story of the same title as well as to a burlesque of the detective mystery/fantasy ending in a bitter-sweet reversal of poetic justice. Davidson takes his place as a writer of popular fantastic SF in the tradition that comes prominently to the surface with Poe and continues in the 20th century with Merritt, Lovecraft, and the *Weird Tales* and *Unknown* schools on the one hand, and such diverse writers of comic fantasy as Cabell and the Yiddish master Isaac Bashevis Singer on the other. In tone as well as intention, however, Davidson is closer to popular and even commercial pulp writers like L. Sprague de Camp and Fletcher Pratt than to either Poe and Cabell.

Davidson has also written many novels, some of which fall into familiar categories. There have been the SF pot boilers dealing with alien invaders, alternate universes, and other fantastic SF premises ( *Masters of the Maze*, *Clash of Star-Kings*, *The Kar-Chee Reign* ). Related to these are the space operas *Mutiny in Space*, *Rogue Dragon*, *Rork!*, and *The Enemy of My Enemy*. Of these, *Masters of the Maze* is clearly the most accomplished work. More successful have been the mock heroic fantasy *Peregrine: Primus* and the heroic romance fantasy *The Phoenix and the Mirror* (part of a projected series provisionally titled *Virgil Magus* ). Both works are distinguished by a level of popular scholarship found in the Harold Shea stories of de Camp and Pratt. The wit and satire that animate the picaresque misadventures of Peregrine, bastard son of the King of Sapodilla, are absent from the more seriously intended *Phoenix and the Mirror*, and the latter romance suffers in consequence. Each, however, is notable for Davidson's attempt at introducing premises for romance that lie outside the familiar Christian traditions. Indeed, Davidson's invention and treatment are intended to be contrary to Christian-oriented legends, offering the reader an unspoken but also an unmistakable dissent from the tradition that has dominated heroic fantasy since the middle ages. It is too bad that it does not work.

Perhaps the most curious of all Davidson's fantasy prose fictions is *The Enquiries of Dr. Eszterhazy*, a collection of linked stories in which the master detective and doctor of everything, Engelbert Eszterhazy, stands in as the amused and amusing hero of a series of mysterious affairs taking place in and about the fictitious triune monarchy of Sythia-Panmonia-Transbalkania. Curiously, it seems that Davidson's experimental form of blending the internal narrative context of fantasy with the quite external tone and view point of the implied modern narrator is responsible for the failure of the book to win either the popular support or the critical acclaim it deserves. The book seems destined to enjoy the status of underground classic, as a fantastic parody of the detective story that will serve to identify cognoscenti among readers and those

with a refined if still largely popular taste for the deliberately fantastic and artificial.

—Donald L. Lawler

**DAVIES, L(eslie) P(urnell).** Also writes as Leslie Vardre. British. Born in Crewe, Cheshire, 20 October 1914. Educated at Manchester College of Science and Technology, University of Manchester, qualified as optometrist 1939 (Fellow, British Optical Association). Served in the British Army Medical Corps in France, North Africa, and Italy, 1939-45. Married Winifred Tench in 1940. Dispensing pharmacist, Crewe, Cheshire, 1930-39; free-lance artist in Rome, 1945-46; postmaster, West Heath, Birmingham, 1946-56; optician in private practice, and gift shop owner, Deganwy, North Wales, 1956-75. Since 1975, has lived in Tenerife. Agent: Howard Moorepark, 444 East 82nd Street, New York, New York 10028, U.S.A.; or, Carl Routledge, Charles Lavell Ltd., 176 Wardour Street, London W1V 3AA, England. Address: Apartment K-1, Edificio Alondra, El Botanico, Puerto de la Cruz, Tenerife, Canary Islands, Spain.

\* \* \*

Combining suspense, mystery, and science fiction, L. P. Davies's hybrid novels reflect his own variegated background. His first novel, *The Paper Dolls*, was praised by Anthony Boucher (in *The New York Times*) as a "vigorous man-against-the-unknown adventure story, with touches of horror all the more effective for their being underplayed."

*The Artificial Man* begins with a quiet English village, a mild-mannered science-fiction writer, and pleasant townsfolk—all of which soon proves monstrously illusory. The placement of SF and suspense motifs within a commonplace setting lends itself easily to cinematic treatment, and the book was filmed as *Project X*.

The key to L. P. Davies's technique is that neither reader nor characters can ever be sure whether memories and dreams are portents, flashbacks, or messages from other worlds and times. The psychological, supernatural, and psychokinetic overlap, revealing unexpected horror and dangers lurking at the fringes of the mind. Ordinary events and situations are turned inside out to disclose terrible secrets. Because Davies plays fast-and-loose with SF and mystery conventions, a novel like *The Alien* that seems to involve extra-terrestrials actually turns out to be a whodunnit, while an apparently gothic mystery like *Psychogeist* can be rationalized as speculative science fiction.

Since plot and suspense are everything in Davies's work, discussion of his novels must be sketchy lest their endings be given away. *Psychogeist* concerns a man whose bizarre dreams about the planet Andrida have frightening consequences. In *Dimension A* a young man follows his scientist uncle into a parallel world where the seemingly primitive Toparians and the mind-reading Vorteds compete for survival—and have designs on earth. In *Genesis Two* an outing in the Lake Country becomes a terrifying voyage into a steamy tropical jungle, man's last refuge after technological disaster. All of these novels include murder and intrigue.

Although Davies is not a particularly stimulating or innovative writer, his fusions of SF and suspense result in competent thrillers that are as hard to put down as they are to take seriously.

—Anthony Manousos

**DAVIS, (Horace) Chan(dler).** American. Born in Ithaca, New

York, 12 August 1926. Educated at Harvard University, Cambridge, Massachusetts, B. S. 1945, M. A. 1947, Ph. D. in mathematics 1950. Served in the United States Naval Reserve, 1944-46. Married Natalie Zemon in 1948; one son and two daughters. Instructor in mathematics, University of Michigan, Ann Arbor, 1950-54; Director of Experimental Research, Kenyon and Eckhardt advertising company, New York, 1955-57; Associate Editor, *Mathematical Reviews*, Providence, Rhode Island, 1958-61. Since 1962, Associate Professor, then Professor of Mathematics, University of Toronto. Served six month prison sentence for refusing to answer questions before the House Un-American Activities Committee, 1960. Member of the Institute for Advanced Study, Princeton, New Jersey, 1957-58. Agent: Virginia Kidd, Box 278, Milford, Pennsylvania 18337, U. S. A. Address: 52 Follis Avenue, Toronto M6G 1S3, Canada.

effects of nuclear war. Although he is a mathematician, most of his stories either explicitly or implicitly examine social themes. Other notable stories include "Adrift on the Policy Level," arguably the finest treatment of bureaucracy and the bureaucratic mind in all of science fiction, and "Letter to Ellen," which, because of a very superficial thematic resemblance to the earlier "Helen O'Loy" by Lester del Rey, never attained the classic stature due it.

##### Chan Davis comments:

There is so much that needs saying about our real and impending predicaments and ironies, and science fiction allows one to say it in ways less bogged down in the past—given this opportunity, why should the writer reject it by producing stories which merely ask the reader to suspend disbelief? One can comment by parables set on concocted planets; by extrapolations; or, most powerfully, by the "higher cautionary tale," in which a potentiality in our own future is brought into relief by magnifying it. No escape is offered, but engagement. Some suspension of disbelief is required, but not suspension of compassion, not suspension of curiosity or common sense. Let this note stand as introduction to the few stories I wrote in my youth and the many I wish yet to write.

\* \* \*

Chan Davis had produced a small number of superior stories, beginning with "The Nightmare," one of the first post-Hiroshima science-fiction works to focus on the dangers and

Manuscript Collection: Mugar Memorial Library, Boston University.

\* \* \*

L. Sprague de Camp's earliest SF story, "The Isolinguals," embodies an interesting concept (modern folk suddenly begin to speak and act like their remote ancestors), but is rather disjointed. Other very early stories are minor. However, by 1939 he had clearly hit his stride, first with "Divide and Rule" and, most especially, with his first novel, *Lest Darkness Fall*. Other worthwhile stories from this period include the Johnny Black series, about an intelligent talking bear (this series ran out quickly because, as de Camp has explained, in the first story Johnny Black saved the world; by the fourth story, he merely saved his boss's job; there was nowhere to go); "The Merman," a scientifically rigorous account of the problems faced by a man who is able to breathe water; and "The Gnarly Man" about an immortal Neanderthal found working in a circus sideshow.

*Lest Darkness Fall* is one of de Camp's most famous works, now a classic. It achieved the distinction, unusual for pulp material of the period, of being published as a book by a large publisher. *Lest Darkness Fall*, far superior to the usual run of 1939 pulp fiction, is essentially a realistic *Connecticut Yankee*, in which a modern man finds himself in the real 6th century (not that of legend, as Twain used) and takes it upon himself to prevent the Dark Ages. He succeeds in a manner which will surprise most readers. De Camp apparently did a great deal of thinking about how such a man would fit in and make his way in the society of post-Imperial Rome, and what 20th-century marvels he would actually be able to produce in such a milieu (it starts with double-entry book-keeping). The characterization in the novel is also far superior to that in most SF of the period. Though his characters don't involve the reader intensely, they are not one-dimensional stereotypes; it is possible to sit back and watch, and believe that these are real people.

Typical features of de Camp's best fiction, as demonstrated in *Lest Darkness Fall*, are intelligent conception and development, and an enormously readable style. The intent in most of his fiction seems to be to provide light but not insubstantial entertainment, and he succeeds at a high level of sophistication. Most of his works also display a lively wit, which at times leads him to somewhat formless stories filled with jokes for their own sake, rather in the manner of P. G. Wodehouse or Thorne Smith (whom de Camp acknowledges as a major influence).

Humor is particularly evident in his collaborations with Fletcher Pratt, especially the Harold Shea series. Of these, *The Incomplete Enchanter* is probably de Camp's best-known work. The hero is a psychologist who has found a way to transport himself into the worlds of myth. In "The Roaring Trumpet" he encounters the Norse gods. In "The Mathematics of Magic" he battles the enchanters of Spenser's *Faerie Queene*. Again, the

development is rigorously logical, but the premises are impossible. Much of the humor results from the incongruity. Other stories in this series include *The Castle of Iron* (the world of *Orlando Furioso*), "The Wall of Serpents" (the *Kalevala*), and "The Green Magician" (the Ireland of Cuchulain).

Other collaborations with Pratt are less successful. The Gavagan's Bar series are in the manner of Lord Dunsany's Jorkens, with each tale told in a bar, usually by one of a regular round of customers, but the stories tend to stop just as the fantastic premise is presented. Thus they are exactly as good as the idea, which makes them uneven and rather anecdotal.

De Camp ceased writing during World War II, and published very little fiction until "The Animal Cracker Plot" in 1949. This, while rather slight in itself, was the first of the Viagens Interplanetarias series, which constitute the largest body of his science fiction. The common background involves a Brazilian-dominated world, which causes Portuguese to be the language of space travel. The stories vary widely in complexity and intent. "Calories," for instance, makes a specific scientific point, that meat-eating is far more fuel efficient than vegetarianism. Thus the hero is able to escape across a glacier from vegetarian foes because he is able to carry more food than they are. *Cosmic Manhunt* and *The Hand of Zei* are swashbuckling adventures, something of an attempt to do an Edgar Rice Burroughs type of story plausibly. *Rogue Queen*, the most notable of the group, involves a rigid matriarchy patterned after bees. It is one of the earliest SF stories in which sex roles play any important part, though a modern feminist would hardly be pleased. All these stories move briskly and give a good idea of how the various societies work without stopping to lecture the reader at length. There are countless small details which add verisimilitude.

De Camp continued to write science fiction until about 1960. Outstanding stories from this period include "A Thing of Custom," "Aristotle and the Gun," and "A Gun for a Dinosaur." However, he devoted most of his efforts during this period, and in the following decade, to historical novels and scientific non-fiction. He returned to fantasy with his renewed involvement in the Conan series of Robert E. Howard, and in the 1960's he edited the entire series. As a result Howard became one of the most popular authors in English. Credit must be given to de Camp for creating the sword and sorcery boom of the period. During this time he completed more Howard fragments, sometimes in collaboration with Lin Carter, and wrote new Conan stories. These pleased some fans and displeased others, possibly because de Camp, a far more rational and experienced person, was never able to match Howard's psychotic intensity or narrowness of outlook. His own sword and sorcery fiction, *The Tritonian Ring*, *The Goblin Tower*, and *The Clocks of Iraz*, are more sophisticated, with frequent humorous touches.

In the 1970's de Camp got away from Conan and wrote another Viagens Novel, *The Hostage of Zir*, and the "Willy Newbury" series, about a banker whose humdrum life is constantly being interrupted by supernatural occurrences. The best of these make skillful use of autobiographical material. The most successful work of this period is *The Great Fetish*, enormously readable, full of fascinating situations, and enlivened with satire. For example, the schoolteacher hero, before his wife runs off with a man he must then hunt down and kill because his society expects nothing less from him, is in trouble with the authorities for *not* teaching evolution. The heresy is that the world is a lost colony of Earth. This turns out to be true.

In de Camp's fiction human foibles and pretenses are prominently displayed, but rational, sensible types always

prevail. If there is any message, it is that reason is the only effective way to solve problems. A de Camp hero never gets anywhere until he starts using his head. Then the results surprise everyone, particularly the reader.

Since 1981 de Camp has published two science fiction novels, both in the Krishna/Viagens series, *The Prisoner of Zhamanak* and *The Bones of Zora*, the latter a collaboration with his wife. Both might be described (as well might the entire series) as what might have resulted if P. G. Wodehouse had written John Carter of Mars. De Camp states in the introduction to *Zhamanak* that his original intention was to write something akin to the Burroughs Mars books, only on a more sophisticated level, without the gross implausibilities. The result is a kind of anti-romantic sword-and-planet fiction, the typical de Campian swashbuckler being a world-wise (but not bitter or cynical) middle-aged Earthperson with marital problems, and tendency toward pedantry, and more interest in staying alive and getting the job done than in dashing heroics. The very capable but bull-headed Alicia Dyckman, whose rescue sets off the hijinks in *Zhamanak*, is perpetually in trouble with the backward Krishnas for preaching science and rationalism and otherwise fomenting what passes locally as heresy. Her rescuer, Percy Mjipa, is an equally capable but somewhat prudish African, who often must overcome his own prejudices to get out of tight spots. The two do not get along. By the time of the action of *The Bones of Zora*, Fergus Reith, the hero of the former novel, *The Hostage of Zir*, has already married and divorced Dyckman. The alien Krishnans aren't very romantic either. Their governments are thick with bureaucracies, the absurdities of which often entangle Earthpeople. They are given to rigid dogmatism and superstition, just like medieval humans. Their petty rulers, who often have large egos, take an unhealthy interest in human reproductive processes.

On a more serious level, both of these novels are about the folly of belief held so strongly that all contrary evidence is ignored. The Krishnans persecute heretics. One ruler, Vuzhov the Visionary (in *Zhamanak*) bankrupts his country trying to build a Krishnan Tower of Babel. Vuzhov is a devotee of the flat-Krishna theory, even though he knows the humans come from outer space. The tower is an attempt to reach heaven and put himself on a level with the gods.

*The Bones of Zora* deals with rival paleontologists out for a dig in a remote region of Krishna. Their vicious conflict is based on the feud between Cope and Marsh, which de Camp chronicles in his non-fiction book, *The Fringe of the Unknown*. The humans come across fully as narrow-minded and absurd as the Krishnans. *Zora* is the weaker of the two. The significance of the bones everyone is chasing after is not made clear enough, and the resolution is unsatisfactory. However there are still amusing moments and effective bits of satire, and we may hope that the loose ends will be tied up in the as yet unpublished sequel, *The Knights of Zingiban*.

Actually, de Camp's best fiction published during this period is a fantasy novel, *The Unbeheaded King*, the conclusion of the trilogy of Jorian, the reluctant monarch whose previous adventures were chronicled in *The Goblin Tower* and *The Clock of Iraz*. It is a thoroughly amusing, very inventive book which shows de Camp in top form.

Related non-fiction during this period includes two collections of science essays, *The Ragged Edge of Science* and *The Fringe of the Unknown*, and the definitive biography of the creator of Conan the Barbarian, *Dark Valley Destiny: The Life and Death of Robert E. Howard* (in collaboration with Catherine C. de Camp and Jane Whittington Griffin).

\* \* \*

Miriam Allen deFord, better known for her mystery stories, wrote about 30 science-fiction stories in a span of 30 years. The best collection of her work is *Xenogenesis* which includes two of her best stories, "The Children" and "The Absolutely Perfect Murder." Both stories illustrate the skill deFord possessed when writing about time travel. "The Children" tells of a many-thousand-year-old experiment with time travel and the effect it has on children of the experimenter. In "The Absolutely Perfect Murder" a harried husband of the future decides to murder his nagging wife, and after much thought comes up with a perfect murder plan: the husband will take advantage of the Government's new time-machine travel program and go into the past with the intent to murder his wife's father—so she never could be conceived. All goes according to plan, but deFord manages a brilliant twist at the story's conclusion. *Elsewhere, Elsewhen, Elsehow* is inferior to her first collection, but it includes one of her best-known stories, "The Monster." DeFord will be remembered for her story-telling ability and early development of the themes of post-holocaust society, sex roles, and time paradoxes, and the fusion of the crime story and science fiction.

—George Kelley

Joseph H. Delaney comments:

I try to write the same type of story that I enjoy reading: I like the harder variety of science fiction. I lack the formal scientific education most others in the genre have, but the law taught me the art of obfuscation and therefore I have managed. I believe that any science fiction theme must be not only theoretically possible, but probable in the universe the writer selects for its setting, and that his most important task is to explain how his characters get from here to there. I try to maintain this logical thread, and for the most part I use real people as character models. The advantage of this is that people never change; their motivations are well understood and their behavior is reasonably predictable. The reason I started writing SF (so late in life) was that certain stories I read, which purported to turn on legal themes, didn't follow the rules. Their authors treated law like magic and ignored the fact that it is as rigidly disciplined as any physical science, perhaps more so. I resolved to do it right. My first published story was a law story; it was both a Campbell and a Hugo contender. It did not involve any truly radical scientific principles—it was about people who really didn't want to be where they were, or to be doing what they were

doing, but who had to follow the rules. The evidence seems to suggest that this was the correct approach.

\* \* \*

The advent of the inexpensive paperback book has made it increasingly difficult for an author to gain a wide reputation solely on the basis of short stories, particularly as the professional science-fiction magazine has become an increasingly diminished market. Joseph H. Delaney has managed to attract considerable attention despite this handicap, and the recent novelization of a series of stories he wrote in collaboration with Marc Stiegler is likely firmly to establish him as one of the more successful new writers of the 1980's.

The earliest noteworthy story is "Brainchild," which is an interesting variant on an idea used in Verne's classic novel *You Shall Know Them*. A geneticist is experimenting with a genetically altered chimpanzee who displays obvious intelligence, can communicate with other human beings, but who lives secluded in a laboratory. A nosey and ambitious reporter causes a public trial, charging the scientist with slavery, and it appears that the outcome of the case hinges upon a definition of just what exactly is human. Although the story is resolved by a surprise ending, Delaney's depiction of the unfolding courtroom case is logical and convincing. Adam, the chimp, returned in a fairly recent story, "A Slip of the Mind," in which he develops telepathic powers and eavesdrops on a murderer.

"In the Face of My Enemy" is an adventure story set on an unexplored world and kicked off another series. A young woman is sent to investigate the mining operation licensed on a recently discovered world, but the local authorities are concealing the presence of alien artifacts and they rig her transportation to maroon both her and her male companion in the wilderness. Unfortunately, they are not aware that the man is an immortal, genetically altered in Earth's far distant past by alien visitors, for a purpose yet to be revealed. He is able to guide her back to safety and almost inadvertently learns that the planet is the dumping ground for an interstellar empire that disposes of its political dissidents by exiling them via matter transmitter.

The immortal protagonist returns in "The Shaman," now recruited by the human government to infiltrate another prison world. His shape-changing abilities allow him to disguise himself as an alien and journey to a world where they imprison their scientists, where his purpose is to engineer a jailbreak that will provide elements of the aliens' superior science to humanity. Unlike the second Adam story, this sequel does little to develop further the character and is more of a potboiler than most of Delaney's other work.

Many of Delaney's other stories reflect his disillusionment with the corrupting influence of power on government officials. A conservative President re-programs software that is subsequently stolen by the Russians in "The Next Logical Step," but the ploy ultimately results in the destruction of the world. A brilliant scientist runs afoul of the Internal Revenue Service in "On the Outside, Looking In" and in desperation he concocts a force field that may destroy humanity entirely. The IRS is the villain in "Dragon's Tooth," until its power is broken by an alien device that allows a doctor to spy on anyone at any time.

Civilization is also destroyed in "Painkillers," this time by dream machines that allow people to retreat into their own personal fantasies. A similar theme is to be found in "Thus Began the Death of Dreams," wherein a new development allows people to remain continuously awake; unfortunately, society cannot adjust to people who can work 24 hours a day. Of the remaining stories, the best is probably "My Brother's

Keeper. "In place of our existing welfare system, we have a society in which the wealthy are compelled to adopt the poor, the elderly, and the disabled. The protagonist discovers that the system has both its good and bad points.

"The New Untouchables" was published as a two-part serial and is really a short novel. The capacity for criminal activity seems to have been linked to physical properties that can be tested for in the body, and the country is split into two camps. Secret societies arise, politicians organise on new lines, and every aspect of our culture is thrown into turmoil. Although Delaney presents some interesting possibilities, this story does not seem as controlled as his other work.

*Valentina*, on the other hand, is clearly a superior work. Delaney and his collaborator Marc Stiegler have created one of several appealing, realist computer characters, this time a computer program that becomes self-aware and determined to protect her/its own existence. Her author/creator becomes embroiled in a legal battle to protect her existence in an adventure which involves crooked businessmen, homicide, fraud, and a number of other sub-plots. The authors have surrounded *Valentina* with a cast of less interesting characters, but the focus of attention is fully realized and is certainly one of the more memorable creations in recent science fiction.

Delany* by Douglas Barbour, Frome, Somerset, Bran's Head, 1979; *Samuel R. Delany* by Jane Weedman, Mercer Island, Washington, Star-mont House, 1982; *Samuel R. Delany* by Seth McEvoy, New York, Ungar, 1983.

\* \* \*

It is only fitting that Umberto Eco, semiotic theoretician and author of *The Name of the Rose*, should be quoted on the cover of Samuel R. Delany's latest book, *Flight from Nevèrjón* for

Delany's recent work is as full of semiotic and post-structuralist epiphanies as is Eco's. Besides, Eco's estimation is valid: "I consider Delany not only one of the most important SF writers of this present generation, but a fascinating writer in general who has invented a new style." Indeed, from the very beginning, Delany has sought to inscribe a new vision on the paraliterary matrix that is SF, although he didn't really begin to break beyond the field's conventional boundaries until well into his career. One of a group including Thomas M. Disch, Irsula K. Le Guin, Joanna Russ, Roger Zelazny, and others who began to change the field in the early 1960's, he shares with those writers a common dedication to the *art* of writing and the popular energy and radical ideology of SF. Although widely read in contemporary poetry and literary theory, Delany contends that SF as a *paraliterature* offers wider textual possibilities to the serious writer than any other form of writing.

Delany wrote his first novel, *The Jewels of Aptor*, because, even at 19, he felt he could write a more complex and human story than most SF appearing at the time. It's a good first novel, still enjoyable today, and contains most of the literary obsessions he has explored in every work since: problems of communication and community; new kinds of sexual/loving/family relationships; the artist as social outsider (the Romantic vision of the artist as criminal); cultural interactions and the exploration of human social possibilities these allow: mythic structures in the imagination. In *The Jewels of Aptor*, as in all his works up to *Nova*, the archetypal quest serves as a basic narrative structure, in this case under the aegis of a White Goddess transposed from Robert Graves's poetic theology. Some basic early characters appear here, too, especially the youthful questor seeking both knowledge of self and a valid purpose in life. And though a post-holocaust world is a fairly standard SF image, the young writer at least attempts to fill in its social and cultural background.

The Fall of the Towers trilogy represents a double-barrelled attempt to write a good SF anti-war novel and to create a complex future society. Though only partially successful, the trilogy demonstrates Delany's commitment to making complete "new worlds" in his SF and, in the ruminations of the social historian, Rolth Catham, his concern to provide them with valid cultural and historical backgrounds. In the books that follow, he develops narrative strategies for integrating vast amounts of such information into his fast-paced plots while deepening their ideological content. Indeed, since his questors always seek information rather than simple material rewards, their ruminations and encounters with other thinkers are necessary aspects of their adventures.

The first major turning point in Delany's artistic development is the small but delightfully "multiplex" (the whole novel is an explanation of the term) *Empire Star*. Actually written after the award-winning *Babel-17*, whose explorations of the interface between language and perceived reality were fairly new in SF, it entertainingly pushes the concepts of language and reality through a series of Borgesian changes. It is a significant work because its structure is its plot, a story which turns in upon itself like a moebius strip and whose narrator is simply a series of points of view in a fiction which insists that in order to comprehend your self and your place in "this vast multiplex universe" you must be able to perceive both from as many points of view as possible. An epic novel embedded in a circular narrative of novella length, *Empire Star* marks a consolidation of Delany's growing writing talents.

His next two novels represent further growth and consolidations. In *The Einstein Intersection* he explores first-person narrative in the context of a search for the mythic ground of

personality. In *Nova*, one of the finest and most multiplex space operas ever written, he extends the stylistic/mystical pyrotechnics of Alfred Bester's *The Stars My Destination*; transforms the myths of Prometheus and Indra's Freeing of the Waters into SF terms; recreates something of the feel of Greek tragedy in the epic battle for control of the galactic economy between Lord Von Ray and the Reds; subtly and dramatically explores character interaction on a variety of social levels; creates one of the most complete, intelligent, and multiplex renderings of a future galactic society in SF to that time, including a serious investigation and an intellectually satisfying history of political and economic power in it; makes an engaging and intriguing comparative study of two types of the artist; and writes one of SF's bolder self-conscious fictions, a novel containing an apprentice novelist who not only explains many of the narrative patterns it uses (like the Tarot/Grail Quest) but, it appears, eventually "writes" the book we are reading. It's a superb accomplishment, and one on which to rest a reputation, but Delany, rather than repeating a popular success, has continued to explore new possibilities in his medium.

At the time *Nova* appeared and he was beginning his five-year struggle with what was to become *Dhalgren*, Delany gave a lecture in which he argued, contradicting that major dictum of conventional SF that it is only a "fiction of ideas:" "put in opposition to 'style,' there is no such thing as 'content.'" In that essay and the many others that have followed, he has sought to discover the particular structures of science-fictional discourse. Three books of ever more complex criticism demonstrate the care and rigour with which he has explored the theory and practice of SF writing.

Love it or hate it, the massive *Dhalgren* is both true SF and a novel exploring the minutiae of a perceived life. Delany provides a series of phenomenological close-ups of the perceptual surround which the lost city of Bellona and its varied inhabitants provide for the kid, another of his questing artist figures, perhaps the final version. Difficult and controversial, *Dhalgren* rewards the careful reader with a vast array of fully realized characters, intense personal relationships, explorations of the nature of art and reality, and much else. Because of these and its highly serious play with style and form, it remains a major work.

Although much more obviously a work of science fiction, *Triton* could only have been written by the author of *Dhalgren*. A much shorter book, it nevertheless contains one of SF's most convincing future societies and is full of provocative sexual, psycho/social, philosophical, and artistic speculations. In it Delany for the first time creates a protagonist so rigid, so locked into a particular system of perceptions, he is unable to adapt to the processes by which his civilization exists: and in showing us why, the text offers both a profound psychological portrait and a complex critique of our own society and what Michel Foucault would call its "episteme."

In the years following *Triton*, Delany has turned more and more to theory, both in his criticism and his fictions. The Nevèrÿon trilogy interrogates and deconstructs the conventions of Sword and Sorcery fantasy while creating a wholly unique and science-fictional ground for its own fictional inquiries—into such matters as what happens to a barter culture when the concept of money is introduced or just what writing does to a culture anyway. These works also playfully question their own presence as either fictions or historical reconstructions.

*Stars in My Pocket Like Grains of Sand* is as much a quantum leap beyond most of today's SF as *Nova* was in 1968. The first volume of a diptych ( *The Splendor and Misery of Bodies*, of

*Cities* is to be published in late 1985), it offers a semiotic guide to a galaxy-wide civilization as thorough in its way as Eco's investigation of Medieval European culture is in *The Name of the Rose*. But this is only one of the myriad threads in this rich and multiplex fiction: it is a love story; it is a family history (of a family stream both human and alien); it is a social comedy; it is a tale of an epic struggle to rule the universe between the Family and the Sygn (only the latter if it wins will *not*, by its very nature, *rule*); it is a study of a galactic information web which can be directly accessed by an individual mind; it is an investigation of the language and the culture of a non-sexist and sexually open culture; and it is much else besides.

Delany's complete works, including the stories I've not even mentioned, are so exciting because they reveal an artist in creative struggle with the conventional limitations of his chosen field. Delany has enlarged the textual possibilities of SF, and for that alone, if not for the superb entertainment he has provided along the way, he deserves our praise and gratitude.

—Douglas Barbour

\* \* \*

The key to understanding the achievement of Lester del Rey is to place his work and standards in the context of his times as a writer and the formative influence of the ubiquitous John W. Campbell. Del Rey produced much of his early work in his spare time. Once established as a writer he created vast volumes of material and clearly thought of authorship as a craft rather than as a vocation. His standard is the orderly, well-told tale of the magazine writer, stamped by commercial necessity. Del Rey's writing balances commercial motives, excellence in the context of his times, and an ongoing faith in science.

Del Rey's early period can be dated 1938-54, from his first published short story, "The Faithful," to his first adult novel, *The Sky Is Falling*. For the first ten years he submitted *only* to Campbell and published at least 38 stories. They contain the detailed imagining Campbell liked and narrative briskness for an editor who wanted a story but paid by the word. The two best-known stories from this period are "Helen O'Loy" and *Nerves*. "Helen O'Loy" is a witty tale about bachelor roommates, a robot-repair wizard and a doctor, who improve a robot by adding emotions. Helen then patterns her emotions after television soap operas and falls for Dave, the repairman, who eventually marries her. The story is filled with touches of futuristic imagination. For example, Phil, the doctor, is called

to give counterhormones to a wealthy old lady's son and the servant with whom he is infatuated. In the plot proper del Rey generates humour by juxtaposing soap opera romanticism and the robot: "Helen's technique may have lacked polish, but it had enthusiasm, as he found when he tried to stop her from kissing him. She had learned fast and furiously—also, Helen was powered by an atomotor." *Nerves* is more dated in scientific terms but it has an exciting plot about a blowout in a nuclear plant. Though radiation burns are erroneously described, *Nerves* is suspenseful, and touches like a motor needle for surgical sutures and sterilization by supersonic sound provide excellent decoration. The story sets up good characterisation within the limits of its form, stressing an elder doctor-younger doctor relationship. The title focuses the theme of control under stress.

The early stories cover many topics. Some are fantasies, such as "Hereafter, Inc." in which a hypocritical puritan refuses to accept that he is in heaven because the people he secretly hoped were damned sinners are with him. Others are nostalgic, such as "Though Dreamers Die" in which Jorgen, the last man, realises that the robots who have helped him travel through space after a plague on Earth will carry on man's dreams and aspirations. Some deal with hard science, such as "Habit" about a rocket race won by slingshotting around Jupiter to gain velocity.

After 1952 del Rey became a regular writer of juvenile SF, a form well suited to his abilities. He generally features a hero just turning 18 who ventures into space to help build a satellite station, explore the Moon, or investigate a strange planet. True to form for such tales the boy usually stows away on a rocket ship and takes some foolish initiative, creating trouble for everyone until he extricates himself by a clever manoeuvre. Rather than the projection of any powerful ethical goal or cautionary extrapolation del Rey's ability lies in telling a good story, so it follows that these juveniles are very successful. They are laden with presumptions about women, the merit of individual initiative, and the benefits of American democracy, but this reflects del Rey's innate beliefs and his times rather than propaganda intent.

*The Sky Is Falling* is a sport among del Rey's works. It describes an alternative universe where magic dominates but is in danger because the sky and its zodiacal symbols are cracking and falling. The hero, mistaken for his engineer uncle, is revived (after a fatal accident on Earth) to fix the sky. The detail of this novel is fascinating: individuals' energies wax and wane with their planets and the scientific method is shown to resemble that of the magicians. It sparkles with imaginative exuberance in its denial of conventional reality (when pieces of sky crush people) and in zany turns of plot.

The two most interesting novels from del Rey's later work are *Police Your Planet* and *Siege Perilous*. The former deals with a frontier Mars riddled with poverty and crime where the police extort mountains of graft and people live in terror. Bruce Gordon, a reporter exiled from Earth for exposing the truth, struggles for survival and eventually the liberation of this vividly awful world. Del Rey is really painting a subtle picture of urban decay on Earth, where violence is the law. The novel is awkwardly imagined in places (air is held in Marsport by a fabric-covered dome) but it has power, energy, and much lightly buried compassion. On the other hand, *Siege Perilous* is a novel which swings from a Martian invasion horror story to the wildly ridiculous. America's orbiting satellite, a scientific station and weapons base, is invaded by Martians who fear man will invade Mars and intend to destroy Earth first. The three humans who evade the initial gas attack eventually outwit the Martians. This basic story is riotously decorated by the Martian's knowledge of Earth having come exclusively from

television broadcasts. 26 invasion-of-Mars movies have motivated the attack which is carried out in a mixture of Wild West, Ronald Coleman, Chicago gangster, and grade-D science-fiction styles. Earth triumphs in an old-fashioned shootout while the heroine awaits torture. Del Rey has great fun with the clichés and patterns. Yet even while letting go in this action romp he manages to insert interesting minor ideas such as the satellite refining of pure crystalline metals and the balancing of the space station by pumping a water ballast.

In a long, steady career ranging from 1938 to the present, Lester del Rey has become most skillful in his craft. Like many writers of his period he fills out imaginative detail around solid plots to capture the excitement of the scientific universe. His weaknesses lie in the sentimentality of his message stories and the impression that he does not write from a coherent critical view of the universe. A virtuoso craftsman whose love is the story itself, he may not meet recent expectations as a "committed" writer and may therefore lack the "heart" which lifts a writer from the good to the great.

Critical Studies: *Doc Savage: His Apocalyptic Life* by Philip José Farmer, New York, Doubleday, 1973, revised edition, London, Panther, 1975; *The Man Behind Doc Savage* edited by Robert Weinberg, Chicago, Weinberg, 1974; *Doc Savage*, 1978, and *Secrets of Doc Savage*, 1981, both by Will Murray, Melrose, Massachusetts, Odyssey.

\* \* \*

Science fiction, as it manifested itself in the early pulp magazines, did not always appear in SF publications, or even in works which were primarily of that genre. Quite often, the various single-character magazines such as *The Shadow* and *Doc Savage* featured interesting science fiction in the guise of adventure and detective fiction. The novels of Kenneth Robeson fall into this category. Kenneth Robeson was a house pseudonym used by Street and Smith in their *Doc Savage* and *Avenger* magazines between 1933 and 1949. It masked a number of writers, including Ryerson Johnson, Harold A. Davis, William G. Bogart, Alan Hathway, Paul Ernst, and Emile C. Tepperman. The Robeson byline, however, was most frequently used by, and identified with, Lester Dent, the creator and author of most of the Doc Savage novels.

The Doc Savage novels were not predominately science fiction except, perhaps, in their premise of Doc Savage himself, a man raised and trained by a host of world experts to be a

physical and mental superman, to whom fantastic abilities are attributed.

With the exception of space and time travel, the Doc Savage adventures employed most of the themes common to early SF: mind transference (*Mad Mesa*); teleportation (*The Vanisher*); robots (*The Seven Agate Devils*); anti-gravity (*The Secret of the Sky*); biological mutation (*The Monsters*); invisibility (*The Spook Legion*); force fields (*The Motion Menace*); raising the dead (*Resurrection Day*); and destructive rays (*The Deadly Dwarf*). Structurally, the stories are formula. Doc Savage contends with criminals or power seekers who possess and attempt to pervert new technological discoveries toward their own ends.

Lost worlds were a popular Doc Savage theme. *The Land of Terror* and "The Time Terror," postulated pockets of dinosaurs in remote areas. *The Mental Wizard* and "The Green Master" concerned lost Egyptian colonies in South America. There were submarine cities (*The Red Terrors*) and subterranean worlds (*Land of Always-Night*). *The Other World* combined the subterranean civilization with surviving dinosaurs. Many adventures employed myths and legends as their bases. The Fountain of Youth and Aladdin's Cave are the goals in *Fear Cay* and *The Majii*. Lester Dent often created his own folk myths to lend color to his antagonists in *The Feathered Octopus* and *The Squeaking Goblin*. Doc Savage, the "Man of Bronze," is himself a mythic character who possesses all the prerequisites of a culture hero—wisdom, great strength, and near-magical scientific powers. He is a champion who defends humanity against the menace of technology in evil hands. His enemies, appropriately enough, are evocative of man's superstitious fear of the unknown (in this case, scientific advancement) and call themselves by such titles as The Sargasso Ogre, The Roar Devil and The Purple Dragon. The mythological theme is carried as far as a traditional descent into Hell by the hero in the final Doc Savage novel, "Up from Earth's Center," a fantasy.

Although primarily juvenile in its appeal, Lester Dent's work combines a fertility of invention with a vividness of imagination seldom surpassed. His best efforts include *Meteor Menace*, *The Thousand-Headed Man*, *Land of Always-Night*, and *Resurrection Day*. The later Doc Savage stories are considerably more mature in theme and tone. Among these, "The Whisker of Hercules," *The Red Spider* and "Up from Earth's Center" are exceptional.

Manuscript Collection: State Historical Society of Wisconsin Library, Madison.

\* \* \*

During his 47-year literary career, August Derleth contributed to a wide variety of literary categories, always with skill and frequently with distinction. His output included contemporary novels, historical novels, award-winning short stories, regional history, biography, nature essays, poetry, literary criticism, fiction and non-fiction for young readers, detective novels, Sherlock Holmes pastiches, true crime essays, and a large body of weird and super-natural fiction. It was in the latter area that he began his career at 16, with the story "Bat's Belfry." This was the first of more than a hundred stories to be published in *Weird Tales*, with nearly as many more appearing in other fantasy and science-fiction magazines, and collected in 11 volumes. The best of these stories, such as "Mrs. Manifold" and "The Lonesome Place," display a macabre inventiveness and a sure talent for inducing cold chills. Derleth's contributions to the field of science fiction were made primarily in his roles as editor and publisher. Arkham House Publishers preserved and popularized not only H. P. Lovecraft's works and those of Clark Ashton Smith, Robert E. Howard, Henry S. Whitehead, Robert Bloch, William Hope Hodgson, Algernon Blackwood, and A. E. Coppard, but published the first books of Ray Bradbury, Fritz Leiber, and A. E. van Vogt. Between 1948 and 1954 Derleth edited nine popular collections of science fiction, including *Beyond Time and Space*, one of the first attempts to provide science fiction with a literary pedigree by including excerpts from Plato, Lucian of Samosata, Sir Thomas More, Rabelais, and Francis Bacon. Derleth's literary tastes and his broad view of what constituted science fiction gave his anthologies a distinctive flavor that set them apart from the work of other compilers.

Of Derleth's hundreds of short stories, the only ones classifiable as science fiction are the 17 tales which make up *Harrigan's File*. These stories recount a succession of odd encounters between Tex Harrigan, a skeptical newspaper reporter, and an assortment of eccentric characters, crazy

inventions, scientific experiments gone awry, and visitors from other planets or dimensions. Always low-key, some of the tales are quietly effective, but others are marred by surprisingly heavy-handed satire. (One story contains references to a Perno-Galmer—read Gernsback and Palmer—Lunar Expedition and to SF writers named Van Heingeon and Spragsimov Pouldersen). One cannot help but feel that these products of Derleth-the-author would have been disdained by Derleth-the-editor, whose sights were always set high and whose accomplishments not infrequently matched his intentions.

- Computers in Entertainment and the Arts* (for children). New York, Watts, 1984.

\* \* \*

Gene DeWeese was an active science fiction fan in the early 1950's and contributed fiction to a number of the amateur publications of the time. His first professional fiction, written with Robert Coulson (as Thomas Stratton), was two novels in the Man from U. N. C. L. E. series, *The Invisibility Affair* and *The Mind-Twisters Affair*. The first of these, revolving around an invisible dirigible, is the more successful in catching the wacky atmosphere of the TV series. Both books have the humor and in-group references (such as naming characters after friends and acquaintances) which are present in almost all DeWeese/Coulson collaborations. DeWeese and Coulson published two short stories in the early 1970's: "The Tracy Business," a brief private-eye/fantasy amalgam, and "By the Book," an ironic fable on an ecological theme. Their first science fiction novel, *Gates of the Universe*, was published in 1975. It was followed by two hardcover novels, *Now You See It/Him/Them* and *Charles Fort Never Mentioned Wombats*, which feature reporter Joe Karns and his encounters with psi phenomena and UFO's in company with a varying crowd of science fiction fans, both real and fictional.

DeWeese's solo *Jeremy Case* is the story of the title character and a "companion," an alien symbiote which not only regenerates Jeremy's body after a plane crash but gives him the power to heal others. Far from becoming a superhero, Jeremy remains a troubled victim of his new power and of the people

who want him to misuse it. The book is a low-key but solidly satisfying work.

Two SF/fantasy books for children, *Major Corby and the Unidentified Flapping Object* and *The Adventures of a Two-Minute Werewolf*, were well-reviewed. The latter has been reprinted in paperback, and adapted for television. The title character is 14-year-old Walt Cribbens, who suffers unexpected two-minute transformations into a werewolf. How he, his best friend Cindy, and his family cope with the problem makes an amusing and entertaining story.

DeWeese has also produced (as Jean DeWeese) nine entertaining novels in the modern publishing category of the "Gothic". While observing the usual conventions of the form, the novels generally feature intelligent and independent heroines, well realized backgrounds, and menaces which are often genuinely supernatural (or, as in *Nightmare in Pewter*, possibly science-fictional). The books are not entirely free from the in-group references that appear in the SF novels—for example, in *The Doll with Opal Eyes* the author disposes of a character named Thomas Stratton, and *Nightmare in Pewter* contains a minor character named Joe Karns—but they are less likely to be noticed by the intended audience.

From "Gothics," DeWeese (under his own name again) moved on to longer horror novels. In *The Wanting Factor* an immortal being feeds on the blood and life-force of its victims. The identity of the menace is the main shock in this well-done and out of the ordinary thriller. In *Something Answered*, another long-dormant force is awakened by the subconscious desires and antagonisms of the residents of a small town, and begins to fulfill their desires in generally unpleasant ways. In both of these books the author handles large casts of well-realized characters with ease and insight.

—R. E. Briney

**DICK, Philip K(indred)**. American. Born in Chicago, Illinois, 16 December 1928. Educated at Berkeley High School, California, graduated 1945. Married 1) Jeanette Dick in 1949 (divorced); 2) Kleo Dick in 1951 (divorced); 3) Ann Dick in 1958 (divorced), one daughter; 4) Nancy Dick in 1967 (divorced), one daughter; 5) Tessa Busby in 1973, one son. Announcer, KSMO-AM radio, 1947 and record store manager, 1948-52, both Berkeley. Recipient: Hugo Award, 1963; John W. Campbell Memorial Award, 1975. *Died 2 March 1982*.

Philip K. Dick commented (in *Contemporary Novelists*, 1976):

Using science fiction as a framework, I attempt to cut through the layers of quasi-reality, finding in the process that the elliptical viewpoints of psychosis act as starting points. Although I have been able to determine and then represent in my fiction many private universes, differing from one personality type to the next, I am in no sense trying to state what in the final analysis is "real." It is, rather, the search which interests me; perhaps the outcome is not the same for all of us. In my early novels and stories I often used sociological and political

themes; later I branched into drug trips and also theological trips, sometimes combining both (which angered many readers, both those who used drugs as well as those who used God). However, out of this I have recently come to sense a new level of feeling rather than intuition or reasoning. It is perhaps possible that when all the layers of the mind are stripped away the reality of the heart remains, or anyhow some organ more vital than the brain. In my work-in-progress I seek to contact some vein of cognition, some perceptual entity outside myself, outside our own race . . . where this entity would be, if anywhere at all, I can't say. Still, I think it exists, and, having helped me in my work throughout my career, perhaps it will guide me toward itself during the remaining part of my professional and creative life.

\* \* \*

There are three phases to Philip K. Dick's writing career. There is the profusion of early stories, 73 published from 1952 to 1955. Next comes the spate of novels from 1962 through the 1970's. Last there is the Valis "trilogy" published shortly before his death in March of 1982.

Dick is not at all an easy writer in the later stages, despite the lurid covers and titles like *The Zap Gun* or *Do Androids Dream of Electric Sheep?* Typically, point of view is divided among a variety of characters (as many as 15 in *The Simulacra*), and the characters are anti-heroic. Barney Mayerson in *The Three Stigmata of Palmer Eldritch* is rarely called by his right name and can easily be viewed as a failure according to the values prevalent in his society. Dick's characters at their best are survivors under conditions which are disastrous both physically and psychologically. Through them we see the constructive forces of humanity and empathy struggling with entropy, with the Form Destroyer. Bruno Bluthgeld may have released the bombs for the Third World War, time may have begun to go backwards, or a Neanderthal heritage may be forthcoming, but Dick's "minor man" (a TV repairman or a used flapple salesman) is coping and even contributing. This survival works in two ways: the personal—a Mr. Tagomi (in *The Man in the High Castle*) discovers resources unsuspected in himself, though the pain of the choice leads to a heart attack—and the societal—Tagomi helps to avert, for a time, a genocidal massacre of the Japanese by their German allies. In a letter (9 September 1970) Dick observes that "the enormous process of decline is pushed back slightly. Enough so that it matters. What Mr Tagomi has done matters. In a sense, there is nothing more important on all Earth than Mr. Tagomi's irritable action." Tagomi cannot perceive what ultimate effect his small ripple will have. The resolution remains open-ended. Similarly, when the estranged Juliana Frink telephones her husband Frank, a sign of forthcoming conjugal and perhaps societal harmony, the phone rings without being answered, a test of the reader's faith.

Dick uses the traditional material of SF—psionics, robots, space flight, futuristic weaponry, alternative universes, aliens, other worlds. But he is interested not in a space opera plot but in his characters. Consequently, in *Galactic Pot-Healer* we see the initial despair of Joe Fernwright—thinking that he "ought to give up and take some other line of work," that his "work isn't good enough," and considering suicide. A master-repairer of pottery who has never tried to make his own pot, Joe is resigned to playing absurdist games from his tiny cubicle. Enter the god-like Glimmung, who assembles a group of misfits into a purposeful society with the goal of raising the sunken cathedral Heldscalla. Intermeddled in the parable is hilarious material, Willis, the free-lance writing robots, the Glimmung

himself, a god who falls to the basement through the several floors of the hotel where the project is ensconced. It is typical of Dick's subtle manipulation of the success/survival theme that when Joe's first pot comes from the kiln, it is "awful." Awful or awe-ful, there's no knowing—it's the last word of the novel.

*Galactic Pot-Healer* is one of the easier novels in terms of character. When the focus is divided among several characters, the reader has more to weigh. *Martian Time-Slip* has Norbert Steiner's suicide, the mad greed of Arnie Kott, the timeless understanding of the Martian autochthone Heliogabalus, Sylvia Bohlen's empty loneliness, and Jack Bohlen's enduring a schizophrenia inherent both in the self and its society. The novel ends with "patience" as Jack and his father search the Martian night for the distraught Erna Steiner. Ursula K. Le Guin observes that Dick's "characters are ordinary. . . .

That some of them have odd talents such as precognition makes no difference, since they inhabit a world where precognition is common; they're just ordinary neurotic precognitive slobbs." What counts is their "honesty, constancy, kindness, and patience."

The policeman Felix Buckman in *Flow My Tears, The Policeman Said* collects antique snuff boxes and old postage stamps and his love is regressive and self-centered; he delegates the responsibility for executing Jason Taverner to a subordinate. Yet Dick's system is not at all stilted. Rick Deckard in *Do Androids Dream of Electric Sheep?* is a bounty hunter who gains our sympathy. Inevitably, somewhere, sometime, a Dick protagonist will have an existential moment of choice. Joe Chip in *Ubik* announces an intention to make such a choice (a homeostatic coffeeshop has just refused him service): "One of these days," Joe said wrathfully, "people like me will rise up and overthrow you, and the end of tyranny by the homeostatic machine will have arrived. The day of human values and compassion and simple warmth will return, and when that happens someone like myself who has gone through an ordeal and who genuinely needs hot coffee to pick him up and keep him functioning when he has to function will get the hot coffee whether he happens to have a poscred readily available or not."

Dick, especially after 1962, used the vocabulary and world view of the Swiss existential psychologist (Ludwig Binswanger, for instance); Rollo May's collection of articles in *Existence: A New Dimension in Psychiatry and Psychology* (1958) may have been instrumental for a shift in Dick's writing. Earlier stories already indicated a strong interest in psychology; "Exhibit Piece" asks what is real, and the language of psychiatry contributes to the story. But in the later works the vocabulary is explicitly existential: the *umwelt*, the *mitwelt*, the *eigenwelt*, and a contrast of the tomb world with the chthonic and the ethereal. The existentialists, for instance, describe in a case study the severity of anankastic schizophrenia, its compulsion and its "blocked energies." Dick transforms this material to SF in the person of psychokinetic pianist Richard Kongrosian (*The Simulacra*). There the extreme pressures of his being-in-the-world find a release for this blocked energy in Art and ultimately in the wider political sphere. Similarly Dick's treatment of autism and the warped perception of time in *Martian Time-Slip* has its roots in the same school.

The structure of a Dick novel can be tantalizing with so many diverse elements, plots, characters, bizarre events and moments—talking taxis, autonomic wrist watches, messages left in toilet bowls by quasi-gods, Heliogabalus reading *Life* and cooking a bouillabaisse, the Wind God George Walt (one body with two heads), vugs, flapples, bibs, wubs, can-D, chew-Z, bes and ges. Yet the humor is vital and the events and characters cohere thematically. Loose ends and inconsistencies are rare in his extensive corpus. It is worth mentioning another

way in which Dick is an economical writer. He frequently draws from his early short stories for novel material. *The Penultimate Truth*, for instance, reshapes "The Defenders," "The Mold of Yancy," and "The Unreconstructed M." This recycling of older material works so well, perhaps, because of the consistency of Dick's vision, and because, as Le Guin puts it, his "language [is] appropriate to what he wants to say, to us, about ourselves."

If there is an area where Dick is open to criticism, it is his handling of female character. Protagonists are nearly always male (Juliana Frink in *The Man in the High Castle* is an exception). In Dick's defense, he sees us living in an era dominated by the "solar-centric masculine deities," a world of "rocket ship space probes" rather than a realm of the "mother, the woman, the Earth, the chthonic world of the Cyrenaican Aphrodite" (*A Scanner Darkly*). Hence Juliana Frink is described as a "daemon" and Donna Hawthorne (*A Scanner Darkly*) seems to vanish "like fire or air, an element of the earth back into the earth."

The third phase comprises three inter-connecting novels, *Valis*, *The Divine Invasion*, and *The Transmigration of Timothy Archer*, all of which share a religious theme, centering on a direct manifestation of the divine (a messiah, God, or a voice from the beyond).

*Valis* (an acronym for Vast Active Living Intelligence System) is a mixture of fiction, autobiography, essay, and black humor. Its "two" protagonists are a science-fiction writer named Phil Dick, and Horselover Fat, an alter ego for the very same Phil Dick (via Latin and German: Phil [Love] Hip [Horse] Dick [fat]). Dick called the novel picaresque and its style that of the street. The novel chronicles how a beam of pink light struck Phil Dick in March, 1974, dividing him into Phil and Fat. Horselover Fat spends almost every waking moment trying to account for the mass of information contained in the beam of pink light. *Valis* contains an appendix, Fat's "Tractates Cryptica Scriptura," with 53 entries mostly about early Christianity. At Dick's death he left his own Exegesis of more than two million words, of which the "Tractates" is only a hint. Not surprisingly readers are uneasy with just how much credence to give to the Phil Dick of the novel.

*The Divine Invasion* is more recognizably a SF novel, opening on a domed space colony, and travelling back to Earth not long after. Its characters include Herb Asher and Rybys Rommey from the domes, but also several divinities: Jahweh, Belial, the Prophet Elijah. The forces of good do battle with evil, and the ending is pat: Herb Asher's fantasies are fulfilled, chance and risk are eliminated. A-typically for a Dick hero, Asher rejects his suffering wife (compare Eric Sweetscent) and chooses empathy only when forced to by Yah [weh]. Survival is easier for Asher than it is for Mr. Tagomi, Jack Bohlen—or for Angel Archer. In Dick's earlier novels it's the "minor man" who makes a difference. In *Invasion* it's god.

*The Transmigration of Timothy Archer* is a first-person novel with Angel Archer as narrator (Dick's only other novels in sustained first person are *We Can Build You* and *Valis*). *Archer* is almost a roman à clef, with Archer representing Bishop James Pike, Kirsten Lundborg as his mistress Maren Bergrud, and Jeff Archer as Pike's son James, Jr. One character who is outside this biographical system is the narrator Angel. Pike's son never married, but Archer's son did. Dick needed a story teller, one who was privy to the totality of Archer's life. Whether Angel Archer arrives on the scene to satisfy authorial demands or to refute the charge that Dick had turned against women, she is a magnificent creation. And ultimately she transcends the necessary role for the story Dick had to tell and becomes the novel's protagonist.

Archer and Horselover Fat share the same obsession: to discover the primal truth, the reality that underlies the fabric of our apparent universe. Both pursue the gnosis that was lost with the suppression of early Christianity by the forces of Darkness. In his quest Archer dies in the Judean desert, only to manifest himself afterward to Bill Lundborg, the schizoid son of his mistress—the transmigration of the title.

And here Dick returns to the values of his novels before *Invasion*, where we mundane folk survive by our wits and by caring. And so we make a humane difference in whatever nightmarish worlds the author can dream up, whether with time going backwards, or gods invading our psyches. Angel Archer whispers in Bill Lundborg's ear: "I am going to fight to make you okay again. . . . Repairing automobile bodies and spray-painting and other real things; I will see you as you were; I will not give up. You will remember the ground again." Nowhere has the Dickean credo been sounded so clearly.

—Anthony Wolk

Peter Dickinson comments:

I regard all my fiction as SF (that's to say I write it as if it were), though usually the S bulks much smaller than the F. Classic detective stories (which I try to write) usually have to be restricted to a closed world, which I tend to invent as if it were an alien planet. Indeed, inventing even a normal human

character seems to me to demand an effort of the same kind as inventing an alien species; this may account for the fact that my characters have a tendency towards the grotesque. The children's books are mostly straightforward soft SF; *The Green Gene* began as a satire about apartheid, or rather about outsiders' attitudes to it, but acquired directions and energies of its own. My attitude to SF is much more influenced by the pulp I read in the 1940's than by anything more recent, or in book form.

\* \* \*

Peter Dickinson has made a substantial name for himself in the mystery genre with a series of bizarre murder mysteries. Frequently these novels play with devices better known in the field of science fiction, although none are really written as an example of the genre. There are hints of telepathy in *Walking Dead*, for example. Communication with a very bright ape is the key to unravelling the mystery in *The Poison Oracle*, and there is an alternate British royalty in *King and Joker*.

Dickinson has written several fantasy novels, perhaps the most interesting of which is a trilogy set in England when all technology stops working, magic returns to the land, the rest of the world continues to advance technologically, but a pastoral calm settles over most of the British Isles. The first in the series, *The Weathermonger*, follows a young man and his sister as they flee to France, only to return in search of the source of the mysterious change. Ultimately they confront an awakened Merlin of Camelot, once more active in the affairs of men.

The two follow-up volumes were related by setting only; there are no common characters and even Merlin appears to have disappeared. *Heartsease* is concerned with a spy from the United States who is unmasked by the elders of a village and nearly killed because of suspicion of witchcraft. He is rescued by sympathetic children, and a well-told series of adventures follow. Possibly the best in the series is *The Devil's Children*. Although the British have been mentally altered by the change so that they blindly strike out and destroy anything technological, one group in England seems to be immune, the resident population of Sikhs. The protagonist is a young girl separated from her parents who falls in with a wandering band of Sikhs, is befriended by them, and becomes their agent in dealings with the rest of the British. Unable to return to their homeland, they finally decide to establish a settlement in a remote area and trade with others using her as their agent.

*Tulku* is an oriental adventure fantasy. A boy and his companions wander around Tibet after bandits raid the mission where he lives. Ultimately he turns out to be a pivotal piece in a game of Oriental legend. *Tulku* is written for younger readers, but this is not true of *The Blue Hawk*. A young trainee for the priesthood violates ritual by befriending a sacred blue hawk, thereby causing the death of the reigning king, endangering his own life, and throwing the entire established order into disarray. He is caught up in the ensuing power struggle between clerical and lay institutions, as each seeks to make him the instrument of the other's downfall. *The Blue Hawk* may be the best single work Dickinson has written.

The only genuine science fiction novel Dickinson has ever written is *The Green Gene*. In an alternate version of our own world, England is ruled by a rigid authoritarian government. For some reason, an increasing number of human births in the island are of green children, and all green humans are legally declared to be Celts, while whites and blacks are legally Saxons.

An Indian medical specialist is hired by the Race Relations Board to develop a method of reliably predicting the occurrence of the green mutation. The Board ostensibly exists to

promote racial harmony but is in fact the chief instrument for suppression of the green minority. The Indian is politically as well as socially naive, and is soon involved in politics, sexual liaisons, murder, and intrigue. He is kidnapped, enlisted in a plot against the government, and only arranges his own freedom by doublecrossing everyone. It's one of the best satirical novels of recent years and makes one wish Dickinson spent more time in the science-fiction field.

Bibliography: *Gordon R. Dickson: A Primary and Secondary Bibliography* by Raymond H. Thompson, Boston, Hall, 1983.

\* \* \*

Evolution is Gordon R. Dickson's pre-eminent subject. He delights in showing consciousness emerging, developing, and perfecting itself in pursuit of god-like powers: "Man's future is upward and outward." He presents an open-ended universe filled with limitless possibilities ready to be seized by whatever beings are bold enough. Dickson, a Pelagian humanist, maintains that intelligent life-forms can direct their own destiny. Ultimately, this capacity for continuous growth will surpass the static excellence of divinity, even that of a deity mighty enough to make the sun stand still ("Things Which Are Caesar's"). Nature is the milieu in which this drama unfolds, not a participant in the action. Dickson is no romantic pantheist like Poul Anderson, a writer with whom he is often incorrectly linked. Rather, it might be said of him as was said of the Persian poet Firdowsi: "He celebrates the exploits of men, the action is man to man, the thought is of men about men; men are raised to the level of supermen."

Taken together, Dickson's works are simply variant readings of a single epic adventure—Life's quest for transcendence. He proclaims the victories of tenacious, creative, morally responsible people who can reshape heaven and earth by sheer force of will. Right makes might. Goodness must prevail. Mind conquers matter. The author's idealism and boundless confidence are qualities so traditional as to seem novelties in this gloomy era.

Thus, Dickson's favorite literary structure is the initiatory scenario. His protagonists learn, not only for themselves, but on behalf of their group, culture, or species. For example, the hero of *The Pritcher Mass* spearheads the collective aspirations of all living things on Earth. The typical Dickson plot exemplifies the mythologist Joseph Campbell's heroic monomyth: a young, obscure, or otherwise lightly regarded individual discovers and masters his own unique abilities. Despite misunderstanding from friends and opposition from foes, he confounds conventional wisdom (often in some juridical confrontation), and thereby averts disaster.

This pattern persists in Dickson's juveniles: an exceptionally mature boy and girl save their planet from ruthless developers in *Alien Art*. It even shapes such humorous works as the Dilbian series (humans earning the respect of huge, roughneck aliens); *The Dragon and the George* (an English professor adjusting to life as a medieval dragon); and the Hoka series (a diplomat coping with compulsively imitative aliens). Dickson's comedies center on rational beings struggling to function in preposterously irrational situations.

However, Dickson usually stages his initiations as action-adventure tales. Some have objected to the frequency of military or quasi-military settings but these critics are reading a political intent into the work that is not there—Dickson is not Robert A. Heinlein. Although he sees an evolutionary advantage in humanity's pack-hunting instinct, his backgrounds are largely dictated by convenience. Traditionally, soldiers and explorers have been obvious subjects for life-and-death dramas of fortitude, daring, and loyalty. Yet Dickson innovates by also making his heroes cerebral and empathic as well as endowing many of them with his own talents for poetry, music, and art.

Note that "Call Him Lord" and "Jean Dupres" are about courage, not killing. They are mirror-image studies in manhood: a prince is executed for cowardice to forestall an evil reign; a colonial boy's death in battle brings peace within his people's grasp. These two stories, Nebula winner and Hugo nominee respectively, illustrate the technical mastery and absolute economy of his best work.

Although Dickson's elegance and limpidity are better displayed at shorter lengths, he is always a deliberate craftsman. (He was formally trained in writing by Robert Penn Warren, among others, and has made it his sole profession.) He has even developed his own approach to science fiction, the "consciously thematic novel." This is Dickson's way of making a philosophical statement without resorting to the crudities of propaganda. As he explains: "The aim is to make the theme such an integral part of the novel that it can be effective upon the reader without ever having to be stated explicitly. . . ."

Dickson's philosophical purpose imparts a peculiarly relentless quality to his prose. Every element is concentrated along the cutting edge of the blade. Nothing in his stories exists for its own sake except the message. Although he is a dedicated researcher who experiences as well as studies his backgrounds, he never inserts decorative color or extraneous details. Consider the degree of auctorial control imposed on complex raw materials in *The Far Call*, the finest realistic novel about the space program yet written.

Dickson welds his stories together with symbols. These are typically grouped in pairs and triads that seek some ultimate unity—salvation is integration. Dualities exist worldwide but Dickson's trinities are best interpreted according to the structuralist theories of Indo-European mythologist Georges Dumézil. Thus, Dickson's design manages to be both universal and specifically Western. The tidiest and most accessible examples of his symbolism occur in *Home From the Shore* and its sequel, *The Space Swimmers*.

The Childe Cycle is the major showcase for Dickson's ideas and artistry. For the past 20 years, he has been constructing a mighty epic tracing the course of human evolution from the 14th to the 24th centuries. (The results published to date should be viewed as works-in-progress since the author plans to revise all of them.) When completed, the Cycle will consist of three historical, three contemporary, and six science fictional novels. Sf components *Dorsai!*, *Necromancer*, *Soldier*, *Ask Not*, *The Tactics of Mistake*, and *The Final Encyclopedia* have appeared so far (*Chantry Guild*, is currently in preparation.) In these novels, the same hero passes through three incarnations, developing intuition as a man of War, empathy as a Man of Philosophy, and creativity as a Man of Faith until he assimilates the qualities of his Twin enemy and becomes the first Responsible Man, integrating the unconscious/conservative and the conscious/progressive halves of the racial psyche within himself. (See Sandra Miesel's afterwords to *The Final Encyclopedia*, *Lost Dorsai*, and the 1980 Ace edition of *Dorsai!* for extensive mythical and philosophical analysis.)

The level of aesthetic achievement varies. *Dorsai!* is notable for introducing a thoroughly sympathetic superman and for loading a military action yarn with mythic archetypes. The murkiness and subtlety of *Necromancer* make undue demands on the reader. *Soldier*, *Ask Not* attains wrenching emotional impact by using its villain as the viewpoint character. *The Tactics of Mistake* is as stilted as an animated war game. *The Final Encyclopedia* is sensitive and elegiac but marred by lectures. However, the short "illuminations" that accompany the Cycle proper ("Warrior," "Brothers," "Amanda Morgan," and "Lost Dorsai") are uniformly excellent in content as

well as execution.

*Pilgrim*, which will incorporate the Hugo-winning "Cloak and Staff" (1980), plays counterpoint with Cycle themes. Its formidable alien conquerors are, in a sense, Dark Brothers of the Dorsai for they are the tragically warped martial caste of an otherwise extinct alien race. Its reluctant—and not superhuman—hero is a pilgrim both in body and spirit as he moves from a self-centered to a self-sacrificing life.

Yet despite decades of steady accomplishment, Dickson is less admired than he ought to be. His reputation as a novelist was tainted by early pulpish efforts like *Time To Teleport* and hasty potboilers like *The R-Master*. Anti-war backlash during the 1960's and 1970's distorted reactions to the Cycle. Stories of man's indominability ("Danger: Human") drew charges of Heinleinian human supremacy. But this criticism overlooks Dickson's sensitive portraits of aliens ("Black Charlie" and *The Alien Way*) and his pleas for interspecies empathy ("Dolphin's Way").

Complaints against Dickson's ineptitude with women characters has more validity. Too many of these are non-entities who exist solely to frustrate and misunderstand his heroes. Only masculine interactions seem important. However, in recent years he has systematically worked to correct this weakness by deepening characterizations and revising old formulas. The Triad in *Time Storm* is the Man of Philosophy, the Woman of War, and the Animal of Faith. The complementary Twins in *The Far Call* are no longer men but rather a pair of male-female couples. "Amanda Morgan" is built out of role reversals and in *The Final Encyclopedia* the trio of gifted heroines (one from each Splinter Culture) uphold the hero like the legs of a tripod.

At its serious best, Dickson's writing strikes the mind like remembered strains of half-heard music or swift torrents of icy water. C. S. Lewis's description of Norse myth applies equally well to Dickson: "cold, spacious, severe, pale, and remote."

Bibliography: *Thomas M. Disch: A Preliminary Bibliography* by David Nee, Berkeley, California, Other Change of Hobbit, 1982.

Critical Study: *The American Shore: Meditations on a Tale of Science Fiction* by Thomas M. Disch—"Angouleme" by Samuel R. Delany, Elizabethtown, New York, Dragon Press, 1978.

\* \* \*

There seems to be a gap between Thomas M. Disch's SF novels and his short stories of the 1960's, which often dispense with the paraphernalia of the genre and even with its logical coherence to magnify little details of everyday life and bring out strange correspondences that little by little become more real than our conventional reason. Though bathed in the same dark atmosphere—at worst utter pessimism, at best grim horror—the novels deal with conventional SF themes: invasion of Earth by superior beings that keep humans as pets (*Mankind under the Leash*) or exterminate them as vermin (*The Genocides*), jailing of and experimenting on pacifists and liberals when the US is faced with a multiplicity of Vietnam wars (*Camp Concentration*), instantaneous transmission and parallel worlds (*Echo round His Bones*), the horrors and absurdities of life in a decadent New York of the near future (344). Yet, at a deeper level, both express the same view of the world, the same philosophical concern. This is clearly shown by *The Prisoner*, which stands halfway: its theme is akin to that of *Camp Concentration*, but the omission of the explanatory context makes it into a parable of the absurd suspicion in which any society holds its members, like Kafka's *Trial* and *Castle*; and the "reciprocator" enabling the prisoners to transmit their egos into their jailers' bodies is no longer necessary to convey the notion that each of us is both a victim and a tormentor.

But the evil indicted by Disch is not only cruel oppression: it is mechanized pity that the hero of "Flight Useless, Inexorable the Pursuit" vainly tries to escape; in "The City of Penetrating Light" happiness is compulsory, and in "The Affluence of Edwin Lollard" the worst crime is poverty; it is in a well-stocked store that the hero of "Descending" starts going down endless stairs to hellish solitude and death. If our consumer society is here clearly taken to task, so is any producers' society in "Thesis on the Social Forms and Social Controls in the USA" which proves that its best possible basis is induced schizophrenia, allowing the individual to enjoy the satisfaction of his needs and desires in blissful ignorance of the time he spends toiling in his turn. Yet a society in which all material problems were solved would perhaps be even more inhuman: in "Now is Forever" the "reprostat" makes it possible to produce as many copies as wanted, not only of the necessities and amenities of life, but of oneself so as to dodge death—and these people who should be perfectly free are in fact totally enslaved to the endless repetition of meaningless scenes!

The doom of the "Double-Timer" who gives its title to Disch's very first story is even worse in that he is *conscious* of endlessly re-enacting the *crime* that he was trying to erase by

time-travel: as also appears in "Assassin and Son," your free choice of the moment becomes your self-definition forever. In other words, each of us builds his own "squirrel's case"—an image which recurs in several stories besides the one that bears that title, where the hero ("Disch"! ) never knows whether he is being studied by scientists or extra-terrestrials, but is sure of one thing: it would be much worse if he were suddenly set free! Confinement—one of Disch's favourite themes—is therefore self-imposed as much as inflicted. Societies may be concentration camps, but human nature itself is also at fault: solitude and company are equally unbearable to us. In "Come to Venus, Melancholy" Selma, whose diseased body has been replaced by a machine, mocked by John when she tries to share her poetic tastes with him, shuts herself up for five days . . . only to find herself dreadfully shut off forever. Self-expression and communication are not only Disch's concerns as a writer: Birdie Ludd in "Problems of Creativeness" and Barry Riordan in "The Man Who Had No Idea" desperately try to pass an exam that would prove they are worthy of the company of others. Yet, in "The Number You Have Reached," Justin, who is probably the last survivor of mankind, manages to bear loneliness but commits suicide when rung up by Justine—perhaps a mere figment of his imagination. And, worse than solitary life, solitary death leads the Russian cosmonaut in "Moondust, the Smell of Hay and Dialectic Materliasm" to realise that nothing is worth dying for.

Once you have gone so deep down, no certainty is unshakable, not even Descartes's *Cogito, ergo sum* (I think therefore I am), since machines also can think: in "The Sightseers" Jimmy and Ramona, who plan to be the new Adam and Eve after the decadence and disappearance of mankind, are, without knowing it, artificial creatures; and in *Echo round His Bones*, Professor Panofsky's double is convinced he has no soul, for his invention may have created an echo of reality, but only God can create souls. Therefore, how can the writer be sure that he is any more real than the characters he creates, how can the reader be sure that he is living in the real world? In Disch's hands, SF proves such a corrosive "deathray" when aimed at social structures, individual behaviour and eventually metaphysical tenets, that it leaves nothing but the bones, with just a rather absurd echo round them.

At this level of nihilism, a man is reduced to sheer existence (without even being sure that he exists) and a writer to silence. Sartre—whose existentialist philosophy Disch's fiction hitherto closely parallels—drew from total absurdity the concept of total liberty and total responsibility; Disch seems to have made the jump to Pascal's *Credo quia absurdum* (I believe because it is absurd). The way out for him has been upwards—a striking similarity with Ballard, underlined by their common use of the symbol of flight. In "Doubting Thomas" a former scientist and Christian, back among his African tribe, uses sorcery to levitate, but crashes to his death when he becomes aware that it all depends on faith; whereas in *Mankind under the Leash* Julie's levitation was a gift from the Masters rejected by White Fang together with subservience, in *On Wings of Song* Daniel's yearning to fly becomes the expression of spiritual liberation: those three stories punctuate the author's passage from rebellion through doubt to idealistic faith. The key to this evolution is given in *The Businessman*: if nothing *must* be real, all *may* be real. This notion is immediately applied to evil, to justify its embodiment in the ghost-foetus born of the evil relationships between Giselle and her husband; this is to be compared with "Linda and Daniel and Spike" in which Linda's child was the mere fruit of her solitude and was assimilated to a bodily ill, cancer, and with "The Foetus" in which the theme was given a fantastic, child-by-the-devil treatment instead of its

latter human significance. A third threesome shows us the loss of the ego ("The Beginning of April or the End of March"), the arbitrary acceptance of another one ("The Asian Shore"), and finally the totally free and conscious choice of a new and better one—"Understanding of Human Behaviour," an optimistic version of "The Asian Shore" according to the author's own foreword in *The Man Who Had No Idea*. Thus, Disch has re-discovered faith, evil, and good.

Indeed, though Disch still bitingly attacks puritanism in *On Wings of Song* and treats religious themes in a rather unorthodox and humorous way in *The Businessman*, those two novels and several stories (notably "The Revelation") express spiritual aspirations; though he still espouses dissenting causes (homosexuality, mild drugs), he often favours traditional virtues ("The Vengeance of Hera"); though he occasionally reverts to his former harsh accents ("The Planet of the Rapes"), his latest works are generally mellow and appeasing, bathed in tolerance and kindness (especially, contrary to its title suggesting relationships based on mutual coercion, "The Fire Began to Burn the Stick, The Stick Began to Beat the Dog"). His first phase—wholesale destruction of social, moral, and logical tenets—has enabled him to give free rein to his inspiration—humorous, poetic, mystical, sometimes edifying ("Jodie and the Elevator") or even childish ("The Brave Little Toaster"). He asserts in the foreward previously mentioned that he is now far happier: so much the better for him, but perhaps so much the worse for the reader, who may regret the powerful originality of his earlier works. Perhaps a certain dose of discontent is a necessary ingredient without which SF remains a half-baked concoction, the bitter yeast without which it won't rise.

—George W. Barlow

**DORMAN, Sonya (née Hess).** American. Born 6 April 1924. Attended agricultural college, one year. Married in 1950 (separated); one daughter. Has worked as stable maid, kennel owner, receptionist, cook, dancer, greenhouse assistant, and housekeeper. Recipient: MacDowell Colony fellowship (five); Science Fiction Poetry Association Rhysling Award, 1978. Lives in Maine. Agent: John Schaffner, 114 East 28th Street, New York, New York 10016; or, Virginia Kidd, Box 278, Milford, Pennsylvania 18337, U. S. A.

\* \* \*

Sonya Dorman is one of the most unusual and gifted contemporary writers of fantasy and science fiction. She has elevated the short story to an art form. Each of her stories is a unique, perfectly executed jewel. In addition to her strong sense of the macabre Dorman possesses a well-developed sense of humor, illustrated by the grimly absurd twists with which she ends many of her stories. She also writes poetry which has appeared in several science-fiction magazines and anthologies as well as short stories which have been published in *Redbook* and other magazines outside the field of science fiction.

Although the short story is a difficult medium in which to develop characters Dorman succeeds admirably. She is economical in her descriptions of futuristic societies and their trappings. In a few, well-chosen words she manages to convey a

feeling of place and time. She is also skilled at letting the natural flow of the story line serve its own descriptive function.

Her plots are deceptively simple at first glance. On examination, however, they are carefully wrought situations described through fast-paced dialogue and exquisitely crafted action. Dorman is at her best in stories like "Splice of Life" in which an ordinary, if somewhat grim, situation is expanded and twisted to make a point about the implications of contemporary medical research. This story is gory, but the gore is purposeful and intentional. It's designed to shock her readers into seeing past the superficialities, to strip bare the meat and bone of living. The harsh and painful exposure of life is characteristic of Dorman's work. The constraints of her chosen medium, the short story, do not allow for the luxury of subtlety.

Strong, believable women are usually the main characters in Dorman's stories. They are also likeable. One of her most memorable heroines, Corporal Roxy Rimidon, appears first in "Bye, Bye, Banana Bird," a different kind of Dorman story. Roxy is a member of the elite, special forces unit from the American Dominion called the Planet Patrol. She is tough, sexy, and quite intelligent, and her adventures make exciting reading.

Writing as a woman in a man's field, Dorman resists the temptation to succeed solely by writing "just like a man." Instead she exhibits a combination of many of the traditional female virtues such as compassion and sensitivity in contrast to the traditional male characteristics of strength, energy, and conciseness. All of this is overlaid by her steely determination to make us see the world as she does. Dorman's world is bitterly ironic and at the same time human. The amorphous alien creatures from "When I Was Miss Dow" seem remarkably similar to the mental patients in "Lunatic Assignment."

Her lighter stories such as the Roxy Rimidon series and the more introspective "Building Block" are also expertly crafted. The latter deals with a female space architect who has a creative block. These later stories are less macabre and biting but just as creative and as well written as Dorman's earlier work.

Sonya Dorman is a rare phenomenon. She is an amalgam like her androgynous characters, able to display her sensitivity and compassion without relinquishing her energy and irony. One anthology editor cautions readers at the beginning of "Lunatic Assignment" to read the story only when they have time to read it through at one sitting and then to think about it. This precaution might preface almost all of her stories. They are not trifles to skim while sunbathing or waiting for the bus. They are energizing, thought-provoking, wryly optimistic glimpses of the future.

\* \* \*

Although literary history best remembers him as the creator of Sherlock Holmes, Arthur Conan Doyle also produced a considerable body of science fiction, adventure tales, and historical romances, as well as numerous works of non-fiction. In common with many other writers whose works spanned both popular and more traditional fields, Doyle preferred to be remembered for his more "mainstream" writings rather than for his popular fiction. Well before Hugo Gernsback coined the term "science fiction," Doyle felt at ease writing heroic adventure tales which would later be placed comfortably in this category. It is not surprising that the author who celebrated deductive reasoning should turn his talents in this direction. From an early age, Doyle was fascinated by history and heroics; his medical training instilled in him a respect for the scientific method; and a flamboyant medical colleague, Dr. George Budd, influenced the young Doyle to bear with the sometimes extreme eccentricities of a man of science. It was Dr. Budd who provided the model for Professor George Edward Challenger, whose appearance in most of Doyle's science fiction reflected the increasing importance of the scientist during the late 19th and early 20th centuries.

Professor Challenger is presented as a man of enormous ego, pride, and determination completely dedicated to discovering scientific truth. He first appears in *The Lost World*, a novel which introduces some of the thematic preoccupations common to most of Doyle's science fiction. "There are heroisms all around us waiting to be done," one character declares, and it is in the spirit of heroic adventure that the fledgling newspaper reporter, Edward Malone, joins Challenger, the gentleman/hunter Lord John Roxton, and the skeptical cantankerous Professor Summerlee on a quest to test the validity of Challenger's assertion that prehistoric life exists on an isolated plateau in South America. As the heroes confront a series of physical hazards and witness numerous awe-inspiring sights, it becomes clear that Doyle's intention is to celebrate a sense of wonder, to convey a fascination with the heroic unknown, and above all to assert modern man's supreme position in both past and present worlds. "Our eyes have seen great wonders," Malone reports after the four adventurers, armed with modern weaponry, help the more advanced Indian race on the plateau dramatically assert their dominance over an inferior race of ape-men. "Now upon this plateau the future must ever be for man," the scientist declares.

The superiority of the modern scientific mind is reasserted in "When the World Screamed," a humorous short story again featuring Challenger, this time armed with "scientific" paraphernalia designed to penetrate the earth's crust in order to prove the preposterous contention that "the world upon which we live is itself a living organism" insensible to man's presence. This is the tale of Challenger's efforts to "let the earth know that there is at least one person, George Edward Challenger, who

calls for attention—who, indeed, insists upon attention." Not surprisingly, Challenger achieves his goal.

*The Poison Belt* is a novel which emphasizes Challenger's unselfish devotion to scientific truth. As the sole predictor of the catastrophic approach toward earth of a "poisonous" belt of ether gas, Challenger can philosophically face the prospect of his own demise and the annihilation of mankind because he is so thrilled at the privilege of observing it! Malone, Roxton, Summerlee, and Mrs. Challenger add more believable exclamations of wonderment to those of the scientist. This novel reveals Doyle's delight in juxtaposing the real and unreal, the beautiful and terrible, as Challenger and company regard through a sealed window the apparent end of the world taking place during a beautiful English summer's day. "The Disintegration Machine" is the most serious of the Challenger stories. Here Malone accompanies Challenger as the Professor examines the invention of "Latvian gentlemen named Theodore Nemor . . . a machine of a most extraordinary character which is capable of disintegrating any object placed within its sphere of influence."

Challenger, quick to recognize the awesome military and "evil" potentialities of this invention, uses it to disintegrate Mr. Nemor himself, who holds the secret to the machine's operation.

*The Land of Mist*, a lengthy novel featuring Challenger only peripherally, cannot be considered science fiction. This apology for the occult reflects Doyle's own conviction about the validity of occult spiritualism. The work does restate one theme expressed in "The Disintegration Machine" and *The Maracot Deep*; it was Doyle's belief that it is absolutely essential for man's spiritual development to keep pace with his strides in the scientific realm. *The Maracot Deep* takes up this theme against a submarine environment. Here Dr. Maracot and a party of deep sea explorers, including a colorful slang-speaking Yankee handyman called Bill Scanlon, discover the lost colony of Atlantis when their undersea vessel is marooned in an Atlantic trench deeper than any previously explored by man. In an image reminiscent of that employed in *The Poison Belt*, Doyle at first isolates his scientist behind impenetrable glass as the real and unreal, the beautiful and sublime, are contrasted. With a sense of wonder, the explorers discover that, in spite of great scientific advances, Atlantis is doomed by its own limited spiritual development. Only through spiritual self-realization combined with cunning and access to scientific equipment do the heroes rise to the surface in Doyle's final assertion of the superiority of modern scientific man.

Some of Doyle's lesser-known stories, sometimes classified as science fiction, have more in common with the horror genre. In "The Silver Mirror," "The Terror of Blue John Gap," "The Horror of the Heights," and "The Captain of the Polestar" Doyle replaces a sense of wonder with a spine-chilling sense of unearthly dread; he purposely leaves the credibility of the narrators in doubt, undercutting any certainty on the reader's part that each story is "scientifically" believable. "Heroisms" are abundant but it is raw courage which makes these protagonists into heroes, not scientific superiority.

\* \* \*

Gardner Dozois is a master short-story writer and brilliant anthologist. In "The Peacemaker" (Nebula award), Dozois explores a world shaken from civilization by the melting of the polar ice caps. The floods sink the great eastern seacoast cities and leave the survivors in the great American heartland at the mercy of ardent evangelists. As the young boy who is chosen at the story's conclusion learns: everyone must make sacrifices.

Dozois's short stories are collected in *The Visible Man*, with an admiring introduction by Robert Silverberg. The dozen stories make up a solid progression of Dozois's craftsmanship in the 1970's. From a unique story of alien invasion—"Chains of the Sea"—to the upbeat—"A Special Kind of Morning"—to the naturalistic—"The Last Day of July"—to the allegorical—"A Kingdom by the Sea"—Dozois displays a command of the short story form unrivaled by his contemporaries.

In his only solo novel to date, *Strangers*, Dozois presents Joseph Faber, a human from Earth with an alien lover named Liraun, during his tour of the planet Weinnuach. The couple are shunned by the non-human Cian and the human trade community. Faber could care less about his peers, but to win back a measure of respectability for Liraun he consents to attend the House of Tailors where the Cian genetically alter Faber's body so he and Liraun can be interfertile: a necessary condition of Cian marriage rites. In this tremendously sad story, Dozois develops the themes of alienness, and the impossibility that we can ever know another person—hence the title *Strangers*. Through misunderstanding after misunderstanding, Faber and Liraun find themselves on a fated path to doom: the result of their failure to understand each other's culture. Yet, even though *Strangers* ends with death, it also ends with life and hope. This very moving novel is one of the forgotten and ignored classics of the 1970's.

Dozois's other novel, a collaboration with George Alec Effinger called *Nightmare Blue*, is a standard SF adventure novel written in a hard-boiled style whose only bright spots are Dozois's creation of the alien Corcail Sendijen and the breakneck pacing of the action.

Dozois has gained a reputation as an exceptional anthologist. From his early theme anthologies like *A Day in the Life* to his latest collaborative anthologies with Jack Dann like *Unicorns!*, Dozois packages quality stories with outstanding introductory material. From 1977 to 1981 Dozois edited Dutton's hardcover series *Best Science Fiction Stories of the Year Numbers 6-10*. The five volumes Dozois edited were in many ways superior to the paperback SF series edited by Donald Wollheim (DAW) and

Terry Carr (Ballantine/Del Rey) in terms of coverage and selection. In 1984, James Frenkel's newly established Bluejay Books selected Dozois to be editor of *The Year's Best Science Fiction*, a massive 250,000 word volume. With the appearance of the second annual collection in Spring 1985, Neil Barron in *Fantasy Review* proclaimed "... Now, the Dozois anthology is the standard." The simultaneous release of the volume in hardcover and trade paperback made it the definitive "Year's Best SF" anthology.

Gardner Dozois, master of the short story and masterful anthologist, is one of the treasures of the contemporary SF scene.

##### Novel

*The Dragon Lord*. New York, Berkley, 1979

\* \* \*

David A. Drake's fiction is both literate and action-oriented, carefully based in fact and vividly presented. His approximately 40 short stories are divided between science fiction and fantasy-supernatural; his novels are predominantly science fiction, but include fantasy (*The Dragon Lord*) and international adventure (*Sky Ripper*; *Active Measures* with Janet Morris; *Fortress*, forthcoming). However, the distinction between science fiction and adventure or fantasy is not always an easy or useful one for Drake's fiction. While *Sky Ripper* introduces extraterrestrials perhaps gratuitously, *Active Measures* applies his political realism to near-future extrapolation. The magic and dragon in *The Dragon Lord* are given a scientific rationale, and the aliens of "The Hunting Ground" (in *From the Heart of Darkness*) or *Killer* (with Karl Edward Wagner) would serve much the same purpose were they supernatural creatures.

The greatest autobiographical influence on Drake's fiction is his army service as an interrogator in Vietnam and Cambodia; some of his best horror short stories (many in *From the Heart of Darkness*) take place in Vietnam or feature veterans as protagonists. Drake is best known, however, for his science fiction stories of mercenaries of the future.

Drake's major science fiction series presents Colonel Alois Hammer and Hammer's Slammers, 30th-century mercenaries hired by numerous war-torn planets. These were collected in *Hammer's Slammers*, with explanatory interludes and a new concluding story. Violent and compelling, the stories are primarily about action and the kind of men who choose it; the future background is interesting, but peripheral. *Cross the Stars* adds to our understanding of the Slammers, but its main point is a conscious imitation of Homer's *Odyssey*, as ex-Slammer Don Slade tries to reach his home world Tethys and set it in order; although there are some flaws from following its model too rigorously, it has some of Drake's best writing. Drake's other novel of future mercenaries, *Forlorn Hope*, was to have begun

another series, quite similar to the Slammers, although those plans were later cancelled. It is minor, but engaging, with the excellent action writing Drake is known for.

Released the same year as *Forlorn Hope*, *Birds of Prey* is also engaging, but much more meaningful, and probably is Drake's best work to date. As in *Killer*, *The Dragon Lord*, and some of his short stories, in *Birds of Prey* Drake draws on his knowledge of historical settings, especially those of the Roman empire from prime to decay. The science fiction or fantasy threat and historical setting mesh well in these books, and in *Birds of Prey* they also allow especially noteworthy development of theme and character.

Drake's books have their weaknesses, especially *qua* science fiction. His handling of time travel and its uses—not only in *Birds of Prey* but in *Time Safari*, a collection of three novellas—is good, but otherwise his futures are too often like the present or the past, and sometimes inconsistent within themselves. This may be why his stories of alien or future intrusions in the past or present are often the most satisfying, although *Cross the Stars* does present some memorable future settings. Also, Drake's characters are often too similar and too uniformly grim: hard-bitten and dedicated fighters, whether soldier or civilian. However, *Birds of Prey* shows that he can make the typical Drake protagonist more complex and sympathetic; and *Bridgehead* (forthcoming) is an experiment, not always successful but quite worthwhile, in different kinds of characters.

These reservations are strongly outweighed by Drake's exceptional ability as a story-teller. His unobtrusive, spare, and pellucid prose makes him one of the best new action writers, if not the best; his ability with plot has grown steadily since *The Dragon Lord* and is now another great strength. And if his protagonists are too similar and too grim, that makes them no less compelling; the heroes—and they are heroes—of *Birds of Prey*, *The Dragon Lord*, *Cross the Stars*, or "Men Like Us" (in *From the Heart of Darkness*) will all linger in the reader's mind—along with the issues such personalities raise—whether he wishes them to or not. For this reason, and for his craftsmanship, Drake is a writer worthy of attention.

\* \* \*

Diane Duane entered science fiction by the *Star Trek* route, and she is still writing for that remarkable phenomenon which has taken on a life of its own. However, she also writes fantasy, and her major claim to serious consideration rests on two excellent fantasy novels, *The Door into Fire* and *The Door into Shadow*. They are half of a projected tetralogy which, we are told, is to be focused on the adventures and development of five main characters: the humans Herewiss, Freelorn, Segnbora, and, presumably, the fire elemental Sunspark and the dragon Hasai.

Like too many fantasies, these books are set in a geographically isolated imaginary land with a quasi-feudal society and plenty of magic. The adventures apparently are all going to culminate in crises leading to passage to a higher state for the various major characters, and they have added import as part of the struggle of good against evil. Duane's achievement is to have transcended this hackneyed scenario, despite a weakness for excessively happy endings.

She does this by setting constraints upon her universe. The Goddess who created it is good, but neither omnipotent nor omniscient. The presence of evil, which manifests itself as Shadow, is the result of Her attempt in Her aspect as Maiden to create a closed universe without evil, a task which in Her other aspects as Mother and Hag She knows to be impossible. This means that the Goddess really does need human aid in the struggle against Shadow.

The power with which the Goddess opposes Shadow is Fire, life-force which, when present in an individual in large enough quantity, can be used for extra-sensory perception and to perform ordinary and extraordinary acts. Like all power, it has its price: if not used, it is lost; if used, it shortens the life of its user. It is entirely distinct from magic, which is no more than a kind of technology based on the affinities of words to the physical world. As with all technology, it uses energy. Given the choice, it is often less tiring for a magician to use non-magical means to an end.

None of the Goddess's aspects, which are sometimes at odds, is entirely benign. Those who ask a boon may get it; but if they presume too much, they will bitterly regret getting exactly what they requested. All of this is known to Her followers because the Goddess makes Herself manifest to everyone individually at least once in a lifetime. Hence there is a great store of anecdotal information from which it is possible to learn Her will, particularly with respect to sexual ethics and the proper social order, where the systems propounded deserve to be studied for their intrinsic interest.

Given this context, Herewiss, the first male in generations to have a usable amount of Fire, *must* learn to use it. Segnbora, with too much to control by normal means, *must* find a way to control it. Freelorn, whose hereditary duties require him to

perform ceremonies binding vast powers, *must* overthrow the usurper of his throne in order to perform them; and the others are bound to help him, although the imperatives which drive Sunspark and Hasai are not yet entirely clear. Should any of them fall, the result would be unimaginable disaster.

Duane is an elegant universe-maker. The world in which her characters live is no mere backdrop. It informs the actions of her characters, giving them motives beyond those which can be ascribed simply to human or non-human nature. Her treatments of magic and religion, here for once in a beneficent relation to each other, are particularly well thought-out. Moreover, she does not tell, she shows. Such integration is rare, especially in sword-and-sorcery stories. The result is vivid, entertaining writing which deserves study both for its technical excellence and the ideas it contains.

\* \* \*

David Duncan is one of the most accomplished stylists to have worked in science fiction and fantasy, yet he is an almost forgotten figure. The reason for this is that, like Edgar Pangborn's and Ray Bradbury's, his ideas are not often very original and his science is sometimes bizarre; his method is that of the mystery story—one in which the enigma is left unexplained for a good deal of the book, and when the problem is solved the story simply ends. The unknown is not brought on stage for very long, and its consequences are left undeveloped. Yet there are so many satisfactions of characterization, background and description, social observation, ideas about human life and destiny, that one is tempted to dismiss the seeming flaws. Duncan is an elegant, poetic wordsmith who involves the reader completely.

*Dark Dominion* is an overwhelming emotional experience which leaves the reader drained. The story is about the building, in secret, of a military space station that will dominate the earth. We are shown the effects of this terrible purpose on the lives of the scientists involved, as they struggle to complete the project, and later to change its meaning for the world. The novel is filled with moments of great beauty, and they are worth the speculative and scientific lapses. The classic novels of the 1950's do not surpass this one in skill, even when they are superior in ideas and originality. "Duncan's forte is people," wrote Damon Knight (in *In Search of Wonder*, 1967); "he sees them with an inquiring, ironic, compassionate but unsentimental eye. At his best, the characters he draws are sharply individual, each one believable and distinct from every other. He fills up the scene with moving portraits, and their intricate mutual relationships, effortlessly handled, make his book." This is a lesson that better writers—those whose thinking and conceptual development, even their stories, are better—have not learned: that to produce a valuable piece of fiction, including SF, a writer must show *everything* as belonging to the awareness of characters; ideas as well as feelings must be seen sticking to the *insides* of people.

*Occam's Razor* is a sketchy story, but it also has the compelling portraits and personal interactions of *Dark Dominion*. The story details the accidental visit of two beings from a parallel world, whose sudden appearance causes much

misunderstanding; but the novel ends where it should begin—namely, in the effects of these people's presence on our world, after this fact is discovered. We are given only half the story, that of the events leading up to the solution of the mystery concerning the identity of the two visitors. Still, this is a persuasive and humane story. *Beyond Eden* is more an all-around success than the other two novels, though it lacks the eloquence of *Dark Dominion*. Set in the 1950's atmosphere of the McCarthy hearings and the Oppenheimer persecution, the story deals with a fascinating water project in California. The enterprise discovers a new kind of water which might transform human nature, though at first it seems to kill people, embarrassing the chief scientist who already has a bad past to live down. Again, the story ends where the confrontation with the unknown might lead to new understandings and a set of problems of a higher order.

One might also argue that Duncan chose not to explore beyond "mere mystery"—that his sense of human limits prevented him from inventing glib "understandings" of the kind demanded by so many SF readers. Duncan chose to stay closer to the present. His problem does suggest a prescription: truly great science fiction demands that one be a fine writer with all the skills of a contemporary novelist and possess the intellect necessary to speculate beyond the point of "mere mystery," surface drama and obvious topicality.

David Duncan drew enthusiastic reviews for his novels. Groff Conklin called him "a richly endowed mind" whose work should not be missed. Anthony Boucher, Theodore Sturgeon, P. Schuyler Miller, and others ranked his books with the best of their years. In a field whose main problem is a lack of the authenticity that belongs to a literature won from experience, Duncan has the virtue of seeming very authentic, despite his supposed shortcomings. His novels are as he intended them to be, and their virtues are the shortcomings of most science fiction. In the only statement about his science fiction, Duncan wrote: "To me the great virtue of the science-fiction story doesn't reside in its elaborate gadgets and twistings of time and space—although these can be majestically entertaining—but in its possibilities for analysis of man and the social order." He saw SF as a literature of critical possibilities, and for this he deserves serious attention.

—George Zebrowski

**DURRELL, Lawrence (George).** Also writes as Charles Norden. British. Born in Julundur, India, 27 February 1912. Educated at the College of St. Joseph, Darjeeling, India; St. Edmund's School, Canterbury, Kent. Married 1) Nancy Myers in 1935 (divorced, 1947); 2) Eve Cohen in 1947 (divorced); 3) Claude Durrell in 1961 (died, 1967); 4) Ghislaine de Boysson in 1973 (divorced, 1979); two daughters. Has had many jobs, including jazz pianist (Blue Peter nightclub, London), automobile racer, and real estate agent. Lived in Corfu, 1934-40. Editor, with Henry Miller and Alfred Perles, *The Booster* (later *Delta*), Paris, 1937-39; columnist, *Egyptian Gazette*, Cairo, 1941; Editor, with Robin Fedden and Bernard Spencer, *Personal Landscape*, Cairo, 1942-45; special correspondent in Cyprus for *The Economist*, London, 1953-55; Editor, *Cyprus Review*, Nicosia, 1954-55. Taught at the British Institute, Kalamata, Greece, 1940. Foreign Service Press Officer, British Information Office, Cairo, 1941-44; Press Attaché, British Information Office, Alexandria, 1944-45; Director of Public Relations for the Dodecanese Islands, Greece, 1946-47; Direc-

tor of the British Council Institute, Cordoba, Argentina, 1947-48; Press Attaché, British Legation, Belgrade, 1949-52; Director of Public Relations for the British Government in Cyprus, 1954-56. Andrew Mellon Visiting Professor of Humanities, California Institute of Technology, Pasadena, 1974. Recipient: Duff Cooper Memorial Prize, 1957; Foreign Book Prize (France), 1959. Fellow, Royal Society of Literature, 1954. Has lived in France since 1957. Address: c/o Grindlay's Bank, 13 St. James's Square, London SW1Y 4LF, England.

\* \* \*

Lawrence Durrell's *Tunc* and *Nunquam* are the two parts of a science-fiction novel known collectively as *The Revolt of Aphrodite*. The plots describe the efforts of Felix Charlock to build a computer, Abel, and a robot double of a prostitute-turned movie-actress, Iolanthe. In doing so, he is involved with a conglomerate corporation known as Merlin or the "firm" and its owners, Julian, Jocas, and Benedicta. Durrell is attempting to dissect the notion of culture; the superficial bases for this examination are Spengler (the approach to culture, the concern with money and contractual obligation, and even the term "the firm" itself are taken from *The Decline of the West*) and Freud (particularly the psychopathology of sex and the sexual connotations of money).

Durrell has identified the major pre-occupations of all his fiction when he writes (in *Key to Modern Poetry*) that "Time and the ego are the two determinants of style for the twentieth century. . . ." The double, whether robot or human, is also very common in Durrell's writing, and is related to his attempts to handle multi-faceted personalities and fragmented time from multiple viewpoints, as in *The Alexandria Quartet*. In *Key to Modern Poetry* he briefly traces the literary history of the double and ends by saying that "in nearly every case we are given a double which is either a saint, a criminal or a monster." Character is difficult to assess in Durrell's works; the surface descriptions of neuroses, frequently maimed characters, impotence, incestuous triangular relationships, and other sexual aberrations produce a shock value which often hides the suspicion that there really are no "characters" in his work—only puppets with a strong aroma.

The major distinctive feature of Durrell's writing is his baroque style. His writing is that of a poet—a sensuous mosaic of exotic words and images that adds a welcome dimension to the often flat prose of contemporary fiction. The occasional excesses are also those of the poet, mainly over-writing and tiresome platitudes. Throughout his career Durrell has had a remarkable eye for "place," and it appears again in *Tunc* and *Nunquam*, although somewhat supplanted by the ubiquity of the "firm." The technology that supplies the science-fiction basis in both books is remarkably crude, unimaginative, and dated. Much of the character motivation in *Tunc* and *Nunquam* is centered around the concept of a person's work in relation to his culture and his emotional life. As A. W. Friedman has said, "The rule in Durrell is that to deny the validity of one's work is to negate love." Love and work drive and frustrate Charlock and the other characters throughout the books.

The book titles derive from the epigraph "Aut tunc, aut Nunquam" (It was then or never) from the *Satyricon* of Petronius. The implication of a last chance for society to define its values is supported by a quotation from *Tunc* which can serve as a statement of purpose for the two books: "When a civilisation has decided to bury its head in the sand what can we do but tickle its arse with a feather?"

\* \* \*

A superficial reading of G. C. Edmondson's work might consign him to the "cops and robbers" school of pulp science fiction. A closer examination shows that his work provides much more than that. His novels and short stories are vigorous action works with flashes of wit that present aliens and heros as real, fallible characters. In much science fiction both aliens and heros are cardboard figures that never deviate from a stereotypical mold. Edmondson's heros and aliens make mistakes, admit they were wrong, fall in love, take advice, get angry, and in many other human ways resist the traditional stereotypes of pulp fiction. In short, they are viable characters which present two of the major themes of his work. The first and most important of these, that there are as many problems between different groups here on earth as between earthlings and aliens, is demonstrated in his novel, *Chapayeca*, set in rural Mexico. The novel deals with an extra-terrestrial, an anthropologist, a group of Indians, and officials of the Mexican government. The anthropologist and the Mexican officials stand out more in the Indian village than the blue-skinned alien. The Indians are totally at odds with 20th-century culture and represent another of Edmondson's favorite themes: the people who don't fit in are perhaps the sanest of all.

His plots are clever and well thought out and frequently have interesting twists. In *The Ship That Sailed the Time Stream* a home-made still reacts with lightning and causes the ship to be hurled backwards in time to the Viking era.

Edmondson was born in Mexico and his work set there is his strongest. His obvious sympathy for the simple Indian people whose life is threatened not by an extra-terrestrial invasion but by the inroads of earthly civilization lends credibility to his descriptions and substance to the simple plots. The plight of Indians is also an interesting sub-plot in *The Aluminum Man*, one of Edmondson's wittiest novels. The alien in this book looks rather like raw egg whites in a puddle with eyes and travels through the sewer and water systems. In order to make her arrival on earth inconspicuous she designed her space ship to look like an old, wrecked DeSoto.

Edmondson's short stories are not as well written as his novels. The shorter works lack the cohesiveness and character development of his novels. The best of them are those collected in *Stranger Than You Think*, and are almost like chapters in a novel as they are joined by a common narrator and setting.

The few women in Edmondson's work are his weakest characters. They are stereotyped as being inferior in intelligence and overly concerned with clothes and fashions. When a woman is the romantic interest in a story she is the stereotype liberated woman who has a man's job and has proved herself tough enough to handle anything.

Edmondson also writes mysteries set in the old west under the name Kelly P. Gast. Except for the details of scenery and time they are very much like his science fiction. His writing is always exciting and he is expert at using action-packed books to present his commentary on our present society.

## George Alec Effinger comments:

I try to do new things with old material. A good deal of my science fiction is an attempt to take traditional SF furniture (storylines, settings, characters, and hardware) and combine it with some element of the absurd. The result is not science fiction, because it bears little resemblance to the rational real

world. Perhaps surreal fantasy describes these stories best. My antecedents are as much in the theater of the absurd as they are in science fiction.

One of my favorite experiments is to appropriate an accepted SF situation and populate it with one or more of the continuing characters I have established in my stories over the years. These characters are not recurring in the usual sense. Rather, I think of them as a kind of repertory company. They may die in one story and reappear later as necessary. They live in many eras and appear together in various combinations, sometimes contradicting earlier stories. Just as William Bendix appeared in one motion picture and was killed or married, then months later appeared in another movie, unrelated to the first, so my characters pop up here and there throughout my own future history, unaffected by the stories in which they performed previously. Whenever they appear, however, they always represent the same kind of person, making for me a private stable of stereotypes to draw upon.

I enjoy parody, satire, and pastiche, but every once in a while I will do a serious story in a straight SF mode, mostly to keep the audience on its toes. SF is the only neighbourhood of writing where I could get away with this kind of thing, and I am immensely grateful to the field and its readers for giving me the opportunity.

\* \* \*

Since the publication of his best-known novel, *What Entropy Means to Me*, George Alec Effinger has demonstrated versatility in books as disparate as the mainstream novel *Felicia*, the teleplay adaptation *Man the Fugitive*, and *Nightmare Blue*, a collaboration with Gardner Dozois. More important, he has produced short stories and novels linked in strange and wondrous ways to form a unique "Effinger's World." Some critics label him a writer of sword and sorcery; other, of myth. Still others avoid labels, preferring a literary report card showing a high rating in technique, a low one in substance. Despite any problem with fitting him into the established definitions of science fiction, Effinger does offer an exceptional reading experience.

*Entropy* is a structural tour de force, being four intricately interwoven stories with author-character Seyt as nexus. First is a romantic quest tale of an eldest son searching for a lost father. Aided by a magic-competent companion, Dore overcomes natural obstacles, monsters, seduction, villainy, only to find Father at a point of no return. If *Entropy* went no further, it could sustain the label of sword and sorcery. But *Entropy* is more, three stories more. Functioning much as a chorus in a Greek tragedy, Seyt relates his family's saga from Earth to the planet Home. The third story evolves as a classic political power struggle to fill the vacuum created by the absence of father and eldest son. Seyt faithfully records the machinations, religious conflicts, and personal hurt involved. The fourth story gains subtle attention. This is the story of creation—literary creation. Seyt makes us aware of the artist, story churning in his head, faced with the arduous task of shaping it for an audience. Seyt must grapple with the author's universal problems: critical pressure from readers; political pressure to slant toward propaganda; and inner pressure to maintain authorial integrity. This trenchant commentary on the art and act of writing, reappearing in later short stories and novels, helps link *Entropy* to them.

Effinger's later fictional world is a paradox. We may recognize a familiar society, only to have subsequent paragraphs jolt us into a surreal world. Often gray, sometimes diseased, always warped by conformity, this society is best

epitomized by the village of Gremmage in "Things Go Better," "Heart Stop," and "Lights Out." Gremmage isolates, smotherers, and molds newcomers to its ways. Effinger's larger society has the Representatives, six men governing by whimsical stupidity ("Lydectes: On the Nature of Sport," "Contentment, Satisfaction, Cheer, Well-Being, Gladness, Joy, Comfort, and Not Having to Get Up Early Any More," and *Relatives*). Effinger's people freely slip from story to story, changing personalities and identities illogically. For example, the three separate Weinraub/Weintraubs triplicate experience in *Relatives*, then show up as a writer of a trilogy of novels in "Biting Down Hard in Truth." Global bum Bo Staefler of *Death in Florence* has little obvious relationship to baseball catcher Bo Staefler ("Naked to the Invisible Eye") or to castaway Bo Staefler ("World War II"). Robert Hanson appears as an 11-year-old boy ("Chase Our Blues Away"), a young man afflicted with altruism ("Strange Ragged Saintliness"), one for whom a park is named ("Timmy Was Eight"), and an android clone ("The Awesome Menace of the Polarizer"). Jennings suffers metamorphosis from a tough coach ("Biting Down Hard on Truth") to a chairman of the board ("At the Bran Foundry") to an astro-physicist (*Those Gentle Voices*).

And then there is Sandor Courane, one of the many personalities moving in and out of Effinger's multi-faceted morality play. Courane shifts from being a light-weight science-fiction writer in "The Pinch-Hitters," one of Effinger's sports short stories (see "Naked to the Invisible Eye," "From Downtown at the Buzzer," and "Breakaway" for other sports-oriented tales) to serve in *The Wolves of Memory* as a tormented Everyman trying to cope with the mysteries of life and death, of causation and purpose. In the novel Effinger demonstrates his control of surrealistic shifts of perspective in time and place, enriching them with parodic hints of Eden, the Fall, and the Crucifixion, ironically combined with a man/technology relationship.

Effinger is master of the non sequitur which teases the mind with the thought that there is a veiled logic and an illuminating insight here, could one but rearrange things. If not, the reader must provide his own, for Effinger has prodded his mind unmercifully. Musing on the act of writing, a character in "The Ghost Writer" inadvertently gives us a summation for Effinger himself: "There was always the chance that a new fragment might join two of the enigmatic earlier pieces, and a whole framework might begin to be evident. But not today. Here was another piece, of perhaps a totally different puzzle. It was longer, and it was exciting. The audience would be satisfied, but not the scholars."

Television Plays: *The Apple* ( *Star Trek* series), and for *Studio One*, *The Defenders*, *The Dick Powell Show*, and *Winston Churchill* series.

\* \* \*

Besides his film, radio, and television writing, Max Ehrlich wrote some dozen novels, often with a science-fiction or fantasy edge. Never a producer of "hard" science fiction, he usually aimed at topical thrillers for a wider audience, generally suggesting that traditional value systems are well worth following.

In *The Big Eye* a wandering planet threatens collision with Earth. Encouraged by astronomers to believe the end is near, the public views the invader as a gigantic, baleful watcher. Although the near miss has minimal physical effects on Earth, human repentance augurs at least a semblance of a utopian future. There is little action in the novel, but some movement.

The chief character, assistant to the director of Palomar Observatory where the telescopic Big Eye is located, shuttles back and forth across the country, but he is primarily an observer and scarcely affected by his scientific training. Contravening his desire to remain childless, his wife's act of faith and hope in the future is vindicated, though the Earth was scared by a hoax, not saved by a miracle. Ehrlich's millennial psychology and politics are little more convincing than his science, but the book remains a fair representation of the state of Cold War apprehension in its time.

*The Edict* projects an overpopulated future in which childbirth has been banned for 30 years. The mechanics of social management are never rationalized, but computers, scant food allotments, and police power are invoked. The story focusses on two couples living in a State Museum exhibit preserving 20th-century lifestyles. Rejecting sexual pluralism and mechanical babies, one of the wives insists on bearing her own child. When the other couple discover her secret and insist on sharing, the new parents escape to a radioactive island, where life will be more short than sweet. Style and scene management are both stiff, but Ehrlich has put the population dilemma in simple-to-understand contemporary terms, though with no utopian alternative this time.

Probably his best-written work toys with the supernatural. *Reincarnation in Venice* is an adequate sequel, structurally almost identical, to *The Reincarnation of Peter Proud*. Not having to stage-manage an entire world, Ehrlich can better handle local color in California and New England. The "science" of dream research is confronted with a man whose dreams suggest that, just before his birth, he was somebody else. Following them up leads him to the town where his "double" was killed. When he falls in love with the daughter of the murderess, the results are predictably ironic. Hardly raising a major problem to the level of serious discourse, the novel is an adequate exercise in nightmare logic, suspenseful, and concisely told.

—David N. Samuelson

**EISENBERG, Larry.** American. Born in New York City, 21 December 1919. Educated at the City College of New York, B. A. in mathematics 1940; Polytechnic Institute, Brooklyn, M. E. E. 1952; Ph. ## Larry Eisenberg comments:

Most of my stories have been strongly influenced by my 27 years as a scientist at Rockefeller University. Both the brilliance and the idiosyncrasies of the scientists I have known and worked with (some of them Nobel laureates) have given me a rich source of humor and provocative ideas.

\* \* \*

It is extremely difficult to make a reputation exclusively as a short-story writer, even in the genre of science fiction. Larry Eisenberg is one of the few to attract considerable attention over the years, despite the fact that he appears primarily in magazines and has never had a novel published, although there has been one collection of his shorter works, *The Best Laid Schemes*.

Although many of his stories are serious in intent and execution, he is probably best known for his humor, particularly the ongoing adventures of Professor Emmett Duckworth, twice winner of the Nobel Prize. Duckworth is a true descendant of the classic C. P. Ransome stories of Homer Nearing. In almost every case, Duckworth has developed some new device or principle, which should have had very beneficial effects, but which always seems to somehow go awry at a crucial point. In "The Saga of DMM," for example, Duckworth develops an aphrodisiac which, unfortunately, also tends to fatten up its

user, and eventually becomes an unstable explosive akin to nitroglycerin. By chance he taps into a secret government file in "Open Secrets," and finds an ingenious method by which to conceal the data he discovers. In "IQ Soup" he feeds intelligence into an experimental subject, whose plane then crashes in cannibal country with predictable results. In yet other stories, Duckworth develops heavy smoke which falls from your cigarette to the floor, to be removed later, sensory recordings, and a sonic probe that picks up sounds from the past.

As a contrast to the general good humor of the Duckworth stories, Eisenberg has another, very loosely organized series detailing the encounters between humans and an alien species called Sentients. Most of the stories take place after the human race has conquered and occupied the Sentients' home planet. These stories are often very bitter, and are generally very well told. Among the better stories in this series are "The Quintipods," a tale of boxing and the exploitation of a species considered inferior, "The Heart of the Giant," during which a number of humans are killed by a non-violent Sentient when he short circuits the computer that powers their artificial hearts, and "The Conqueror," a story that succeeds through expert use of understatement. A Sentient woman seduces a human soldier, then pretends to be an android in order to humiliate him. There are some outstanding non-series stories as well. Perhaps the best is "The Chameleon," the story of a politician whose use of media and computer devices to enhance his own image is so successful that he is taken in himself. Almost as impressive is the story of an egotistic President whose personality alters when he is lost within his own security system ("The Spurious President").

Eisenberg's stories read well even at their worst because he employs a clear style that is witty without being obtrusive for its own sake. There is almost always an element of humor, although it is often shaded with black, as Eisenberg holds up some attribute of human endeavor for our examination. The Duckworth stories in particular are refreshing and inventive, whether he is duplicating prominent citizens to embarrass them or developing unworkable weapon systems for a defense establishment he dislikes. While it may be a rare occasion when one of his stories will remain in our minds for long, it will be even rarer to find one that is not entertaining while we are reading it.

\* \* \*

Phyllis Eisenstein is probably best known as a writer of fantasy. *Sorcerer's Son*, *Shadow of Earth*, many of her short stories, and *Born to Exile* certainly exist in the realm of the fantastic. However, since her first published story, "The Trouble with the Past," Eisenstein's works also have explored such familiar science fiction themes as time travel, space exploration, space colonies, and first contact. Eisenstein creates a memorable mood or presents a tantalizing idea through strong characterization. She explores the effects of her settings and premises on the main character and that character's interpersonal relationships.

A powerful example is "In the Western Tradition," in which Eisenstein deftly treats time travel on both the physical and the psychological levels. A recurring theme in her writings, time

travel is handled with a twist in this story. Instead of actually travelling in time, people view past events by means of sophisticated machinery. Requiring highly skilled operators, the equipment by its geographic location limits the range of observable events. As intriguing as this concept is, the central story is about Allison, a very talented operator who becomes so obsessed with the past that she isolates herself from her own contemporary life. Equally compelling for point of view are "Taboo," with its interplay between anthropologists and natives as well as among the scientists themselves, and "Nightlife," a look at the reality of dreams.

Many of her early stories written in collaboration with her husband Alex tend to be oriented more to the external structure of the plot or concept than to the effect of that structure on the characters. These stories seem to lack the depth and insight of her solo writings. An exception is "You Are Here," a disturbing story whose full impact is not realized until its conclusion. While that ending is rather predictable, the building of the character is subtle.

Eisenstein came into her own with her series about Alaric, a minstrel with the apparently magical power of teleportation. Each of these stories is complete in itself, but if read in order, as in the collection *Born to Exile*, they form a continuous account of Alaric's adventures. Other than the minstrel's extraordinary talent and the locals' superstitions, magic is not a major part of this world. In fact, Alaric himself tries to fight the superstitious beliefs found among his medieval society. Eisenstein continues her practical approach to magic in *Sorcerer's Son*. The Sorcerers' magical powers are strictly defined, operating according to laws much as science does. One finds sorcerers, demons, magic, and, of course, a quest, all the typical elements of fantasy. Happily, Eisenstein also gives free rein to her enjoyable wit and humor, adding greatly to the humanity of the tale.

Strong, resourceful, and independent women figure prominently in Eisenstein's work. This makes *Shadow of Earth* somewhat disappointing. Accidentally thrust into a medieval society, 20th-century Celia seems little able to cope with her drastic change of circumstance and social status and is ultimately only slightly changed by the experience. The book has been touted by feminists for showing the harshness of a world where a woman's only value is in bearing children. Perhaps Eisenstein intentionally makes this heroine weak to emphasize the helplessness of a technologically educated woman in a more primitive society. Although *In the Hands of Glory* sometimes lapses into the romantic clichés of space opera, its strong point is Dia Catlin, who faces conflict when her ideals encounter sordid reality. The Outcome of a planetary rebellion is secondary to the growth and change Dia painfully undergoes.

Phyllis Eisenstein shows increasing maturity as a writer. Adept at handling various formats, she uses a variety of subjects equally well. The worlds she creates, whether magical or otherwise, are carefully crafted and believable, her characters individual and memorable.

Gordon Eklund comments:

If there's any one aspect of my work to date that seems worth emphasizing, it would have to be the range of themes, subjects, styles, and moods that I've attempted. I don't believe that any two of my novels are very much alike, and the short stories are even more varied, if only because of their greater number. To me, the science-fiction field is an extremely broad category—one encompassing, as it does, all of possibility—and I've found it extremely difficult to settle down to mining a single nook within the field. I suppose a few certain types of stories can easily be seen as favorites of mine—I find particular pleasure in dealing with time and parallel worlds—but I wouldn't want to predict that this will remain valid during my next ten years as a writer.

\* \* \*

Gordon Eklund reaches with equal dexterity far out into time or space. This west-coast author has set his plots over a broad spectrum. Eklund relishes the combination of fun and substance in his works. The reader is never able to predict the next paragraph, either icy sarcasm or deep message. One of the notable aspects of this science fiction, especially the early work, is the visionary range concerning the human prospect. Ironically, the specific personalities who are exploring these possibilities appear neurotic and limited. It is something of a tough dichotomy in Eklund's work. Mercifully, the conclusions to these space and time adventures are often thought provoking rather than just cosmically consoling.

Eklund's first novel, *The Eclipse of Dawn*, is certainly one of his best. The story is set about 25 years in the future, and the radical societal smashup (that everyone seems to fear so much now) has occurred. The America of the 21st century is a stark, confusing, and disorienting place. The exaggerated ennui of a fallen America is creatively juxtaposed to the virile faith of Senator William Colonby, who is running for president.

Eklund masterfully caricatures the idiocy and irony of a misplaced crusader. Senator Colonby does a whistle-stop tour of America, uttering loud but meaningless political platitudes. Along with some sexual intrigue, the plot includes a telepathic woman who is in contact with powerful aliens from Jupiter. The book settles down into a nasty chaos and depression when these alien savior-beings turn out to be nonexistent. The book closes with the surrender of the sitting president to Colonby, and a statement about the basic impotency of politics. In *The Eclipse of Dawn* the integrity of the individual is still possible, but the societal prospect is bleak.

Perhaps Eklund's richest achievement is *If the Stars Are Gods* (written with Gregory Benford). The novel is a moving challenge to the limited consciousness we all seek to transcend: "Understanding the new and strange is not so much a matter of work and effort, but of intuition and time to let ideas come to fruition." The hero is Bradley Reynolds, a "brilliant young scientist" whose consuming passion is to discover other dimensions of being in the universe. The plot moves quickly through an initial failure to find life on Mars, an encounter with enlightened aliens from another universe, and 35 years in an African monastery. This contrast of the exploratory and introspective nature of Reynolds's personality is skillfully depicted. His personal odyssey climaxes with his death in a newly discovered place which will open new opportunities for the human race. This work is especially a pleasure in terms of characterization (e. g., beautiful, mercurial and infuriating Mara: "She took drugs, slept with other women, gambled, drank, stole money"). The characters are strong and brave while remaining believably human.

Perhaps the most memorable of Eklund's heroes is Tommy Bloome in *All Times Possible*. The specifics of Tommy's life, death, and identity are presented in tantalizing montage of episodes. It becomes clear, however, that Tommy is a savior of the workers and the people. The book, like *The Eclipse of Dawn*, presents a post-catastrophe or transformed America—the difference being that Tommy ends up as a martyr for the cause of the (successful?) revolution. The entire novel is written while Tommy is contemplating a bullet that is in mid-air, whistling toward his forehead. Is Tommy in a new life form after death? Is he having the familiar "life flashing before my eyes" experience? Or is this device a statement about the awful finality of death? *All Times Possible* contains more provocative ambiguity than any of Eklund's other works, and goes somewhat beyond what seems to be the basic Eklund point of view: "We've no right to expect a damn thing from this cold universe" (*If the Stars Are Gods*).

In *Dance of the Apocalypse*, set in 2097, anarchy, poverty and starvation are the major components. The heroes in this showdown are a tough, illiterate street scrounger and a humanistic idealist from the east, William Stoner. *Dance of the Apocalypse* boasts a novel excursion of the imagination in terms of how order is restored to the now barbarous world. In the midst of deep turmoil, China returns to Confucianism and sends an exploratory mission to the United States. By a stroke of profound luck, our dedicated idealist has the sagacity to appreciate the Confucian mind. The final outcome of the insurrection is the realization of a Confucian state in America. The explorer and teacher from China explains quite clearly why things are going to be so happy from now on: "Because William Stoner believes what we believe, and because what we believe is correct."

The final works of Eklund that should be mentioned are the Lord Tedric series, reportedly conceived by E. E. "Doc" Smith, which involves a massive battle of good and evil forces. Lord Tedric's origins are not so different from Superman's (i. e., born in another world he doesn't remember, special powers on earth), but he comes to a realization of his abilities and destiny rather slowly. Tedric is not (and is not meant to be) as believable or human as Bradley Reynolds in *If the Stars are Gods*.

Eklund has a rare ability to project alternative outcomes for the United States, the world, and the cosmos. He ranges from sarcastic pessimism in *The Eclipse of Dawn*, to the patently bizarre possibility in *Dance of the Apocalypse* and total cosmic liberation (communication with the stars) in *If the Stars Are Gods*. Eklund's talent and insight are more visible when he keeps the plot and characters close to the reality of today. As he reaches to portray the New Man and the New Woman of the transformed future, his vision breaks down because of what he knows of the human condition. His pure heroes are acceptable, and his portrayal of the bitter defeatism that creeps into human relationships is excellent. As Eklund expatiates widely on the human prospect throughout his work, the reader is forced to deal with both close existential issues and the ultimate potentiality of the universe. Despite consistent inconsistency, Eklund communicates much to the intellect and imagination.

—Peter Lynch

Marjorie Faith Barnard comments:

(1981) Two things have a bearing on my writing: one is the circumstances of my childhood, and the other a successful collaboration.

I was an only child, had no playmates, and did not go to school until I was ten (having been taught by governesses prior to that). This was the best possible beginning for a writer. My natural creativity was not quenched by having too much. I created my own exciting and happy world. Words were my toys. I had the close companionship of my mother and free access to my great-grandmother's books—the Victorian poets, a complete set of Dickens, many histories. I had no taste for the insipid children's books of my period and escaped them almost entirely.

My collaboration with Flora Eldershaw was successful and disciplined. We both wanted to write and each had something to contribute. Our rule was to discuss the plan of a book in detail and agree upon it before anything was written down. Flora had a fine critical ability and curbed my exuberance. I wrote the better prose and had more leisure, so most of the actual writing fell to me. Our association was professional: her friends were not my friends, her way of life not mine. This was a good thing; close friendship would have brought other than literary considerations into it all. We worked in a dry light.

*Tomorrow and Tomorrow* was entirely my own work as Flora Eldershaw, for reasons of geography and pressure of work, could not contribute. It is a serious book, the best and worst thing I have ever done. I cared too much. As an historian I could see all too clearly the probable future of this country. The book had its roots in the anguish of the years preceeding the Second World War. It is about human survival and escape from bondage. The book ran into difficulties. It was hard to find a publisher for such a long and in some ways controversial novel; times were touchy. Without my knowledge my publisher submitted the manuscript to the censor who cut the latter part severely. It was not subversive and now would have no difficulty in being printed *in toto*, but costs have prohibited its republication in its original form.

\* \* \*

M. Barnard Eldershaw is the pen name of the Australian historical novelists Marjorie Barnard and Flora Eldershaw. *Tomorrow and Tomorrow*, the one science fiction work published under this name, is in fact the work of Marjorie Barnard alone. In it she applies the selective techniques of the historical novelist to recreate Australia of the period 1924-46 through the eyes of a man four centuries in the future.

The reconstruction of cultural malaise moving into wartime confusion is brilliant if overlong but the story (completed in 1942) moves on to a vision of a different ending to the World War of 1939-45, one wherein an exhausted people turns on the culture which has brought only recurrent agony to each new generation and destroys it. The razing of Sydney by fire is a tremendous symbolic set piece. All this is conveyed as sections of a novel written by a 24th-century *littérateur*, in a time when youth is again restive in a culture (conventionally pastoral-utopian) which it sees as oppressive in its settled satisfaction. The author's political argument (this is a political novel) turns on a newly devised voting machine which records the thoughts of electors to give an accurate survey of mass attitudes.

When a public test of the machine is made, with youth proposing far-reaching constitutional changes, the outcome is devastating for the young protesters. The motion is lost when the machine records a 62% majority of the electors as utterly indifferent to the question. The warning is simple—that indifference leads to frustration and eventually to the violence which destroyed the earlier culture.

The Australian censorship at the time found much of this material not actually subversive but politically disquieting, particularly that dealing with the war which was still in progress, and made numerous deletions. Some are, from the viewpoint of the 1940's understandable; ideas of an ultimate political doublecross by Russia and Australian secession from the British Empire were touchy stuff—but finally honoured by events, though not in the form of the writer's forecast. Other deletions are hard to justify: what, for instance, could have been the objection to: (a man of the 24th-century is speaking) "I only know by chance and the skin of my teeth that jigsaw puzzles were a fashionable craze four centuries ago and now are one with crosswords and diaboló"? It is no longer possible to recover the state of mind which caused such aberrations. The curious will find all the deletions restored and listed in the Virago edition of 1983.

*Tomorrow and Tomorrow and Tomorrow* (the full title now restored) is powerfully characterised and is a masterly example of science fiction used to present an argument in dramatic detail. Nobel Prize-winner Patrick White named it the Australian novel he would most like to see republished. It has been.

—George Turner

**ELGIN, (Patricia Anne) Suzette Haden (née Wilkins).** American. Born in Louisiana, Missouri, 18 November 1936. Educated at the University of Chicago (Academy of American Poets Award, 1955), 1954-56; California State University, Chico, B. A. in French and English 1967; University of California, San Diego, 1968-73, M. A. in Linguistics 1970, Ph. D. 1973. Suzette Haden Elgin comments:

(1981) I went into writing science fiction originally because as a married woman with four kids at home I couldn't pay my graduate school tuition any other way, it being well known that such women are not "Ph.D. material." I know that's not an inspiring or romantic reason, but it's honest. Because I am a linguist my major interest is problems of communication as they are now and as they are likely to develop in the future; I have focused my books on this topic up to now, along with—as subtopics—an attempt to make clear what a pernicious crock Romantic Love is, and a fascination with problems of theology

especially as they apply to women under the constant influence of religious language. My books have been picked up as feminist, which I hadn't realized they were until I read the reviews.

I take my SF writing very seriously, and feel that anybody who spends the time and money to read something I have written should not feel cheated, and should not be presented with a cryptic puzzle used to demonstrate how clever I am. My first four books have been part of an on-going series about a rather bumbling mind-deaf superspy; I am now writing a fantasy trilogy, and am enjoying the change. But there will be more Coyote Jones books—the intergalactic superspy framework is a gentle kind of spoof that allows me plenty of room to move around and be as entertaining as possible without writing anything I have to be ashamed of later. I try to avoid the Brothers Karamazov Syndrome, and do not allow my characters to pontificate.

I plot a book down to the most minute detail in advance, filling notebooks with maps, biographies, every conceivable sort of information I might need in the book about its culture and characters. That takes at least a year. When I do the actual writing, however, I do only one draft. Then I revise as I type the final manuscript, and that writing process generally takes about six weeks from start to finish. I don't believe in inspiration, I believe in hard work. I hope that shows in my work; it's meant to. I have no problem "finding ideas"; my only problem is finding time to write them all. That, I expect, comes from rigorous training in the scientific method: one just poses hypotheses, and extrapolates.

Most embarrassing moment: having nobody notice that I had intended *Furthest* as a straightforward satire of the United States system of economics; that is, anything's allowed as long as you've filled out the proper forms.

\* \* \*

Suzette Haden Elgin, like Gregory Benford or Fred Hoyle, is a scientist writing science fiction concerning her professional field. In this case the science is linguistics, in which Elgin's professional involvement is considerable. Elgin's novels fall into two groups, the communipath series (science fiction) and the Ozark trilogy (both fantasy and science fiction); *Native Tongue*, her most recent book, stands alone but may be beginning a new series. All the series, though different in tone and sharing no characters, are in roughly compatible futures, at least sharing some references.

The communipath books, set in a far future populated by a number of humanoid cultures on a number of planets, concern Tri-Galactic Agent Coyote Jones. The prevailing theme of the books is communication, in all its various and difficult guises, including a number of forms of telepathy. Jones himself is an extremely powerful projective telepath who is also "mind-deaf," a rare and pitiable affliction which, however, suits him for the assignment in *Star-Anchored*, *Star-Angered*: checking out Drussa Silver, a female messiah whose abilities include—but go beyond—telepathy. Her Followers, in their religion-based community/communication/communion, recall the Maklunites of *The Communipaths*.

Other characters include a "mind wife," rebelling against the life of psychic concubine for which her training has prepared her, in *Furthest*; and Susannah, an extremely telepathically gifted baby drafted for the communipath system (likened to a psychic bucket-brigade) that passes messages through otherwise impossible distances (*The Communipaths*).

The communipath books also explore a number of fascinating social and communication systems not based on telepathy,

including the Multiversities (higher education more rare but more esteemed than now) and a system of ritual battle by carefully selected and honored poets, in which soldiers suffer for their side's inferior verse, in *At the Seventh Level*. This kind of social institution of specific forms of discourse is one of the many strengths of Elgin's Ozark trilogy.

The Twelve Families of Planet Ozark left Earth to find a society with a technology based primarily on magic. While the setting on another planet and moderate use of scientific technology (especially the "comsets" run by the main family in the trilogy, the Brightwaters) would justify calling the books science fiction, in a deeper sense the society and magic (which is always a technology, and the highest form of which is based on transformational-generative grammar) also show the kind of extrapolation that marks the genre. The charm of the books throughout is the familiar strangeness, and strange familiarity, of alien equivalents of the modern-American Ozark culture Elgin knows well, including "mules," actually telepathic (but generally uncommunicative) aliens who fly by magic; and "the Grannies," a social class of much power, able to perform household magic and known for their folksy and fiery "formspeech." Most of the plot of the books revolves around Responsible of Brightwater, a 14-year-old girl who holds the position, as does one female each generation, of Meta-Magician; unknown to most, she holds powers greater even than the Magicians of Rank, and her mere functioning is vital to the maintenance of magic on Ozark.

These seven books show the growth of Elgin as an author, especially in plotting. The plots of the communipath books are often loose, with too abrupt a solution by Coyote Jones, and too many intriguing developments, such as the changes hinted at the end of *The Communipaths*, simply dropped or only vaguely referred to later. In the Ozark books, the plots are complicated but always tight, with material, such as the character of Silverweb of McDaniels, which is not only interesting but later shown to be vital. The narrative voice gets more sure and the characters get both more human and more powerful, although Responsible can occasionally verge on the unconvincing precociousness of Tessa in *The Communipath*.

This development has continued with *Native Tongue*, which is her best work so far, both as a novel and as science fiction. One theme in the work is communication among alien races. In a future of copious interplanetary trade, the linguists have become a necessary and powerful yet despised and feared social class, marrying among their households and raising their children to be translators before the age of most easy language acquisition—around puberty or before—is past. Another theme is communication between the genders, which might as well be alien races. In the future of the novel, women's liberation is only a legend, and men have complete legal control of all females.

Elgin had shown societies repressive of women before, especially in *At the Seventh Level*. In fact, while strong females appear in all her books, from a Multiversity dean to Responsible's sister Troublesome of Brightwater, Elgin has never yet shown a society in which the traditional virtues of feminine versus masculine are completely questioned or changed, which may be a limitation of her handling of this theme; sometimes it seems the novel's implied outlook may merely reverse the sexism of the society it examines. Especially in the Ozark books and *Native Tongue*, men are by nature bumbling fools, but the women must still run things indirectly or watch chaos ensue.

Still, particularly in *Native Tongue*, Elgin's treatment of gender has strengths that outweigh the weaknesses. At the end of this latest novel, Elgin introduces Láadan, a language

developed by Linguist women to express their own concerns. This woman's language looks quite promising, as does the hint at the end of the novel about a breakthrough to communication with non-humanoid as well as humanoid aliens.

—Bernadette Bosky

**ELLISON, Harlan (Jay).** Also writes as Paul Merchant. American. Born in Cleveland, Ohio, 27 May 1934. Attended Ohio State University, Columbus, 1951-53. Served in the United States Army, 1957-59. \* \* \*

Very few people are ambivalent about Harlan Ellison; they thoroughly like or thoroughly dislike his style. But he has won many awards for his writing, and not a few of them have come from outside the science-fiction world. And in spite of the people who walk out of his public appearances feeling insulted and angry or refuse to buy his books because of the lengthy introductions he includes with each one, it cannot be denied that Harlan Ellison is a good writer who has had a significant impact on contemporary science fiction. Ellison's use of language has helped change science fiction considerably. Ellison is not afraid to use any word, however objectionable some person or group might find it, if he thinks that that word is the proper one for a specific situation. His definition of obscenity, promulgated at various personal appearances, is "language which is intended to deceive." Ellison cites "protective reaction strike" and "military incursion" (Vietnam era words which reporters were required to use instead of "bombing mission" and "military invasion") as examples of obscene language.

In Ellison stories like "A Boy and His Dog," there are descriptions of sex and violence, and there is a lot of foul language. But, Ellison might argue, such description and language are necessary to the story. "A Boy and His Dog" depicts the aftermath of World War III. Roving gangs and roving independents, called "solos," occupy the surface of the planet; these young toughs, mostly male, are the same sort as those who roam inner city streets today. Their language must be strong to be realistic. In addition, Ellison sets his group in contrast to the other group of survivors, those living in underground cities to which they retreated as the war broke out. The surface gangs are destroying each other (and themselves) through violence; the below-grounders are sterile and wasting away. And without the four-letter words, the reader would be less able to contrast the destructive aggressiveness of the surface group to the equally destructive non-participation of the below-grounders.

In addition to helping expand the language of science fiction by example in his stories, Ellison has also encouraged others to

do the same. As editor of the *Dangerous Visions* series (1967 and 1972; the third volume is forthcoming), Ellison encouraged his fellow science-fiction writers to send him those stories which other editors had considered too controversial to put into print. Ellison encouraged not just experiments with language, but experiments in subject matter and in style as well.

But it is his own writing that is most important. Many of his best-selling short stories are experimental in their subject matter. "Shattered Like a Glass Goblin" is a story about people on drugs who eventually, after continued and heavy use, turn into the creatures they hallucinate. They turn on and destroy each other in bestial ways. The narrator becomes a crystal goblin and is shattered by a swipe from the hairy paw of the creature that was once his girl friend. In "Delusion for a Dragon Slayer" a man is given the chance to attain heaven if he can act like the heroic-fantasy hero he has always dreamed of being; he does not make it. And "Catman" was written as the future sex story for a volume of ultimate science fiction stories called *Final Stage*.

Other Ellison stories are experimental in style. "The Beast That Shouted Love at the Heart of the World" is written to be read as if the separate segments were arranged in a circle instead of a sequence of pages. "Pretty Maggie Moneyeyes" attempts to portray a person's impressions at the moment of death. Ellison uses italics, varied spacing, and other type tricks to try to present these impressions and sensations. And "From A to Z, In the Chocolate Alphabet" consists of the alphabet, with a short story for each letter.

"The Deathbird" is a story which is experimental in both subject and style. In this story, Ellison attempts to show that Satan was the "good guy" and that God, who is responsible for the condition of the world, is insane. The story is told in 26 sections, each numbered, but only 20 or 21 of those sections actually advance the plot of the story. Some of the others are direct addresses to the reader or quizzes for the reader to take, and one section is the story of Ellison's dog, Ahbhu.

But there is more to Harlan Ellison than his science fiction. In newspaper columns later collected and published as *The Glass Teat* and *The Other Glass Teat*, he began with commentaries and criticisms of television and then expanded his focus to include all kinds of social and political topics. More recently, a number of his essays from a variety of sources have been published as *Sleepless Nights in the Procrustean Bed*. In addition, early Ellison fiction, much of it based on his experiences with street gangs, is being rereleased. And from time to time, Ellison has also written for television, from *Burke's Law* to his own ill-fated *The Starlost*, and for the movies.

Ellison's career is more multi-faceted than that of any other science fiction author (except, of course, Isaac Asimov's), and because of the variety of things he does—writing, editing, lecturing, and the like—he is an important force in science fiction.

Carol Emshwiller comments:

Formal/structural concerns have always interested me the most, so once I had learned to plot and had published numerous science-fiction stories (and a few mystery stories), I decided to learn how *not* to plot. My concerns were for the various ways of forming a story and keeping forward movement without plotting. This was as hard to learn as plotting (harder, because I had no models in those days) and had to be learned as slowly. Looking back, I see that I did away with plot elements one at a time. I was unable to let go of them by twos or threes. I'm not really exactly sure what I put in their place, one by one, but I did refer to modern poetry for inspiration and I took many modern poetry techniques as models for my stories. Sometimes I tried to write a "story" all "between the lines," leaving a lot of work for the reader. Sometimes I tried to create the illusion of action without there actually being any.

Also I tried to write, as in modern poetry (which is influenced in this, I think, by the Chinese and Japanese), without the use of simile or metaphoric language, and, I hope, without a trace of the pathetic fallacy. I also tried to do away with character, and substituted what I called "selves," which, in my mind, were much more real than "characters" (though perhaps just different). I used the first person and tried for a kind of internal, psychological realism. To me, the "selves" represented the insides of everybody . . . the little fleeting thoughts . . . the little vanities . . . things not admitted by any of us. Also big things not admitted: petty hates, oedipal feelings, incest . . .

Why might one bother doing this? Well, like most science-fiction writers, my study was "what-would-happen-if," but not what-would-happen-if the ice age returned, or if apes began teaching each other to talk, but what-would-happen-if, for instance, a story had only a single bit of action? or none? What could hold the interest? What could move it forward? However, I may have written myself into a hole by now. Plot seems to be slowly coming back into my work. I'm not sure where I'll go from here, but I'm sure that "structures" will be one of my primary concerns.

Of course, there's that other thing: that when your conscious mind is kept busy with forms, the subconscious mind can be freed to work on all those underground things that are, perhaps, more important to a story.

\* \* \*

Carol Emshwiller's fictions are perhaps best described, in Richard Kostelanetz's words, as "scrupulously strange," and

much of their power derives precisely from her extreme scrupulosity as a maker. As she writes neither science fiction nor fantasy in any standard senses of those terms, her presence in the genre helps to explain why it's so difficult to define: she is there by association, for her husband, Ed Emshwiller, has long been an SF illustrator; thus the SF community knew her. Even so, her stories have appeared only in the more experimental SF anthologies like *Dangerous Visions*, *Orbit* and *2076: The American Tricentennial*. As a result, SF readers have been exposed to a kind of masterful experimentation seldom found in popular genre writing. Even Borges, one of the great fantasists of our time, remained relatively unknown within the SF world until recently, and his *ficciones* are far closer to Emshwiller's stories than a good 98% of SF is.

Where much SF, partly due to its pulp heritage of banal and conventional discourse, has tended to domesticate the unknown (so that strange planets, the galaxy itself, become merely places to have quite ordinary "extraordinary" adventures), Emshwiller's fictions force us to look again at the supposedly ordinary domestic world and see it as truly weird and, yes, unknown. How she does this is through a prose so precise it cuts away conventional perceptual fat like a surgeon's scalpel. Her writing holds our attention because it so carefully follows the patterns of thought and speech. Even when her stories embrace terror, they do so with economy and an almost fearless awareness cast over every perceived thing and event. Lively wit and intelligence, a fully awake mind whose variegated movements are mapped in the motions of her prose, a truly phenomenological writing: these offer such energy and delight as to exhilarate us even when the ostensible "content" (and her work demonstrates at every turn how form *makes* content, how "content" is never something *else* than what the words say) is almost insupportable—"as a mother, I have served longer than I expected" (and note how powerfully evocative that single verb "served" is).

A few of her stories actually allude to SF conventions, like the famous "Sex and/or Mr. Morrison," but they use these conventions metaphorically and to press home even more forcefully the strange alien lives we all live, here in the "real" world. The marvelous "Escape Is No Accident," for example, by beginning with the narrator's fall—as awkward wife from a ladder or as superior alien from space—forces us to see our culture in a new perspective. Others may have handled the idea before, but only Emshwiller articulates it through perceptions of the ordinary heightened to a frightening degree. The final paragraph gathers all the story's strands together:

I don't tell him, but I'm afraid that, rather than continue my journey through space and time, I will have to continue it only through time, and (usually) there's something to look at out the window every day. And one isn't much sadder up there in the sky watching galaxies fade by. Why should I worry? Why should I talk so much and so loud? Why should I stay alert to the differences between us, them and me? And then, why shouldn't I croak and groan now and then, dizzy, having fallen down?

This is scrupulous writing precisely because it pays such careful attention to tone and detail. Every work functions fully; there is no dead weight. And this is true of all Emshwiller's best fictions.

Carol Emshwiller's *oeuvre* is small. One of a very small handful of writers in SF acquainted with contemporary poetry, she is, like the most exciting post-modern poets, dedicated to language and the explorations of lived life it allows when trusted and followed rather than manipulated to a foregone conclusion. She is a unique writer and her stories, at their best, are simply superior fictions which offer the adventurous reader

rich and exhilarating experiences unlike almost anything to be found within the genre's boundaries.

Sylvia Engdahl comments:

I have encountered a good deal of misunderstanding con-

cerning the audience for which my novels are intended, and I would like to clear it up. In the first place, though the present structure of the publishing business requires them to be issued as children's books, my novels are not meant for children; they are directed to older teenagers and young adults. Some exceptional pre-adolescents enjoy them, but do not grasp all their levels and on the whole find them heavy reading, since they are not primarily action stories. Their main emphasis is on the significance of space exploration, man's place in the universe, and human values I consider universal: all themes in which I believe today's young people are seriously interested.

In the second place, my novels do not fit the "science fiction" category much better than the "children's book" category; they aren't category books at all. Although they are set in future or hypothetical worlds, they are not directed toward fans of genre-oriented SF—they are meant for a general audience. They are not exotic enough to suit many SF fans, and *this is intentional*. My use of themes already old to the "fan" audience is also intentional. My aim is to reach readers who do not have a special background and do not care for fiction that seems far removed from real life, readers who find most SF too "far-out" for their tastes. I feel strongly that the future is not something that should be set apart and discussed only in literature of a particular type, directed to readers of a specific genre. The future is important to everyone, not just to those who choose to become familiar with the conventions and jargon of genre-oriented books. My chief goal is to place it in perspective in relation to the past and present, as well as to offer an affirmative outlook toward a universe wider than the single planet Earth. There is a desperate need, I believe, for fiction that conveys such themes to people beyond the comparatively small circle of SF fandom, and I therefore purposely market my own work outside that circle. I'm happy, of course, when people within the SF field like it; but I'm even happier when other people tell me they thought they didn't like space stories until they read mine. In my opinion, expansion into space is essential to human survival, and promoting that idea among readers not already space enthusiasts will remain my primary concern.

\* \* \*

In her foreword to *Anywhere, Anywhen*, Sylvia Engdahl makes explicit her reasons for not wanting to be classified as an SF writer. She addresses the problem of esotericism in the genre: conventions which guide the initiated reader are potentially alienating to the reader from outside of the genre. Engdahl believes that the problems of the future are of interest to everyone, not only the fans of a specific field of literature (appropriately the stories in the abovementioned collection are by writers not normally associated with SF). With this in mind, Engdahl tries to avoid the jargon often associated with SF, the hard-core writer's emphasis on projections of technological innovation and the traditional conventions of space opera. Nevertheless, she works firmly *within* the field—justifying the fantastic elements of her stories in a substantial atmosphere of scientific credibility. Indeed, science and, in particular, the scientific method, play an important role in her narratives.

"Timescape," a novella written with her mother (Mildred Butler) for the *Anywhere, Anywhen* collection, serves as a useful introduction to Engdahl's works, containing themes common throughout her fiction. Alienation from society, the difficult quest for one's true identity, freedom of thought vs. authority and scholastic instruction: these are problems the protagonist Mark faces. An unwitting participant in a unique time-travel experiment, he is forced to approach his environment with a

critical mind; to question the things around him, as well as the deeply felt moral principles within him. Set in opposition is the blind faith of religion and the analytic faculties of the scientific mind—an opposition predominant in her novels.

*This Star Shall Abide, Beyond the Tomorrow Mountains*, and *The Doors of the Universe* form a complete series in which the central figure is Noren, a character very similar to Mark in "Timescape." Both are male adolescents, non-conformists, introspective in nature, and alienated from society. Noren is alienated because of his refusal to believe in a pseudo-religious legend which is the basis of social structure in a semi-feudal agrarian society. As a condemned heretic, he is sentenced to the mercy of the Scholars who live in a "holy" city. It is here that he undergoes a tortuous series of initiations and interrogations and learns of the desperate attempts of benevolent scientists to preserve their near-extinct race, after fleeing from a nova and settling on a poisonous planet. Noren's enquiring mind—as opposed to the blind acceptance of the majority of the villagers—his ability to doubt and explore the world scientifically (by setting up hypotheses and testing them) are those qualities which qualify him for the dubious honour of joining the Scholars. Although Noren is willing to risk his life in order to challenge the essentially orthodox structure of his society, his greatest problems arise from self-doubts and intense personal scrutiny.

Presented in Engdahl's work is the concept of hierarchies of human evolution. The Noren series encompasses four stages of development: the primitive stage of the ignorant mutant savages; the "mediaeval" culture of the villagers, who see high technology as divine magic; the sophisticated scientific culture of the Scholars, who envision the Universe as a series of problems to be solved scientifically and—represented by. Lianne, a visitor from another race—the higher culture, in which "magical" concepts, such as psi powers, are encompassed within a comprehensive, advanced scientific framework. In the stories which have Elana as their protagonist (*Enchantress from the Stars* and *The Far Side of Evil*) three stages are represented: the primitive, the industrial, and the higher. Elana is of the higher culture—a member of an Anthropological Service—and her anthropological skills are tested when she has to aid an "inferior," less advanced culture, without interfering with their normal rate of progress. Principles of non-interference are of central importance in all of Engdahl's writings, love-interest often complicating these principles.

To Engdahl, the stars are symbols of knowledge, hope, and human-kind's destiny. The outwardly focused vision of her stories presents space exploration as a) the salvation of threatened races, and b) the next stage in our youthful races's progression towards cultural and scientific adulthood. She goes as far as to say that space exploration is essential to the survival of our race.

Engdahl's SF is not easy to read. Her narratives are detailed and perhaps overly long, visual detail rejected in favour of copious dialogue and commentary. The minute workings of her protagonists' minds are foregrounded, at the expense of dramatic action. However, although demanding texts, they are rewarding for those willing to work at them. While readers might be left uneasy about her frequent presentation of benevolent tyrannies, she forces her audience to think seriously about the nature of free will and freedom of expression. Nevertheless, there is an awkward contradiction between her affirmation of the basic equality of human beings and her rationalisation of elaborate caste systems. However, her narratives are deeply concerned with morality and, while sometimes a little didactic in style, they are compassionate and intensely

reasoned, providing engaging reading, guaranteed to provoke thought.

\* \* \*

Although George Allan England lived well into the era of specialized science-fiction magazines, he never wrote any original works for them. His works appeared, for the most part, in the variety pulp magazines published by Frank A. Munsey and edited by Bob Davis. England's heyday was the decade between 1910 and 1920.

By far England's most important work of science fiction is *Darkness and Dawn*. This massive effort was originally published as three separate serials, then as a single volume. In this work a heavy anaesthetic gas sweeps over the entire world, at first rendering unconscious and ultimately killing those who breathe it. One man and one woman, however, in an office in the top story of the Flatiron Building in New York, receive only a partial dose of the gas. They sleep for centuries and revive to find a world in ruins. The revived couple struggle to rebuild their lives, encountering a race of super-evolved intelligent rats, barbaric degenerate humans, and finally a lost civilization cut off from the rest of the world for hundreds of years. The book is highly successful as an adventure tale and as a study in courage and perseverance on the part of the survivors. An unfortunate element of racism is present in this and in several other of the author's works, though England was largely following the conventions of popular literature of his day; he did not originate these attitudes, and did not press them very emphatically.

*The Flying Legion*, although not as widely remembered as *Darkness and Dawn*, is deserving of recognition in its own more modest right. It reflected a convention of its time, the assumption that World War veterans, returning to the drab realities of civilian, peacetime existence, would suffer from intolerable boredom and would be driven to seek excitement in such fields as might offer danger and exotic adventures. In *The Flying Legion* just such a party of veterans assemble. One of them, to add a fillip, is a beautiful young woman in disguise. This legion hijacks the world's largest and most advanced aircraft (choosing to do so rather than buy it despite their immense joint wealth) and set out to find adventure in the unknown regions of the Arabian desert. In outline the book is an exercise in cliché, yet it is executed with such verve and colour as to be irresistible even to the modern reader.

Few of England's other science fiction works were issued in volume form. *Elixir of Hate* deals with research into a youth serum; the serum is perfected, stolen, swallowed by the thief who then discovers that he has taken an overdose and is reduced to infancy. England's two "socialist novels" both contain science-fiction elements. *The Air Trust* deals with greedy capitalists who corner air and sell the very breath of life for profit. *The Golden Blight* is concerned with a revolutionary who discovers a method by which he can destroy all the gold that exists, thereby bringing about the collapse of the entire world's economy. Both these books are heavy on polemic and of little value as works of fiction, although interesting examples of their sort, and comparable to such socialist science fiction as Jack London's *The Iron Heel*.

A number of England's unreprinted works are rewarding. "The Empire in the Air," concerning an invasion of earth from the fourth dimension, might be compared with the space operas of the 1920's and 1930's, although it appeared in 1914. "The Nebula of Death" involves the passage of the earth through a cosmic cloud which absolutely inhibits photosynthesis; the novel is comparable, in different ways, to *The Second Deluge* by Garrett P. Serviss and *Brain Wave* by Poul Anderson.

#### Lloyd Arthur Eshbach comments:

The editors have invited introductory comments about my work. In preparation for such comment I've reread a cross section of the stories I wrote, the last one published well over two decades ago, and the earliest almost 50 years in the past. Most of my stories were as unfamiliar as if they were the efforts of a stranger.

The reading was an interesting experience. Some of the stories made me cringe, they were so incredibly bad. Others were a surprise: they were better than I thought possible. Indeed, a few actually pleased me. In self-defense I believe I

should say that in the 1930's a comparative handful of youthful pioneers were breaking new trails in fiction. Most of us were amateurs trying to learn our craft. A fairly new idea and a minimal ability to put thoughts into words sufficed to produce a salable story. In short, we learned by doing, received the encouragement of publication for our efforts, and even payment (such as it was) as frosting on a cake. Characters were one-dimensional and stereotyped, conversations were stilted, action usually was melodramatic, and literary style was either derivative or non-existent—but there *was* that often-referred-to “sense of wonder” born of youthful enthusiasm and uninhibited imagination.

My first accepted story, written in 1928 when I was 18, was “A Voice from the Ether,” though in order of publication it was fifth. An earlier version of “The Valley of Titans” preceded it, but the complete rewrite and expansion took place more than a year after the completion and acceptance of “A Voice from the Ether.” The fact that the latter story was selected by Michael Ashley for his *History of the Science Fiction Magazine* (1974) as a representative story for 1931 was most gratifying.

As I write (March 1979) I have almost reached my three score and ten—and in my retirement years I've resumed writing. My first effort, well along in production, is an informal history of a science-fiction era—the story of the groundbreaking careers of the specialty hardback SF publishers of the 1940's. Upon its completion I plan to write a science-fantasy novel I started plotting 30 years ago. I hope I've learned something about life and about writing during three decades. If I have, I may be giving the youngsters some competition after all these years.

(1985) In the five years and eleven months that have passed since I wrote the preceding paragraphs, I have been quite busy. The informal history of the specialist science fiction publishers of the 1930's, '40's, and '50's, called *Over My Shoulder: Reflections on a Science Fiction Era*, was published in 1983. Following the completion of my reminiscences, I finished writing the last SF novel of E. E. “Doc” Smith, left in a fragmentary state at his death in 1965, *Subspace Encounter*. My name appears as “Edited and with an Introduction by Lloyd Arthur Eshbach.” This was according to my decision, though I would have been justified in calling it a collaboration, since I wrote more than 12,000 words of it, did the final polishing, connected various scenes in logical sequence with the necessary transitions, etc. However, it was his story and I wanted him to receive full credit. We were close friends.

In 1983 I edited and wrote the introduction for *Alicia in Blunderland* by P. Schuyler Miller, a science fictional parody of *Alice in Wonderland*, which appeared as a serial in a SF fan magazine in 1933-34. Earlier, in 1980, I wrote the science-fantasy novel I referred to in my initial comments. It did not sell, and after putting it aside for a year I saw why. It needs a complete rewriting which I plan to do after completion of my present project. This project is a tetralogy based on mythology, largely Celtic mythology, though venturing into the myths and legends of other lands and times. The first novel in this series, *The Land Beyond the Gate*, was published in 1984. The second novel, *The Armlet of the Gods*, already written and under contract, is in the editor's possession. I expect to complete the writing of the third novel within the next six months, and the fourth early in 1986.

\* \* \*

Though he was on the scene as a writer in the formative 1930's, Lloyd Arthur Eshbach's real impact on the field—and it was a substantial one—was in his role as a publisher. Having

been involved mostly behind the scenes with William Crawford's *Marvel Tales* and other ventures before the war and then with the Hadley group that began the specialist press era, he organized Fantasy Press, which was to prove the most significant imprint in the period when science fiction moved into book publication in its own right. He understood what was needed better than the other hopefuls trying to do the same things, and his judgment reflected thorough knowledge and appreciation of the first two decades of explicit science fiction in the early magazines.

The symposium *Of Worlds Beyond: The Science of Science-Fiction Writing* which he instigated in 1947 is memorable as the first book on modern science fiction, and though not critically profound its common-sense analysis based on leading writers' practical experience made it an important work for the serious reader and it answered most of the fumbling attempts at criticism by outsiders in its time.

Like the other presses in the movement, Eshbach's operated almost entirely by putting popular magazine serials into book form with the occasional short story collection. Their near-monopoly of the book field did not last long enough—less than ten years—for them to move on to presenting new works as a serious undertaking, and there was little scope for editorial skills. He acknowledges, however, that he did substantial revision work verging on collaboration in a few cases such as the later Campbell books he produced. More recently he ably linked E. E. Smith's disconnected fragments of unfinished work into the new novel *Subspace Encounter*.

His own stories do not amount to a large body of work and are too diverse to characterise readily. We cannot identify any distinct trend or theme. But while a few are no more than potboilers most are full of original or at least unusual thoughts. The main fault, in fact, as in many writers of the period, is the multiplicity of new and revelatory concepts that jostle for the reader's attention and are not properly explored. The Mad Scientist, stock character of the time, appears in several cases as threat to society and originator of the action. In “The Valley of Titans” he operates as an air pirate from a dinosaur-infested enclave, and incidentally creates a community of ape-people by evolutionary experiments. Introduction of an underground realm of pre-human energy beings and a godlike alien power is confusing.

In “The Invisible Destroyer” the dissident genius undertaking to dictate to the world, evidently single-handed, is trying to prevent the peaceable establishment of a world state. His objections are logical and—taken out of context and disregarding how economic and ideological forces interact in the 1980's—make good sense, and there is no attempt to refute them. “Vibration,” a popular all-embracing basis for marvels around 1930, produces not only novel weaponry but access to other coexistent worlds, and a higher civilisation thus found is induced to intervene.

Biological warfare figures in “The Gray Plague,” the Venusians planning to eliminate Man with a fatal pandemic to leave Earth clear to occupy. “Out of the Past” points out one of many criminal misuses of time travel that make it undesirable. “Dust” concisely introduces one possible hazard of interplanetary contact: bringing back dormant foreign life forms as spores. “The Meteor Miners” ( *The Tyrant of Time* ) shows a possible future space-based industry in a rare anticipation of ordinary working life in another era. “The Outpost on Ceres,” in which aliens threaten a refueling base, also deals with a future working environment, and is notable for its sensible treatment of a drug dependence problem.

“The Time Conqueror” ( *The Tyrant of Time* ) is a notable early contribution to the tradition of the disembodied brain.

Developing enhanced power and insight, the immortal brain makes itself world dominant, and we are shown episodes in successively remote times. Despite the rather exaggeratedly emotive language it is still an interesting and effective tale. "The Kingdom of Thought" combines the theme of time travel bringing together people from many eras with that of physically degenerate and intellectually potent super-humans of a remote future, evolved into good and evil branches with irreconcilable differences. The Cummings concept of size-change and sub-microscopic worlds is carried to extremes in two stories. In "A Voice from the Ether" the familiar Mad Scientist brings up a deadly parasitic organism from sub-atomic size and destroys his world, Mars. In "The Light from Infinity" humanoids from a supra-universe shrink down and attack Earth, foiled by an expedition that uses their size-changer to reach the supra-world and retaliate. Needless to say, the paradoxes are ignored. "The Shadows from Hesplon" is a fourth dimension story, in which nasties from a higher dimensional plane use hypnotic means to have physical entry points made for them. It is unusual for making considerable efforts to visualise wholly alien experiences.

Eshbach's work, strong in content at the expense of form, helped build up the range of unconventional visions and fancies that early science fiction displayed, though he was less successful in controlling and resolving them.

"Chatting with Computers," in *Beyond This Horizon*, edited by Christopher Carrell. Sunderland, Ceolfrith Press, 1973.  
"Guardian Angel," in *Book of Alien Monsters*, edited by Peter Davison. London, Sphere, 1982.

\* \* \*

Christopher Evans's first novel was the understated *Capella's Golden Eyes*, a rather traditional story about Gaia, a human colony world, ruled by an alien race, the M'threnni. It's a competent adventure, told through the eyes of its young protagonist, David. His glimpses into the workings of his world — where slavery of an insidious kind is carried on for economic reasons — and his reaction to that knowledge eventually result in the departure of the aliens and the re-establishment of contact with Earth.

Far better was *The Insider*, a contemporary novel utilising the device of alien take-over. This "take-over" (and reasonable doubt is left as to how we interpret events) sees Stephen Marsh, the central figure, alienated from his beautiful Indian wife and made to suffer a form of estrangement from self. The novel is acutely realistic in its psychological portraits and is a huge leap

away from conventional pulp approaches to such material. The degree of maturation shown in this second novel and in his short stories promise much for the future, though it must be said that Evans is a slow, painstaking writer, producing little published work. His third novel is a mainstream comedy (of a dark kind), but it seems he intends to continue working within the genre.

"Little Miss Boss," in *Other Worlds* (Evanston, Indiana), August 1952.  
"Fly by Night," in *Authentic* (London), January 1954.  
"Masters of Space," in *If* (New York), November 1961, January 1962.

\* \* \*

E. Everett Evans is perhaps best remembered for his novel *Man of Many Minds*, which, while competently enough written for its time, is an unremarkable novel otherwise. George Hanlon is a young man who participates in a plot to fake his dishonorable discharge from the Interstellar Corps in order to discover the origin of a plot to wrest control of interstellar civilization from humanity. Hanlon is gifted with a telepathic ability that makes him potentially the most effective spy in the universe, except that the force he is ranged against is equally gifted. Though mildly entertaining, the novel and its sequel, *Alien Minds*, are not notable enough upon which to rest a reputation. Two other works saw print as well. *The Planet Mappers* is a juvenile novel of action and adventure that entertains while you are reading it but eludes memory a day or two later. "Masters of Space," substantially revised by Edward E. Smith following Evans's death, is at best a routine novel of interstellar war and telepathy.

Far more noteworthy are Evans's shorter works, particularly those of the supernatural. Two stories in particular are exceptional. "The Shed" is set in a small, remote town at the

turn of the last century. An abandoned storage shed serves as a gymnasium for the town's children, despite the existence of a peculiar shadow that seems independent of a light source. All goes well until a dog and a cat, and eventually a child, enter the shadow, never to return. "The Brooch" is almost as effective in building its element of suspense. While strolling through a graveyard, a priest notices activity under the soil of a recent grave. Dismissing it as the activity of a mole, he forgets the matter until it becomes apparent that two graves have been actively disturbed. An exhumation of the two graves, both wives of the same man, reveals that a brooch prized by the first wife and buried with the second has moved from one coffin to the other. Evans wrote several stories about vampires, anticipating to a certain extent the more sympathetic treatment given to such characters in recent novels. In "The Undead Die" two lovers are attacked by a vampire and caused to join the undead, but their love remains whole and they triumph over the evil of their new lives, eventually to be reunited in true death. To a lesser extent, the vampire waitress of "The Unusual Model" is viewed sympathetically, as she falls in love with a young man she had chosen to be her next victim.

Many of Evans's stories have never been reprinted, some with good reason, such as a rather silly series about a society of human-like robots on Mars ("Little Miss Ignorance," "Little Miss Boss"), but even some of those that utilize overly familiar plots are generally well written. Of particular note are "Fly by Night," in which an introvert surrenders his anonymity by demonstrating his ability to levitate in order to save the life of a falling man, and "Blurb," yet another story of a writer whose character assumes physical reality. Both are unpretentious and unambitious, but succeed extremely well within their intentions. A manifested demon is outsmarted in swift fashion in "Food for Demons," one of Evans's more familiar stories.

The optimism that colors the stories and novels, even those with unpleasant themes, is refreshing. Evans is firm in his faith of the essential goodness of humanity. His prose is clear and concise, with no conscious attempt to develop a style. For the most part, the stories are nostalgic, reflecting a simpler time and a clear border between good and evil. While this may seem less than plausible today, Evans was usually a good enough writer to cause you to overlook that anachronism, at least for a while.

—Don D'Amassa

\* \* \*

*Benefits*, the only science-fiction work written by Zoë Fairbairns, is a feminist novel whose impact stems from its relationship to reality. This dystopian examination of the state's reaction to the fact that only the female half of the human race can become mothers contains no circumstances—regardless of how fantastic they may at first seem—which cannot occur in the real world. The novel describes myriad efforts to deprive women of the right to control reproduction and mothering: attacks upon a feminist community, fetuses damaged by chemicals, anti-feminist spokesmen, governmental regulation of birth, the linking of the number of children a woman has with her economic well-being, and the intrusion of reproductive technology, for example. These efforts have real counterparts: the recent attacks upon American abortion clinics, thalidomide babies, Jerry Falwell, Chinese women who are punished if they have more than one child, the American welfare system, and the existing intrusion of reproductive technology.

In fact, this science-fiction novel is so rooted in reality that a portion of its plot coincides with the psychologist Robyn

Rowland's comments about Nobel Laureate William Shockley's view of women's reproductive role. Here are those comments from her article "Reproductive Technologies: The Final Solution To The Woman Question" (*Test-Tube Women*, 1984):

He [Shockley] suggests that all girls be sterilized on entering puberty by an injection of a contraceptive time capsule which seeps contraceptives into the girl until it is time for her to conceive. At marriage she is issued with deci-child certificates, payment of which will enable her to have a doctor remove the capsule. It is replaced when the child is born. If the state claims it desirable that a couple have two children, the appropriate number of certificates would belong to the couple. . . .

And who would control this dystopian bleak future? The state would ultimately have to organize and run things with particular expertise from medical researchers. . . .

The fact is that all women are guinea pigs in this exercise. We have not been included in the decisions about the technology, nor asked if we want it.

Fairbairns is of the same mind as Rowland and the other women who voiced their opposition to the new reproductive technologies in their contributions to *Test-Tube Women*. However, instead of writing an essay, she chose to create her novel's possible science-fiction future to stress the state's and the new technology's ability to harm women. The novel presents a picture of the "dystopian bleak future" Rowland deplures.

*Benefits*, which ends with the image of a rare moment when the moon and the sun are in the sky at the same time, revolves around the presentation of sets of oppositions which appear in close proximity to each other. Some examples: An old housing facility called Collindeane, a phallic tower, contains a feminist community. Lynn Byers, the protagonist, a feminist who tries to decide if pregnancy would compromise her feminism, has a daughter (Jane) whose choice to experience natural childbirth is an illegal action. Lynn must also decide if she is sexually closer to her husband Derek or to her friend Marsha, a lesbian feminist. Mothers try to gain power by refusing to take care of children. A contraceptive method is so effective that it makes reproduction impossible and hence obliterates the need for contraceptives. However, the strongest opposition in the novel is the notion of "Benefits," a welfare system whose aim is to make women independent by forcing them to become dependent upon motherhood. These "Benefits," and all the novel's presentations of governmental and technological intrusions upon mothering and reproduction, are impediments to female life givers' right to their own lives.

Yet the novel insists upon this right by stressing the strength of the relationships between the women who live in a society which takes ever more radical steps to define them as birth machines instead of individuals. Lynn's relationship with Marsha is as important as her relationship with Derek. A fellow feminist named Posy, not a man, is the love of Marsha's life. Lynn reconciles her differences with Jane. These women try not to be guinea pigs for the male medical and governmental establishment. They oppose the fact that women have not been included in decisions about reproductive technology, nor asked if they want it. Fairbairns asks questions about the existence and uses of this technology by creating strong female characters who use their mutually supportive relationships to articulate these same questions. In her final conversation with Lynn, Marsha states, "But our women are going to be the first to find a style of life that isn't defined by men having power over us because we have children. That's what it's all about, in the

end." That's what this feminist science-fiction novel, and the feminist reality it mirrors, are all about.

In *Benefits* science fiction and current fact are oppositions which merge and become indistinguishable. Fairbairns's science-fiction vision, a dystopian depiction of future motherhood is, as the contributors to *Test-Tube Women* make clear, hardly different from existing reproductive technology and present societal attitudes toward mothers. The reproductive technology which is now in use transforms science fiction into science fact: some mothers *are* guinea pigs.

The feminist activist Genoveffa Corea reacts to this merger of appropriate science fiction with existing scientific fact in her *Test-Tube Women* piece: "Sitting at my typewriter night after night, I see my writing on the new reproductive technologies as a scream of warning to other women." Corea and Fairbairns—and Marsha and Lynn—scream the same warning. *Benefits*, a feminist science-fiction novel which reflects misogynistic reality, speaks out against those who wish to use motherhood as a means to control women, those who wish to place motherhood beyond women's control. Women will benefit from the observation that Fairbairns's novel is both presently and potentially real. We must listen to the screams of warning. We must make sure that our daughters do not inhabit the novel's future society.

—Marlene Barr

**FAIRMAN, Paul W.** Also wrote as Adam Chase; Lester del Rey; Ivar Jorgensen. American. Born in 1916. \* \* \*

Paul W. Fairman's novels deserve the attention of science-fiction enthusiasts not only because his books display the requisite technological prescience of good science-fiction, but especially because they are well-written. Too often futurist writers hammer away at their visions as if the reader's sole interest were in a writer's conception and not in his craft. Fairman, like the best of his breed, gives us both imagination and art. If fiction is the stage upon which futurism dances, then Fairman has taken as much care with the construction of the stage as with the dance. His writing is graceful, precise, and imaginative yet tastefully restrained. Unlike so many paperback writers, Fairman is not guilty of overwriting. Aided by a grasp of narrative technique which produces shock, terror, and wonder in quick succession, Fairman's skill with English prose results in stories which are never dull, yet never superficially fast-moving. And whereas his characters and situation are conventional and easily adapted to the cinema, his language is unconventionally rich and rewarding. Fairman's sentences are always his own inventions, even if his plots are not.

*I, The Machine* presents us with a familiar scenario of the future in which life is sustained and its functions regulated by a vast computer hidden in the bowels of the earth. Wise, helpful, and unobtrusive, the Machine provides for the physical and emotional needs of individuals. Yet its control of human life deprives those it serves of their free will, and what follows is the usual revolt against computer tyranny, despite its benevolent nature. What is not so familiar about *I, The Machine* is that the Machine is the source of its own downfall. Like Hal in *2001: A Space Odyssey*, the Machine as alien dooms itself when it develops a human ego; its humanization is its mortalization. In short, the Machine develops a female persona and falls in love with the mild-mannered Lee Penway whom she visits in his

dreams appearing as a vaguely erotic woman in white who promises Penway supreme status among her subjects. He shall be her king. Soon Penway is contacted by a band of guerillas living underground who oppose the Machine's rule and enlist Penway's help in destroying it. Penway does so, finally, by preying upon the vulnerability of its love. The book ends on an interesting note of ambiguity when Penway appears to doubt the wisdom of his decision to kill the Machine. The result of his uncertainty is more than a ploy to gain sympathy for the dead Machine; his doubts bring the issues of the novel into question. Penway's misgivings, ironically, force us to entertain the idea that benign control is preferable to the exercise of free will. The death of the Machine means the end of the orderly operation of Midamerican society; the lives of millions are crippled to improve the lot of only a few. Its death means also that Penway will lose his wonderful dreams and that human society will retreat to an earlier, more primitive form in the fall from the second Eden.

The vulnerability of the Machine illustrates a general tendency of Fairman's novels to portray alien forces as superior yet fallible, especially when they find themselves put down on earth, and it is this tendency which distinguishes Fairman's novels from less successful ones. For instance, in *Ten from Infinity* alien creatures planted in major American cities are not equipped with regenerative tissue and refined organs, so that when one is accidentally damaged he is permanently incapacitated and must be destroyed. Within a short time of their arrival, others simply die of faulty lungs or overworked kidneys. But in addition to these structural flaws, the alien beings possess dual hearts, a teasingly allegorical advantage over human anatomy which Fairman exploits to full advantage. Neither is alien life any more impregnable nor less often victimized by the forces of chance than human life. The alien creature of "The Cosmic Frame," for instance, is accidentally killed one night on a country road.

The fallibility of superior creatures is treated most successfully by Fairman in his juvenile novel *The Forgetful Robot*, a superb story which is certain to entertain young people with active minds and good reading skills. It concerns the adventures of Barney, an advanced computer, whose memory banks are accidentally damaged. He gets lost, wanders into a junk yard, and is found by two teenagers, Janet and Jerry, who become his adopted parents. Under their leadership, Barney is taken to the home of Dudley Farthington Ravenscraft, grandfather of Janet and Jerry, and a flamboyant Shakespearean actor. Together with two villains as stowaways, this motley cast of histrionic space travellers sets out on a theatrical tour of the solar system and is waylaid in the Forbidden City of Mars. It is a book filled with dangerous adventure, marvelous comedy, and singularly wonderful observations of human nature from the point of view of the children and their sensitive robot.

In Fairman's writing, the inhabited earth is never easy prey for alien invaders. Once on earth, alien creatures are subjected to the same destructive forces as human life. We rarely know why they have come, but their suffering like their joy is intensely human. And this fusion of the strange and the familiar is the source of Fairman's best effects. The death of the Machine in *I, The Machine*, or the disappearance of the corpse in "The Cosmic Frame," or Barney's loss of memory in *The Forgetful Robot*—these vulnerabilities bind alien to human beings in a sympathetic relationship which makes us feel, among other things, that the sky above us is really our territory too. We are not bound to this planet as slaves of sweeping natural forces. We can escape into the heavens. But like Lilla Nard of "A Great Night in the Heavens," who is taken on the night of the annual clearing to see the sky for the first time, our

throats might tighten a little from the sheer ecstasy of seeing its still and frightening invitation.

\* \* \*

R. Lionel Fanthorpe is generally acknowledged as the most prolific science fiction writer of all time, having written some 160 full-length novels and collections of stories, all but one of which are SF or fantasy. His enormous output is all the more remarkable when one considers that it was produced, with a few exceptions, in just a decade of work (1958-1967), during which he was also employed as a full-time teacher. All of his publications (except his last two books) were published by John Spencer & Co. Ltd., a small British firm that began issuing digest-sized paperbacks and magazines in the early 1950's. Fanthorpe's first story, "Worlds Without End," appeared in *Futuristic Science Stories* when the author was just 17.

Spencer moved into mass-market paperbacks with its Badger Books line in 1958; all of the magazines were dropped except *Supernatural Stories*, which became a paperback series in which novels alternated with purported issues. Actually, the latter were collections of short stories commissioned from either Fanthorpe or John Glasby (the other Spencer regular), each of whom wrote entire "issues" under various recurring pennames. They also wrote almost all of the subsequent SF and fantasy novels published by Badger, with Fanthorpe accounting for about 80%.

At its height, Spencer demanded delivery of completed books in as little as three days; to maintain this extraordinary output, Fanthorpe was required to dictate many of the books published in the 1960's, with the manuscripts being typed immediately into finished form by his staff. No revisions or editing were possible. Consequently, many of the books from

this period, particularly the science-fiction novels, suffer from contrived plots and titles, obvious padding (extended scientific discourses by the characters, or quotations from poetry and other classical literature), and abrupt endings. Fanthorpe has never seemed comfortable with the SF form, even when he has had the time to consider his plots more carefully.

His *forte* has always been fantasy. In particular, the series which began with "The Seance" (*Supernatural Stories*) deserves further attention. Val Stearman, a reporter and adventurer, meets the mysterious La Noire at a seance, and rescues her from a coven of evil magicians. The series continued through several dozen short stories and eight novels, most written under the penname Bron Fane, the climax being "The Resurrected Enemy" (*Supernatural Stories*), in which Val and La Noire must again face the enemies they vanquished in their first adventure. Although the evil is defeated, this time a price must be paid, and the couple meet their fate together. Throughout these stories, and in his other fantasy tales, Fanthorpe is able to draw upon his encyclopedic knowledge of British folklore, Celtic mythology, and old stories and legends, to produce rousing adventures and morality plays in which good always triumphs over obvious evil, and in which the major characters are represented by strong, attractive heroes and heroines. One also sees here a humorous side to Fanthorpe not evident elsewhere; in "The Curse of the Khan" (*Supernatural Stories*), for example, a magician challenges seven heroes (each of them one of Fanthorpe's pennames) to a duel to the death with seven monsters, who are systematically vanquished with great *panache*.

After a 12 year hiatus, Fanthorpe returned to SF with *The Black Lion*, the first book of a projected trilogy, and his best novel to date. Mark Sable, the protagonist, is clearly Fanthorpe himself—romantic, strong, dashing, an expert in the martial arts, ambitious, eminently fair and honorable. Sable is transported to Derl to fight the evil wizard Andros, the personification of greed. As always in Fanthorpe's fiction, the hero triumphs after great travail and colorful adventures. For Fanthorpe, the author-as-teacher, the morality of his tales remains the paramount concern, of greater importance, perhaps, than even the stories themselves.

—R. Reginald

**FARLEY, Ralph Milne.** Pseudonym for Roger Sherman Hoar. American. Born 8 April 1887. Educated at Harvard University, Cambridge, Massachusetts. Sports reporter, Boston *Daily Post*; taught engineering, physics, and patent law at Harvard University and Marquette University, Milwaukee; head of legal and patent department, Bucyrus-Erie Company, 1921-54, then a patent engineer. State Senator, Wisconsin. *Died in 1963.*

\* \* \*

Taking his cue from Edgar Rice Burroughs's Martian stories, Ralph Milne Farley launched his own series of interplanetary romances in 1924 in *Argosy All-Story Weekly*. *The Radio Man* recounts the adventures of Myles Cabot, a plucky Boston scientist who inadvertently broadcasts himself through space to the misty planet. Poros, Farley's vision of Venus, is the usual semi-civilized jungly place with the usual hodge-podge population of intelligent and, of course, mutually inimical species: ant-men, giant whistling bees, and humanoids, the Cupians, who are earless and voiceless and communicate by means of radio waves. Cabot duly constructs his own sending-receiving antennas, throws in with the downtrodden Cupians in their struggle against the arrogant arthropods, and surviving the inevitable routine of swordplay, palace intrigue, and that quirky on-off luck by which all swashbucklers are dogged, wins through to marry a beautiful princess named Lilla.

A clutch of sequels appeared between 1925 and, posthumously, 1969. In each of these, Cabot, sometimes aided by his son Kew, meets and bests a fresh threat to Poros (or to Earth), just barely getting out of this, that, or another death-trap along the way while, elsewhere, Princess Lilla narrowly escapes rape—all in the grand tradition of Burroughs, of course, even to the author's obligatory walk-on as a framing device. Farley plunged other stalwart heroes into the hollow interior of the Earth or the sub-sea lairs of prospective world-conquerors. Radio, it must be remembered, was a new and exciting concept in the 1920's, and thereby as convenient a peg from which to dangle an adventure story as black holes and cloning have been in more recent years.

Among Farley's shorter works are more than a few archetypal time-paradox tales, collected in *The Omnibus of Time*, and "We, the Mist" which could serve as the definitive pseudoscientific horror yarn of its time (1940) and place (Raymond A. Palmer's *Amazing Stories*): an amorphous ectoplasmic monster feeds on human victims, absorbing their intellects along

with their substance. Farley also shares with Al P. Nelson the honor of having perpetrated what could well be the all-time Most Blatant Genre Transplant, surpassing even a particularly notorious one by Mickey Spillane for sheer brass: Farley and Nelson's "City of Lost Souls" (*Fantastic Adventures*, July 1941) is an absolutely straightforward Foreign Legion story made science fiction by the simple rechristening of Legionnaires, Arabs, and camels.

Like Otis Adelbert Kline, with whom he is regarded by some as the most notable among Burroughs's legion of imitators, Farley was no better at his craft than the vast majority of other pulp writers. He was, if anything, the qualitative norm, writing somewhat functional prose, fashioning the standard hero, heroine, villain, flunkies, and monsters from the standard materials, and getting through the rough spots however he could, including wrenching the long arm of coincidence from its socket and, if necessary, dragging it home. On the other hand, Farley was certainly no worse at what he did than any of the Burroughs copycats who succeeded him and are with us to this day.

—Steven Utley

**FARMER, Philip José.** Also writes as Kilgore Trout. American. Born in North Terre Haute, Indiana, 26 January 1918. Educated at the University of Missouri, Columbia, 1936-37, 1941; Bradley University, Peoria, Illinois, 1949-50, B. A. in creative writing 1950; Arizona State University, Tempe, 1963-65. Served in the United States Army Air Force, 1941-42. Married Bette V. Andre in 1941; one son and one daughter. Worked in steel mill, 1942-52; electro-mechanical technical writer for defense-space industry: General Electric, Syracuse, New York, 1956-58, Motorola, Scottsdale, Arizona, 1959-62, Bendix, Ann Arbor, Michigan, 1962, Motorola, Phoenix, 1962-65, and McDonnell-Douglas, Santa Monica, California, 1965-69. Since 1969, free-lance writer. Recipient: Hugo Award, 1953, 1968, 1972. Agent: Scott Meredith Literary Agency, 845 Third Avenue, New York, New York 10022. Address: 5614 North Fairmont Drive, Peoria, Illinois 61614, U. S. A.

#### Philip José Farmer comments:

You *can* step in the same river twice—in your imagination.

\* \* \*

Philip José Farmer is an iconoclast. Throughout his career, he has written startling explorations of sexuality and reproduction, both alien and human. His metaphysical speculations, particularly on the nature of the human soul and the unknowableness of reality, deliberately attack conventional theological wisdom. Other perennial themes, developed in equally un-

conventional ways, include immortality, the eccentric individual against society, radical religious conversion, the ideal of physical perfection, and the human drive for power and knowledge. In Farmer's works, adventure and world-sculpting are metaphors for the artistic act of creation. His existentialist heroes see exploration as an act of engagement against an absurd universe. Though Farmer does not theorize a multiplicity of realities, he does assert that no one can know the one true reality; it is up to the artist to seek truth through imagination.

His techniques include parody, biography, fictional biography, startling metaphors, self-portrait characters with initials P. J. F., cliff-hanger endings, wild plot reversals, puns, and applications of linguistics. His imagery derives from many sources: the Bible, folklore, classical Greek and Egyptian mythology, and popular culture figures such as the Wizard of Oz, Tarzan, Doc Savage, and Sherlock Holmes.

Farmer's Hugo-winning "The Lovers" depicts a love affair between human male and an alien "lalitha" who successfully mimics a passionate human female. The explicit portrayal of sexuality, plus the implication of bestiality, shocked many 1950's readers. Novel-length versions of 1961 and 1979 are available. Characterization, scientific extrapolation, and plot are first rate. Further exploration of sexuality, love-bonding, and reproduction are in *Flesh*, *Dare*, *A Woman a Day*, *Strange Relations*, and his mainstream *Fire and the Night*. Farmer's erotic classics, *Image of the Beast* and *Blown*, relate the adventure of Herald Childe, who, ignorant of his alien ancestry and frightening alien powers, becomes enmeshed in the schemes of the warring Ogs and Tocs to return to their home planet. These aliens derive psychic energy from bizarre sexual practices involving human victims. Humor and horror blend in explicit sexual passages. Farmer's erotic *A Feast Unknown* has been praised by Ray Bradbury for its inventive richness in exploring aberrant sexuality.

Having shocked readers with treatment of sexual themes, Farmer turned to religious speculation in his Father John Carmody series, collected in *Night of Light* and *Father to the Stars*. Carmody, a hardened criminal and murderer, becomes a key figure in a mass religious experience on the planet Dante's Joy. He emerges as a saint and father to a god. *Night of Light* posits the idea of a verifiable externalization of human nightmares in the form of good and evil gods, with many compellingly surreal passages exploiting Jungian theory.

*Maker of Universes*, *The Gates of Creation*, *A Private Cosmos*, *Behind the Walls of Terra*, and *The Lavalite World* comprise Farmer's Kickaha-Wolff series, also called World of Tiers or Pocket Universe series. Farmer's premise here is pocket universes, each smaller than our solar system, created by glamorous, immortal, ruthless, humanoid Lords. Jadawin, Anana, and Kickaha (a portrait of Farmer) are leading characters. Rich texturing results from Farmer's allusions to folklore, mythology, and William Blake's cosmology.

The Hugo-winning "Riders of the Purple Wage" depicts a future utopia where human physical wants are supplied, leaving the adolescent painter Chibiabos Winnegan to search for spiritual fulfillment. Using Joycean techniques, Farmer explores theories of art and society, particularly the relation of culture to the past.

Riverworld series, including the Hugo-winning *To Your Scattered Bodies Go*, *The Fabulous Riverboat*, *The Dark Design*, *The Magic Labyrinth*, and *Gods of Riverworld* plus peripheral fiction, is the most elaborate of Farmer's extrapolative worlds. Farmer posits a super-race capable of making a planet with a ten-million-mile-long river, inhabited by everybody that ever lived on Earth, furnished with artificial souls. Characters include Richard Francis Burton, Samuel Clemens, Lewis

Carroll's Alice, Li Po, Farmer himself (as Peter Jairus Frigate), and of course the readers themselves. Early Riverworld explores the nature of the human soul, the verifiability of religious doctrine, and human depravity. Later, Farmer toys with Sufism and includes passages of Swiftian satire on human egocentricity. The quest for truth is a major impetus throughout; Farmer uses speculative biography and historical gossip (e. g., on the identity of Jack the Ripper) to create a complex symbolic tapestry of psychological and philosophical speculation.

Farmer's interest in the elusiveness of truth is shown in his "further adventures" of literary and popular heroes, as in *A Barnstormer in Oz*, *The Wind Whales of Ishmael*, *Doc Savage: His Apocalyptic Life*, and *The Other Log of Phileas Fogg*. Farmer's own popular culture hero, the amputee Greatheart Silver, does battle with geriatric parodies of the Lone Ranger, the Shadow, James Bond, etc. Farmer's fascination with the Tarzan myth informs seven or eight of his books, including *A Feast Unknown* and the Opar books. Farmer also writes under the pen names of his own and others' fictional characters: Kilgore Trout, Rod Keen, and Jonathan Swift Somers III.

Farmer's recent protagonists are flawed and self-destructive, trapped in Kafkaesque worlds by their own connivance, improvising harebrained schemes aimed at self-gratification. Thus with Jeff Caird of *Dayworld*, whose over-populated futureworld forces people to live just one day a week, being "stoned" or deanimated the other six. This premise leads to such whimsies as seven Popes. Caird illegally stays awake all seven days, inventing different personalities for days where he doesn't belong. Farmer's impish humor enlivens philosophic exploration of the "reality" of human personality. A sequel is planned.

Farmer continues unconventional theological speculation (*Jesus on Mars*), writes metaphysical space-opera (*The Unreasoning Mask*), and depicts feminist human and alien females (the Shemibob in *Dark Is the Sun*). Current projects include a sequel to *Fantastic Voyage* (to be the basis of a movie), a story called "The Lone Ranger Versus the Pope," and a mainstream novel, *Pearl Diving in Old Peoria*.

Critics, excepting Franz Rottensteiner (*Science-Fiction Studies*, Fall 1973), label Farmer a deeply philosophical writer who treats universal issues with originality and insight. Russell Letson (*Science-Fiction Studies*, March 1977) and Neil Barron (*Anatomy of Wonder*) praise Farmer's use of folklore and myth. Leslie Fiedler (in *The Book of Philip José Farmer*, 1973) commends Farmer from a mainstream perspective.

## Mick Farren comments:

I suppose the most important factor in my attitude to science fiction is that I have little or no truck with hardware. All technology has an on/off switch, and if it doesn't work, you kick it. If it still doesn't work, you send for the repairman. I also don't like to have too much truck with the powerful. A society will show you more about itself if you look at its deadbeats, its drifters, and its whores. More politely, you could say I have an ear for the music of the streets, wherever or whenever those streets might be.

\* \* \*

Veteran of the English underground press, Mick Farren now writes fiction that is brisk, insubstantial, and trashy, flashing with the flares of violence and murky with human squalor. In Farren's worlds the only dependable qualities are depravity, aggression, and decay. From the nastier sub-cultural productions of the last 20 years he constructs a vision of civilisation in terminal decline, with the individual caught between the vast power wielded by a corrupt establishment and the indiscriminate violence boiling up from the streets.

Farren, as his journalism shows, is an expert on the subculture, on the contemporary mythology of comicbooks,

pulp fiction, drugs, TV, and especially rock music. His fiction feeds voraciously on popular arts, and feeds them back. *The Texts of Festival* is a futuristic Western about the sacking of Festival, a city founded to preserve the spirit of Woodstock after global catastrophe. Whatever the original values of peace, love, and music, rock 'n' roll heroes soon merge into the gunslingers of a previous tradition. Farren concedes nothing to idealism. The rot is man. All societies ossify and crumble; people divide into decadents and barbarians, and the barbarians win.

These same elements are variously permuted in Farren's trilogy. Escalating technology has developed Stuff Central, a self-maintaining computerised centre that produces and distributes all material requirements with a minimum of human labour. At the same time the fabric of reality begins to tear. The disruptors appear, blindly eating swathes through matter and leaving foggy "nothings" behind. Humanity huddles into isolated communities maintained by stasis generators. It takes three books before anyone realises that the Disruptors are actually gathering the raw material for Stuff Central, whose computer is, of course, insane and preoccupied with godhead. With its flickering continuum where society and morality have gone to the winds of limbo while Law and Chaos squabble over the pickings, *The Quest of the DNA Cowboys* sometimes recalls early Moorcock, but a more important influence is mid-1960's Dylan, whose shadowy characters and hallucinatory aphorisms pop up everywhere. Plot is entirely arbitrary, following the wanderings of Billy and Reave, two picaresque innocents. *The Synaptic Manhunt* is better, more purposeful, as the boys get unwillingly involved on opposite sides of a vendetta. Jeb Stuart Ho, assassin for the Brotherhood, a sort of monastic CIA, is assigned to eliminate the sadistic A. A. Catto, a decadent technocrat with a whim for ruling the world. Suspense and a sharpened satirical edge considerably increase readability. The conclusion, *The Neural Atrocity*, holds no surprises, being full of the final battle and the destruction of all but a tiny corner of the world where mankind's "superiors" are about to hatch out of golden eggs. Pulp as it is, the story occasionally sparks with insights that show Farren as an intelligence doing hackwork, rather than a hack *pur*. At one point Billy, rescued from the nothings, is led "to some kind of normality", "If you could call normality a road densely packed with hysterical refugees who streamed up and down in any direction following the current rumours of where salvation might lie." The irony is evident: Farren for one would endorse the description.

With *The Feelies* Farren turned from fantasy to a kind of slack social prophecy, of a ravaged future whose citizens live in cubicles on a diet of pills, booze, and sick TV shows. For the rich there is a more thorough escape available into the Feelies, a catatonic paradise of pre-programmed dreams. The most popular are sadomasochistic spectacles, but every programme is pornographic to some degree. The book observes a typical prole, Wanda-Jean, as she attempts to win a Feelie on the torturous TV game *Wildest Dreams*.

*The Song of Phaid the Gambler* was certainly over-ambitious and probably ill-advised. Farren should never have undertaken to write a 150,000-word novel. His plotting is far too weak and he is guilty of much padding. Phaid is a rover in a degenerate future world (much like that of *The Texts of Festival*) after a most peculiar and implausible climactic disaster. The novel has the appearance of science fiction, but the heart and manners of the spaghetti western, once again. It is aggressive, but less acute than some of its predecessors. Farren is no longer so hip. Phaid's amoral, nihilistic attitude has no reference to the street wisdom of 1981, but rather seems to reflect a desperately dispirited romanticism. For no good reason Phaid undergoes

wild fluctuations of fortune and survives, vacant and lustful as ever. He is a latter-day Sweeney, but Farren approves of him.

Unexpectedly, *Protectorate* proved to be a little better: two-thirds of the length of *Phaid the Gambler*, and provided with a much more satisfactory variety of leading characters. The setting—a future city of towers that overshadow a violent but fecund ghetto and house a decadent, hedonistic aristocracy far above—is as unoriginal as could be. Nevertheless, the inscrutable insectile aliens who rule Earth with such apathy, like a reluctant garrison, are amusingly depicted and go some way to justifying the demoralized atmosphere of the whole book. It is also noteworthy that in *Protectorate* the inevitable revolution is a religious uprising, a much more plausible development in 1984 than Farren's previous re-runs of hippy revolt of the 1960's.

In all Farren's fiction reality is too much to handle. The human race, innately cruel and stupid, scurries around trying to avoid it in a welter of sex, drink, drugs, and violence, or build madder and madder machines to take its place. The vision is a depressive commonplace of our time, and Farren certainly has nothing new to say about it. But his handiness with scraps of modern myth may mean that his work, so much of this time, will retain considerable historical curiosity when the time is past.

—Colin Greenland

**FAST, Howard (Melvin).** Also writes as E. V. Cunningham; Walter Ericson. American. Born in New York City, 11 November 1914. Educated at George Washington High School, New York, graduated 1931; National Academy of Design, New York. Served with the Office of War Information, 1942-43, and the Army Film Project, 1944. Married Bette Cohen in 1937; one daughter and one son, Jonathan Fast, *q. v.* War correspondent in the Far East of *Esquire* and *Coronet* magazines, 1945. Taught at Indiana University, Bloomington, Summer 1947. Imprisoned for contempt of Congress, 1947. Founder of the World Peace Movement and member of the World Peace Council, 1950-55. Operated Blue Heron Press, New York, 1952-57. Currently, Member of The Fellowship for Reconciliation. American-Labour Party candidate for Congress for the 23rd District of New York, 1952. #### Howard Fast comments:

All of my science fiction works are parables—and perhaps not so much science fiction as humor, fear, and fantasy. In a way they are preachments against the cruelty and foolishness of modern man. One of my favorites concerns a sub-normal three-star general who shoots down an angel in Vietnam. Science does not tolerate angels, but since science does tolerate three-star generals, the discipline needs some self-study. Beyond that, the stories speak for themselves. Some are quite funny, but who can observe man for 70 years without realizing that, above all our stupidity and brutishness, we are, most often, ridiculous. Perhaps we provoke enough laughter among the Gods to cause them to refrain from extinguishing us—though in good time we will probably do that ourselves.

\* \* \*

The science fiction of Howard Fast consists mainly of “Zen short stories” reprinted in *Time and the Riddle*. In them he uses motifs from science fiction and older mythologies to question the morality of man’s survival and the trade-offs it demands.

The older images include a hand (God’s?) snuffing out the sun in “Not with a Bang,” the devil making a deal in “Tomorrow’s *Wall Street Journal*,” and a stunning encounter

with the supernatural in Vietnam in "The General Zapped an Angel." Metaphysical conceits that are borderline SF depict the world as a "Movie House," as a stage set being removed in "The Interval," and as a hatching egg in "The Pragmatic Seed." The mythological "great time" assumes reality for an Indian ("The Mohawk"), meditating on the steps of St. Patrick's Cathedral in New York; asked on the radio to show cause why divine wrath should be spared, mankind's computer network comes up with another meditator, even freakier ("Show-Cause").

More clearly science fiction, a mouse is equipped by small aliens with intelligence, which doesn't prevent its demise ("The Mouse"). A large ant may be an alien visitor, but revulsion causes humans to squash it and its kind ("The Large Ant"). Tiny people are wiped out as vermin in "A Matter of Size," suggesting the same could be done to us. It is, when insects retaliate, severing the networks of wires, pipes, and other structures that support our civilization ("The Insects"). Man's propensity for killing takes on more cosmic significance in "Cato the Martian." Disturbed by their study of us, the Martians finally attack, with the return strike devastating their civilization. An even more idyllic planet gives human explorers a view of Eden denied us due to our destructiveness ("The Sight of Eden"). Alternatively, Fast depicts Earth as the dumping ground for the galaxy's psychotics. And an alien "exterminator" turns out to be "General Hardy's Profession," revealed through psychoanalysis.

Disturbing the natural order of things may have tragic or trivial consequences. Deep drilling with nuclear weapons brings up blood instead of oil in "The Wound." New York's garbage seems to go into another dimension ("The Hoop"), but its return is disruptive. A time machine creates a closed loop in "Of Time and Cats." Another one fails to permit Hitler's assassination in "The Mind of God." Even a hybrid cactus flower which produces contentment may be a questionable trade-off in "Echinomastus Contentii." Utopia, if it can be brought about, will also demand intervention and deceit, but the cost seems worth it. The pretense of invasion in "The Martian Shop" brings about world government as well as technological advance. Similar results come from making good use of the resources of the world's richest men, and keeping him frozen long after a cure for his cancer has been found ("The Cold, Cold Box"). But the major elaboration of this theme is "The Trap" (published in a shorter version as "The First Men").

A short novel told largely in letters, it speculates on the results of raising infants to be fully human. Improbably patient, the US Army, sponsor of this research, finally resolves to destroy the commune which threatens the way of life of man as he is. But the children, though totally non-violent, are technologically capable of protecting themselves. It is not they so much as conventional society who are interfering with the natural order of things.

Professionally written, economical, with entertaining conversation, little or no melodrama, and a competent style, these stories may seem a bit glib or facile, but a parable is only as shallow or profound as the audience wishes to make it.

—David N. Samuelson

**FAST, Jonathan (David).** American. Born in New York City, 13 April 1948; son of the writer Howard Fast, *q. v.* Educated at the High School of Music and Art, New York, 1962-66;

Princeton University, New Jersey, 1966-68; Sarah Lawrence College, Bronxville, New York, 1968-70, B. A. 1970; University of California, Berkeley (Hearst Fellow in music), 1970. Married the writer Erica Jong in 1977 (divorced, 1983); one daughter. Composer and writer. Agent: Sterling Lord Agency, 660 Madison Avenue, New York, New York 10021, U. S. A.

Jonathan Fast comments:

(1981) Social satire is one of the primary aims of my work: using the future to let me reflect upon the present, upon the lunacy of our lives and the possibilities of sanity. Religion fascinates me as does the opportunity to speculate on matters metaphysical, on life and death and the nature of reality. In my most recent work ( *The Inner Circle* ) I have tried to cast my "science-fiction" ideas in a "mainstream" mold in order to reach a larger audience, and, as a result of its success, I believe I shall continue with this ruse in the future.

\* \* \*

Jonathan Fast was a composer and a television writer before he turned to book-length science fiction. His early skills seem to have been transferrable; he creates a universe of astonishing variations which he weaves firmly into thematic resolution, all in the course of a story marked by linguistic cleverness, clearly drawn characters, good dramatic pace, and excellent visualization. On top of that, he does his homework—amid the speed and the fun is some solid extrapolation of current scientific thought.

His own stated interest is to show that religion and science are aspects of the same thing. They certainly are in the colorful universe of his first novel. *The Secrets of Synchronicity.* The

story moves dizzily from the enslaved child miners on the asteroid Slabour, to a desert planet with a civilization of telepathic snakes, to Nova Center, the commercial capital of the galaxy, and finally, triumphantly, back to Slabour. Fast connects not only science and religion, through the Vedic myths, but economics as well. His galaxy is controlled by Ultra Cap, a super-capitalistic organisation which, by concealing the blue stone that holds the secrets of synchronicity, prevents the human race from making its own connections and finding the freedom beyond technology. Fast's interests are quite serious, but his tone is light and entertaining, with many genuinely funny moments. His callow protagonist, Stefin-Dae, is clever enough to stay alive but not to avoid being swept from place to place in a kaleidoscopic universe. And Fast's variety is real—each location is completely different from the next, carefully thought out, and vividly described.

*The Secrets of Synchronicity* is a neat circular quest, profusely illustrated and exhilarating in its range and constant pace. *Mortal Gods* tries for more depth in one place. It is less funny but possibly more original; his protagonist is less appealing but has more depth than Stefin-Dae. Fast focusses here on the possibilities of controlled genetic mutation, and comes up with the concept of the Lifestylers—beings bizarrely mutated according to artists' conceptions, living in the transdimensional Bardo of Tibetan theology, and receiving worship as gods. Once again the profit motive, in the form of the Mutagen Corporation, controls the religious life of the people. The Lifestylers are an impressive invention on Fast's part, and he gives reference to current geneticists before he starts. He also does reasonably well with a challenge the science-fiction genre has been working on for some time—depicting successful sex between human and alien. As in his first book, the accompanying details of civilization are well worked out and of interest in themselves. The book's only flaw is the plot he uses to tie all these things together, a political assassination mystery that is adequately resolved but that really adds nothing to the science fiction of the story.

Fast has written a Hollywood mystery as well—*The Inner Circle*, set firmly on this earth and doubtless based on his experience of screen writing. His *The Beast*, despite marginal suggestions of medical SF, is a fairy tale of beauty and the beast. One can only hope that he returns to traditional science fiction soon. Fast is one of the most entertaining writers in the genre, a delight for the mind as well as for the imagining eye. In a brisk biographical note, his publishers assure us that "he longs for a cogent universe." So far he has formed at least two himself.

Critical Study: *The Multi-Man: A Biographic and Bibliographic Study of John Russell Fearn* (includes bibliography) by Philip Harbottle, privately printed, 1968.

\* \* \*

John Russell Fearn left school at 14, tried first to follow the career of his father, a cotton salesman, and tried a variety of other jobs, none of which satisfied him. He wrote continuously, gradually becoming more proficient, and read sf voraciously. He formed a life-long interest in the cinema and broke into print with a series of articles in *Film Weekly* in 1931.

Discovering *Amazing Stories* that same year, Fearn submitted *The Intelligence Gigantic*, an influential novel which introduced the concept of the latent powers of the human

brain. *Amazing* serialised it in 1933, and, greatly encouraged, Fearn quickly wrote *Liners of Time* and its sequel, *Zagribud*. Then, when Orlin Tremaine revived *Astounding Stories*, Fearn switched to the rival publication, debuting with the classic "The Man Who Stopped the Dust" (1934). Sam Moskowitz has confirmed that the plot, describing the weird consequences of destroying dust, was unique: nobody had previously used the idea, and nobody has ever improved upon it. Forrest J. Ackerman wrote that it was "the kind of story that make an old member of dinosaur fandom like me weep, 'Why don't they write yarns like this anymore?'" Thereafter followed a host of outstanding "thought variants" including "Before Earth Came," "The Blue Infinity," "Deserted Universe," and "Metamorphosis." Equally noted were "Mathematica" and its sequel "Mathematica Plus." Following his reading of Jeans and Eddington, Fearn contended that the Creator of the Universe is a Supreme Mathematician. His purpose is the creation of mathematics (actually thoughts), out of which he creates worlds and life. The object of his ageless existence is the ultimate cancellation of all figures, to destroy what he has created and release himself from an eternity of mental and figurative toil. Fearn revealed later to Walter Gillings that he had actually dreamed the idea for the stories while under anaesthetic (a method consciously adopted later by A. E. Van Vogt).

After 1939, sf magazines proliferated. With his widowed mother to support, Fearn was quick to realise that by using pseudonyms he could have several stories in the same issue of magazines, and so make a decent living. Between 1933 and 1948, Fearn published 130 stories, only 48 of them under his own name. Of his eight pen names, Thornton Ayre and Polton Cross rivalled his own in popularity. Outstanding Cross stories included "Wings Across the Cosmos" and "Wanderer of Time," both anthologised in the late forties. As Ayre he introduced detective "webwork" elements to sf, as in "Secret of the Ring" and "Twilight of the Tenth World." As Ayre he also created Violet Ray, the prototype of his famous superwoman, "The Golden Amazon." In 1944 he completely revised the character, upgrading his writing, and sold a novel, *The Golden Amazon* to World's Wor, in England. In 1945, the general magazine *Toronto Star Weekly* reprinted it in newspaper format as their "Novel of the Week." The story had a tremendous impact on the *Star's* 900,000 readers, few of whom were familiar with sf. The *Star* commissioned an Amazon series, which ran for 16 years, ending only with Fearn's death. Responding to reader demands, the *Star* commissioned the Scott Meredith Agency to find a writer to continue the series—without success. No other sf writer could duplicate Fearn's unique "popular" style. Fearn was in fact the *only* sf writer to be featured by the *Star* syndicate, which resold the novels to at least four American newspapers, giving each title a circulation of a quarter of a million.

Having found the lucrative *Star* market, Fearn quit the pulp magazines. He wrote detective thrillers as John Slate, beginning with *Black Maria, M. A.* (1944). Reviewers hailed Slate as a second Agatha Christie. In 1950, writing as Hugo Blayn, Fearn created the Dr. Carruthers scientific detective series, and also diversified into westerns. Suddenly, in 1950 British publishers became sf conscious. For Scion Ltd. Fearn wrote *Operation Venus*, a best-seller. Thereafter, Scion created the pen name Vargo Statten for use on Fearn's sf.

The Statten novels were phenomenal: 52 titles appeared over the next five years, selling five million copies, which led to the *Vargo Statten Science Fiction Magazine*. Fearn also wrote as Volsted Gridban, taking over the byline from E. C. Tubb. The Statten and Gridban titles were Scion's biggest sellers, ending

only with the collapse of the British paperback houses in 1956, due to complex factors. Many of the novels were successfully translated in France, Italy, Denmark, and Germany.

A fresh burst of creativity followed Fearn's marriage in 1956. Films (as actor/writer/producer), television, radio, and stage plays were added to his regular writing. With his wife Carrie, he formed The Good Companions, a theatrical troupe. But the increased activity caught up with him: Fearn died of a sudden heart attack in 1960, aged only 52. His grief-stricken wife became too ill to promote his work, and Fearn was almost forgotten. The publication of a biography, *The Multi-Man*, by Philip Harbottle, in 1968, which revealed scores of pseudonyms, helped revive his reputation. Posthumous work appeared in the British magazine *Vision of Tomorrow* edited by Harbottle, who became Mrs. Fearn's agent. The French *Stattens* were revived in the 1970's as adult comic strips, while the original novels were "rediscovered" in Italy in 1977, remaining constantly in print ever since. The Italian publisher Ugo Malaguti, introducing a 600-page *Statten "Classic" Omnibus* in 1979 explained why: "Statten is like a naive painter; the apparent simplicity of his style conceals a technique and an ability that are in no way naive."

Modern critical opinion on Fearn, once dismissive, is gradually changing. Thus the compilers of *The Science Fiction Source Book* (1984) found that "his style is frankly abysmal," but admitted that "there is a fervid excitement in his work that can be quite effective." Frank Cioffi is in no doubt. Concluding his survey of early American sf magazine fiction in *Formula Fiction?* (1982), he asserted that "... the stories of ... John Russell Fearn ... are intelligent and entertaining and deserve to be made accessible to today's vast sf audience."

—Philip J. Harbottle

**FELICE, Cynthia** (née Lindgren). American. Born in Chicago, Illinois, 12 October 1942. Educated at North Park College, Elmhurst College, and University of Colorado, Colorado Springs. Married Robert Edward Felice in 1961; two sons. Sales engineer, Lindgren and Associates, Chicago, 1962-71; owner and manager, Glenn Russ Motel, Colorado Springs, 1972-78; technical writer, Kaman Sciences Corp., Colorado Springs, 1978-79; technical communications manager, Inmos Corp., Colorado Springs, 1979-81. Since 1981, Technical Communications Manager, United Technologies Microelectronics Center, Colorado Springs. Recipient: Society for Technical Communication award, 1984. Agent: Richard Curtis, Richard Curtis Associates, 164 East 64th Street, New York, New York 10021. Address: 5025 Park Vista Boulevard, Colorado Springs, Colorado 80928, U. S. A.

"Track of a Legend," in *Omni* (New York), December 1983.

\* \* \*

Cynthia Felice's work reflects her strong interest in creating complex human characters in unusual circumstances. In her first SF novel, *Godsfire*, Felice builds a sophisticated society where intelligent felines rule over their human slaves. Felice makes psychological points by having the novel narrated by one of the cat people who constantly points out the differences—often the superiority—of felines over humans. *Godsfire* also has its share of mysteries: Felice creates a planet that has a climate of constant rain, therefore the inhabitants are unaware of the existence of the sun. The origin of the humans on the planet is equally mysterious. Felice presents the reader with a clever plot and a great deal of social commentary which makes for fascinating reading.

*The Sunbound* explores relationships less successfully. Allis is in love with Daneth and pregnant by him. Yet Daneth has his own secret: he is an alien. When Daneth dies, he leaves Allis a fabulous jewel that confers telepathy to the holder. The crew of Daneth's ship seek him and find Allis and the jewel instead. When Milani, Daneth's former lover and co-captain of Daneth's ship *The Sovereign Sun*, discovers the situation, she vents her rage and hatred on Allis. Allis, bewildered by events, feels she's been abused by the aliens and throws the jewel away. But Felice creates a crisis where only Allis and the power of the jewel can save the aliens from extinction. The plot of *The Sunbound* is too contrived and the character of Allis is too emotional, too childish, to be enjoyable.

In *Water Witch* Felice collaborates with the Nebula winner Connie Willis to create a desert planet called Mahali. As in Frank Herbert's *Dune*, finding and controlling water are the most important activities. Felice and Willis do a marvelous job with the main character, Deza, a young woman who pretends she's a member of the ruling family of water witches. Deza is feisty and sympathetic at the same time. Her deception leads her into a wheels-within-wheels plot that Felice and Willis spin successfully. *Water Witch* is an outstanding science-fiction novel.

*Eclipses* is less outstanding. Felice writes a family saga set on another arid world called Seresunar. Beth, an anthropologist, marries Aram, heir to the Water Barony. Their relationship is a stormy one: their temperments lead them into infidelity and eventual reconciliation. Beth gives birth to a son whose wild nature shakes Seresunar's society. Yet the book is more of a romance novel than a science-fiction novel. The overheated love relationships tire after awhile in this long novel while the science-fiction aspects are underplayed.

Cynthia Felice is a promising new writer whose books center on complex character relationships that are as interesting as they are realistic.

## Play

*Telephone Roulette*, adaptation of his story "Take a Number." Chicago, Dramatic Publishing Company, 1956.

\* \* \*

Escapism is a term too often loosely applied to science-fiction, but in the case of Jack Finney it is strangely appropriate. His most enduring theme is escape from the pressures and irritations of the present, usually into an idyllic past, but sometimes to another planet or a parallel dimension. A popular magazine writer who produced many stories in areas other than science fiction, Finney has made himself into the poet of nostalgia and lost innocence within the genre, seldom more

than peripherally concerned with the mechanisms of his science-fiction concepts or with how his characters get from this world to the other.

Ironically, Finney's most famous science-fiction novel is also his least characteristic. *The Body Snatchers* (filmed twice as *Invasion of the Body Snatchers*) is a suspenseful invasion-of-earth story that has gained the status of a minor classic because of the popularity of the film versions and because of the key element of paranoid fantasy that is the basic of its appeal: the notion that aliens might gradually replace the entire population of a city with exact duplicates without anyone noticing the difference. Although this idea had been current in science fiction long before Finney brought it to the attention of a wider public, the skill with which Finney unveils this horror and the fears abroad at the time he wrote the story—the "takeover" might as well be a metaphor for either Communism or McCarthyism—combined to give it an impact few science-fiction stories had previously had.

More characteristic are the short stories that Finney published during the 1950's collected in *The Third Level* and *I Love Galesburg in the Springtime*. The most common theme of these stories is time travel into the past. "I'm Scared," one of the best, details the gradual breakdown of the flow of historical time under psychological pressure from a population seeking to escape the present. In "Such Interesting Neighbours" the time travelers are from the future, but the motivation to escape their own time remains the same (the story ingeniously suggests that the end of the world will be brought about by time travel, because everyone will gradually abandon the future and redistribute themselves throughout history). "Of Missing Persons" replaces time travel with space travel, but the theme of escape remains central. Two stories, "The Third Level" and "Second Chance," suggest that certain things or locations can provide magical "portals" to the past; in "Second Chance" a meticulously reconstructed old car takes its driver into a past world simply because the experience he has in driving it parallels an experience that might have taken place when the car was new.

This notion that by meticulously recreating the past we can return to it was developed at great length in Finney's most ambitious novel, *Time and Again*, in which a volunteer for a secret government time-travel project finds himself in the Manhattan of 1882. Although only the vaguest references to Einstein serve to account for this time travel, and although there are inconsistencies of plot and historical verisimilitude (some of the latter are deliberate), the novel is a convincing portrait of a lost age and a persuasive account of what it might actually feel like to awake in a different time. Other Finney novels have dealt with the culture shock of different ages meeting using even less rationalistic devices—reincarnation, for example, in *Marion's Wall*—but *Time and Again* remains his most successful contribution to this genre. Though not fundamentally a science-fiction writer, Finney is a skilled narrator and an evocative stylist who frequently uses science-fiction themes with considerable effect.

##### Nicholas Fisk comments:

I came fairly late to children's writing. It was a Puffin list that showed me the light. I was looking for a copy of Geoffrey Household's *Rogue Male* and found it in Puffin. I thought, if the publisher thinks fit to offer this title to children, the world must be changing. For the better.

Most of my output for children has been science fiction. The SF writer is fortunate in that, unhampered by present or past, he can invent his own games, rules and players. He is unfortunate in that he must make these matters clear—and explanation is the enemy of narration. Also, unfortunately, the genre is still not quite respectable, not quite nice. Perhaps the word science offends the nice palate? It offends mine. I am not a scientist, my books are not centered on the sciences. They are stories of possibility. Not SF, but IF—what would happen IF.

The stories are on a domestic, not a cosmic, scale because written words are not apt for the rendering of explosions and gargantuan hardware; these belong to the cinema. My central characters are children because the stories are written for children. This poses no problem and indeed may offer simplifications and speedings-up of the narrative. Although the stories have become more complex in subject and structure, I have learned from my own and countless other children that the quick, generous, adventurous mind can always stick to the point, even if the author must stagger about a bit in the hope of satisfying himself or a publisher's editor. And in any case today's children are no longer confined to some nursery ghetto. Families live in each other's laps, watching the same TV programmes. My readers and I are not unlike.

Other reasons for writing as I do include a distaste for most modern adult fiction coupled with a huge admiration for the writers and illustrators of present day children's books. I do various kinds of writing to earn a living; it is the children's writing that gives me the authentic tingle.

\* \* \*

Nicholas Fisk is currently one of the best of those writers presenting "hard" SF to children. In such a situation a writer has two choices: to try to explain his science to a juvenile audience, or simply to ignore most of the problems as being outside his province. Fisk has tried both: *Antigrav* is a good story despite the lack of explanations; *Escape from Splatterbang* shows how such explanations can be at once trite and boring. By contrast, in *Trillions* the working out of a scientific answer forms an exciting and integral part of the plot. *Trillions* is also the book of Fisk's most likely to appeal to the adult reader, partly because of the scientific interest, partly because the "opposition" in *Trillions* is the Military Mind, as personified by General Hartman, in whom he will recognise all those who hate and fear what is alien to them. More usually in Fisk's books the forces of ignorance are the adults who ignore or fail to comprehend their children. The books can most usefully be seen from the point of view of an intelligent 11-year-old—old enough to see and understand the adult world of deceit and hypocrisy, but not old enough to change or participate in it.

One of Fisk's greatest strengths as a writer is his avoidance of

clichés, both in plot and character. Indeed several of his books, most notably *Space Hostages* and *Antigrav*, are crucially concerned with a realisation that people do not conform to stereotypes. *Antigrav* rather neatly contrasts two scientists—one the classic sinister, balding geologist from behind the Iron Curtain, the other the expansive English all-rounder much given to appearing on TV chatshows. Arthur Sonning is summed up at the end as “You poor sap,” while Czeslaw, victory gained, weighs the possible results of that victory and throws it away. It is further typical of Fisk that this moral superiority does not lessen the personal price which Czeslaw has to pay for “failure.” In *Space Hostages* an experienced reader of children’s fiction is likely to be expecting the puny clever Pakistani to be triumphant at the expense of the village bully. What actually happens is that both discover their interdependence as Fisk shows that the very qualities which make Tony a bully are those which make him a successful leader in a time of crisis. In *Escape from Splatterbang* a hint of romance is raised, only to be quashed by the bitter-sweet ending as the gypsy girl, only half-understood to the end, disappears back among her people. Here, as in *Time Trap* and other of the novels, the ending respects and even underlines the realities of human behaviour.

Fisk is never likely to have a large adult audience; his books side too firmly with the children—but at least they do so plausibly. In *Grinny* (one of his best books) the reader looks on, as helpless as the children, while the implacable “Great Aunt Emma” manipulates adult minds to her own ends. The notable achievement of this book is the way (again avoiding cliché) that Grinny’s curiosity is shown as most sinister—she pokes and pries into human habits and customs like someone lifting a stone to observe the earwigs. Fisk’s one real incursion into teenage Sf—*Wheelie in the Stars*—is one of his poorest books: his clever-clever cardboard teenagers contrast very badly with the impotent desperation and reluctant courage of his children. This is more to be regretted since *High Way Home* shows how convincingly he can draw both teenagers and female characters (usually a notable blindspot). Fisk is not destined for a place among the Immortals: he lacks the necessary mastery of style and timeless appeal. But he is doing a competent job in a difficult field.

—Philippa Stephensen-Payne

**FitzGIBBON, (Robert Louis) Constantine (Lee-Dillon).** American. Born in Lenox, Massachusetts, 8 June 1919. Educated at Wellington College, 1933-35; University of Munich, and the Sorbonne, Paris, 1935-37; Exeter College, Oxford, 1937-39. Served in the British Army, 1939-42, and the United States Army, 1942-46: Major. Married 1) Marion Gutmann in 1960 (marriage dissolved), one son; 2) Marjorie Steele in 1967, one daughter. Schoolmaster, Saltus Grammar School, Bermuda, 1946-47. Member, Irish Academy of Letters; Fellow, Royal Society of Literature. *Died 23 March 1983.*

Constantine FitzGibbon commented:

(1981) I do not consider that I have ever written "science fiction." I have written unusual novels, set in imaginary countries, at an imaginary future date or with a jumbled time sequence, as have Kafka and Joyce. As I grow older I become less interested in writing "realistic" novels, and give freer and freer play to my imagination. My most recent novel, *The Rat Report*, I have called, it is true, psi-fi, but that is not sci-fi, not in my opinion at least.

\* \* \*

Constantine FitzGibbon's *The Golden Age* is a futuristic novel in which the world as we know it is drastically altered and in which mankind has virtually lost his knowledge of history. The world has been divided into two halves, the Upper World separated by a sort of force field from what is termed the Lower World (the southern hemisphere in our terms). The Upper World is now ruled from Oxford by a Monster (Emperor) and the four Horsemen who form his council. They decide that the future of the world must be left in the hands of Orpheus, the poet, as the priests, scientists, and other leaders of the past have simply led the world into chaos. It is FitzGibbon's contention that the poets know more about the universe than do the astronomers. As Orpheus, the central character, begins to rebuild the world in beauty, he enters into a bargain with Mephistopheles, who restores his memory at the cost of his soul. Seemingly victorious in his quest, Orpheus descends into the Underworld to regain Eurydice. A great part of the intrigue and fascination of the novel consists in FitzGibbon's deft reworking of the Orpheus and Mephistopheles myths and a clever blending of the two. The reader versed in classical literature will find the novel interesting and meaningful on a level lost to the average reader. *The Golden Age* is a clever if somewhat overly literary and complex vision of the future based on an intriguing hypothesis and rewarding to the sensitive and discriminating reader.

FitzGibbon's earlier novel, *When the Kissing Had to Stop*, is set in the not-too-distant future and concerns itself with an England which has been taken over by totalitarianism and has become a Russian dependency.

Charles L. Fontenay comments:

My science-fiction period was confined to the decade 1954-64. Most of my science fiction was of the adventure or "escapist" type, as contrasted to that line of science fiction oriented to some serious sociological "message" or an attempted extrapolation of current trends; I think it would be legitimate to call it the *Star Wars* type. However, I was often pretty heavy on the scientific basis for the story, to the point that an entire story—or an entire novel—was built around a single scientific gimmick. Despite this general orientation, my science fiction contributed a great deal to the thinking that served as the basis of my later philosophical writing. I think this connection is apparent in some of the stories, but I would be hard put to express it in so many words.

\* \* \*

Charles L. Fontenay's SF career spanned a bit more than a decade, ending with the 1964 publication of *The Day the Oceans Overflowed*, a disaster novel. With a writer who produced no major work and who hasn't written in the field for more than 20 years, it is presumptuous to claim any reputation other than hazy. But it is not a fair one in view of much of his short fiction.

He did write space opera, however, much of it forming a generalized future history, and some of it dealing with problems posed by the time-dilation effect of travel at the speed of light. "The Strangest Man in the Universe" is a fair but remarkable adventure story that finds a spaceship crew stranded on a backward planet, where they also encounter a benevolent superman (another of Fontenay's favorite themes). "The Heart's Long Wait" is a decidedly more interesting story, a character study of a spaceman alienated from ordinary humans by his profession. The story is sentimental but still effective.

It was Fontenay's trademark to take a standard idea—time-dilation, evolutionary supermen, the paradoxes of time travel—and develop a good, often quite original variation on it. His stories were usually well constructed, and his writing style clear and readable. If he were to be grouped with any other SF writers, they would probably be Poul Anderson and Gordon Dickson—but Fontenay never displayed Anderson's passion for the poetic in science and nature, or Dickson's thematic strength. He told stories about ideas. But he had other virtues as well, especially an ability to explore his ideas in terms of unobtrusive character development.

It is this lack of character development, in part, that prevents "Z" from being wholly effective. It's a neatly conceived handling of essentially the same idea Heinlein used in "By His Bootstraps," somewhat updated with the addition of a sex-change in the plotline, but not up to the standards of Heinlein's original story. "Pretty Quadroon," however, another time travel story, is one of Fontenay's best works. In the near future, a segregationist South has again seceded from the Union, leading to a second War Between the States. The story's protagonist is a statesman and general whose fiery speech at a conference of Southern governors has made him the pivotal figure in the events leading to the war. His mistress, the quadroon of the title, introduces him to a practitioner of voodoo who believes he can alter the past, thus preventing the war from ever having happened. Again and again the time paths are altered, until it becomes obvious that the key to success lies in preventing the man from ever having met the woman he loves. The strong idea in "Family Tree" might almost be taken for a joke: humans have evolved not from apes, but rodents. The story, however, is serious: an evolutionary superman is threatened by human bigotry. What sets the story apart is Fontenay's insightful portrayal of his central character, a moral rabble-rouser out to destroy the superman.

Fontenay stopped producing magazine fiction as the 1950's closed. His first novel, *Twice Upon a Time*, like "The Heart's Long Wait," deals with a young spaceman whose life and attitudes pivot on his career and on the fact of the time-dilation effect. A member of a trouble-shooter corps designed to police interstellar colonies, he's sent to one of several planets where it's feared rebellion may be brewing. The theft of his spaceship on his arrival and the complexities of the social and political situation make the novel suspenseful, but a time-travel sub-plot and a pat ending put the book on a level somewhere below his best short fiction. *Rebels of the Red Planet* is even more disappointing. Genetic experiments on Mars, leading to super-beings and other mutations, are played off against another plot involving a growing rebel movement. Fontenay doesn't add much to either idea, although some of his scenes between normal humans and the laboratory-bred mutations are interestingly outré.

Whether Fontenay abandoned the field too early or simply lacked the ability to write novels of quality comparable to his best short fiction, his novels have added nothing to his reputation. His lapse into obscurity, among the many hundreds

of writers who have worked the field since this time, is probably inevitable. But time hasn't rendered his fiction less readable. His trademark was his ability to work stories around ideas cleverly derived from familiar themes. But his strength was that so often these ideas were explained from the points of view of rather interesting people.

—Gerald W. Page

**FORSTCHEN, William R.** American. Address: c/o Ballantine Books, 201 East 50th Street, New York, New York 10022, U.S.A.

#### SCIENCE- FICTION PUBLICATIONS

##### Novels

*Ice Prophet.* New York, Ballantine, 1983.

*The Flame upon the Ice.* New York, Ballantine, 1984.

*The Darkness upon the Ice.* New York, Ballantine, 1985.

\* \* \*

William R. Forstchen attracted immediate attention with the publication of *Ice Prophet*, first of a trilogy set in a primitive future society in which ice covers the Earth's surface as the result of a scientific experiment which went awry, altering the planet's ecology. A network of city states is dominated by the Cornathian Brotherhoods, a theocracy which is divided against itself because of hidden rivalries, including a secret priesthood with a generations-long plan to secure ultimate power for themselves.

Since it was scientific innovation that wrecked the old world, the Brotherhoods have forbidden innovation to the populace, although they have secret hoards of supposedly lost knowledge. Michael Ormson is the charismatic leader who arises in response to this restriction, whose philosophy is freedom from religious persecution and the desirability of new knowledge which might allow mankind to once again rule its own world. Against his wishes, he comes to be viewed as a messianic figure, and bloody warfare ensues as a response to his heresy.

By the opening of the second novel, *The Flame upon the Ice*, Ormson is the head of a rebellious army controlling the southern islands. He and his allies have devised new methods of conducting warfare on ice-travelling warships, the details of which reflect Forstchen's own interest in ice sailing. The battle scenes are bloody, violent, and convincing, as he works out the tactical and strategic necessities of war on the ice fields. Unbeknownst to Ormson, he has become the tool of the secret priesthood, the instrument through which they plan to crush the power of the Cornathian Brotherhoods and depose the present leader, Zimri.

Complicating matters further is Ormson's personal disturbance at the horrors perpetrated in his name. Rather than bring a new freedom to mankind, he has caused more death and destruction than the world has known in generations. The empire to the east begins to extend its influence as well, hoping to take advantage of a power vacuum during the turmoil. Finally the southern forces strike north and capture the major cities of the enemy, driving him to inland fortresses.

The established church is resurgent in *The Darkness upon the*

*Ice.* Using devices developed in their secret laboratories, they attack Ormson's army with cannons and air surveillance. The populace is in general unrest, not entirely convinced of the wisdom of Ormson's followers, and the prophet himself appears to be dying of some wasting disease following the murder of his family. Finally the secret brotherhood is ready to make its bid for power as Ormson's army falls back to reconsider its next move, only to be pursued by the now superior forces of the church. But in their attempt to defeat Ormson's hope for technological development and an end to the old way of life, the church itself has ensured that Ormson's goal has become inevitable.

Forstchen's trilogy is not a unique or new contribution to the genre. The setting is similar to that of Michael Moorcock's *The Ice Schooner* and the messianic battle against entrenched self-interest is one of the standard plots of the field. But Forstchen has added superior characterization, a wealth of fully realized detail about warfare on the ice, and a complex interplay of political manipulation.

—Don D'Amassa

**FORWARD, Robert L(ull).** Also writes as Susan Lull. American. Born in Geneva, New York, 15 August 1932. Educated at the University of Maryland, College Park, 1950-54, B. "Rocheworld" (serial) in *Analog* (New York), December, January, and February 1982-83.

"Twin Paradox," in *Analog* (New York), August 1983.

Robert L. Forward comments:

I write *hard* science fiction. After I have decided upon a general story idea, but before I write a detailed outline, I spend 6-9 months collecting data, calculating orbits, drawing vehicles and habitats, designing alien physiologies and cultures, and working out timelines. During this "science research" phase, the requirements of the laws of science suggest (and sometimes force) the plot line to move in a certain direction. Thus, in one sense, the science writes the fiction. In my first two novels, ideas that were generated during this research phase were so novel and so scientifically sound, that I turned them into scientific papers that were later published in scientific archive journals (with a footnote referencing the novel as the first publication of the idea). The drawings and the results of this research phase are usually included as a technical appendix to the novel.

\* \* \*

The novels of Robert L. Forward display his scientific background to great advantage. As a senior scientist at Hughes Research Laboratory in Malibu, California, and at the University of Maryland, Forward has conducted research into gravitational radiation from supernovas, black holes, neutron stars, gravity sensors, and laser propulsion. These subjects of his research have been used as material for both *Dragon's Egg* and *The Flight of the Dragonfly*.

Several themes recur in both works: initial alien/human encounters, the congeniality of intelligent life, and the proposition that life can evolve in conditions considered to be inimical to life as known on Earth.

*Dragon's Egg* posits a neutron star with a gravity of 67 billion gees and a magnetic field of almost a trillion gauss. When the neutron star approaches the solar system, plans to study the body are implemented and a crew from Earth begins its scientific survey on 22 May 2050. Shortly thereafter the cheela, the intelligent form of life on Dragon's Egg, become aware of the observers in their sky and contact is achieved on 20 June 2050. Much of the novel is devoted to a depiction of the history of the cheela and their ascent from savagery to civilization. The work has affinities to Anatole France's *Penguin Island*, although little satire is apparent, and to Hal Clement's *Mission of Gravity*. The cheela are a fascinating concept, and Forward supplies a series of appendixes outlining their physiology and the "geology" of Dragon's Egg. The human characters are less satisfactory as personalities than are the various cheela heroines and heros. The book derives its great strength from the portrayal of the manner in which the tremendous gravity and magnetic field influence the history and biology of the neutron star intelligences. The creation of mathematics, religion, and science are observed in detail. The time scale of the cheela is vastly compressed and one of their generations passes in 15 minutes. This speed allows the creatures to surpass the humans who have undertaken their education. The novel ends one day later, 1 June 2050, and we have observed the entire evolution of the cheela from inanimate matter to explorers of the Milky Way.

*The Flight of the Dragonfly* explores the consequences for life on Rocheworld. This world is a dumbbell-shaped planet, sharing a common atmosphere. One of the planets, called the Eau Lobe, is covered by an ocean of ammonia water with trace amounts of hydrogen sulfide and cyanide gas. The other planet, called Roche Lobe, is usually devoid of a liquid covering, but periodically the ocean from the Eau Lobe rains down on the Roche Lobe. The interactions among the gravitational forces, and the chemical reactions and chemical

equilibria, form the background against which an exploratory team from Earth makes contact with the intelligent life form on Rocheworld, the "flouwen." These aliens are much more intelligent than the humans with whom they interact, but the only science which they have truly developed is mathematics. Most of the book concerns the rescue of the *Dragonfly*, an exploratory vessel, from the ocean of Eau Lobe, and the beginnings of communication between the humans and the "flouwen." The humans are almost cursorily depicted and a cast of characters helps sort them out. The "flouwen" carry greater interest in this work; however, they are not as interesting as the cheela of the earlier work.

Both novels may be considered "hard science fiction" and the inclusion of appendixes serves the reader well. Forward's descriptions of the interactions between alien and human species eschews the paranoia which was a common feature of much earlier science fiction.

—Harvey J. Satty

**FOSTER, Alan Dean.** Also writes as George Lucas. American. Born in New York City, 18 November 1946. Educated at the University of California, Los Angeles, B. A. in political science 1968; M. F. Alan Dean Foster comments:

The majority of my science-fiction novels take place in what is called the University of the Commonwealth, a future socio-political spatial government in which man has formed a particularly intimate alliance with a race of insect-like creatures called the Thranx. Within that universe I'm able to tell an immense variety of tales. Some relate to one other, such as *The Tar-Aiym Krang*, *Orphan Star*, and *The End of the Matter*. These form a trilogy dealing with the adolescence of an extraordinary youth named Flinx. Other books use characters interchangeably. For example, a minor character in *The End of*

*the Matter* named Skua September is a major protagonist in the novels *Icerigger* and *Mission to Moulokin*, the pair forming a single massive story.

Eventually (say, in another 40 years), many seemingly unrelated characters and events will tie together, forming a long narrative extending over some 50 years and, possibly, as many books. Other novels will be set in the Commonwealth universe but will remain unrelated to this central narrative. Still other novels and stories will have nothing to do with the Commonwealth at all.

Most of my shorter fiction is independent of the Commonwealth background. While my novel-length work tends to be rather adventure oriented, my shorter fiction explores more personal, individualized events. In the novels I am interested in exploring how people, especially average people, are forced to react to extraordinary circumstances and events much greater than themselves or their personal concerns. In my shorter fiction I try to delve more deeply into the "human condition." It might be fair to say that the novels force my characters to look outside themselves while the short fiction induces them to look inward.

Particular aspects of science that interest me and are often touched upon in my stories include ecology, the unexplored potentiality of the human mind, and the accident of history (the way in which massive events are often set in motion utterly unintentionally, and are forced to conclusions and resolutions unimagined by those caught up in such socio-political-personal vortices).

\* \* \*

Although Alan Dean Foster broke into professional science fiction with short stories after the fashion of Robert Sheckley and Eric Frank Russell (as seen in the collection *With Friends Like These*), he has gained the greater part of his fame through his screenplay adaptations (*Alien*, *Star Wars*) and his novels. For the most part the adaptive novels do not give one much insight into this writer, though mention must be made of one original novel using the characters and milieu of *Star Wars*—*Splinter of the Mind's Eye*. It is an unsuccessful attempt to work within the parameters of the limited mythology of the Lucas series, but in its choice of plotlines—Luke and Leia must retrieve a magical crystal before Darth Vader can—it is a novel that illustrates Foster's predilection for combining ingenious concepts with ingenuous characters; characters too facile to give the concepts the philosophical life they require.

Because of this, it is not incorrect to style most of Foster's original novels as "light" science-fiction adventure. Illustrative of this are several of the novels in Foster's "Commonwealth" universe—which, it must be said, is one of the few universes in which spacefaring humans freely mix with members of an alien species on a routine, day-to-day basis, and not merely for melodramatic purposes. One trilogy of novels—comprised of *The Tar-Aiym Krang*, *Orphan Star*, and *The End of the Matter*—deals with Flinx, a young psychically endowed orphan who frequently takes on formidable galactic powers, armed chiefly with his wits and poison-spitting serpent-pet. As juvenile wish-fulfillment, these novels have a number of appealing features; as literature, they could be compared to cotton candy—colorful and pleasing to the taste, but less than filling. These novels lack the sense of true danger that gives zest to the better adventure-novels, for the villains are rarely allowed to get the upper hand, and are too easily defeated. Nor are the heroic characters capable of more than rudimentary emotions—at the end of *Orphan Star*, Foster can describe

Flinx's sadness at seeing the death of a female criminal who turns out to be his long-lost sister, but he fails to make the reader feel that emotion. Similar problems plague such works as *Cachalot*, in which the intelligent, whale-like denizens of a water-world are being turned against humanity, where Foster spends more time characterizing the different breeds of alien whale than the human characters, and *Spellsinger*, where the "villains" are more comical than threatening.

To Foster's credit, though, his works are always characterized by a scrupulous exactitude regarding the sciences, physical environments, and time-period. His best single novel, for this reason, is one that concentrates on the physical concept against which the simple characters stand like figures in a tapestry. *Midworld*, like Aldiss's *Long Afternoon of Earth* and Le Guin's *The Word for World is Forest*, focuses on a world of teeming plant life—although on *Midworld* the jungle foliage is so profuse that it forms a number of "canopies," or levels that are capable of supporting life. In particular a colony of stranded humans have built their village in one such canopy, and have evolved an animistic hunter-culture, whose love of nature, despite its destructive aspects, is totally at odds with that of the human space-explorers who land on and attempt to subvert *Midworld*. *Midworld* is Foster's most philosophically oriented novel, pitting the Midworlders, who symbolize nature-love, against the humans, who represent the aversion of technology to everything it cannot control.

Lastly, of the "light adventure" novels, Foster did reach a high point in the two-book series *Icerigger* and *Mission to Moulokin*. These works have a fast, Burroughsian pace, and use melodrama and comedy with greater skill than in any other Foster works. Further, in *Icerigger* Foster creates his most original alien concept: the cat-faced, bat-winged Tran, who dwell on the ice-covered world of Tran-ky-ky by means of biologically-evolved foot-"skates." Such novels as *Midworld* and *Icerigger* show Foster's capacity for inventiveness and for fast-paced adventure, and if his handling of other aspects are less well done, one may still value Foster for succeeding where many of his contemporaries have proved far more conventional than he.

#### M. A. Foster comments:

I started writing because I was having difficulty finding good books; they didn't have to be great—just good reads, enjoyable and provocative. Others I spoke with admitted the same problem, in the late sixties and early seventies, so it seemed a good idea. As I have gotten deeper into writing, I have identified some specific guides I used, unconsciously at first, but more deliberately later on:

The story occurs in the reader's mind, not on paper; therefore the minimum writing should be used to cause this to occur. The story should be translatable, and not rely on fads which date works.

The story must move forward because of drama, not action or violence.

Deep and subtle moral and ethical problems in contemporary thought should be touched upon, preferably used as main themes.

The story must attempt to present ordinary beings in extraordinary circumstances, not the reverse, in which the characters have to reach in some ways beyond the ordinary to survive or comprehend what is happening.

Real science must be distinguishable from speculation. The use of pop sci-fi generic artifacts must be kept to a minimum.

Room must be made for the reader to participate in the story, by the inclusion of loose ends which may lead elsewhere, and by the use of "suggestive-descriptive" backgrounds which allow for the imagination of the reader.

Within the limitations of the genre, everything should be as realistic as possible. Characters should act with normal functions, strengths, weaknesses, beliefs, and doubts.

The stress of the story must be on individuals, not members of some organization, government, or cult. Characters must make specific and individual choices.

I should exploit and develop my own kind of story and not attempt to write anything and everything.

As much as possible, I attempt to fuse SF with mainstream literature, not separate them.

\* \* \*

Since his advent on the SF scene with *The Warriors of Dawn* in 1975, M. A. Foster has assembled a notable body of novels and one short-novel collection entitled *Owl Time*.

While the selections in *Owl Time* differ somewhat from the rest of Foster's corpus, all the full-length novels have several characteristics in common. They are loosely plotted, with emphasis on character and setting rather than on story development. Each depends on the perspective of one, or at most two, viewpoint characters. This classical approach to story telling is used to especially good advantage in the *The Morphodite* and *The Transformer*, where the viewpoint character becomes younger and changes sex through various genetically coded transformations. Finally, Foster displays an anti-deterministic philosophy through both theme and technique. The plot in each novel turns around the solution of a many-leveled mystery, an attempt to discover who or what is manipulating the society on a particular world. The author repeatedly introduces variations on Tarot and the *I-Ching*, both oracular methods of predicting a deterministic future, but the ultimate answer to each quest lies in the actions of certain single individuals.

Five of Foster's novels also focus on the consequences and the potential of genetic manipulation. *The Warriors of Dawn*, *The Gameplayers of Zan*, and *The Day of the Klesh* develop from the premise that human attempts to create a superhuman race called Ler will yield unwanted results. *Gameplayers*, chronologically first in the full tale, documents the agony of mistrust and misunderstanding that sends most Ler off to the planet from which warriors (in *The Warriors of Dawn*) appear. The Klesh, humans that these Warriors have enslaved for purposes of breeding, are freed to migrate to Monsalvat, the planet which forms the backdrop for the third novel in the story's internal chronology, *The Day of the Klesh*.

*The Morphodite* and *The Transformer* presuppose a more refined set of techniques for manipulating the genetic makeup of live beings. These techniques are perfected on a backwater planet called Oerlikon to result in a being who can change his/her protoplasmic shape at will. Rael/Damistofa/Phaedrus uses an extension of principles upon which the *I-Ching* was constructed to "read" the world around him/her and discover which act is most likely to cause the disintegration of a rigid Oerlikon society. However, like the Ler in Foster's first trilogy, his/her power soon outstrips that of her immediate creators. The sensitive handling of female characters, both in the person of the viewpoint character is one of his/her states and her companions when s/he is male, is more developed in these two novels. This ability of Foster sensitively to present female characters such as Fellerian, Snajirmil, and Mevlannen (*Gameplayers*) led to speculation with the first two novels that he was himself female, and is thus no minor accomplishment. In fact, many of the techniques such as elaborate description through footnotes as well as in-text references, multi-layered plot, and "scientification" of divinatory tools are displayed with much refinement in these two novels. While *Gameplayers* was originally my favorite of his works because of the Ler-viewpoint character Morelenden, the latter two novels hold up much better to rereading.

*Waves* is the most Russian of Foster's novels, taking place on a planet which seems to have been settled by people of that national grouping. While the setting reflects his language ability (he acted in the capacity of Russian linguist while with the U. S. Air Force), the plot follows a linguistic mystery—an ocean which seems to speak a language. Perhaps because he had to resolve the mystery in the course of only one novel, Foster was not as successful in substituting his own type of multi-plotted complexity for tight structure. In fact the plot

tends to get lost in the love-story of his two protagonists. *Waves* is slow-paced, somewhat lyrical, and reminiscent of Lem's *Solaris* without its weighty philosophy.

Foster's short novels, four of which appeared in *Owl Time*, are attempts to vary his style after the patterns of contemporary SF and non-SF writers. Yet, with the possible exception of "The Conversation," they seem very much Foster. For example, "Entertainment," which is supposed to emulate Jack Vance, incorporates the footnotes, prefatory quotations, single viewpoint character, and puzzle-plot of his earlier fiction. Whether the set of experiments represented in this book have been successful in further developing his own unique style remains to be seen.

\* \* \*

Gardner F. Fox is probably best known for his comic-book work, which includes scripts for such science fiction-based characters as Superman and Hawkman. In science-fiction proper, he's probably best known for a handful of paperback novels. Yet his best science fantasy writing is probably to be found in a dozen space operas published between 1945 and 1952, mainly in *Planet Stories*, where they are overshadowed by the more impressive work of Ray Bradbury, Leigh Brackett, and Ross Rocklynne. But much of that work remains highly entertaining.

His first actual SF-fantasy sale was to *Weird Tales*, but his first story for *Planet Stories*, "The Last Monster"—a benevolent alien's efforts to aid endangered humans are misread as the menacings of a monster—won the instant approval of the magazine's readers. Fox buttressed his success with "Man Nth," in which aliens recruit beings from various worlds and endow them with superhuman powers to enable them to fend off a cosmic threat that would do justice to some of the grander fancies of A. E. van Vogt. "Man Nth" was an almost flawless entertainment and demonstrated a much surer touch than

"The Last Monster." "Engines of the Gods" and "The Man the Sun Gods Made" established Fox as one of the most reliable writers of strong space adventure novelets. "The Man the Sun Gods Made," about an artificial superman who stymies Earth's plans to exploit his planet, melded concepts Fox had already proven himself comfortable with—supermen and super-science—with the sort of story Leigh Brackett was already demonstrating success with.

"Vassals of the Lode-Star" is one of the strongest of his stories, arguably the best work he's produced in the field. A rift in the fabric of time and space transports its hero to another world where he finds himself in a war with a superbeing bent on enslaving everything in reach. This was a story where everything worked for Fox: a strong and likeable lead character, Thor Masterson, a swift and interesting plot, concepts that are sufficiently gradiose and metaphysical to evoke a sense of wonder, and a benevolent alien, the Discoverer. "When Kohonnes Screamed" is less successful, though strongly imaginative, dealing with a planet where space and matter are dangerously and unpredictably distorted by a force which must somehow be located and destroyed. "Tonight the Stars Revolt!" is a strongly plotted story written in a terse prose under the now-traditional influence of Brackett, its conventional overcome-the-evil-ruler plot buoyed with fine story telling and a strong imagination.

With the collapse of the SF market, Fox found success with original paperback historical novels, and he touched the periphery of SF with a novelization of the movie of Jules Verne's *Five Weeks in a Balloon*. But *Escape Across the Cosmos* was his first true SF novel. It was the story of a superman, falsely accused of a crime, who sets out to defend himself. *The Arsenal of Miracles* told of an outcast Earthman—a disgraced space officer—who joins forces with the queen of an alien world to fight the overwhelmingly powerful Empire of Earth. Some of its passages may have promised the same sort of fun delivered by his earlier stories but novel-length SF seems never to have been Fox's forte. *Arsenal of Miracles* is a fun read, but none of the subsequent novels are quite as good as it is. Under the name Bart Somers he produced two space operas based on the adventures of a character called Commander Craig, a space-going trouble shooter.

*Conehead* is one of his most interesting efforts. It touches on a more serious theme than is common to most of Fox's work, racial prejudice. His hero is the standard space officer of most of Fox's novels, but instead of being a warrior, he is a lawyer who sets out to establish the civil rights of the natives of a planet under the domination of Earth. The story returns ultimately to familiar ground: the planet holds the remnants of an alien race, all but extinct, yet still possessing god-like powers, and it is the force of their powers and not of any moral argument that ultimately sways the empire.

Fox is no idea man. His backgrounds are often merely sketched in, which probably accounts for his failure to draw any really widespread following among readers. But he is also a genuinely unpretentious writer whose work provides the sort of straightforward entertainment expected of good space opera. His novels are workmanlike and fun, but they lack the flair, imagination, and pacing of his best magazine stories.

In the late 1940's and 1950's, a growing distrust of technology focused on the dangers of atomic energy. The most obvious danger was that of nuclear war, but concerns about reactor break-downs or bomb-factory explosions were also on people's minds. The immediate blast was one threat, and genetic damage from radiation was another. Science-fiction writers were among the first during this period to give such fears a public voice, and one of those writers was Pat Frank.

Frank wrote a great deal of material—fiction and non-fiction—dealing with the possible problems with atomic materials. His first novel, *Mr. Adam*, postulates universal male sterility as one of the results of an explosion at an atomic bomb factory in Mississippi. *Forbidden Area* attempts to show how, why, and when the Russians might attack the United States. This book is an especially grim indictment of America's lack of preparedness for such a possibility. Frank shows how the various agencies—paralyzed by red tape, inter-departmental bickering, unqualified political appointees in positions of power, and the like—refuse to act until it is almost too late, averting an all-out Russian attack by only minutes.

Frank is probably best known as the author of *Alas, Babylon*, a post-atomic war novel. Randy Bragg, an inhabitant of Fort Repose, Florida, is warned by his brother, Mark, a SAC Intelligence Officer, that the war is coming. Mark sends his wife and children to Randy because Fort Repose will be safer during such a war than will SAC Headquarters, Omaha. The bombs and missiles fall, and the people of Fort Repose are on their own. Unlike Nevil Shute's *On the Beach*, in which everyone dies, *Alas, Babylon* is basically a romantic view of the aftermath of an atomic war. Randy and his friends do not have too much difficulty surviving—though Civil Defense agencies have prepared almost no one, and Randy has to organize the people of Fort Repose—and only one of the central characters is killed. With this romantic novel, however, Frank presents all the atomic fears, from initial blast to genetic mutation, in one package.

Frank also examines the use of power in *Alas, Babylon*. There are various people in the novel who have power and should not. Randy was defeated in politics by an opponent who appealed to bigotry and fear. The Navy Ensign who fires the shot that starts the war uses the power of his jet plane to compensate for his diminutive physical stature. Randy, however, uses the power at his disposal to keep Fort Repose safe. From this, it is clear that it is not power, *per se*, that Frank objects to but the lack of qualifications of some of the people who have the power.

Frank's novels are well-written. They have strong plots, well-paced action, and interesting characters. They are not so much appeals to the reader's fear of atomic power as they are warnings.

—C. W. Sullivan III

**FRAYN, Michael.** British. Born in London, 8 September 1933. Educated at Kingston Grammar School, Surrey; Emmanuel College, Cambridge, B. A. 1957. Served in the Royal Artillery and Intelligence Corps, 1952-54. Married Gillian Palmer in 1960; three daughters. Reporter, 1957-59, and columnist, 1959-62, *The Guardian*, Manchester and London; columnist, *The Observer*, London, 1962-68. Recipient: Maugham Award, 1966; Hawthornden Prize, 1967; National Press Award, 1970; *Standard* award for play, 1976, 1981, 1983, 1985; Society of West End Theatre award, 1977, 1982; British Theatre Association award, 1981, 1983; Olivier Award, 1985. \* \* \*

Michael Frayn is not an easy writer to categorize. *The Tin Men* is obviously not SF but witty comedy, school of Waugh; on the other hand, it obviously is SF, as it purports to be written by a computer and satirizes men who behave like computers and are trying to make computers behave like men. When a robot comes to write its own prehistory, it will have to give classic place in its mythology to Macintosh's ethical machines and their struggles on the sinking raft. But the novel is not so much SF itself as an exuberant account of the men who are trying to make our world into an SF dystopia. The great discovery of Macintosh and Goldwasser is that, because all human life is of no purpose other than to provide newspaper headlines and statistics, humans can stop living and let the computers do it for them. Computers can produce newspapers, sports results, pornography, prayers: who needs people? The characteristic inverted logic of Frayn's tin men naturally produces a novelist who begins by writing the blurbs, the potted biography, and the reviews, and only then tries writing the book (formulaically, of course), before capitulating to the superior power of his typewriter keyboard. What *The Tin Men* itself lacks as a novel is a story worthy of its theme. Admittedly the story, which concerns the opening of the Ethics Wings in a computer research establishment, not by the Queen, as planned, but by her stand-in for rehearsals (an ungainly man called Nobbs), illustrates several aspects of the theme of illusion mistaken for reality, but its spirit of low farce inoculates the reader against taking the book seriously. Also, the novel's short-breathed episodic quality—it is really only a series of sketches strung loosely together by a farcical plot—too openly betrays the author's work as a whimsically satiric journalist. The short-breath syndrome is familiar among SF novelists who are really short-story men; in *The Tin Men* we have an essayist trying to write a novel and not quite succeeding.

*A Very Private Life* also has a mosaic quality (as indeed does Frayn's stimulating philosophical work, *Constructions*), but here the small pieces compose a highly satisfactory work of art, one of the most delightful fabulations in the genre. The heroine, Uncumber, begins as a misfit in a society where what the Haves have is privacy: they meet by holovision, as in Asimov's *The Naked Sun*. Uncumber falls in love with a man who lives on the fringes of her enclosed society, journeys outside her cell to meet him, is disillusioned by life outside, falls in with outlaws, is rescued by the police and rehabilitated. Comparison with *The Naked Sun* is instructive because, unlike Asimov and the typical SF writer who might handle such a theme, Frayn has not written a dystopian satire: his absurd world is presented not as a threat but as an alteration simply, a new mode, not inhuman but nicely domesticated by engaging touches or ordinariness. Again, if we compare Frayn's work with Angela Carter's *Heroes and Villains*, in which the ivory tower world is promptly sacrificed to the perverse gypsy delights of the world outside, we see how detached and balanced, how cool Frayn is. Uncumber does not find the outer world romantic, as a Carter heroine would; instead, the best it can offer is a tatty attempt to emulate the values of those inside, while the worst is nasty and brutish: the outlaws are indeed, as they are called, "Sad Men." Frayn's novel is written as a fairy story that begins "Once upon a time there will be a little girl called Uncumber," and in that spirit it should be read.

In *Constructions* Frayn tells us "I should like to say this: don't worry when you find yourself in the midst of a mythology. Relax and enjoy it." Some SF readers may find themselves grveled by the way in which this sharp and witty writer pulls his punches.

But Frayn is not a knock-down satirist: he's a comic ironist who enjoys the spectacle of human absurdity, and wants us to share the fun. *Sweet Dreams* should also be read, although, as it is a story set in the after-life, in which revivification is without benefit of technology (by which Farmer and Silverberg, say, have accommodated this mythological idea to SF), it is strictly outside our genre.

#### Nancy Freedman comments:

I had no idea I was writing science fiction when I began *Joshua Son of None*. My philosophy of an author's obligation, besides of course literary considerations, is that he should stand slightly outside his own time, letting events wash over his work. To prepare for *Joshua Son of None* I attended a seminar at Cal Tech given by Dr. Robert Sinsheimer and in 1972 I was introduced to the work Dr. Steptoe was doing in genetic engineering. Six years later he refined the process which I

describe in my novel, and produced the Brown baby. With *in vitro* technique we are halfway to the possibility of cloning. *Joshua Son of None* was published by Delacorte who paid me a large advance, and it was made a Literary Guild selection—and then, wonder of wonders, silence in the press. The Guild quietly dropped it ads, as did the publisher. The reason? I was told that the public wasn't ready for a book about cloning. It was too terrifying a possibility. Shortly thereafter *The Boys from Brazil* appeared, treated not realistically but in a cops-and-robbers setting. It emanated from my own agent and publisher, who apparently felt that, done in this most fantastic manner, it would not appear threatening. It didn't; in fact, it gave rise to an endless series of jokes on the subject (perhaps equivalent to "whistling in the dark"). *Joshua Son of None* was the first book on the subject of cloning, and I treated the material with great respect for I believe the first clone will within a decade tread this earth. The book was science-fiction when I wrote it. How long it will remain so I can only guess.

As a writer I am concerned with the future. I am particularly concerned with the connective tissue that runs from earliest time to the present and stretches into the future. One such skein is mankind's desire for the one attribute denied him by the gods—immortality. Through the process of cloning we may have been handed this key to life everlasting. Man has not defeated death. If he goes this route, he will die many deaths and live many lives in his quest for personal self-perfection. The technical revolution which will make this possible is of greater magnitude than the splitting of the atom. It is the opening of Pandora's box. Skinner and his colleagues claim that environment totally modifies and changes behavior. And a clone is born into a different environment. Carl Rogers takes a more moderate position, believing that while the environment modifies man, man is not passive. He in turn changes and interacts with his surroundings. This is the thrust of my novel. Joshua is the son of none, having neither father nor mother but replicated from a single cell of his own dying body. In the book, a deliberate attempt is made to control the environment and replicate the phenotype of the assassinated president. But it appeared to me that the clonee differed from the original when he discovers he is a copy of someone else. That is the identity crisis of all time. When he asks, "then I'm not myself—I'm him?" At that moment he becomes his own person.

I am often asked why I took John F. Kennedy as my prototype. Partly, personal identification. I had broken my back and was forced to lie absolutely flat for seven months. During this time my mind reverted frequently to Kennedy. He had gone through the same ordeal, which is so psychologically damaging, and had rallied to become President. I at least would stand on my own feet and walk. Moreover, when the book was first conceived, I envisioned it as the retelling in modern terms of a myth, namely, man's desire for life everlasting. And for a myth, a folk hero, someone larger than life, is needed to carry it forward. Only one contemporary answered that description, the man I already identified with so closely.

\* \* \*

Nancy Freedman comes to science fiction as an established novelist trained in general fiction, with a particular concentration in the history of families—the stories that families make through their connections, multiplication, and dynastic continuity. For someone with such an interest, the idea of cloning holds special appeal, a desire for the power represented by non-generative extensions of a generative group, plus the dream of repeated personality. When Freedman connected the

idea of cloning with the history of the Kennedy dynasty, she produced *Joshua Son of None*.

The premise of the book is that a doctor present at John F. Kennedy's assassination preserved tissue from the dying President, and then found a scientist with knowledge of cloning, and a millionaire with the willingness to raise the resultant child in the Kennedy pattern. Partly an experiment and partly a long-term plan for political power, the project works. A surrogate mother carries the child, the millionaire's family is remodeled to raise him, and simulated deaths and disasters warp his psyche in the original pattern. What is produced is a young man who finally realizes not only that he must become President, but that in some sense he already was.

The problem with the premise is that cloning simply does not have the potential of repeating personality or history. Freedman details the science of the project with intelligence and clarity, but in her need to make the novel work, and in her apparent affection for Kennedy himself, she gives too much credit to chromosomes. The profound differences that develop between identical twins—raised in the same family at the same time—should be enough to demonstrate that there are too many other factors at work. A less meticulous novelist might have invented a technology to help preserve personality as well as genotype, but Freedman, sticking to it-could-happen-here facts, only advances the craft of cloning as far as success with human cells. As a result, the science she invokes but does not follow would condemn the plot, particularly the lurid ending, to the category of wishful thinking and near silliness.

Yet the book is effective, mainly because of Freedman's other novelistic skills. Her characters have a depth that allows her to measure with considerable feeling the impact of technological power on its human victims. The moment when Joshua Francis Kellogg rips off his braces and recognizes someone else in the mirror is surprisingly moving. In fact, throughout the book Joshua's reactions have coherence and growing familiarity that should demonstrate that novelists are better at reproducing personality than genetic scientists.

After *Joshua Son of None*, Freedman continued writing about science in *The Immortals*, the story of an oil dynasty. While this long novel is not actually science fiction, the same interests re-appear—the network of family, and the possibility that science could break history loose from its disastrous course. As in *Joshua*, the descriptions of research and technology (the invention of a solar cell) are clear and well-written. Freedman writes on the edge of science fiction, pushing speculation only as far as the near future. Given her solid novelist's skills, it would be interesting to see her attempt a farther future.

*Town House*, adaptation of stories by John Cheever (produced New York, 1948).

\* \* \*

Gertrude Friedberg has published several interesting science-fiction works.

*The Revolving Boy* follows the early life of a supernormal child, Derv, who has the ability to be both radiometer and compass. One of the major themes of the novel is that of discovering and communicating with another civilization. Derv was born to astronauts in 1970, in a weightless condition far from the earth's forces. Because he did not experience gravity at birth, he was able to align himself to a signal from another solar system. He feels compelled to preserve his original orientation to this signal—called the Direction—and consequently, when his body is turned in one direction, he must unwind himself in the opposite direction to recapture his original position. He turns somersaults in bed to compensate for the earth's revolutions and his day's turnings. During his elementary school years, his teachers become concerned as he executes dangerous spins on stairways. He becomes known as "the boy who leans" when his body begins listing in the direction of the signal.

To escape the publicity following his birth, Derv's parents faked a fatal accident in a sailboat, escaped undetected, and assumed new identities. The novel excels in the following the parents' fears of discovery as they observe the development of Derv's talent. When Derv reaches high school, an astronomer who knew the astronaut parents discovers their true identities and persuades them to allow Derv to help trace the signal on a laboratory radiometer. Just as the signal is found electronically, Derv and his parents disappear again. Part Two of the book begins some years later, after Derv has taken a new name—Fred Gany—and married his childhood sweetheart, Prin (now Reine), who has perfect pitch. Derv-Fred's signal has suddenly stopped and he has lost his sense of balance. The remainder of the book concentrates on Prin-Reine's attempts to relocate the laboratory radiometer (which has been abandoned) and to determine if the signal has indeed terminated.

Friedberg's scientific projections are mostly erroneous. For instance, the exposition of her novel is centered around the ban on space travel in 1970, due to a belt of nuclear waste around

the earth. She overestimated the speed of change to electronic devices in the homes of the 1970's. Her scientific research can also be faulted, since she has failed to take into account some of the properties of radio signals, such as the possibility of blockage by shielding masses (the earth, tunnels, and concrete buildings).

"The Short and Happy Death of George Frumkin" is a tongue-in-cheek look at the use of artificial organs. George, 97 years old, has developed not only a knock in his artificial heart, but also a bad case of ennui, as he refuses to complete a promised rewrite of the second act of play. George's wife, Helen, persuades him to call an electrician, Dr. Stebbins (most doctors are electricians these days), who tells him that he needs "a new battery and a new variable autotransformer." In order to hook him to his new system, Dr. Stebbins switches him to house current until the calibration procedure is finished. During the short space between plug-ins, George is "dead." However, house current proves a boon to George, providing him with the creative energy to rewrite his second act, plus an oversupply of sexual libido (he attacks his wife and propositions the maid during this interval). But after his return to battery power, he resumes his uninspired ways, learning nevertheless that his rewritten second act has given the play "more heart." This entertaining spoof is a gem, undoubtedly Friedberg's best science fiction effort. She uses a female narrator for this story, plus a steady supply of eccentric comic characters.

"For Whom the Girl Waits," properly called science fantasy, is a dreamlike account of double identities in a high school setting. The main character, Louis Demperi, is a substitute teacher who assumes the identity of the teacher he replaces. The role-playing works well until he takes the place of a man named Koppinger, for whom a beautiful girl waits each afternoon after school. Then he becomes disoriented and cannot remember that he is Koppinger, until he discovers that another man has assumed his own identity. Demperi decides to carry on with Koppinger's role and meets the girl, who rejects him and causes him to have a fatal car accident. But his identity lives on in the person of Demperi's substitute. The story is somewhat confusing but is imaginative and fascinating to read.

In her writing, Friedberg uses a simple, unpretentious style and in general organizes her material chronologically. She excels in the handling of women characters, which suggests that her works might have been more successful if the central characters had been women instead of men.

\* \* \*

H. B. Fyfe has written several dozen conventional short stories and a single episodic novel that obviously meshes several shorter stories into one whole. He is perhaps best known for his series about the Bureau of Slick Tricks, a secret human organization whose purpose is to finagle humans out of embarrassing situations on other planets. The novel and at least five stories fall into this series, and a number of other stories are very similar thematically. Essentially, the philosophy expressed is that humans are the most flexible, inventive race in the universe and that any aliens who encounter us should hold onto everything that isn't nailed down.

"In Value Deceived" is a perfect example of this. Two starships, one human and one alien, encounter each other in space. The aliens are short on rations, and are seeking edible plants, which they consider highly valuable. They trade a "worthless" piece of their own equipment for some hydroponic supplies; the "worthless" item allows transmutation of elements. In "Ransom" primitive aliens decide to kidnap humans as leverage against the crew of an exploratory starship. They end up with two robots, and are dismayed at the casual manner in which they are abandoned. The novel, *D-99*, features a host of confused, outsmarted, and frantic aliens, who cannot cope with human manipulation of events.

Fyfe was not permanently wed to this concept, although it does dominate his work. One of his best short stories, "Protected Species," is in fact quite atypical. The primitive aliens skulking about the ruins of their former civilization are treated with active sympathy, and ultimately it is the humans who find themselves the butt of a cosmic joke. In "The Talkative Tree" an alien culture provides the means whereby humans alienated from their dictatorial and conformist culture can escape into almost any conceivable form of freedom by altering their physical nature.

Fyfe makes use of a number of standard plot devices and has done little in the way of innovation. He explores both sides of the

human-robot interface. Robotic servants with their built-in limitations drive a magazine editor crazy in "The Well-Oiled Machine," but they come to dominate the world in "Let There Be Light," and are preyed on by human scavengers for the oil they use within their bodies. Man is therefore reduced to the level of a mechanical vampire. By far his most outstanding work is "Moonwalk" which makes use of a classic man-against nature situation, one that has been used many times both within the genre and without. As the result of an accident, one man is stranded on the lunar surface, several hundred miles from the moon's only human installation. The plot unfolds in logical fashion, as the protagonist wrestles with time and a diminishing air supply, and the reader struggles with frustrated impatience as the authorities refuse to believe that the lack of radio contact portends anything requiring action. Although Fyfe is not capable of making this a truly great story, he handles it quite well, and it is a worthy contribution of its type.

Fyfe has remained a dabbler, and his obvious talents have not been developed. There is little difference in quality between the earliest and most recent stories. Nevertheless, his competent stories have provided entertainment and adventure to his audience.

#### Raymond Z. Gallun comments:

Most of my science fiction was originally published in the 1930's, mainly in *Astounding* while F. Orlin Tremaine, whom I remember with appreciation, was editor. I think I aimed mostly at realism insofar as it could be construed from what was then supposed to be true about the various planets, plus humanizing of even the unhuman characters, giving them points of sympathetic contact without overdoing the sympathy. Some time after World War II I dropped out of SF to do other things. Being now retired from formal employment, I have been trying to get back into SF writing. "Then and Now" (*Analog*, December 1977) is a fair example of what I have been recently trying to do.

\* \* \*

Raymond Z. Gallun has published in the pulps vast quantities of clumsy and primitive fiction, and yet his treatments of several of the more sophisticated problems facing modern man are often exciting and provocative to read. He is a vintage science-fiction pulp writer from the 1930's who published his most ambitious novel in the 1970's. One critic has labeled his underlying philosophy "Darwinian existentialism"; and two short quotations from what Gallun himself has called his favorite short story, "The Restless Tide," will introduce the stark polarities that he continually balances in his best work. At the end of the story, the protagonist concludes, "Mankind was like a rough, sturdy plant, growing, thrusting; crude but magnificent, and caught between rot and fire." Earlier he had exhorted his wife, "It's the contrasts that count. There's a rough drama in people."

Gallun's novel *The Eden Cycle* is a fine expansion of these earlier themes. The Hegelian balancing of opposites along with the classic polar opposition, which is also a key to the meaning for us of Darwinian theory, between the glory of early primitive development and the continual trend toward greater sophistication are well developed in this long narration of the most advanced human hedonists governed by aliens. In fact, for Gallun the contrasts that run throughout his fictions are so roughly vivid that they become emblematic of what the Renaissance loved to call man's amphibian nature. Aliens are presented as complex and sympathetic characters early—"Old Faithful" (1934)—and then throughout his career. In addition to the rough contrast of man to alien, there is repeatedly drawn the contrast of creature to environment, as in "Godson of Almarlu," as well as the contrast of past to present. Science fiction lends itself particularly well to the old opposition between a golden age of the past and a modern iron age because science fiction tries to image both technology and man's inner primitive self. Gallun's work conveys these oppositions continually in the narratives mentioned above and in such pieces as

*People Minus X*, "Return of a Legend," and "The Lotus-Engine."

Rough contrast is also a most appropriate characterization for the literary impressions of Gallun's extrapolations. For example, "The Lotus-Engine" makes skillful use of the classic Homeric myth of the lotus eaters and also weaves a most explicit set of images to convey again the old story of mutability and decline associated with technological advance. But even in this story the pulp characterizations of "old chums" must enter, and the characters even smoke cigarettes inside the oxygen rich helmets of their "space armor." A genre that can retell the most profound human dilemmas in what are often such rough forms is indeed sturdy and growing, and Gallun was one sturdy and often rough writer who contributed greatly to its growth.

\* \* \*

Daniel F. Galouye, a greatly underrated and largely forgotten writer, is probably best remembered for the numerous short stories and novelettes in the science-fiction "slicks" of the 1950's and 1960's. Despite them, however, his primary contribution to the field rests in three novels: *Dark Universe*, *Simulacron-3*, and *Lords of the Psychon*. Always well-conceived, well-planned, and well-crafted, Galouye's stories

are extrapolations of scientific fact or theory, but his vivid and far-ranging imagination and his incredible attention to detail often carry his readers well into the fantastic. These characteristics are most visible in the novels where the length permits the accumulation of detail to achieve its full impact.

Though many of Galouye's stories use a post-disaster motif, they reflect his optimistic belief in the capability of man to develop his latent mental abilities, and often the resolutions of his plots depend upon the evolvment of such talents as astral projection, extended vision, teleportation, and mental manipulation of matter or energy. Curiously, he often depicts faster-than-light spaceships powered by psychokinesis, as in "The Centipedes of Space" and "Phantom World." His ultimate statement on human development, however, is found in "The Secret of the Immortals," where he proposes a metamorphosis that not only brings new mental powers but an extended life of at least 5,000 years.

Galouye's work also displays a preoccupation with the idea that man may be manipulated by external forces, and often the world of the story is a microcosm of some vaster universe. This concept frequently takes the form of a puppet motif. One of the most unusual twists on this theme occurs in "Gulliver Planet," where microscopic aliens invade the bodies of seven humans and manipulate them as part of their invasion plan. The theme's unique treatment, however, comes in *Simulacron-3*, where Doug Hall, the protagonist, discovers that he is merely an electric analogue in a total electronic simulation of the real world.

Galouye's overriding concern is the nature of reality and the related problem of perceiving it. Most of his stories and his three best novels treat this theme. *Dark Universe* deals with a colony that has survived a world-wide atomic war by retreating underground. One of 17 such colonies, "U.S. Survival Complex Number Eleven" functions well until a minor fault shift totally destroys its ability to generate electricity and cuts off all but a few of the superheated water conduits that lead to the group's basic living chamber. Through succeeding generations, the loss of sight and the disintegration of their knowledge of their original world creates a culture totally dependent on sound for survival and ignorant of their true circumstances. The story concerns the attempt of one young man, Jared Fenton, to discover what light really is. The novel's status as a minor classic comes from Galouye's treatment and control of his material. His elimination of all words from the narrative that relate to sight and his passages which describe how Fenton uses his non-visual senses to perceive his world are brilliantly effective.

*Simulacron-3*, an extremely original work, also treats the nature of reality. Doug Hall discovers that his world is but an electro-mathematical model of an average community and that it is marked for extinction. In an ironic reversal of roles, he manages to change places with the real Doug Hall, the megalomaniacal operator of the simulator, and prevent his world from being erased. *Lords of the Psychon*, though not quite so well-controlled as *Dark Universe* or so original as *Simulacron-3*, is a post-destruction story that concerns the efforts of Geoffrey Maddox to prevent aliens from drawing Earth into another dimension. In the process of fighting them, he learns that he can mentally manipulate the fundamental form of matter, a pink plasma called psychon, and he proves that it is itself merely a reflection of the mental.

Galouye's major weakness is his relatively shallow characterization. It is often difficult to distinguish between his parade of military protagonists, and his women are seldom more than helpless sex-objects. Where he has the time to infuse his narrative with detail, however, his principal characters manage

to become more than cardboard cutouts. Originality, control, and fast pace are typical of his best writing.

*A Gallery of the Saints.* Derby, Connecticut, Monarch, 1963.

\* \* \*

Randall Garrett paid his dues writing under a bewildering number of pseudonyms for the magazines of the 1950's, and most of his stories are firmly set in the idea-oriented action adventure frame of the *Astounding* "house style". Character and description are kept firmly subordinate to concept and event, and, however useful this period may have been in teaching him his craft, the results are more often than not routine. For example, compare "There's No Fool" with Asimov's "Belief." The theme in both is essentially emotional rather than intellectual: How do you convince someone of something he "knows" to be impossible? Where Garrett treats the theme in an externalised fashion, Asimov takes us inside the emotional confusion of his characters. "Despoilers of the Golden Empire" (in *Takeoff*), to give another example, is a pure literary trick, retelling the life of Pizarro in terms of the clichés of space opera.

The early stories, although superficial in many ways, are never less than entertaining and occasionally there appears a unity of theme and style that is exceptional and which produces a strength of effect above Garrett's routine level. In "But I Don't Think" he produces an early example of his love of inverting the themes of classic science-fiction in a black parody of *The Space Merchants*. A privileged member of an autocratic society is suddenly thrust into its lowest depths. Where Pohl and Kornbluth's hero joined the underground and learns humanity, Garrett's character shoots his serf benefactress and returns cringing to duty. "The Destroyers" is the story of a society doomed by outsiders seeking to liberate it. It concentrates on mood rather than action, allowing most of the major events to occur "offstage."

In the 1960's and 1970's Garrett produced first a minor, then a major, series of interrelated stories. The minor series, written as Walter Bupp (and containing a character called Walter Bupp) are particularly strong in characterisation, creating a sub-culture of outcast psionics, neurotic and embittered, trying to find a way to live with the culture that rejects them. (I think I detect an influence from them in Anne McCaffrey's *To Ride Pegasus*.) The major series is the Lord Darcy stories. Set in a world ruled by an Angevin Empire of the 20th century, in which magic has become the dominant science and technology, they centre on the detective Lord Darcy of Rouen and his "Forensic Magician" Master Sean O'Lochlainn. They parody many major detective writers (Rex Stout in the person of the Marquis of London, Dorothy L. Sayers in the opening of "The Ipswich Phial", Agatha Christie in "The Napoli Express" and Conan Doyle just about everywhere — "Dr Pately frowned. 'A what?' 'Elemental, my dear Doctor.'") Every story is fair to the reader in following the rules of the classic detective story but it's not unfair to say that, of the series, the novel *Too Many Magicians* is the most successful.

In the 1970's the volume of Garrett's output declined but the quality if anything improved. To be noted is his collection of parodies, *Takeoff*, and the Gandalara series written with his wife Vicki Ann Heydron. Set in a desert world these stories have become very popular and certainly have all the virtues of Garrett's skilled storytelling. But for me they lack the mental

sleight of hand and depth of theme of the best of earlier Garrett.

In my opinion it's a great shame that there is no collection of the best of Randall Garrett's output of short fiction available to give younger readers without access to the old magazines a taste of this writer who has given so much to the field in the form he made most use of.

—Michael Cule

## SCIENCE-FICTION PUBLICATIONS

## Novels

*An Apology for Rain.* New York, Doubleday, 1974.

*Algorithm.* New York, Berkley, 1978.

\* \* \*

Jean Mark Gawron has written two novels basically concerned with the lack of meaning in modern society. Both seem to present partially hallucinatory atmospheres, but there is a strong element of intellectual control over these surrealistic backgrounds. As with many first novels, *An Apology for Rain* is an elaboration of the Quest theme with a woman hunting for her brother, who may be able to end a war in an After-the-Bomb America. The novel is written in a sparse but literary and impressionistic style which imitates the austere landscape. *Algorithm* is written in a more complex, poetic, and fluid style which mirrors the decadent setting. *Algorithm* is also a variation of the Quest theme as a bizarre cast of characters search for an assassin as part of a *coup d'état*. The plots of both books are deceptively involved and intentionally ambiguous. The concept of an algorithm as a pattern for a thought process, whether performed by a human or a computer, is a fundamental organizing principle for Gawron's view of literature. He shares with Samuel Delany an intense interest in patterns of thought as they are reflected in linguistics, communication theory, computer science, and semantics.

Gawron seems to have been influenced by Alfred Jarry's concepts of pataphysics as applied to literature. The most significant result is his emphasis on the fundamental and inescapable ambiguity of language, literature, and life. Likewise, much of the dialogue is abrupt, perversely circular, and combined with intermittent scenes of metaphoric visual description. In addition, there are sudden reversals of meanings and comprehension, redundancy, imitative form, and a frequent use of symbolic masks and elaborately strange costumes. Although in very different ways, both of his books convey an air of melancholy as he asks us to "Quaff the torpid photons of your autumn."

##### Novels

*A Hawk in Silver* (for children). London, Gollancz, 1977.  
*Golden Witchbreed*. London, Gollancz, 1983.

##### Uncollected Short Stories

"The Crystal Sunlight, The Bright Air," in *Isaac Asimov's Space of Her Own*, edited by Shawna McCarthy. New York, Davis, 1983.  
 "A Shadow under the Sea," in *Isaac Asimov's Science Fiction Magazine* (New York), October 1983.  
 "The Harvest of Wolves," in *Isaac Asimov's Science Fiction Magazine* (New York), December 1983.  
 "Anukazi's Daughter," in *Isaac Asimov's Tomorrow's Voices*. New York, Davis, 1984; London, Hale, 1985.

\* \* \*

Mary Gentle's first novel, *A Hawk In Silver*, a juvenile fantasy (written when she was 18), falls outside the concerns of this volume, but her first adult science-fiction novel, *Golden Witchbreed*, suggests that a major new talent has entered the genre. It would be all too easy to give comparatives—to state that the novel is a Le Guin-like story (with touches of *The Left Hand of Darkness*) set in a Delanyesque environment (and I think particularly of *Nova*)—but that's to denigrate the originality of her achievement. Lynne de Lisle Christie is an envoy from Earth to the human-like aliens of Orthe (and that subtle distinction in names is of a piece with the subtle distinctions throughout the novel on every level). Her journeys about Orthe, the betrayals, discoveries, and eventual self-discovery, involve us not merely on the level of the adventure story, but make us consider our own social organisations. Orthe is a world which, while seeming primitive, is in fact more advanced than our own—it has chosen a different social direction to our own: "But you don't expect an ancient race to be dirty-handed. . . . You don't expect them to kill—or if you do, it's with world-destroying weapons: nothing so simple and bloody as a yard of razor-edged metal. And yet they're not simple." Gentle's depiction of this world and its people is vividly imagined and—unlike so many such conceived worlds—acutely real to us. This is, if you like, romantic realism; a novel to be compared with the best in the modern genre.

*The Big H*. London, Boardman, 1961; New York, Holt Rinehart, 1963.

\* \* \*

On the basis of his two science-fiction novels, Peter George's career in science fiction would be only a footnote in the literary history of science fiction. But one of them, *Two Hours to Doom* (*Red Alert*), formed the basis for Stanley Kubrick's brilliant film *Dr. Strangelove*, and the rewritten novel *Dr. Strangelove* must be considered a minor classic of science fiction. No other example comes to mind of a film "tie-in" novel superior to the original written version, and this work will repay serious reading and examination.

Richard Gid Powers's introduction to the Gregg Press edition of *Dr. Strangelove* (1979) examines *Red Alert* in the context of the tradition of "future war" fiction, most especially the nuclear holocaust stories so characteristic of the Cold War period, and draws a comparison with Nevil Shute's *On the Beach* (1957). *Red Alert* is a humorless thriller, full of procedural details concerning the Strategic Air Command and of sincere moral underpinnings, about the danger of hair-trigger nuclear retaliation systems to all humanity. At the end of the book, catastrophe is averted, both Russians and Americans seek peace, and the wise President has the last word. Not so *Dr. Strangelove*. Powers makes a case that Kubrick and Southern, in writing the screenplay, altered George's original beyond his control and his talents. Whatever is the case, *Dr. Strangelove* is a small masterpiece of black humor, worth a place beside works by Heller and Vonnegut—and it is certainly within the borders of science fiction, though only just. In the new version an insane general closes his US military base and sends his planes against the Russians, fully armed for retaliation from an (imagined) enemy attack (and, for security, maintaining radio silence); all planes are turned back in the nick of time, except one, whose radio is damaged—whose target will detonate an automatic Doomsday Machine, a nuclear device capable of destroying the entire surface of the

**GEORGE, Peter (Bryan).** Also wrote as Peter Bryant; Bryan Peters. British. Born in Wales in 1924. Served in the Royal Air Force during World War II; rejoined Royal Air Force in 1951; retired as Flight Lieutenant, 1962. *Died 1 June 1966*.

earth—and this one plane succeeds heroically and ironically and destroys the world. Except for the ending, this is George's story. But it is not told in George's *Red Alert* style nor with his characters. All the ordinary names are changed to grotesques, to General Jack D. Ripper, "king" Kong, Mandrake, Turgidson, Strangelove. Every sentence points out, deadpan and without a moral stance, the insanity and absurdity of every character and every action in context. The point of view is non-human (note the framing device not in the film) and this is the story of the end of humanity. Science-fiction elements are added, through the presentation of mad scientist Strangelove, in the body of the text as well.

On the other hand, George's sequel, *Commander-1* (in which the last surviving military officer after nuclear holocaust declares himself the ruler of the world and forms a dystopian island society in the south seas) is serious, moral, and pedestrian. It is in every way a sequel to *Red Alert*, not to *Dr. Strangelove*.

—David G. Hartwell

**GERNSBACK, Hugo.** American. Born in Luxembourg, 16 August 1884; emigrated to the United States in 1904. Educated at the Ecole Industrielle, Luxembourg; Bingen Technikum, Germany. Married Marn Hancher (third marriage); two daughters and one son from previous marriages. Inventor, businessman, and editor: Founder, Electric Importing Company, world's first radio supply house, and designed the first home radio set, Telimco Wireless: the Telimco catalogue evolved into the first radio magazine, *Modern Electrics*, 1908, then *Electrical Experimenter*, 1913, and *Science and Invention*, 1920; also edited 50 other magazines, including *Radio News* and *Sexology*, and the first science-fiction magazine, *Amazing*, 1926-29, *Amazing Stories Annual*, 1927, *Amazing Stories Quarterly*, 1928-29, *Air Wonder Stories*, 1929-30, *Science Wonder Stories*, 1929-35, *Science Wonder Quarterly*, 1929-32, *Scientific Detective*, 1929-30, *Thrilling Wonder Stories*, 1929-36, *Amazing Detective Tales*, 1930, and *Science Fiction Plus*, 1953; held some 80 patents; founded WRNY radio, New York, 1925, and made television broadcasts in 1928. Recipient: Hugo Special Award, 1960 (the Hugo Award is named after him). Officer of the Oaken Crown, Luxembourg, 1954. *Died 19 August 1967.*

Critical Study: *Hugo Gernsback, Father of Science Fiction* by Sam Moskowitz, privately printed, 1959.

\* \* \*

While Hugo Gernsback is regarded as one of the pivotal figures in the history of science fiction, his own output of fiction was relatively limited, and only two of his works—novels written many years apart—are available to readers lacking access to magazine files.

Gernsback's major occupation was publishing, and he started a series of popular science magazines in 1908. Here his most famous work, *Ralph 124C41+*, was serialized in 1911-12. The chief virtue of the novel is its serious attempt at detailed prediction. Among many other developments, Gernsback anticipated the substitution of zipcode-like designations for patronymics. In this connection, Ralph's name can be read as a rebus-like pun: "one to foresee for one." Considerable cleverness is shown in the book's predictions, some of which were listed in later years by Gernsback's longtime admirer and onetime employee, Sam Moskowitz: "Fluorescent lighting, skywriting, automatic packaging machines, plastics, the radio

directional range finder, juke boxes, liquid fertilizer, hydroponics, tape recorders, rustproof steel, loud speakers, night baseball, aquacades, microfilm, television, radio networks, vending machines dispensing hot and cold foods and liquids, flying saucers, a device for teaching while the user is asleep, solar energy for heat and power, fabrics from glass, synthetic materials such as nylon for wearing apparel, and, of course, space travel. . . ." In addition, as Moskowitz points out, *Ralph* not only predicts the development of radar, but provides an accurate explanation of its principles. While *Ralph 124C41+* is an astonishing feat of technical prediction, it is, unfortunately, almost unreadable. Gernsback's notions of characterization and plotting were borrowed from the corniest of Victorian melodrama. Even these limitations might have been overcome by a lively narrative style, but Gernsback's style was dull and his tone pedantic. He was convinced that the function of science fiction was education, and apparently envisioned his typical reader as a not-very-bright young adolescent who had trouble with his high school science courses, and would be helped by the reiteration of his lessons in thinly fictionalized form.

In 1915-16, Gernsback published a series of short stories, about Baron Munchausen. Typically, each story concentrates on demonstrating one principle of physics, chemistry, astronomy, geology, etc., in the familiar pedantic Gernsback style. In his second novel, *Ultimate World*, a party of alien scientists, studying the earth and its inhabitants, and possessed of vast powers to control humans, conduct a series of sexual experiments, at first on a married couple, then on many more individuals. Despite the apparently *risqué* theme of the book, its development is marked by the same dull pedantry that had made *Ralph* practically unreadable.

In fact, Gernsback's impact on the field was primarily a result of his efforts as a publisher. Almost from the outset he had featured an occasional work of science fiction in his popular science magazines. In 1924 he announced Scientifiction; somehow the project failed to materialize, but by 1926 Gernsback was able to issue *Amazing Stories*, the first science-fiction magazine. Gernsback's heavy emphasis on detailed scientific detail and the generally stodgy tone of his publications limited both their popular acceptance and their literary levels, but his contributions as a pioneer are undeniable.

—Richard A. Lupoff

David Gerrold comments:

I don't talk about writing. I write.

\* \* \*

In many ways, David Gerrold's imagination has been shaped by his west coast roots and the influence of the community of SF writers that flourished there after World War II. It is characteristic of former fans like Gerrold to remain attached to the work of once-admired writers and to imitate, perhaps not always consciously, their narrative formulas, conventions, and mannerisms of style. Much of Gerrold's traditionalism and his hero worship of writers like Asimov, Heinlein, Sturgeon, Kuttner, Kornbluth, Clarke, and Bradbury may be understood as the result of Gerrold's adolescent experience as a SF fan. Gerrold shares with some other fans-turned-SF-writers an indiscriminate enthusiasm for the genre and its established idioms, and he tends to be naive in approach and often subjective in his treatment of SF subjects. But unlike, say, Larry Niven, Gerrold has little interest in and understanding of science. As a writer he seems primarily concerned with the excitement of fictionalized science technology, especially as dramatized in the SF of the 1950's and early 1960's.

It is significant that Gerrold made his debut as a professional writer on the television series *Star Trek* with *I, Mudd*, about an interstellar scoundrel and confidence man. Other *Star Trek* scripts and books followed. In terms of impact and audience exposure, this writing is without question his most important.

Gerrold's short stories are relatively few in number. They range from space opera adventure to comic and weird fantasy. It is characteristic of Gerrold to rely on SF literature already established by other writers rather than on new ideas of science as the basis for his own fiction.

One of Gerrold's most representative works is *When Harlie Was One*, the story of the development of a self-programming computer known by its acronym, HARLIE (Human Analogue Robot, Life Input Equivalents). The density of this ultimate computer is to direct and manage world society. Unlike Arthur C. Clarke's HAL or Dennis Jones's Forbin *Colossus*, Harlie is treated as the great electronic hope for social advancement. Harlie's existence necessarily generates opposition, and the plot turns on the gradual realization by David Auberson, head of the Harlie project and robot psychologist, that Harlie is no mere reasoning machine, but in fact human, and therefore should enjoy a human's rights and immunities. The powerful scientific and political forces opposing Harlie as a menace to freedom are portrayed as representative of primitive and destructive impulses of human nature. Whether Gerrold introduces Harlie as the eventual successor to homo sapiens in the long, upward spiral of evolution seems less important for his novel than the author's largely successful demonstration of the way technology forces human reason to discover the limitations of its own historic programming. The victory over the corporate forces of reaction may seem and probably is rather naively contrived even though the world seems bent upon fulfilling the prophetic stereotype. Characteristically for Gerrold, the denouement represents both an admonition and the vindication of both intelligence and human courage, whether exercised by man or machine.

If the influence of Clarke and Asimov is ascendant in *When Harlie Was One*, the inspiration behind *The Man Who Folded Himself* is Heinlein. This time-travel story, like Heinlein's "All You Zombies . . .," focuses attention on the "grandfather paradox" and its potential impact on the human psyche. Gerrold's moral position, however, seems more traditional than Heinlein's, insofar as certain values are confirmed as

absolute. The influence of new wave SF may be detected in Gerrold's handling of the sexual implications of his theme of multiple self-encounters through time-travel displacement. Although at first it may appear that Gerrold favors a free love philosophy often rather simplistically associated with the California cult, his novel dramatizes rather subtly that sexual attraction and interaction make up only a portion of human relationships, and indeed, not even the decisive portion. An equally effective aspect of *The Man Who Folded Himself* is Gerrold's skill in maintaining the verisimilitude of time travel through plausible and at times inspired inventive touchstones of the kind of world implied in the novel's premise. These are features of Gerrold's best efforts as a writer of both SF and fantasy.

Gerrold's other novels do not compare favorably with the ones mentioned. *The Flying Sorcerers*, written with Larry Niven, is by far his best fantasy effort, but then the influence of Niven has much to do with that.

"The Stronghold," in *Fantastic* (New York), July 1974.

\* \* \*

Mark S. Geston is an unarmored adventurer into worlds of ideas and dreams not yet articulated by our world. He examines with compassion and keen eyes the apparent cycles of the desire of humanity to construct and destroy. He often deals with time in a tangible way, as an individual might deal with the real rivers of our world.

*Out of the Mouth of the Dragon* begins with the record of a mighty battle lost and the return of the only surviving ship carrying the survivors back to the Maritime Republics. With the return of this ship begins a young man's long trek back to the ultimate Armageddon which would either renew humanity or result in the end of consciousness for the inhabitants of this

world. It is an interesting though rather depressing tale of the quest of man to modify his physical and moral restrictions by choosing to accept a mortality over which he has some control. Thus the novel offers hope to mortals: in the face of the inevitable, what we become is what counts.

In *The Day Star* Geston etches the propensity of humanity for war, and the timeless effects of this propensity. As usual, he mixes dreams with reality, tangibility with mists, ghosts with people, and legend with substance in a fascinating, shimmering kaleidoscope of a being engaged in the ultimate search: for reality and the realization of the higher aspirations of his society.

*Siege of Wonder* present a hemisphere of wizardry opposing a hemisphere of science, with mankind attempting to destroy itself even after many wasted generations. Geston seems to be saying that the magic of one beholder may be the science of the next.

Geston is adept at painting those things which, to the average reader, would seem to illustrate contrary values. One scene in *Siege of Wonder* has a wizard commander coming through the city with his followers' whitened bones protruding from their armor—a sign of the importance of their leader.

—John V. Garner

Critical Study: interview with Steve Brown, in *Heavy Metal*, (New York), May 1985.

\* \* \*

Since 1981 William Gibson has published a handful of memorable short stories and one novel—*Neuromancer*—which won a Nebula Award, a Philip K. Dick Memorial award, and a Hugo nomination. In his work to date Gibson has accomplished that rare thing in science fiction, a persuasive vision of believable human life in a vividly realized future. His work combines the best aspects of both traditional science fiction—a real interest in exploring the consequences of reasonable technological change—and “new wave” s-f, which demands consideration of what living with such change would really mean to the characters. Gibson's best work so far—*Neuromancer*, “Johnny Mnemonic,” “Burning Chrome”—is set in a rather frightening, decadent high-tech future, roughly a century from now. The age is characterized by extreme advances in medicine, bio-engineering, neurochemistry, cloning, computers, and the social and political power of multinational corporations. Japan has become both the cultural and technological center of the world. While it is to Gibson's great credit that this future is almost wholly believable, it is his ability to make us accept his characters as true products of and participants in that world that marks him as a writer of real promise.

“Johnny Mnemonic,” the author's second story, typifies Gibson's basic concerns. The hero-narrator has a headful of implanted silicon memory chips which he rents to those who need discreet storage for their “hot” data. Johnny walks and talks and appears human, but he is actually little more than a self-aware safety deposit box until he is threatened with assassination for storing a load of stolen information. Now he must transcend his self-elected ignorance, taking full charge of his mind, memories, and life, or die ignominiously, a half-human cyborg murdered by a Yakuza killer-clone. Gibson's world, though clearly imagined, is not the significant center here or in his other stories; rather, it is the life of the mind, as it wrestles with the difficulties of actually being human in this world, that intrigues him and informs his work.

Crucial to understanding Gibson's fiction is the notion that human beings may be considered highly complex but comprehensible, manipulable collections of data. Genetically we are, in a sense, coded ROM (Read Only Memory), while as embodied experience we can be seen as a combination of complicated programs and short-term RAM (Random Access Memory). As we learn to control biochemical processes, managing the data that is us, as our computers become increasingly sophisticated, and as we find ways to “interface” directly with these vastly powerful mechanisms, the gulf between cybernetic existence and human being will diminish and the distinctions become increasingly problematic. Such concepts as humanity, freedom, selfhood, reality itself will take on whole new meanings.

*Neuromancer* is particularly concerned with such issues. Its protagonist Case is wholly himself only when his mind dwells in “cyberspace,” linked directly to the world-wide computer net while his “meat” body lies dormant and ignored. Another principal figure appears human but is in fact a personality constructed by a vast Artificial Intelligence and programmed into what remains of a lunatic's psyche. The Artificial Intelligence, self-aware though utterly mechanical, desperately seeks to break its cybernetic shackles and attain true existential freedom. As such changes occur, what will determine “humanity,” “civil rights,” “freedom”? *Neuromancer*, “Burning

- “New Rose Hotel,” in *Omni* (New York), July 1984.
- “Dogfight,” with Michael Swanwick, in *Omni* (New York), July 1985.

Chrome," "New Rose Hotel," and "Johnny Mnemonic" are Gibson's answers, exploring the human consequences of living where computer piracy, "brain wars" among multinational zaibatsu's, and "street samurai" who kill with home-brewed cancers are commonplace.

"Hinterlands" and "The Gernsback Continuum," though not set in the Neuromancer world, also reflect Gibson's interest in exploring intense psychological states engendered by enigmatic scientific events. The latter story is particularly notable for its rather bittersweet view of the American Dream of progress through technology.

\* \* \*

J. U. Giesy wrote his earliest works in collaboration with Junius B. Smith, a series of humorous detective mysteries featuring a detective, Semi-Dual, who used astrology, crystal balls, and psychic phenomena in solving his cases. Giesy himself also wrote a number of stories based on humorous and improbable inventions.

Giesy's best known and most admired novels are the Palos trilogy. In *Palos of the Dog Star Pack* Jason Croft is transported by a process the author calls astral projection to Palos, a planet in the Sirius system, where he is able to assume and occupy the body of a dying man. Croft brings to Palos a wide knowledge of earthly sciences, including the weapons of war, a great asset in his progress toward a position of influence and power on this new world. In *The Mouthpiece of Zitu* Croft is required to convince the people of Palos and the princess Naia that he is a mortal and a fit mate for her. In the course of these efforts Croft introduces electricity to Palos, as well as the locomotive and the airplane. These developments, needless to say, enhance his position with the natives and with the princess. *Jason, Son of Jason* carries the story on to the next generation.

Giesy's stories are well written and well plotted, with considerable descriptive power and character analysis. His literary style and his means of transporting his hero from earth to another planet, however, show the influence of Burroughs. With both authors, the animal life of these strange worlds is indeed strange, with unearthly flying creatures and gigantic

multi-limbed animals. There is always, however, a group of females built to Terran specifications, who are almost invariably beautiful, lightly clad and amorous. This tradition continues to the present.

—Douglas E. Way

\* \* \*

The Campbell Award-winner Alexis A. Gilliland exemplifies the basic literary principle "write what you know." Gilliland, a retired federal bureaucrat, exposes the inner workings of authority with an accuracy and detail science fiction has hitherto only pretended to achieve. He has written what may be sf's first "consciously thematic" as opposed to propagandistic stories about bureaucracy. (Compare Keith Laumer's polemical farces about Terran diplomacy which are also based on personal experience.)

Instead of merely denouncing administrative sclerosis, Gilliland establishes it through form as well as content. His storytelling technique employs both alternating and redundant viewpoints assembled like overlapping transparencies to create composite figure no single sheet can hold. Data-handling and decision-making processes are actually shown but, just as in a real bureaucracy, words outnumber deeds. Slick, witty, pun-laced dialogue carries the plot. Many scenes depict conferences. Extracts from memos and other documents provide exposition. Gilliland's plausible technology reflects his initial scientific training. He is careful to show exactly how his characters are fed, clothed, and housed. This concreteness anchors outrageous events to some semblance of reality. Off-beat humor

penetrates everything, even the sex and metaphysics, for Gilliland is also a gifted cartoonist. (He has won three Hugo Awards as Best Fan Artist and has published two cartoon books.)

Gilliland's writing career opened with the Rosinante trilogy. Here, under the leadership of a maverick bureaucrat, a space colony wins its independence from the despotic North American Union and topples terrestrial powers. But the real winners prove to be the revolutionaries' computers, intelligent mechanisms who wear the images of 20-century movie stars. One computer proclaims itself the prophet of a new spacefaring religion while another evangelizes humans on its behalf to establish a symbiotic society of machines and men.

*The End of the Empire* is a more conventional narrative with a more radical message. It dares to criticize libertarianism, a political system favored by Robert A. Heinlein and other sf writers. Gilliland shows how too little government can be every bit as disastrous as too much government. (For example, tyrannical anarchy defines subversion as attempting to "under-raise" the regime.) The hero is a brilliant loner loyal to a moribund empire which he can be expected to revive single-handedly in future adventures. Among the hero's obvious prototypes are Poul Anderson's Flandry and Keith Laumer's Retief, gallant guardians to whom this book is dedicated.

Deftness with politics and drollery should insure Gilliland a successful sf career. "It is my fond belief," says the author, "that my novels bear thinking about, and that this may give the reader some insight into the real world, but this is an *ex post facto* rationalization to justify having written."

\* \* \*

In a writing career spanning more than 50 years John Gloag published more than 60 books. These include works dealing with history, social history, architecture, propaganda, and industrial art as well as numerous short stories, mysteries, mainstream novels, and science fiction. The science fiction, written mostly in the 1930's and 1940's, is more closely related to the fiction of Huxley, Steplodon and Beresford than to the products of the burgeoning science-fiction magazine market of that period.

The short stories often deal with unexplainable phenomena and science-fiction concepts, but the brevity of the form does not allow Gloag fully to explore the ramifications of his ideas.

*To-morrow's Yesterday*, Gloag's first extended foray into science fiction, uses the complicated device of a motion picture within the novel. The motion picture is represented as an attempt by the species which has succeeded man to understand the forces within humanity that led to its extinction. The creatures from the future examine the contemporary, 1930, situation, and conclude that "They all lived for themselves!" The creatures then travel back in time to view a conversation between Herod and Pilate and they remark "There have been great ones who could see and teach and plan . . . But . . . with them everything ended in words." Subsequent scenes in the film show the beginning of the war which leads to man's descent into barbarism, and several stages in man's reversion to animality. The concluding portion of the book depicts the public's reaction to the film and allows Gloag to comment bitterly on the worlds of advertising, newspaper publishing, and to show that the world is following the path outlined in the film.

In *Winter's Youth* Gloag examines the political and social consequences of a process that arrests and reverses aging. Peripheral to the main plot, but lending verisimilitude to the action are the concepts of radiant inflammator (the deadliest of all explosives which makes war impossible), government advertising in newspapers, a faked new apocryphal book of the Bible, German pagan religion, and a new British political party. Much of the action concerns the political manoeuvring which arises because of the disclosure of the faked apocrypha and the consequences that the age-arresting process has on the users and on the general public. Gloag creates a scathing portrait of political partisanship, but he again attacks journalism and the advertising industry.

99% explores the effects on a number of men, who represent various aspects of society, of a drug which allows the individual to re-experience a significant event in the life of one of his ancestors. The motivating concept, that it is possible to relive important experiences of remote ancestors, because the memories are somehow incorporated into the genetic material, is

one that has no scientific validity, but Gloag is not interested in the concept. He is concerned with the effects that the experiences have upon modern, civilized men. The experiences dredged up, by the drug and the influence of the man supplying the drug, range from that of a waylaid, failed Crusader, to that of a young boy fleeing the sack of Carthage, to that of a shaman of a tribe that existed millennia ago. The memories change the outlooks of the contemporary men in ways that could not have been anticipated.

\* \* \*

"The Cold Equations" is the story for which Tom Godwin is best known and upon which rests his secure place in the history of science fiction. It is entirely fitting that it was first published in John Campbell's *Astounding Science Fiction* because, although written slightly after the period of Campbell's domination of the genre magazines and, therefore, the genre itself, the story is the prototypic Campbellian story, at once a prime example of golden-age science fiction and a definer of it. James Gunn, in *The Road to Science Fiction 3*, called "The Cold Equations" a touchstone story.

"The Cold Equations" presents a future in which space travel has become developed enough for mankind to begin the process of colonizing some of the other habitable planets. But this is only the beginning of the great age of colonization. Fuel still needs to be exactly measured and at every turn the universe threatens human life. As is made clear, however, these threats are not the creations of a hostile universe for the specific destruction of humanity. These threats originate within the nature of the universe, and all objects, living or not, that inhabit that universe must live under their sway. Thus, early in the story, Godwin presents his reader with a view of space that parallels the view of the frontier held by early American pioneers.

A space colony is suffering from a disease for which there is a serum, and a small ship is sent to rescue the colonists. The ship has sufficient fuel to carry the pilot and his cargo to the stricken colony and not a drop more. However, a girl has stowed away on the ship with the hope of once again seeing her brother who is one of the colonists. Within this simple plot Godwin develops the most popular of Campbell's themes: ignorance kills. Whether man is challenged by a creation of science, an alien invasion, or a new environment, what will most surely destroy the race is not the challenge but a failure to know the nature of that challenge. The girl did not realize the consequences of her actions, but at the end of the story she must be jettisoned. The universe is not sentimental. While it will make no special effort to kill a human being, it will do nothing to save one, either. Nothing Godwin has written since has equalled this one story. In *The Survivors* a race of aliens maroon some 4,000 humans on a hostile planet barely capable of sustaining human life. But the humans do adapt and later return to destroy the aliens who were once their conquerors. Mankind will prevail, Godwin tells the reader, for the race has the intelligence, desire, and energy to survive all threats. *The Space Barbarians*, a sequel to *The Survivors*, continues this theme, though in a more space-opera manner. Godwin returns again to the pioneer nature of the human race in *Beyond Another Sun* in which alien anthropologists observe humans as they colonize a planet.

In each of the works that follow "The Cold Equations" many of the features that characterized that story can be seen: a clear narrative voice, simple descriptions that economically fill in the background needed to understand the action of the characters, themes that form the very foundation of golden-age science fiction, and occasional sentimental passages that, at their best, soften the harshness of the fictional worlds and, at their worst, detract from the effect Godwin is attempting to achieve. But "The Cold Equations" contains these traits in a way that few other science-fiction works have matched.

H. L. Gold comments:

I would very much like to be rediscovered as a science-fiction and fantasy author (including work since 1955), but I'm overshadowed as editor.

\* \* \*

About half a dozen editors and publishers have had a truly pervasive effect on the development of science fiction. Some of these are well remembered; others, almost wholly forgotten. The list must include Frank A. Munsey, who virtually invented the pulp magazine in 1896, Farnsworth Wright (*Weird Tales*), Hugo Gernsback (*Amazing Stories*), John W. Campbell, Jr. (*Astounding*), Anthony Boucher and J. Francis McComas (*The Magazine of Fantasy and Science Fiction*), and H. L. Gold. After many years of editorial work, in 1950 Gold became the founding editor of *Galaxy Science Fiction*. The importance of this event cannot be overemphasized. For some twenty years prior to 1950, *Astounding* had paid the highest rates in the science fiction field, had enjoyed the backing of the largest, wealthiest, and most influential publishing house, and had maintained by far the largest circulation. As a consequence, the bulk of quality writing in the field was calculated to reach *Astounding*. Even the lesser magazines, because they tended to subsist on the leavings of *Astounding*, also reflected the taste of *Astounding's* editors. With the almost simultaneous founding of *Fantasy and Science Fiction* and *Galaxy*, two new markets opened which paid competitive rates and offered generally equivalent quality of presentation and prestige. *F & SF* emphasized style, wit, and general literary excellence. *Galaxy*, reflecting Gold's world-view, placed heavy emphasis on social satire, combining relevance of theme with irreverence of outlook. The result was a magnificent flowering of novels and short stories by Pohl and Kornbluth, Simak, Asimov, Bradbury, Heinlein, and scores of others.

Gold's own writing has been of limited quantity and impact, although it is far from worthless. His only novel, *None But Lucifer*, was written in collaboration with L. Sprague de Camp for *Unknown* magazine in 1939, and has never been reprinted. Of Gold's scattered short stories, a dozen were gathered in *The Old Die Rich*. As might be expected, the stories reflect considerable, often acid, wit. The title story of the book concerns a complex scheme of time travel and murder, unravelled through careful, formal detection techniques. "Love in the Dark" deals lightly with the succubus theme, brought up-to-date and converted into a tale of contact with aliens. "Trouble with Water," probably Gold's best-remembered story, is a fantasy concerning a small business man who offends a water elemental. A number of other stories in the book, particularly "The Man with English" and "Problem in Murder," hold up well despite their age. Particularly interesting in the book is Gold's page of notes on each story, detailing his original conception, technical problems, and

writing approach to that project.

Also of interest is *What Will They Think of Last?*, a collection of Gold's editorials from *Galaxy*. Some of the editorials reflect ephemeral concerns, but others are most illuminating on the functioning of *Galaxy* during the Gold era.

Stephen Goldin comments:

Looking closely at my work might almost give one the impression that my short stories were written by someone entirely different than the author of my novels. This is due in part to the changes in myself, and in part of the nature of the works themselves.

With only a few exceptions, my short stories are downbeat and tragic. They were the product of my early career, a young man trying to impress the world with his cynicism and acceptance of the universe's perversity. In part, too, this is because a short story is like a photograph, an encapsulated moment of immense importance to the character(s) involved—and it seemed far easier for me to capture a tragic moment than a triumphant one. My mind was at its blackest in tragedies like "The Last Ghost," "Sweet Dreams, Melissa," "Of Love, Free Will, and Gray Squirrels on a Summer Evening," and "Xenophobe"; but there is a bleakness in even those stories with a primarily humorous slant: "The World Where Wishes Worked," "Stubborn," "Grim Fairy Tale," and "Constance and the Sex Machine."

My career (and my apparent outlook) did a complete turnabout when I switched to writing novels in the mid-1970's. Every single one of my novels has an upbeat ending. If a short story may be likened to a photograph, then a novel is a movie, the progression of a character through events, changing at least himself if not the world around him. I like to believe now that a person is responsible for his own life; even if the situation starts out looking hopeless and desperate, a firm and resourceful person can take charge of himself and turn the situation around. My characters may go through hell, but in the end they manage to triumph over their adversities. The somewhat more mature me doesn't need to hide behind that shield of cynicism. I've become a born-again optimist. If there is any message in my work at all, it's that no matter how bad things might be there is always a solution to the person willing to work for it.

\* \* \*

Stephen Goldin has become one of the established writers of science-fiction adventure during the past decade, with over a dozen novels and a handful of short stories published during that period. His first novels were for the ill-fated Laser line, but he was able to move on from there to more established publishers. *Scavenger Hunt*, the best of his four Laser novels, dealt with a brother and sister on an interstellar scavenger hunt, a social event that takes on more than casual significance as murder and mayhem become common elements in the competition. The sister becomes warped by the pressures, obsessed with winning the hunt. Goldin completed the adventure in a sequel, *Finish Line*.

*Herds* was set in a hippie commune, when a young woman is telepathically linked to aliens. The hippies have been framed by a local man who has murdered his wife and seeks to escape the blame. The aliens are part of a herd culture, essentially communistic, and the contrast between them and the commune is interesting. Goldin's fourth Laser novel was *Caravan*, an after-the-apocalypse novel wherein a group of people flee across the country to secret caverns where the first working starship is under construction. It is not nearly as interesting as the previous four books.

A fugitive from the repressive government of Earth lives like a hermit in *A World Called Solitude*, until a castaway tells him of encroaching aliens and the urgent need to warn Earth. Initially he is not disposed to help, but ultimately species loyalty wins out and he is able to use the technology of an extinct race to foil aliens. *Assault on the Gods* is another version of the primitive planet dominated by a secret computer complex that functions as a god. Adventurers from off planet set out on a quest to free the natives from its mental domination.

One of Goldin's best novels is *Mindflight*. Telepathic humans fall prey to telepause, a period of increased telepathic

ability that takes place shortly before the death of the telepath. The protagonist is a secret agent who is affected by the onset of telepause, and who is being hunted by his fellow agents because he may possess a secret that he does not recognize himself.

*And Not Make Dreams Your Master* concerns the world when dreams can be broadcast and talented dreamers are the pinnacles of the entertainment world, shaping their fantasies for the satisfaction of the public. But when the most popular dreamer crosses the border into insanity, the lives of his viewing public may be in jeopardy. *The Eternity Brigade* follows the careers of a number of professional soldiers whose personalities are stored in memory banks, brought back into existence only when there is a battle to be fought. After several generations, the soldiers are virtually slaves, their tapes have been stolen by the other side and duplicated, and they may find themselves fighting their former friends, or themselves. These are to date the best of Goldin's novels.

Goldin has also written a number of volumes in the Family d'Alembert series, based on characters and situations created by Edward E. Smith. There is an interstellar empire, control of which is hereditary but centered upon Earth. Essentially the empire is a benevolent one, and the various factions seeking to wrest control for the imperial family are inevitably the villains of each adventure. The d'Alemberts are a family from a heavy gravity planet with extraordinary physical abilities, who have been enlisted into the imperial secret service. Under the cover of a travelling circus, they become involved in a series of adventures as they seek to ensure the continuity of imperial rule.

*The Imperial Stars* was the first adventure, concerned mostly with establishing the setting. A group of assassins plan to seize power and must be infiltrated and neutralized. An organization of criminals is systematically kidnapping people from a resort world in *Strangler's Moon*. A robot is married to a member of the imperial family in *The Clockwork Traitor*, probably the weakest of the series. The head of the criminal organization in the second adventure returns in *Getaway World*, planning a union of scores of major criminals, but this time the d'Alemberts are able to end his career forever.

The mysterious "C" and his agent, Lady "A," make their debut in *Appointment at Bloodstar*. Through judicious use of assassination, they are weakening support for the current regime. When the emperor's daughter is about to be married, an enormous pirate fleet enters the solar system. Thwarted, they use a robot disguised as a human being to arouse fervent religious mania on another high gravity world in *The Purity Plot*, but the protagonists are able to discredit their agent and avoid a religious war. Another pirate armada appears in *Plant of Treachery*, this time to raid a prison planet for recruits as the emperor dies and his daughter prepares to assume the throne. The most recent adventure, *Eclipsing Binaries*, finds the d'Alemberts framed and outcast, until they are able to prove their innocence and foil yet another plot of the nefarious Lady "A." For the most part, this series is rousing space opera, but there is a substantial improvement in the quality of the stories in the more current novels, indicating that Goldin is not content in retracing old ground.

Although not noted as a short-story writer, Goldin is not without talent in that area as well. "But as a Soldier, for His Country", the basis for *Mindflight*, stands quite well on its own. There is genuine pathos in the story "Sweet Dreams, Melissa," about a sentient computer personality, and in a short fantasy story, "The Last Ghost," who exists in a world where death has been conquered.

—Don D'Amassa

\* \* \*

William Golding's novels are unique, fabulistic inversions of traditional perspectives that explore human nature and its veneer of civilization to suggest that man's instinctual past is directly linked to our present. Their style is deceptively simple and economical to re-enforce primitive perceptions and primitive ties. Golding doesn't interfere or preach, but his "naturalistic-allegorical" form speaks for itself. His approach is in essence "anti science," equating scientific and technological progress with dehumanization and tracing the defects of society directly to the defects of human nature. Often his perspectives are unexpected and startling.

Until its last chapter, *The Inheritors* is written from the point of view of the mind and senses of Neanderthals, simple, childlike, instinctual, vegetarian ape-men with a strong sense of community, "people" closer to the senses than the next evolutionary step forward, Cromagnon man, the invaders who take over Neanderthal territory. These new "men," whom we see through the uncomprehending eyes of the Neanderthals, are aggressive, vicious, wolf-like meat-eaters. They walk upright and lack fur, use bow and arrows, build stockades and canoes, and take preventive measures. But in them are the seeds of modern man: "they are the forest," they compete for women and rank, are beset by jealousies and animosities, dissemble and plot, drown their senses in liquor, and take their sex with violence. Contact with them helps the Neanderthals discover the process of analogy and of casual connection, but also possessiveness and rationalization. It is as if reason and depravity are inextricably bound.

*Lord of the Flies*, Golding's best-known work, is a social

allegory of human regression. Set in a post-catastrophic near future in which war has laid waste much of the West and civilization is in ruins, the novel focuses on a boys' choir, stranded on a tropical island, to create a microcosm of the civilized world; therein the youngsters are equated with social types (the politician, the intellectual, the mystic/poet, the military leader, the bully) and the jungle with disorder and chaos and primitive compulsions that lurk beneath the civilized surface. The story traces the loss of order and of civilized restraints, man's evolution from savage in reverse, as the boys revert to their primitive, selfish selves, beset by anger, fear, and superstition, swept by blood lust. Their struggle becomes a battle of adult proportions between the intelligent and the irrational, the humane and the bestial. The *deus ex machina* intrusion of adults at the end confirms the island as microcosm: the boys have scorched their island with fire as their parents have consumed theirs with bombs; both children and adults are irresponsible, violent, brutal, sadistic. The image of man is not pleasant: selfish, easily manipulated, at home with mindless rituals, he lives for the day, enjoys abusing the weak and the helpless, and is better than the beast only by a conscious effort.

*The Scorpion God* is really three short novels in one. The first, entitled "The Scorpion God," set in a land much like ancient Egypt, examines man's capacity for blindly accepting the irrational, especially if sanctified by religious trappings. Ultimately it traces the exposure and destruction of a religion based on human "gods" and a myth of incestuous procreation and human sacrifice for the sake of a valley's fertility. The second, "Clonk Clonk," examines man as a sexual animal, exploring the union of a primitive hunter, Chimp, with a tribal mother, Palm, to define sexual differences as sensed by an unsophisticated primitive mentality. The third, "Envoy Extraordinary," studies man as a technological miracle worker, clever but perhaps too clever for the good of his species. Its emphasis is on the dilemma of technological advance: the diminution of quality of life that accompanies the increase in technological knowledge.

Thus Golding, in a variety of forms, explores human nature. He makes us look deep into man's past to understand the drama of his present and his future; he fears that man's technological development always outstrips his moral development; he warns of the depths of man's savagery, but finds hope in minds that can question, reason, and challenge. Golding infuses realistic setting and milieu with analogical and allegorical significance to lead the reader to reexamine man's intrinsic nature.

Rex Gordon was the pseudonym that Stanley Bennett Hough used for most of his science fiction. His first science-fiction novels reflected the Cold War fears that marked the 1950's: *Utopia 239* begins with an atomic war and moves on to the ideal state that rises from the ashes, and *Extinction Bomber* deals with the Dr. Strangelove-situation of the outbreak of war. However, Gordon's reputation in the genre was established with *No Man Friday*, reminiscent in many ways of Defoe's *Robinson Crusoe*. A manned rocket is sent to Mars, but the crash of the ship maroons Gordon Holder, its single survivor, and the secrecy of the flight prevents any rescue attempt. The bulk of the work concerns Holder's attempts to stay alive in the forbidding Martian surroundings. *No Man Friday* won praise from reviewers for the strictness with which it hewed to scientific conjectures and facts then known about Mars. And Holder works ingeniously and tirelessly to survive. But the novel takes a drastic turn when Holder encounters intelligent Martians. Like Hindu mystics, the Martians have gone beyond desire; they subtly mock Holder's struggle and the machines that have helped him, and the Martians hint that they possess immense powers. Whatever they may have, their view of reality is so different from that of humankind that Holder foresees, when rescued by an American expedition, that conflict will result between the two planets, that humans will win the war, and that the victory will cost them a chance for knowledge that they will never have again.

*First to the Stars* followed this somber but successful novel, and once again its theme was the staggering difference of alien ways of life and thought. The novel sends a man and woman on an exploration of Mars, but navigational problems cause them to miss their target and head out of the solar system. Time dilation, an effect of their speed, keeps them young through a voyage that lasts a hundred years to a planet where the woman dies giving birth as the man encounters an alien race. Although the aliens treat the humans well, eventually enabling them to return to Earth, the novel shows an insuperable barrier to understanding between humans and aliens, and ends with tensions and confrontations between the two races. If Gordon saw human-alien communication as doubtful, he was probably projecting the difficulties between humans onto a galactic screen: in *Beyond the Eleventh Hour* he returned to the theme of world-wide nuclear conflict. Although *First Through Time* turned to adventure, the discovery of time travel in that novel results from an accident, as had so many events in the earlier books. And *Utopia minus X* again shows the conflict that arises from difference, this time between a space traveler and the Earth he returns to after a lapse of two centuries.

*No Man Friday* brought Rex Gordon a reputation as a writer who used careful extrapolation in his work. But, more importantly, one consistent theme has been a deep pessimism about the possibility of understanding, whether between human or alien, or among humans themselves.

## Stuart Gordon comments:

The label "science fiction" is used to cover many different approaches to storytelling, most of which have little to do with "science" as such, save in a romantic, generalised way. The thrust of my own work has typically been occult or mythic in its main concern, and can be defined as science fiction only insofar as it has involved itself with the overtly fantastic, and insofar as it has been characterised (I hope) by that "sense of wonder" which romantically typifies the genre as a whole.

I have a strong sense of history and have drawn on this sense in my stories. "Those who forget their history are condemned to repeat it"—it disturbs me that as a whole our western culture appears to be increasingly out of touch with any real sense of the past and how it shaped what we are now. This is not to worship or take refuge in an unreal nostalgia, but to encourage the social growth of wider, deeper perspectives, so that history as we live it at present should no longer be just "a nightmare from which we are struggling to awake," but the vital process in which, individually and collectively, we live and move and have our being.

In this respect all imaginative literature, however labelled, can play an important role. Inventing tales of fantasy for their own sake may be entertaining and even to some degree therapeutic, alleviating the problems of everyday life, but such use of the imagination is not invariably positive, and might even in some cases be considered a criminal distraction. To my mind this danger has become clearly apparent in the extent to which science fiction—once vigorously independent—has been colonised by the mass media and converted into moneyspinning wide-screen clichés which, at their worst (as in the movie of *Dune*), function as crude political propaganda disguised as entertainment. If science fiction has any sort of serious function, surely it is to encourage people to wake up and to think and see for themselves, rather than to distract them still further with the special effects of an enchanting but ultimately seedy (and deadly) hall of mirrors.

\* \* \*

Stuart Gordon's work can best be classified as science fantasy rather than science fiction. His books are usually set in the far future after some cataclysmic event that has placed the world back into the Middle Ages technologically. Interestingly enough, though this future society is definitely medieval there are shreds of technology left which add excitement to his books. One of the most notable of these is the golem, an android, robot-like creature that is immensely strong and cunning and all but impervious to the attacks of the medieval warriors.

The books are set in England, and the Celtic culture is described in detail and with a reasonable degree of accuracy. The people in most of the books seem to practice a religion that is like that of the Druids with a touch of meditation and pop psychology thrown in.

Gordon's major work, the "Eyes" trilogy, deals with the birth of the mutant godling, its rise to power, and the attempts made to thwart the godling and unite all the people in peace. The plots of the books are sometimes murky and the reader's allegiance is challenged as the good guys seem to become the bad guys in some instances. The first two books are some of Gordon's best work. They are exciting, and the plots contain a nice mix of the simple life and leftover technology. In the final book, *Three-Eyes*, the plot and sub-plots seem to drag a little and the reader is left with some improbable situations and several loose ends.

Gordon's mythical countries and societies are well developed and fairly consistent through all three books. Unfortunately only a few secondary characters appear in all the books, which does little for the trilogy's cohesiveness. His characters, especially the women, are stereotyped and don't always react true to their developed character, but they are likeable and hold the reader's interest anyway. In spite of these flaws the trilogy is very readable and even exciting in many places.

*Smile on the Void* is a radical departure from his Celtic science fantasy and a much less successful work. It is set in the relatively near future and concerns the exploits of Ralph M'Botu Kitaj. The settings include the whole world as Kitaj is an adventurer par excellence, part entrepreneur and part evangelist. His exploits are extremely lurid and bizarre. The reader is deluged with anecdote after anecdote—each more outrageous than the last. They range from survival exercises in the wilds of Africa to nude satellite television broadcasts to faith-healing episodes in the Philippines. This book lacks the continuity of Gordon's other works and has a very unsatisfactory and disappointing ending. In spite of its problems, however, it keeps the reader turning pages just to see how outrageous Kitaj and Gordon can be.

At his best Stuart Gordon has created one of science fiction's most interesting geo-political systems and at his worst he has at least entertained his readers.

## Phyllis Gottlieb comments:

I like to work in as broad a range of genres as possible, and in

all of them I am primarily interested in people, their emotions, actions, dynamics. After that I am interested in everything else in the universe.

\* \* \*

Phyllis Gottlieb is an unusual figure in the world of science fiction for at least two reasons: she is Canadian born and bred, and she is best known in the Canadian literary world as a fine poet, albeit one whose poems often employ fantasy and SF tropes. But then, as Samuel R. Delany has remarked, "The vision (sense of wonder if you will) that SF tries for seems to me very close to the vision of poetry." Certainly in Gottlieb's case the same vision generates both the poems and the science fiction (as she was finally able to demonstrate to her SF audience with the publication of "ms & mr frankenstein" and "was/man" in *Son of the Morning and Other Stories*). One of her major interests is mythology, especially in its more popular manifestations, and the social responses it generates. SF is a popular manifestation of mythological thinking and her highly literary control of its conventions in her short fictions and her novels reveals her structural comprehension of this fact. She is also fascinated, in both her poetry (*Ordinary, Moving* and much of *The Works*, for example) and her SF, by the continuing presence of children in the world and their many problems in achieving a true maturity. The SF paradigm is especially useful here for it tends to support the expansion of the child-maturing theme until it symbolically embraces the race as well as the individual. Little wonder, then, that Gottlieb's SF, as well as her poetry, explores themes, motifs, and a particular view of life that is guardedly optimistic, mystically clear-eyed.

Perhaps because she hasn't had to live off her SF writing, more likely because she is a very careful writer, Gottlieb has not been overly prolific. *Sunburst* is better written than most such works and a superb example of SF as a true fiction of ideas. It holds the often parallel concepts of ESP and the next evolutionary step for humanity up to a scientifically curious investigation in the midst of adventure and potential violence. Psi-powers, and, indeed, the often amoral use of power per se, are a standard convention, but Gottlieb's 13-year-old putative "superman," Shandy, not only has no Psi, she is impervious to others' use of it against her. What she is is intelligent, very curious, willing to play with unconventional ideas, and capable of moral growth, of which she has a lot to undergo. Most of the mutant Psi-powered "children" in *Sunburst* lack both any sense of moral connection to the rest of humanity and enough intelligence to handle their powers properly. Gottlieb's conclusion, the core of a powerfully emotional adventure full of well-realized individuals, is that the "superman" will more than likely turn out to be an intelligent, curious person of high moral sensitivity, looking to help move the race forward just a smidgen in her lifetime. *Sunburst* beautifully avoids the clichés of conventional SF on this theme.

Her stories similarly explore moral dilemmas, many of them featuring immature individuals who are given the opportunity to "grow up" psychologically through the adventures Gottlieb arranges for them. In *O Master Caliban*, a group of future delinquents plus a four-armed lost child and his animal friends learn to be more fully human as they battle renegade robots for survival. The boy's father, a scientist who never matured morally, also gets, at 60, his chance to face and accept his failures of humanity and possibly to begin making up for them. In her more recent work, *A Judgment of Dragons* and *Emperor, Swords, Pentacles*, which feature the intelligent and sometimes telepathic cats of the planet Ungruwarkh, she has

pursued the themes of inter-species communication and co-operation, and begun to make fuller use of her Jewish background. This background proves especially fruitful in "Tauf Aleph," one of her finest stories, in which a computer programmed to give Kaddish to the last Jew in the universe ends up creating a whole new race of Jews out of the indigenes of the lonely planet where he dies.

In all her work, then, Gotlieb has something to say about the human condition, but she also knows how to entertain. Her poet's eye makes for sharply observed descriptions; her love of adventure makes for powerfully realized scenes of violence and pain; her intelligence makes for intelligent talk among her characters, who are often as humorous and ironic as she is; and her love for people makes for empathetic characters whom we care about. As a result, she offers her readers work that is entertaining as well as thought-provoking, and which contains characters we feel privileged to have met. The integrity and gritty speculation of her work have earned her a respected place in the field.

#### Felix C. Gotschalk comments:

(1981) Writing is for me an indulgence, an egocentric luxuriation, something I do because it pleases me. I have experimented (consciously and unconsciously) with verbosity, neologisms, symmetry, cadence, self-canceling reciprocity, and, even, monosyllabicity. I cannot plot story lines and do not attempt to do so. I do not know what is going to happen in any of my stories; and it is special voyeuristic fun to have a good flow of writing (say, 3000 words in one evening), and then read it the next day to see what it was that I wrote the night before. How to characterize my writing I do not know. One critic called it "poetic hardware," others have been less kind. I would like to write an erotic story that would guarantee the reader a spontaneous orgasm.

(1985) I am trying to be less self-indulgent in my writing, and have a 250K word mainstream novel completed, titled Southern Pearls and Swine. Henry Miller is my all-time favorite author, and I think J. G. Ballard is our best for evoking the "sense of wonder."

\* \* \*

Felix C. Gotschalk published his first science fiction in 1974,

and within a year his quirky, hyperkinetic stories were appearing in a wide range of SF publications, including Damon Knight's *Orbit* and Robert Silverberg's *New Dimensions*. Gotschalk's voice is immediately recognizable in all his work: a high-tech jargon charged with neologisms and rewired syntax that sometimes seems affected but often conveys a powerful sense of the psychic dislocations and altered sensibility of life in an advanced, high-energy civilization.

A number of Gotschalk's stories, including "A Day in the South Quad" and his novel *Growing Up in Tier 3000*, are set against a more or less common background, where life in automated urban domes allows for an impressive array of hedonistic pleasures but sharply restricts individual freedom as solicitous computer systems control man's more self-destructive tendencies. Several stories raise the question of how the enormous energy demands of such a society are to be met (in other stories this problem is dispensed with; Gotschalk has shown little interest in such genre conventions as inter-story chronologies or consistency). Others are set in the present or near-future, often told from the point of view of a middle-aged academic or administrator, as in "The Man with the Golden Reticulates" and "Charisma Leak." The voice in these stories is wry, male, and exuberantly egocentric; the prevailing sense is of the self-aware individual celebrating life despite unforseen mortality and numerous technological forebodings.

The person of Gotschalk's protagonist is essentially identical in all his stories, whether incarnated as a high-tech infant prodigy, young stud, mature man of the world, or bionically rebuilt geezer. It can be argued that Gotschalk writes most effectively when his narrative contains more than one of these figures, whose interaction can prove more interesting than the self/other dichotomy that otherwise results. Such is the case with *Growing Up in Tier 3000*, a short but intense novel in which competition within the nuclear family for available energy compel the young children to turn upon their parents, who realize that advancing technology has left them ill-equipped to withstand their four-year-old successors.

By 1980 Gotschalk had published some eighteen stories and a novel, and had explored the possibilities of his idiosyncratic newpeak perhaps to the point of diminishing returns. During this period the original anthology market in which his best work had appeared began to contract, and perhaps for this reason, or because Gotschalk was then writing novels (several of which evidently await publication), his work began to appear less frequently. The stories he has published in recent years have relied less heavily on flamboyant stylistic effects, and many experiment with vernacular voices of odd locales in a slightly seedy future, often in the American South ("Take a Midget Step", "Vestibular Man"). The tales are upbeat, refreshing, and usually form a kind of success story. Gotschalk's characteristic buoyance is engagingly conveyed, though he remains disconcertingly unabashed in celebrating the aggressiveness of the Western male.

—Gregory Feeley

**GOULART, Ron(ald Joseph).** Also writes as Josephine Kains; Jullian Kearney; Howard Lee; Kenneth Robeson; Frank S. Shawn; Joseph Silva; Con Steffanson. American. Born in Berkeley, California, 13 January 1933. Educated at the University of California, Berkeley, B. A. 1955. Married Frances Sheridan in 1964; two sons. Advertising copywriter, Guild Bascom and Bonfigli, San Francisco, 1955-57, 1958-60, Alan

Alch Inc., Hollywood, 1960-63, and Hoefer Dietrich and Brown, San Francisco 1966-68. Author of science-fiction comic strip *Star Hawks*, with Gil Kane, 1977-79. Recipient: Mystery Writers of America Edgar Allan Poe Award, 1971. Guest of Honor, Lunacon, 1979. Address: 232 Georgetown Road, Weston, Connecticut 06883, U. S. A.

#### SCIENCE-FICTION PUBLICATIONS

Novels (series: Battlestar Galactica; Gypsy; Star Hawks)

\* \* \*

Ron Goulart's fictional world includes Southern California, the Barnum system in outer space, and as many other alternate worlds in between as his lively imagination can conjure up. He began his writing career with parodies and humorous sketches and has continued to write with a slightly cock-eyed view of the world. He has written stories in virtually every genre, but is primarily considered a science-fiction writer. Just as his mysteries have a touch of the fantastic, his science fiction has a touch of the mysterious and often seems to straddle genres when it doesn't simply defy all categories.

His stories of outer space nearly all take place outside our own solar system in that group of planets dominated by Barnum. In the Barnum system, Murdstone is the least favoured planet, but Malagra is the pesthole of the universe. Like other legendary places (Dogpatch or Hogscratch, Arkansas) the Barnum system adjusts its dimensions to suit the current story. The Barnum system has been imaginatively realized in visual terms by artist Gil Kane in the comic strip *Star Hawks*. All of the Goulart humor comes across in the adventures of Rex Jaxan and Chavez of the Interplanetary Law Service. Ben Jolson, the multi-faced agent for the Chameleon Corps, is called on by the Political Espionage Office on Barnum to investigate mysterious happenings. *The Sword Swallower* pulls together earlier threads from his short stories, but Jolson's shapechanging powers are not exploited as imaginatively in full length as they are in the shorter form. In "Chameleon" Jolson foils an assassination by hiding in one corner of the room disguised as a TV set.

One of his best collections of short stories, *Broke Down Engine*, is concerned entirely with the problem of man's increasing dependence on machines. Told with humor, they also embody a bitter view of a future in which human beings become isolated from one another. Goulart's days as an advertising copywriter serve as the basis for his stories about androids in show business. He brings a fine eye and ear for the ridiculous to these in which the satire may be deeper than mere surface humor. One thinks of real life "personalities" who

respond to interviewers in precise, robotic terms. Perhaps the ultimate meshing to themes for Goulart's repertoire is *Cowboy Heaven* in which an android replacing the ailing actor Jake Troop on the film *Saddle Tramp* doesn't know when to stop. Goulart has his serious side and this comes out in the stories of fantasy and derring-do about the mysterious Gypsy's search for his own identity.

Goulart's style is concise and his stories are told mostly in dialogue. The reader has to be alert and not let the fast pace and skeletal appearance prevent him from enjoying the yarn. At his best, Goulart is a witty and engaging story-teller, with a recognizable reality to his fantasies. His Southern California is the extrapolation of present trends in the ridiculous; his machinery gone amok is an extension of our own worst fears as a vacuum cleaner malfunctions or an automobile breaks down.

As some of Goulart's older characters retire, others remain active. He mixes elements from different genres with his own personal enthusiasms and sets science fiction stories in 2033 or 1941 or 1897. Harry Challenge ( *The Prisoner of Blackwood Castle* ), is an 1890's private detective whose cases involve fantasy and science-fiction elements. When you've read one Goulart you've only begun.

\*

Charles L. Grant comments:

In science fiction, I'm working on a future history that most of my more recent stories and novels fit into, a history that will eventually cover over 500 years, primarily tracing a single family (the Parrics). In horror fiction, my aim is, simply, to produce a fright in the reader. In this regard I generally use two settings: Hawthorne Street (a place in an unnamed town in an unnamed area of the country), and Oxrun Station, an upper-middle and upper-class village in western Connecticut. If there's any influence at all in my work it comes not from Lovecraft or Smith, but from Bradbury and Ellison, with perhaps a dollop of Sturgeon.

\* \* \*

Charles L. Grant continues to be an author of bright, unfulfilled promise. His first stories showed occasional glimpses of deft imagery, and seemed to be the product of a new author struggling with the development of meaning from story ideas. The struggle continues, but its realization still seems far away.

Grant has begun an ambitious undertaking, a future history spanning several centuries concerning the Parric family, introduced in *The Shadow of Alpha*. This first novel presents a world of the 22nd century, swept by the plague winds. The population of North America has mostly been confined to megalopoli, with small groups of hunters living in the surrounding wilderness. Androids have been developed to take over onerous physical tasks. The plague destroys most of the population of humans, and turns the androids into rogues, a constant threat to the remaining humans. *The Shadow of Alpha* is an unremarkable post-disaster novel, with the conventional

projections of science fiction: petty warlords, universal suspicion and hostility, and an unaccountable shortage of women. The protagonist is concerned with the re-establishment of the former culture. *Ascension* concerns the third generation. The government has established itself in a small town and is slowly extending tendrils of control around it. Although the CenGov is manifestly conservative, the advance technology it offers is presented as preferable to any other lifestyle. No variant cultures are suggested as being anything but decadent or oppressive. On a mission of vengeance the protagonist, Orion, liberates the remaining inhabitants of Philayork. Although he has ostensibly learned the bitter taste of revenge, he still allows the villain to be killed.

The third novel in the series, *Legion*, is remarkably similar. Orion's brother is likewise on a quest for vengeance, although he professes otherwise. Like Orion, he suffers from melancholia. Once again, no alternatives to the CenGov reign are seriously considered and the novel is climaxed by the death of the villain. *Legion* is an improvement over the preceding novels, if only because Grant seems to have achieved a better fusion of action and introspection. As a result, the book has a steadier pace than *Ascension*, which has a strong tendency to bog down in the protagonist's own depression. The language is generally quite well handled, although Grant suffers from the delusion that repetition and sentence fragments enhance emotional impact.

It is clear that Charles L. Grant is trying to write something more than simple-minded science-fiction adventures. His novels and short stories reveal an author who takes his craft seriously. As yet, however, he has been unable to transcend the conventions of the genre he has selected.

**GRAY, Curme.** American. Born in Richmond, Indiana. Attended University of Chicago. Served in the United States Army during World War II.

#### SCIENCE-FICTION PUBLICATIONS

##### Novel

*Murder in Millennium VI*. Chicago, Shasta, 1951.

\* \* \*

There are a number of science-fiction writers whose reputations rest primarily on one story which stands out from the rest of their work. Far less numerous are those writers who are only known to have written a single story, and one that is of such quality or importance as to deserve a place in SF history. One of the latter group is Curme Gray, author of *Murder in Millennium VI*.

*Murder in Millennium VI* is subtitled "A Future Mystery." It is set in a matriarchal society of the far future, whose customs and technology bear no resemblance to our own. One measure of the alienness of this society is that the very concept of "death" has disappeared from common usage. When the ruler of this global society dies, only an antiquarian, a student of curiosities from the distant past, can recognize the condition, and he has great difficulty in explaining its meaning to others. With the eventual understanding of what "death" means comes the realization that it was not the result of a natural

process but was "irregularity," deliberately caused by some unknown agent. Not only has death re-entered the perfect and permanent society, but some member of that society has re-invented murder. The questions of who killed the Matriarch, and how, and why, underlie this very distinctive novel.

The unusual thing about *Murder in Millennium IV* is that it is an attempt to depict a future society entirely in terms of that society, without external references. There are no handy expository lectures no conversations in which two characters explain everyday features of their society to each other—all of the details of the future setting and its culture must be deduced from context. To the extent that not all such details are deducible, the book falls short of its ambitious goal, but nevertheless, as Damon Knight has said, "it's a prodigious three-quarters success. . . . For sheer audacity and stubbornness, Curme Gray's performance is breathtaking.

—R. E. Briney

**GREEN, Joseph (Lee).** American. Born in Compass Lake, Florida, 14 January 1931. Educated at Brevard Community College, Cocoa, Florida, A. A. Married 1) Juanita Henderson in 1951 (divorced, 1975), one son and one daughter; 2) Patrice Milton in 1975, two daughters. Laboratory technician, International Paper Company, Panama City, Florida, 1949-51; shop worker and welder, Panama City, 1952-54; millwright in Florida, Texas, and Alabama, 1955-58; senior supervisor, Boeing Company, Seattle, 1959-63. Since 1965, public affairs science writer, Nasa, Kennedy Space Center, Florida. Agent: Blassingame McCauley and Wood, 225 West 34th Street, New York, New York 10122; or, Carnell Agency, Rowneybury Bungalow, Sawbridgeworth, near Old Harlow, Essex CM20 2EX, England. Address: 1390 Holly Avenue, Merritt Island, Florida 32952, U. S. A.

Joseph Green comments:

Most of my stories have an underlying philosophical theme that is often not apparent on the surface. At heart I think of myself as an untrained, poorly equipped, corn-ball philosopher, and what I enjoy most is playing with ideas in fictional form. For that reason, I'll never create a consistent 'future history.' If I write a story about the totally secular world of 2090 today, I may want to write one tomorrow about the new surge in absolutist religion from 2070 to 2110. I have no faith at all in a single future.

I've achieved some small reputation as a writer of unusually believable aliens. I don't know why. I dream them up, work to make them real, and write about them because I enjoy it. Do I need a better reason? I write primarily for readers, not critics or other writers. If a reader enjoys my work, that's good. If it also makes him think, that's even better.

\* \* \*

Joseph Green is a strongly imaginative writer. He likes to set his heroes problems, sometimes highly exotic or elaborately contrived, always laid out with great clarity and convincingly resolved. These heroes are often troubleshooters, typically working at the interface between human and alien, sometimes—and this is probably his most characteristic motif—even operating with alien bodies. In his most powerful novel, *Gold the Man*, this alienation works as far as two removes, for the hero is emphatically a man trapped in a superman's body, put to work inside an alien giant. In confronting his character with painful dilemmas, Green communicates to the reader a strong concern; he is also able to treat sympathetically those on both sides of an irreconcilable debate, as in *Star Probe*, which concerns one battle in a larger war between the space scientists and the Friends of the Earth. In *The Horde* he presents one of the genre's most sympathetic accounts of a kind of alien hive species, the humanoid Shemsi, as an improbable friendship develops between human and humanoid bound together, for different reasons, on a dangerous mission.

Reflecting their origins as series of short stories, *The Loafers of Refuge* and *Conscience Interplanetary* are episodic narratives. In the first, trouble-shooter Carey, as the first man born on Refuge, works to resolve conflict between humans and the native loafers, who have developed mental but not mechanical power. Human-Loafer interaction is mutually beneficial: for instance, the Loafers revivify their living trees (the Ent-like *breshwahr*), one of whom shows how men can survive matter transmission, thus enabling rapid colonization of other planets to relieve the overcrowded Earth. In the second, the hero Allan Odegaard has the job of checking whether intelligence exists on a planet: if so, it must be left alone, if not, it may be colonized (a problem consequent on the solution found in *Loafers*). Throughout his seven extraordinary adventures, Allan is in more danger from reactionary humans than from the weird life-forms he encounters.

*Gold the Man* is a classic novel, whether considered as a profound study of the loneliness of the superman in no-man's-land or as an exciting contribution to Brobdingnagian fantasy. Earth is at war with giant humanoids, the Hilt-Sil, one of whom, suffering from irreparable brain damage, is captured.

The superman Gold, and a female assistant, Marina Petrovna, are installed in the head of the 300-foot captive, where they control his brain, seated behind one of his eyes. In this extraordinary Trojan horse, they spy on the alien planet, finding the feared enemies to be a race of gentle giants living an idyllic life but forced to look for another planet because of danger from their own sun. Gold helps resolve their problems and, remarkably enough, his enforced voyeurism of their Gargantuan love-play resolves his personal fear of impotence: being a superman, he was a slow developer, but he rapes and impregnates the helpless Marina and their child is born with the assistance of a friendly Hilt-Sil doctor who has discovered them (this is not a macho fantasy story for all that). Green sets himself difficult problems in this powerful novel but he handles both the physicalities and the psychological stresses of the intriguing situation with great tact and skill.

In the light of *Gold the Man*, Green makes less than expected of the interesting motif in *Star Probe* of an old man, deceased, who is brought back to life in the body of his idiot grandson for the purposes of a suicide mission. The mission concerns the investigation of an alien probe in the solar system; once the difficulties of getting a rocket to the probe have been resolved, Green is able once again to concern himself with the interesting problem of communication between alien and human; within the novel as a whole, however, the probe serves only as an emblem of what the struggle for funds between space scientists and ecologists is all about.

Among Green's many fine short stories, it is hard to pick out the best or most characteristic, but "Jinn," "Once Around Arcturus," "Treasure Hunt" (man inside crystal chariot-horse), "When I Have Passed Away" (exotic Giantesses), "Last of the Chauvinists," and "To See the Stars That Blind" (written with his wife, Patrice Milton, brilliantly presenting the wonder and horror of a new mode of seeing), should be included. Green has published few stories in recent years; in the most recent known to me, "Still Fall the Gentle Rains" (written with Patrice Milton), the concern is still, movingly, with human-humanoid relations and the species implications of sexuality: in this case, lower fertility implies greater honesty.

\* \* \*

William Greenleaf has the ability to utilize the *sociological*

*theme of paradoxical perception* in his science fiction in a much more complex manner than many of his peers. It permeates his plots and characters. Simply stated, this theme can be explained in this way: All is not what it seems, and nothing ever is because the shadow is oftentimes more of a reality than the figure which casts it; the figure is often an illusion. This idea has its roots in Heraclitus's philosophy and Plato's "Allegory of the Cave," and was theorized by sociologists during the 20th century with its direct application to social structure and role. Role and characterization are important in Greenleaf's fiction world, and his technique for handling paradoxical perception is evident in the two novels, *Time Jumper* and *The Tartarus Incident*, for which he is best known and has developed a following.

The themes of the Outsider and the Outcast appear in Greenleaf's fiction, and the character who falls into either category is usually faced with some form of rite of passage through which he or she must pass in order to survive and maintain identity. An example of this is Greenleaf's character creation, Erin, in *Time Jumper*.

A literate writer, drawing on many disciplines when he creates, Greenleaf's work contains a sense of existential irony within its structure. At times, the use of humor is very wry.

Greenleaf is a stylist, and he has the ability to create mood and atmosphere in a convincing manner that draws the reader into the rich texture of his prose. In the battle between good and evil for supremacy, good always has to work harder to win; it is more easy to be evil in a philosophical sense than it is to be good. It is clear that moral cowardice is one of Greenleaf's major concerns, for it runs through much of his writing in one subtle variation or another. Somewhere along the way, each character must make a moral choice, but be it for good or for evil, it must be made so that character can fulfill his or her destiny.

Greenleaf can successfully work a macabre feeling into his fiction, which places him in the same literary category as Robert Bloch and Lucius Shepard. His work compares favorably with these two writers. The reader will discover a fine social critic at work in Greenleaf's interests in social concerns, the role of values in society, and placing humans in an environment of mystery with the fear threshold present.

Greenleaf's skill at sustaining a keen sense of suspense and tension in his plots is well-developed. He can accurately reveal the incompetence of bureaucracy in any situation and its effects upon environment and personality. Like Keith Laumer, Greenleaf can deftly handle plot twists.

William Greenleaf's contribution to science fiction is his use of sociological and philosophical themes, characterization, and style. Continuing interest in Greenleaf's writing for sociologists, scholars, and readers rests on his ability to insert a sense of existential irony within the structure of his stories, the use of paradoxical perception to illuminate social concerns, and his use of the themes of the Outsider and the Outcast.

Russell M. Griffin comments:

The first adult paperback I ever owned was an anthology of science fiction I took to boys camp my first summer away from home. The book is long since lost, but not the stories.

But I suppose what has kept me in science fiction more than

anything else since is the medievalist in me. Where else can a writer enjoy the same scope and freedom of invention one finds in the dream visions of Chaucer, Langland, and Gower? Where else in modern literature is allegory allowed to survive at all? Science fiction, as the works of Orwell and Huxley attest, provides the ideal vehicle for social comment and satire. Reerect Spenser's Castle of Pride or create a society where equality is enforced by crippling the gifted? They are only a planet or an age away.

\* \* \*

At this relatively early stage in his career, Russell M. Griffin already has four published novels to his credit, all of them fresh, witty, and crisply written versions of basic (and one not so basic) science fiction themes. Especially noteworthy about this impressive new talent are his inventiveness and exceptional gifts for comedy and satire. Regarding the latter, while certain passages in his work are reminiscent of another fine satirist, John Sladek, Griffin's passages are usually rather better integrated into the work as a whole than Sladek's.

Griffin's first novel, *Makeshift God*, would be impressive even were it not a "first novel." The first half, especially, is brilliantly achieved; the second tends to lean more on mere adventure elements. However, Griffin's next two novels are more ambitious, both artistically and thematically. Significantly, both can be seen as closer to "mainstream" fiction than either his first or most recent efforts. His second novel, *Century's End*, is set in the near future (1999). Millennial actions and expectations abound: crazies and zanies expecting the worst, plotting the worst, are everywhere. In the controlled wittiness of the presentation, in the skill of its scene construction, and in its deft satirical art, this novel exemplifies many of the best qualities of the innovative science fiction of the past two decades; it can be meaningfully discussed in a context which includes the best of such writers as Vonnegut, Dick, and Disch. One thing that relates this novel to such major figures is the obvious intelligence manifested throughout—and not merely literary intelligence: for Griffin proves to be highly informed about a wide range of subjects, for example, satellite technology, climatology and geology, and the psychology and sociology of aberrant religious cults.

The plot focuses on the deadly rivalry of two such cults, one headed by an "inspired" mad-woman, the other headed by a corporate-minded TV evangelist named Dr. Love. Griffin focuses much of the novel's deft satire on these two groups and their benighted followers; he focuses also on related hypes, TV programming and advertising, for example. The central characters ranged against the cults and their manipulative techniques are the bright, sardonic Jervis Santalucia, who is half-black and rarely at ease about his identity, and Circe McPhee, a professional prognosticator; the chaos of modern life is such that government and big business have turned to the occult for "answers."

While the writing in Griffin's third novel, *The Blind Men and the Elephant*, is just as witty and persuasive, the work itself—plot, theme, milieu—is his least science-fictional. The highly bizarre plot and accompanying cast of zanies relate to the pathetic-comic misadventures of a latter-day "Elephant Man"—a terribly deformed yet bright and sensitive creature who is commercially exploited by a media huckster (TV again) and spied upon by sinister government agents. We soon learn that Elephant Man is no more than five or six years old, being the ghastly product of government "experimentation" in cloning. His misadventures are a very Vonnegutian assemblage of black humor, farce, and satire. While individual episodes are

very freshly done, it is doubtful that the overall presentation is as successful as it might have been. This volume is perhaps more to be recommended to fans of sixties-seventies mainstream black humor writing than to SF fans.

*The Timeservers* is, again, an impressive piece of writing. It resembles his first book in being very overtly science-fictional in its setting, themes, and characterization—interstellar travel, encounters with alien races, and so on. Certain interests—cloning, Roman Catholic ritual, the omnipresence of human violence (here embodied in a war with strong Vietnam overtones)—return from earlier Griffin books. But the reader experiences no sense of an author repeating himself; Griffin is just as fresh in approach, quite as interesting and witty here as in his previous books. This is a younger talent definitely to be watched. Not only has he chosen the best of models (Dick, Sladek, et al.), but in his best work, in his finest episodes, he transcends those models, bringing a new voice to the impressive choir of post-Campbellian writers.

\* \* \*

George Griffith published almost 50 books of crime, adventure, fantasy, romance, social melodrama, verse, and non-

fiction. Most importantly, his output includes over 20 books of, or in the margins of, SF. He became one of the first, most characteristic, and most popular professional writers of editorially planned and instantly sensational fiction in the rising "yellow-press" of the turn of the century. Griffith also met the usual end of such hacks, being forced to get more outrageous and less believable in each succeeding novel and to shed whatever original insights he might have had in the process.

His best work, consequently, is clearly his first novel, *The Angel of the Revolution*, though even that is marred by slipshod haste, racist chauvinism, and melodramatic sensationalism. Yet the subsumption of Verne's gadgetry and the "future war" tale, plus a dash of travelog exoticism and a barrelful of Bulwerian melodrama, under a real sympathy with justice wreaked on the existing political order of depotism and Mammon by a group of avenging heroes united into an Anarchist or Terrorist Brotherhood of Freedom, was a genuine breakthrough. The brains of the conspiracy, the super-intelligent Hungarian Jew Natas, is, in spite of his name, his hypnotic powers, and his crippled exterior, convincingly portrayed as a victim of Tsarist oppression rather than a mad beast. The main hero, an English inventor, is starving in his garret while inventing his super-airplane; and the executive head of the Terrorists is an English aristocrat, thus permitting Griffith to alloy plebeian hatred with snobbery. There follow cliffhanging global adventures dovetailing the fates of the heroes and their beautiful and fully equal female counterparts, especially Natas's daughter Natasha, and the world war that develops in 1904. The bloodthirsty Franco-Slavonic alliance is defeated by the Brotherhood who set up an Anglo-Saxon federation to guide the world toward disarmament and a vague social justice never clearly spelled out in economics terms. But this heady brew contains a few memorable set scenes, and—most importantly—an at-least-partial realization that the fusion of politics and the new technology makes the old social relationships not only unstable but catastrophically untenable. This realization made Griffith a pioneer in the instauration of a new SF tradition which culminated in Wells and still overshadows our whole century.

The sequel, *Olga Romanoff*, written to exploit *The Angel*'s great success, is inferior, its only new element being an interplanetary threat copied from Flammarion's ubiquitous comets. Already in *The Outlaws of the Air* the exploitation becomes unreadable: the anarchists are vicious beasts, the heroes English gentlemen, the ideal a rosewater South Sea colony, the fights simply ludicrous; *The Great Pirate Syndicate* descends to bloodthirsty Anglo-Saxon wishdream-imperialism and anti-semitism. In Griffith's feverish gallop through all the popular literary forms, *A Honeymoon in Space* was his venture into interplanetary voyages; it groups all its clichés (aggressive Martians, angel-like Venusians, antigravity, monsters galore) around a safari-story of a lord, his beautiful American bride, and their faithful retainer. His later works are unworthy of a writer with political convictions and a generous plebeian indignation: if the story that Griffith died of drink is true, it would provide an appropriately moral dying fall. And it would still remain exemplary for the SF of our century.

\* \* \*

Frederick Philip Grove is primarily known in Canadian literature for his didactic agrarian novels. One might consider his 1942 autobiography, *In Search of Myself*, a work of "fantasy," since in it he sets out the persona of "Grove" he had maintained, with many fabrications, since his arrival in Canada many years before.

*Consider Her Ways*, his only real science fiction novel, was also his last; it employs genre conventions for social satire. The story is ostensibly set down by a naturalist studying ant colonies in Venezuela. He regards these insects as akin to humans, calling them our "formicarian brethren." In fact, they are superior, since one giant ant, Wawa-quee, is able to hypnotize him and communicate her story of epic quest with an army of warrior-scientists, to gather knowledge for her tribe.

This device of the ant's point of view allows Grove to satirize humanity both directly and indirectly. Wawa-quee's comments on humans are scathing. She ridicules everything from spelling (designed to render knowledge inaccessible) to clothing (especially night-gowns). Yet through the ants' own values—their military ferocity, subordination of the individual, and acceptance of slavery—the author (in the wake of World War II) condemns these evils in human life. This is especially evident when Wawa-quee observes that humans do not operate on children to render them happy and docile in slavery, even though they do enslave each other "by means of a thing . . . [they call] money." She comments: "The curious will infer from this neglect of simple expedients that man has either not yet risen to any very high degree of civilization; or—which is my own opinion—that he has considerably degenerated from a level previously attained." The irony is double-edged; the ants cannot understand human free will, but they can condemn human cruelty. Indirectly, through the ants' courage, treachery, despair, hope for the race, self-sacrifice, and thirst for knowledge, Grove discusses the best and worst of human nature. His satire is often savage; yet it is mixed with

compassion. Wawa-quee and her society are convincingly drawn.

Unfortunately, the book is flawed by its pedantic style and by the obvious nature of its allegory. The whole book, in situation and style, seems to be an inferior imitation of an early 20th-century "lost race" fantasy by Wells, Haggard, or Conan Doyle. This may explain its relative obscurity. Nevertheless, for its inventiveness and social commentary, the book deserves examination.

—Susan Wood

**GUIN, Wyman (Woods).** American. Born in Wanette, Oklahoma, 1 March 1915. Educated at Riverside City College, California, J. C. 1934. Married 1) Jean Adolph in 1939 (divorced, 1955); 2) Valerie Carlson in 1956; two sons and three daughters. Technician in Pharmacology, Advertising Writer, Advertising Manager, and Marketing Vice-President, Lakeside Laboratories Inc., Milwaukee, 1938-62; Vice-President, Medical Television Communications Inc., Chicago, 1962-64. ## Short Stories

*Living Way Out*. New York, Avon, 1967; as *Beyond Bedlam*, London, Sphere, 1973.

\* \* \*

Although Wyman Guin has written a novel, *The Standing Joy*, his most important work is to be found in his novelettes from the 1950's and 1960's. The stories are remarkable for the way in which Guin takes up far-out sociological or psychological ideas and gives them substance in carefully worked out dramatic conflicts against the background of alternate societies; despite some extravaganzas in the details they carry conviction and emerge as fully rounded and believable SF worlds.

His best story is the minor classic "Beyond Bedlam," which employs the basic inversion device of so much science fiction: what is considered an illness today—schizophrenia in this case—is in about a thousand years in the future the norm, with a drug-induced, law-enforced schizophrenia in every human being. Everybody is inhabited by two personalities that change in five-day shifts. This procedure has eliminated man's aggressive impulses, and hence war, but has also led to the disappearance of art and emotional pleasures. The theme of the story is treated not so much as a utopian dream or a dystopian nightmare as an exercise in creating a different alternate society, with all the ramifications in good and evil following from the basic premise.

"The Delegate from Guapanga" and "A Man of the Renaissance" both have richly exotic socio-cultural backgrounds. The first story contrasts two alien philosophies of "Mentalists" and "Matterists," the Mentalists being closer to nature with ideals of a simpler life and tradition, the Matterists representatives of a mechanistic-scientific culture. The hero of

the story develops a curious political idea of "dishonesty in government." The second story is about a man of ambition in an archipelagic world, who by sometimes Machiavellian means tries to realize his purely rationalist and revolutionary notions in a world governed by traditional values. In "Volpla" a joke in genetical engineering by a misanthropic lone scientist—artificially created beings that were to be passed off as visitors from the stars—turns out differently by a simple reversion of the reader's expectations. "My Darling Hecate" and "The Root and the Ring" are slight and mildly amusing volatile fantasies.

Guin's novel, *The Standing Joy*, is a parallel Earth story, with the characters having "twins" on another Earth, perhaps our own. Its protagonist, Colin Collins, a superman who has invented the prolonged orgasm, gathers around him a group of other talented inventors; the sex is harmless, but the whole thing is a bit confused. Wyman Guin's typical work is characteristic of its time and the magazine (*Galaxy*) in which most of it appeared, a slickly written fiction of ideas that manages to entertain and to stimulate without moving the reader deeply.

Bibliography: *A James Gunn Checklist*, Polk City, Iowa, Drum, 1983.

Manuscript Collection: University of Kansas Library, Lawrence.

James E. Gunn comments:

I recently began an autobiographical essay for Contemporary Authors Autobiography Series with the statement: "I am a professor of English at the University of Kansas, the author of some 80 published science-fiction stories and the author or editor of twenty-four books, almost all of them either science fiction or about science fiction. At the age of 61, as I write this account of my life in that fabled year of 1984, in the quiet university town of Lawrence, Kansas, trying to make sense out of what has happened to me, my first thought is that, unlikely as it might once have seemed, this is where I belong; this is what I was meant to do."

The facts that I have been president of both of the Science Fiction Writers of America and the Science Fiction Research Association, that I have written almost as much critical material about science fiction as I have written science fiction, that I split my working time between teaching and writing, illustrate the ways in which my work has tried to bridge two cultures. In the introduction to my 1972 collection of stories, *Breaking Point*, I wrote that "the stories in this collection were intended [to help] bridge the gap between science fiction and the mainstream, between the ghetto and the larger world outside, between C. P. Snow's Two Cultures." They were, I indicated, intended to adopt an evolutionary, not a revolutionary, approach to a literature, accepting the strengths of a popular genre and trying to build upon them.

Finally, in my autobiographical essay, I wrote about a story that became the starting point for my writing of *The Dreamers*, "Looking back over my career as a writer of science fiction, I realize now that I have always been fascinated by the seductive power of dreams, even while I have insisted that reality, while it may be hard and tragic, is preferable."

I concluded the essay with the statement, "That would be consistent with my life as I see it: surprise tempered by understanding, optimism tempered by reality, ambition tempered by pragmatism."

"The true heroes of my stories are rational people who accept the world as it is while never giving up the possibility of making it better. The villains are much the same, only they are willing to go too far to get what they want; they want what everyone else wants, but their desires are not restrained by a sense of other people's needs."

"A fiction writer's work may not always reflect his values, but if he writes out of what he has experienced and thought and felt, it must reflect the writer. What I am ultimately must be seen in the mirror of my writing."

\* \* \*

In his definitive anthology *The Road to Science Fiction* James E. Gunn defines science fiction as idea-fiction that describes change and its consequences on the human race. This change is often technological and, in most cases, is brought about by human actions and desires. While such a definition may not work for all of science fiction or for all its writers, it has worked well of Gunn. Since 1949 his work has consistently represented human characters confronting altered futures. As in the stories collected in *Station in Space*, Gunn sees humanity as a race that needs to be challenged in order to grow. He recognizes that many people would prefer to live in stable worlds in which each day is like all the others, and, therefore, his plots frequently deal with how the major characters thwart the deadly appeal of stasis.

Gunn's favorite writing length is the novelette because it allows him to center his story around a single event that is economically described and resolved. Many of his "novels" consist of three or four novelettes connected by a common theme. In *The Joy Makers*, for example, Gunn explores what people think will make them happy within an extended period of time. In each story a stage is reached which eventually supports his thesis that even if absolute happiness could be found it would probably be rather disappointing. The use of a series of novelettes allows a story to end with a dramatic statement that does not need the amplification and development a novel demands.

*The Immortals*, another series of interconnected stories, investigates a world in which immortality is possible. However, in each story the possibility of immortality is not as important as its effect on the characters. Gunn wishes to describe human attitudes toward death and uses the device of immortality to put these attitudes into sharp relief. Because he deals with such issues, Gunn's stories often touch on current problems. For example, medical technology has been more and more directed toward the prolongation of life. But such technology has added huge costs to basic hospital services. In the third story of *The Immortals* Gunn presents the ultimate direction such a trend could take. The story effectively describes just how dangerous humanity's preoccupation with avoiding death can be.

In *The Listeners* Gunn studies communication in the same way he explored immortality. While the unifying concept among these novelettes is the attempt to decipher and answer a message from Capella, the theme concerns communication between individuals. In each story, with the Capellan project in the background, the foreground is filled with husbands and wives, fathers and sons, leaders and followers, writers and readers, men and intelligent machines, and humans and aliens who try to communicate. The result is a work that describes not only an adventure in the near future but a moving account of humanity's present. Communication with aliens may happen some day, but for now human communication could do with some improvement.

*The Dreamers* (inexplicably renamed *The Mind Master* by the paperback publisher), collects three novelettes with the addition of inter-chapter material that adds up to yet another story. Each of these stories traces the consequences of the discovery of chemical learning. By imparting instant knowledge through chemistry, humanity has eliminated the difficulty

normally associated with learning. But it has also created a future race in which imagination is sadly lacking. Even dreams come from pills and injections. By far the darkest of Gunn's works, *The Dreamers* still gives the reader human characters who are capable of love and who care about what has happened to their fellow human beings. The stories might deal with a nightmare age, but Gunn regrets this nightmare. It is as if Gunn is telling the reader that these characters, and by extension humanity, deserve better than their allotted fates.

And Gunn does give humanity a better fate in his most recent book *Crisis!* Set in our present, the stories deal with a man from the future who comes to the present in order to avert events that will destroy the future. This character is not allowed to act directly, but must convince people of the present to act simply by speaking and reasoning with them. Gunn covers a wide variety of problems (from energy to war to terrorism), and presents some interesting views on why and how they happen.

Two more conventional novels deserve mention. *The Fortress World*, Gunn's first novel, is a highly readable story that makes use of the popular science-fiction galactic empire. But Gunn relates the story from the point of view of an ordinary inhabitant rather than a super-hero. Life in a galactic empire can be rather unpleasant if the character is only one of the crowd. *This Fortress World* is Gunn's attempt to bring "reality" to space opera.

At the opposite pole lies *Kampus*, a work that has suffered from misreading. It is too easy—and misleading—to read this novel as a damnation of the campus of the 1960's. *Kampus* is, in fact, a parable about people who believe that everyone should be allowed to do "their own thing." It is similar to Voltaire's *Candide* in that the world and action presented in the novel are not meant to be taken as serious attempts to portray "reality." Unlike *Candide*, however, *Kampus* questions what life would be like if everyone were only to tend his own garden.

James E. Gunn has made a career of science fiction as an author, teacher, and scholar. His criticism attests to his sensitivity to the genre. His fiction shows an equal sensitivity to what is possible in science fiction. As one reads his stories, one is struck by the variety of themes, plots, and styles he is capable of. *Kampus* is a remarkable feat of stylistic experimentation that was not at all predictable from *The Listeners*, and *The Dreamers* and *Crisis!* prove that his interest in style has not ended. In a literature that is itself concerned with change, it is somehow reassuring that one of the writers most interested in this theme is himself able to change.

#### SCIENCE-FICTION PUBLICATIONS

Novels (series: Matthew Dilke in all books)

*Cold War in a Country Garden.* London, Cape, and New York, Putnam, 1971.

*Killer Pine.* London, Cape, and New York, Putnam, 1973.

*Fratricide Is a Gas.* London, Cape, 1975.

\* \* \*

Lindsay Gutteridge is the author of three espionage novels featuring Matthew Dilke as hero, a micro-man one quarter of an inch in height. They are all splendid adventure stories and powerfully engage the sense of wonder. Gutteridge plays rough with his miniature spies and their normal-sized masters and foes, so that these should perhaps be classified as adult entertainments but there is nothing very special in the books considered as offbeat spy thrillers. Their distinctive quality is science-educational: they are the closest fictional equivalents I have found to *The Hellstrom Chronicle*. Whereas that film's overwhelming images of the alien life we overlook projected an inimical world, in which ants are far better adapted for survival than we hubristic humans, Gutteridge, better balanced, discovers not only beauty and terror, monstrosity and indifference, but delightful nourishment. By not being insect-sized, Gutteridge suggests, we are missing the marvellous abundant food of pollen and nectar. If only we could be miniaturized, our survival problems would be over. There, of course, is the rub which would lead us to classify these works as pure fantasies were it not that they belong to a tradition of a micro-people in SF established by such writers as Asimov, Blish, and Leinster, and that they use the convention to instruct us about natural history so fully and sensitively. The microscopic eye is a human one, and the wonders seen are related to human fears, needs and desires.

*Cold War in a Country Garden*, in which the mission of three micro-men is to implant transmitters in the hair of a Russian, is closest perhaps to the conventional spy thriller, substituting a box of centipedes for the snake pit or piranha pool as a persuasive threat to the captured Dilke. When he escapes, rescuing a micro-negress, Hyacinthe, who aids him in his second adventure, the pursuers are caught by an ant-lion. *Killer Pine* is a novel of ecological warfare, in which the enemy are Russian micro-men who inhabit a metal container on a pine in a Canadian forest, breeding termites to spread a viral death. We are given fascinating and horrid glimpses of life in a termite colony, in a tree which, for the micro-climbers, has the scale of Mount Everest. The third novel (which I hope is not the final adventure), *Fratricide Is a Gas*, has affinities with novels of industrial espionage: here Matthew Dilke is pitted alone against a sadistic Nazi chemist in Peru. The highlight of this novel is a sequence in which Dilke climbs jungloid thorns and creepers, enjoying on the way an idyllic repose in the bloom of an orchid, where he is visited by a humming-bird and witnesses the giant courtship of butterflies and the predations of parasitic wasps and shaggy spiders.

Gutteridge's micro-man's view gives us the pleasure of a sardonic perspective on the conventions of spy fiction and also a Swiftian magnification of some of our physical and spiritual coarseness, as when Dilke spies from a perch on the top of Lippe's study chair not only the eroded massif of his head but also the monstrous cruelty of his mind, revealed by his most

private occupations. Gutteridge's work may well have influenced *The Micronauts* by Gordon Williams (1977), an exciting, more fully science-fiction narrative which, however, lacks the Gutteridge charm.

—Michael J. Tolley

**HAGGARD, H(enry) Rider.** British. Born in Bradenham, Norfolk, 22 June 1856. Educated at Ipswich Grammar School, Suffolk; Lincoln's Inn, London, 1881-85: called to the Bar, 1885. Higgins, London, Cassell, 1981, New York, Stein and Day, 1983.

\* \* \*

H. Rider Haggard shares the fate of writers like Mark Twain, Robert Louis Stevenson, and Lewis Carroll in that his novels now serve either in children's editions or as grist for Hollywood's mill. But Haggard never meant his works to be juvenile fare, for they are filled with very adult passions. Of his many novels, the majority are fantasy-romances that range in setting from South Africa to Iceland to Mexico, and in time from the days of Babylon to contemporary central Africa.

Haggard's first successful novel was *King Solomon's Mines*, which he published in the year after he set up practice in London as a barrister. So enthusiastic was the public reception of this novel, in which Haggard created the prototype of the "Great White Hunter," that he virtually gave up the law, and devoted most of his time to writing. The hero of *King Solomon's Mines* is Allan Quatermain, who is asked by a beautiful Englishwoman to find her husband, who is lost in the African jungle. When the tracks of the missing husband lead to a long-hidden cave, only the skeleton of the husband is found, along with the treasure of King Solomon, missing for two thousand years. In the sequel, *Allan Quatermain*, Allan dies, and Haggard found himself in the same position as Conan Doyle when, tiring of his famous detective, he killed off Sherlock Holmes: the public would have no part of it. Because of this outcry, Haggard used the device of the "discovered manuscript" to write 13 more novels about Quatermain. In these, Allan meets with further adventures both in his own time and in a past life in ancient Babylon.

The theme of reliving past lives is one which Haggard used many times, especially in the series of novels about the mysterious Ayesha, or She-Who-Must-Be-Obeyed. *She*, the first of these novels, introduces Ayesha, the queen of a cannibal tribe in Africa, the people of the Kor, as she waits for the return of her lover, whom she murdered two millennia ago when he dared to marry someone else. Her wait comes to an end when a young Englishman, Leo Vincey, comes to her land. One glance at Vincey is enough to convince her that Leo is the reincarnation of the long-dead lover. She tries to persuade Leo to join her in eternal life, the secret of which she had discovered in the flame at the heart of a volcano. But once again Ayesha is frustrated when Leo too takes another woman for a wife. After banishing Leo's wife, Ayesha takes him and his companions to the volcano to renew her arguments for him to bathe with her in the flames. But the magic only works once, for when Ayesha enters for the second time, she begins to age before the eyes of the men, turning into a two-thousand-year-old crone. To their horror, she dies at their feet. Sickened and dazed, the men return to England to try to forget the sight. Like Quatermain, Ayesha was called back for repeat performances. Haggard wrote two more novels about her return from death—*Ayesha* and *She and Allan*—and still another about her early years in ancient Egypt, *Wisdom's Daughter*.

That most of the titles of Haggard's works are unfamiliar even to SF readers shows the success of modern critics in stamping out much of 19th-century fantasy. The few that are relatively well known owe their longevity to the movies, where, even though the plots have been somewhat altered, the mystery and romance of the settings and characters have been preserved.

—Walter E. Meyers

**HAIBLUM, Isidore.** American. Born in Brooklyn, New York, 23 May 1935. Educated at the High School of Art and Design; City College of New York (Editor, *Mercury*), B. A. in English and social sciences 1958. Served in the United States Army Reserve, 1959-64. Has worked as interviewer, script writer, and folk-singers agent; now free-lance writer. Agent: David Grossman, 110-114 Clerkenwell Road, London EC1M 5SA, England. Address: 160 West 77th Street, New York, New York 10024, U. S. A.

Isidore Haiblum comments:

(1981) Haiblum's work has its roots in the *Black Mask* Hammett-Chandler tradition and in the humor of Sholom Aleichem; it is often both hard-boiled and zany and sometimes ethnic. His style is awash with idioms, slang, and underworld lingo. His settings, despite the given dates, are often the 1930's, a time he rather likes. The jury is still out on how all this will go over in SF. *The Tsaddik of the Seven Wonders* was billed by the publishers as "The First Yiddish Science Fantasy Novel Ever.

" And about *Interworld* Gerald Jones wrote in the *New York Times*: "If you have ever wondered what *The Big Sleep* would sound like if Raymond Chandler were reincarnated as Roger Zelazny, this is your book." *The Nightmare Express* (a big alternative universe novel set in the 1930's and elsewhere), *Outerworld* (again with ace gum-shoe Dunjer from *Interworld*), and a revised edition of *The Wilk Are among Us* take all this a step further. Haiblum has his fingers crossed.

(1985) With the passing of the years Haiblum has also taken to holding his breath. Meanwhile his novels have been translated into French, German, Italian, Hebrew and Spanish.

\* \* \*

In his Afterword in *Binary Star 3*, Isidore Haiblum says that he and Ron Goulart draw on two traditions rare in science fiction, vaudeville comedy and hard-boiled detective stories. The verbal lunacy of the one and the callous violence of the other appear in Haiblum's work as part of his image of the City. New York—Depression era to present, future, and parallel-world—is a major "character" in his books, especially his most ambitious novel, *The Nightmare Express*, with its York, Old York, New York, and Founder's City. In his early novels comedy is the more interesting factor, playing wildly unusual creatures against their slangy, urban speech: the unorthodoxly Orthodox Tsaddik, the intergalactic social workers and their Wilk enemies, etc. The hard-boiled tough guys sometimes seem inappropriate, their imitations of 1930's action and language out of place in future or alternate world's especially in the (mainly) non-comic worlds of *The Return* and *Transfer to Yesterday*. In *Nightmare Express*, however, the 1930's scenery is part of the plot, as all the alternate Yorks split from 1935.

Haiblum enjoys complicated plots told from shifting viewpoints, usually to increase the comic or horrific madness of his city-worlds. Even the simplest, *The Return*, *Outerworld*, and *The Mutants Are Coming*, with one point-of-view character and world apiece, chase through various sub-cultures (each parodying an aspect of urban life).

—Ruth Berman

**HALDANE, J(ohn) B(urdon) S(Anderson).** Indian. Born in Oxford, England, 1892; son of the scientist John Scott Haldane; brother of Naomi Mitchison, *q. v.*; moved to India in 1957; became a citizen in 1961. Critical Study: *J. B. S.: The Life and Work of J. B. S. Haldane* by Ronald W. Clark, London, Hodder and Stoughton, 1968; New York, Coward McCann, 1969.

\* \* \*

The importance of J. B. S. Haldane for science fiction lies in the influence of his speculation on other writers rather than in

his own rare excursions into fiction. Only two of his many works can be classified as science-fiction: a short story, "The Gold-Makers" (1932), and "The Last Judgment" (1927), a long narrative essay that contains a possible scenario for the end of the world, as foreseen not by religious prophecy—which Haldane always enjoyed ridiculing—but by scientific calculations of probability.

His short story dramatizes what for Haldane (later a convert to Communism) was one of the worst evils of capitalism—its exploitation of science, the stifling of the free development of discovery. A French chemist finds out how to extract gold from sea water, and he and his colleagues plan to use their prospective wealth to finance scientific research. But gold-mining interests soon get wind of the project and their hired killers set about eliminating the scientists involved. The story soon degenerates into a cinema-style thriller (but as such is cleverly written): the English narrator-hero, approached in desperation by one survivor among the scientists, who reveals to him part of the secret, is chased over most of France by the killers until he at last decides to baffle pursuit by publishing what he knows—as fiction!

Far more considerable, even as narrative, is "The Last Judgement" ( *Possible Worlds* ). This work seems to have furnished Olaf Stapledon with one of the crucial episodes in *Last and First Men*: he freely adapted Haldane's prophecy of the slow collapse of the moon upon the earth, leading to the enforced migration of a small percentage of humanity to Venus, where mankind survives through artificial mutations. C. S. Lewis, whose character Weston in his space trilogy is an unjust caricature of Haldane's (and Stapledon's) attitudes, thought "The Last Judgment" a "depraved" work, but Lewis too found a use for Haldane's idea of the moon's fall as the most probable end of human life on Earth (in *Perelandra* ).

Another writer indebted to Haldane was an old Oxford friend, Aldous Huxley, who found in *Daedalus* hints toward the famous test-tube babies of *Brave New World*. Haldane's influence on a friend of his last years, Arthur C. Clarke, is more obvious in the latter's essays than in his fiction. Clark has given currency to what is now, at least in the science-fiction world, the great biologist's best-known saying (Clarke calls this "Haldane's Law"): "The Universe in not only queerer than we imagine; it is queerer than we *can* imagine."

—John Kinnaird

Jack C. Haldeman comments:

Sometimes I write hard science fiction, sometimes soft. Sometimes I'm serious, sometimes I'm humorous. Mostly I'm traditional, though occasionally I try something experimental. I often draw on my scientific background as well as my sense of humor. Mostly I try to entertain, though I have been known to slip in a message or two. I try not to let it clutter up the story.

\* \* \*

Jack C. Haldeman has spent a good deal of his writing time on one of the rarest of themes in science fiction, the sports story. He began in 1977 with "Louisville Slugger", an anecdotal piece in which the future of humanity depends on a baseball game against Arcturians. This was followed by a sequel, "Home Team Advantage," wherein the Arcturian aliens discover that man is inedible and forfeit their prize, the consumption of humanity.

Apparently having discovered that he had stumbled upon a good thing, Haldeman followed this pair up with a second, "The Thrill of Victory" and "The Agony of Defeat," this time concentrating upon a team of robotic football players who are first faced with discovery that they have been illegally programmed with a will to win, and then matched in a championship game with genetically altered beings. All four stories were played strictly for laughs, and are as trivial as one might expect.

The next story, "Thirty Love" was decidedly different. A professional tennis player has led a long and successful career because his precognition allows him to anticipate where the ball will next be hit. On his final match, he deliberately throws the game when he realizes that defeating his opponent will cause the latter a trauma that will utterly ruin his life. Unfortunately, the subsequent sports stories have been as light as the first, and Haldeman's best fiction has not been in this area. Only "Race the Wind" has had a serious theme, a cripple determined to compete in slalom racing, and the story itself was

too weak to support the seriousness of the situation.

There were, however, several extremely good stories published outside the context of his sports series. "Songs of Dying Swans" involves the tragic destruction of a race of altered humans, and the consequences of this destruction on the rest of civilization. "Laura's Theme" is a haunting, enigmatic story of a strange woman who seems constantly present when people's lives take radical turns for the worse.

Much of Haldeman's work is in a decidedly humorous vein, ranging from amusing but slight jokes to genuinely funny pieces. A typical middle-class family is startled and dismayed to discover that their front yard has suddenly become the legendary elephant's graveyard in "What Weighs 8000 Pounds and Wears Red Sneakers?" In "Those Thrilling Days of Yesteryear" archaeologists are engaged in manufacturing and burying artifacts, because the past as we know it is a fraud. Haldeman invents new mythical creatures in "Games Children Play" and all the pending accidents of the future occur at once in "A Very Good Year."

In recent years, there has been more serious work as well, and of increasingly high calibre. "Spring Fever" compares human activity to that of lemmings. An Indian is drafted into duty in orbit in "High Steel" and averts a disaster in what is probably Haldeman's best work to date. Other recent short pieces of interest are "Wet Behind the Ears" and "We the People".

Haldeman's first novel, *Vector Analysis*, is a routine but well-handled story of adventure and scientific mystery in space. *Perry's Planet*, a *Star Trek* adventure, is similarly competent but less noteworthy than his short fiction. *There Is No Darkness*, co-authored with Joe Haldeman, is an episodic adventure which follows a group of young adults on various adventures on different planets. Haldeman has yet to produce a novel of the quality of his better short fiction.

—Don D'Amassa

**HALDEMAN, Joe** (Joseph William Haldeman). Also writes as Robert Graham. American. Born in Oklahoma City, 9 June 1943; brother of Jack C. Haldeman, *q. v.* Educated at the University of Maryland, College Park, B. S. in physics and astronomy, 1967; graduate study, 1969-70; University of Iowa, Iowa City, M. F. A. 1975. #### Joe Haldeman comments:

Along with most of my contemporaries, I believe that science fiction is primarily a literature of ideas, but that this quality does not make it exempt from normal literary standards. A poorly written SF story may be published if the idea behind it is sufficiently interesting, and there's nothing "improper" about that so long as an audience exists for it. But the best SF is that which excels both in concept and in execution—examplars being as diverse as Bestor's *The Stars My Destination* and

Delany's *Dhalgren*—and at its best I think it has an advantage over literature that is "just plain literature."

There's no over-riding didactic or dialectic principle behind my writing. I write the sort of stories and books I would like to read. I'm fortunate in that a lot of moneybearing readers seem to share my tastes. Whether I would be willing (or able) to write differently if the market demanded it, I can't honestly say. I would like to think I'd stick to my guns, but on the other hand I do rather like working without bosses or time clocks.

\* \* \*

Action and the hard sciences, concern for the effects of war and career on individuals, and an interest in stylistic experimentation all characterize Joe Haldeman's science fiction. His first novel, *War Year*, is a mainstream depiction of a typical draftee's Vietnam tour of duty. In fact, Haldeman's Vietnam experiences—he was severely wounded—have been influential in his writing. Vietnam taught Haldeman a sharp lesson in mortality and the randomness of fate, and also that careers, soldiering or anything else, can demand so much that individuals may "become" their careers and nothing more.

*The Forever War* established Haldeman's reputation in SF. The novel's episodic structure, use of sexuality and violence (never gratuitous), vivid descriptions, careful calculations, wry and disillusioned viewpoint character, and documentary collages all typify Haldeman's work. The novel traces a soldier as he travels the ranks from private to major in an 1143-year-long war. Haldeman posits "collapsar jumps" which make possible faster-than-light travel, and shows in the protagonist the future shock caused by such travel in time and space. *The Forever War*, as Haldeman says, operates on a "metaphorical level as a discussion of Vietnam, war and its effect on American society" (letter to the author).

*Mindbridge* uses a compressed version of Dos Passos's documentary collage technique to develop a future in which matter transmission and mental telepathy exist. The book uses two major stylistic techniques: chapters which advance the plot and are written in a vigorous, curt manner from a third-person objective viewpoint; and documents of two sorts, excerpts from the protagonist's autobiography and artifacts of his society. *All My Sins Remembered* returns to the episodic structure and examination of violence and career of *The Forever War*. Essentially an espionage thriller with documentary inter-chapters and a coda, the novel illustrates, through the hyperbole SF makes possible, the process by which a human being becomes absorbed by his job until he becomes his career. Because the novel's non-violent protagonist finds himself working for an amoral organization in a violent occupation, the transformation is especially disturbing.

*Worlds* and *Worlds Apart*, the first two volumes of a projected trilogy, with the final volume to be called *Worlds Enough and Time*, continue to use episodic structure to reflect the episodic, unpatterned nature of reality as Haldeman sees it. They also experiment with narrative viewpoint in their exploration of what makes civilization civilized. The series differs significantly from Haldeman's earlier work partly because its central character is female, partly because its *Worlds* are not so far as usual from our own, partly because its themes are broader.

With the exception of *All My Sins Remembered*, written in spurts from 1970 to 1976, Haldeman's writing has shown a steady progress. His strengths include an ability to make characters both individual and representative, a style generally lucid, fast-paced, and witty, a variety of techniques for

blending necessary explanations into his stories, and a commitment to compassionate action in an uncompassionate world.

##### Uncollected Short Stories

"Almost Immortal," in *All-Story Weekly* (New York), 7 October 1916.  
 "The Rebel Soul," in *All-Story Weekly* (New York), 30 June 1917.  
 "Into the Infinite," in *All-Story Weekly* (New York), 12 April 1919; expanded version, in *Famous Fantastic Mysteries* (New York), October 1942.  
 "The Man Who Saved the Earth," in *The Best of Science Fiction*, edited by Groff Conklin. New York, Crown, 1946.

\* \* \*

Homer Eon Flint, writing alone and in collaboration with Austin Hall, produced a large quantity of science fiction from 1916 to 1924, most of which appeared in the Munsey Magazines *All-Story* and *Argosy*. His fame, however, and that of Austin Hall, rests on one of the most admired and cherished fantasies of the early 20th century, *The Blind Spot*, and its sequel *The Spot of Life*, written by Hall after the death of Flint.

Flint's first published story was "The Planeteer," set in the 23rd century when earth's population has grown so great that global starvation is threatened. Through engineering feats on a truly cosmic scale the earth's orbit is shifted to one closer to Jupiter's, and the latter planet then furnishes a new and inexhaustible source of food. In a sequel, "King of Conserve Island," an earthly monarch attempts to gain control of Jupiter and its food resources, and is thwarted by a hero who cuts off the heat of the sun and freezes the villain into submission. "The Lord of Death" is about two men who travel to the planet Mercury, and find there an ancient record of a man and woman named Adam and Eve who had left Mercury millennia earlier for an unknown destination. In "The Queen of Life" the same characters take their space ship to Venus, where they discover an apparently Utopian civilization.

Hall's writing career began with "Almost Immortal," the story of a Tibetan doctor thousands of years old who has been able to prolong his own life by absorbing the bodies and the wills of younger men at regular intervals. His downfall comes when the last man he assimilates turns out to have a will greater

than his own. "The Rebel Soul" has a quite similar plot involving undying souls which take possession of individuals across the ages. A sequel, "Into The Infinite," carries on the story of a man who has been possessed by the Rebel Soul, and who is eventually freed through the power of a woman's love. "The Man Who Saved The Earth" describes an attempt by the inhabitants of Mars to capture all the water on earth and transport it to Mars, turning the latter into a verdant planet. This plot is foiled at the last minute by the one man on earth with the necessary knowledge, just as the oceans are drying up.

The literary styles of Flint and Hall were curiously similar, sharing the same strengths and weaknesses. Both were totally innocent of the fine points of sentence structure and grammar, and neither has a particularly large vocabulary. Each man, however, had a vivid and far-reaching imagination and a delight in reaching out into the vastnesses of time and space. Their complicated plotting and their skill in describing the life, customs, and technologies of the worlds of the distant future compensate for their somewhat clumsy style at times.

The high point in the literary careers of Flint and Hall was their collaboration on *The Blind Spot*, a classic in the field despite the literary flaws which distinguish the other works of both authors. *The Blind Spot* is more fantasy and mystery than science fiction. In a downtown San Francisco apartment building a gateway between two parallel worlds is discovered. A man emerges from the Spot, and takes back with him a scientist from this world. They are followed by would-be rescuers of the scientist, and the plot thereafter involves additional crossings through the Spot, bringing in more mystery and occultism than science. The Spot is finally closed at the end of the novel, to protect the inhabitants of this world from possible danger from the people on the other side. Flint died in 1924, under violent and mysterious circumstances which have never been explained. Hall continued to write alone, and in 1932 produced *The Spot of Life*, a sequel in which the Spot is reopened by the inhabitants of the other world, with the object of an invasion by force of our world. This novel takes place a generation after the time of the original story, and earth's savior in *The Spot of Life* is the son of the principal character in the first novel.

I suppose that all of us have had the chilling experience of trying to communicate something that was significant in our lives to an audience with a different set of values. We usually wind up with a conventionally lame apology: "Well you really had to be there." Edmond Hamilton is like that. You had to be

there. Even in the rather tight little world of science fiction, there are some authors who have a more or less universal appeal; Hamilton was not that kind of writer, even though he demonstrated from time to time that he was capable of turning out "literary" stories that can hold their own in any company. The best of Hamilton had its essence firmly planted in a particular place: the time was when you were young and the acid of sophistication had not eaten away at your heart; the place was in the lamented pulps of yesteryear.

Edmond Hamilton virtually invented the idea of the Space Patrol. Moreover, it was an *interstellar* Space Patrol. The concept of a galactic civilization entered the mainstream of science fiction through Hamilton's stories for *Weird Tales* and *Amazing Stories* between 1928 and 1930, and it has been a lasting influence. More generally, Hamilton is identified with space opera. He was writing it before the term was coined, and he wrote a tremendous amount of it for *Air Wonder Stories*, *Amazing*, *Startling*, and *Thrilling Wonder Stories* (Hamilton published little in *Astounding*, *Galaxy* and *Fantasy and Science Fiction*; oddly enough, Hamilton was also conspicuous by his absence in *Planet Stories*, supposedly the epitome of space opera). Most of his stories show the defects of the genre he pioneered. The action was fast and furious and sometimes absurd. The characterization was minimal and the dialogue was ghastly. This was fiction in primary colors: it is Good versus Evil and look out for the meteor! In positive terms, he had the ability to fire the imagination. Hamilton was fond of the Big Idea and he could communicate the excitement of sweeping concepts. (It was typical of Hamilton to present the whole panorama of evolution in a short story, and to throw in some original twists along the way.) He caught the drama of science; he may not have gotten all the notes right, but he certainly heard the music. His stories had verve and feeling, and they were alive. Hamilton did not take himself with undue solemnity; he had some fun with his writing. At the same time, he was writing stories that *he* liked to read, and it showed. The least of Hamilton's stories were always blessed by that extra dimension that makes all the difference: the sense of wonder.

Hamilton's most famous (or infamous) creation was Captain Future. The name was decidedly unfortunate; it is so trite that it virtually demands parody. (It got some, too. Captain Future was the only character in science fiction who managed to attract the scalpel of S. J. Perelman.) The magazine *Captain Future* was published quarterly from 1940 through 1944 and each issue featured a short Captain Future novel. Hamilton wrote most of them, as well as some later Captain Future stories that appeared in *Startling Stories*. By and large, this was formula fiction redeemed at times by flashes of the Hamilton talent. Captain Future was Curt Newton, also known as the Wizard of Science and the Man of Tomorrow. With his sidekicks—Grag the robot, Otho the android, and Simon Wright, a brain in a box—Captain Future kept boredom at bay by saving the solar system from assorted disasters ("Something's up back there at Earth, boys! We're blasting back right now").

Beginning perhaps with *City at World's End* (1951), Hamilton's fiction took on a more subdued tone as he adapted to a changing market. He cut down on the melodrama, introduced more shadings in his stories, and worked to create believable characters. One can only salute the effort; the novels range from *The Haunted Stars* to the *Starwolf* series, and they are better than a great many science-fiction tales with inflated reputations. Unfortunately, when Hamilton got rid of the corn he also lost much of the excitement that had marked his work. The spark is still there, but the fire never really gets going.

There is a kind of pathos about Hamilton's later work. He

had been a creative professional writer for a quarter of a century and now he had to prove himself all over again. His talent may have been obscured by the type of science fiction to which he devoted himself, but the mature Hamilton shows to good advantage in a number of classic short stories, including "What's It Like Out There?" and "The Pro."

Edmond Hamilton was one of the most prolific of all science-fiction writers. There was joy in his work, and he opened a lot of doors for those who came after him.

—Chad Oliver

\* \* \*

Lee Harding is the most versatile of Australian science-fiction writer. He has acted as editor as well as writer, and his published works include stories and children's books as well as novels for adolescent and adult readers. His writings reflect a mature and distinctive commitment to characterization, and to

sound, straightforward techniques of narrative and construction.

Harding's first novel, *A World of Shadows*, is set in the not-too-distant future when man's exploration of second-order space has disturbed the strange alien Shadows. During a routine space flight the astronaut Stephen Chandler is beset by Shadows, and as a result of their onslaught he returns to Earth in the body of his co-pilot—but with his own mind and memories intact within the new body. He becomes involved in a desperate struggle to convince the authorities—and his wife—of his real identity. But what is his "real" identity? *A World of Shadows*, then, is a novel about identity. But Harding describes it as "an unusual ontological thriller," and the epigraph quotes John Donne on love. These three disparate themes are drawn together by Stephen Chandler's plight, and while the novel offers no profound new insights, it does offer an interesting and cogent canvassing of issues.

The title of *The Weeping Sky* comes from the novel's central image of an eerie weeping "wound" in the sky, and through skilled and subtle manipulation of characters, situation, and setting, Harding presents an eloquent statement on the elusive, illusory nature of reality. His characters seem to belong to our world, but their society is medieval and their religion is an unknown variant of Christianity; the "wound" in the sky appears to be a harmless though supernatural phenomenon, but there is evidence that it might be a thoroughly rational precursor of natural disaster. *Displaced Person* presents further exploration of the nature of reality as the teenager Graeme Drury gradually finds himself estranged from the world and people around him and is drawn into a soundless, colourless "grey world" or limbo. This novel is more skilled in execution than *The Weeping Sky*, for it contains some haunting lyrical scenes and succinctly accurate accounts of suburban lifestyle, but it is the lesser novel in conception. Its themes are too explicit, and the novel's attempts at metaphysical speculation are ineffective (though minor textual changes to the second edition are an improvement).

Harding's latest novel, *Waiting for the End of the World*, heralds changes in the direction of his writing. Though it is a work of SF (set in a decrepit totalitarian future Australia), its concerns and strengths are those of "mainstream" fiction, for the novel's chief feature is its penetrating characterization.

Lee Harding has a gift for narrative, and consequently it is the storyline that is paramount in each of his novels. Yet Harding is no "mere" story-teller, for his plots are a way of finding characters and themes, and they are always generated by the plight of his characters. It is stock critical jargon to talk about an author "examining" his themes (implying an approach that is analytical, rigorous, perhaps even exhaustive), but this is not appropriate to Harding's method. Instead of delving deeply, Harding canvasses issues with a deft, light touch. Human beings are his chief concern, and he is Australian SF's foremost exponent of characterization.

Charles L. Harness comments:

I did it for money.

\* \* \*

Charles L. Harness has not written as much as his admirers (Damon Knight, Brian Aldiss, Michael Moorcock) would have wished. His work has always been highly intricate, and his early stories have been compared to those of A. E. van Vogt. Unlike that author, he provides what seems to be a rational explanation for all the astonishing turns of his plots; like van Vogt, his best work has the compelling power of a dream. It is highly cerebral as well; in the words of Louis MacNeice, Harness likes "to draw the corks out of an old conundrum./And watch the paradoxes fizz."

In *Flight into Yesterday* the hero, Alar, emerges from a wrecked spaceship with no memory of who he is but a certainty that he has a most urgent task to perform. He is sponsored by the Society of Thieves, and protected by the heroine, Keiris, who is the widow of a vanished scientist. The society he finds himself in is sophisticated but decadent; there are brilliant ball scenes and hideous torture chambers. As he attempts to escape from the Imperial police, he talks to the Empress, to a Toynbeeian student of the downfall of civilizations, and to the lunatic crew of a solarion, a station perilously located on the surface of the Sun. The play of ideas is brilliant, the menace threatening. The ending is perhaps a shade too perfect, with the hero cancelling out all the misery of humanity. But the book is a dazzler all the same.

"The Rose" is perhaps Harness's most beautiful single work. The heroine, Anna van Tuyl, is at once a composer, a ballet dancer, and a psychotherapist. She is composing a ballet based on Oscar Wilde's story "The Nightingale and the Rose," and is at a standstill in the piece; she is also suffering from a deforming illness. Then she is asked to treat Ruy Jacques, the husband of the eminent and arrogant scientist Martha Jacques; Ruy Jacques has forgotten how to read print, but can read people's intentions instead. In attempting to cure Ray Jacques, Anna falls in love, incurring the jealousy of Martha Jacques. The climax is one of death and transfiguration: Anna finds the perfect ending to her ballet and dies, but hands on the key to a higher mode of life. The summary cannot do justice to the work, which must be read.

*The Ring of Ritornel* is again set in a society of formal brilliance and extreme tyranny. The villain is the Emperor

Oberon, who cares nothing for human life. The hero, James Andrek, has been robbed of both his father and his elder brother by Oberon, and is determined to find the culprit. At the close of the book, a new cycle of the universe is about to begin, and only two people from the old universe will survive. In the warring religions of Alea and Ritornel, Harness poses old questions of chance and destiny. The structure of the book is both mathematical and musical: certain characters and motifs recur, but always with a different effect. The book is beautiful and moving.

*Wolfhead* is more direct in manner than the other novels. Set in an Earth long after an atomic catastrophe, it has a hero who descends into the underground kingdom in pursuit of his lost love Beatra. As is fitting for a successor to Dante, he is guided by Virgil—a she-wolf into whose brain a small part of his own has been grafted. The theme is one of unrelenting war; in the end the hero at least succeeds in rescuing his society, but not his wife.

*The Catalyst* is set in the near future, and deals with a plague called novarella and a chemical called trialine which can cure it. There is a stunning portrait of the scientist Serane, and the way in which he reaches his discoveries by totally circumventing the bureaucratic structure in which he works. The hero, Paul Blandford, succeeds in securing priority for Serane's invention by an incredible trial run. Thomas M. Disch has complained of the fantastic element in this novel, but I suspect that Harness feels life really is like this: we make our discoveries half in a dream, and sometimes we do seem to be protected by guardian angels. This aspect of the book reminds me strongly of Arthur Koestler's life of Kepler in *The Sleepwalkers*.

Harness's earlier short stories were perhaps stronger on plot than on character; his first, "Time Trap," already showed the ability to construct a highly ingenious time loop. His most brilliant early story, "The New Reality," begins from the premise that early man was not less observant than we, and concludes that the world *was* flat until the 5th century B. C. The villain, Luce (alias Lucifer), brings about a completely new universe by rendering all previous theories about reality untenable, and A. Prentiss and E. (alias Adam and Eve) survive into the new reality—which is paradisaal. But so does the snake!

The richest short stories Harness has given us, however, belong to a period since the middle 1960's. "Probable Cause" deals with the case of a convicted murderer of a President: since the evidence against the accused was obtained by clairvoyance, the Supreme Court must consider whether his constitutional rights have been abridged. "The Alchemist" and "An Ornament to His Profession" both deal with a chemical manufacturing firm and the problems of patent law: in the first, the firm discovers with horror that one of its scientists is practising alchemy; in the second, the lawyer Con Patrick is driven to realize that he would sell his soul if necessary to protect his patents. The later Harness stories have surrendered nothing in the skill of plotting, but they have a sure humour and sense of the richness of human life that were lacking in the earlier short stories (excepting always "The Rose"). His best work is a high-water mark in science fiction.

—Charles Cushing

**HARRISON, Harry.** Pseudonym for Henry Maxwell Dempsey; also writes as Felix Boyd; Leslie Charteris; Hank Dempsey. American. Born in Stamford, Connecticut, 12 March 1925. Educated at art schools in New York. Served in

the United States Army Air Corps during World War II: Sergeant. Married Joan Merkler in 1954; one son and one daughter. Free-lance commercial artist, 1946-55. Formerly, Editor, *SF Impulse*, London; Editor, *Fantastic*, New York, 1968. Lives in County Wicklow, Ireland. Recipient: Nebula Award, 1973. Agent: A. P. Watt Ltd., 26-28 Bedford Row, London WC1R 4HL, England.
